LIGNUM RUBRUM. Offic. *Braſilio ſimile Lignum Vernimbock Germanis dictum.* J. B. 1. 492. Raii Hiſt. 2. 1737. RED-WOOD.

It grows in *Braſil*, and the Wood is of Uſe in Dying; but I find no medicinal Virtues aſcribed to any Part of this Plant.

LIGNUM { SANCTUM, SASSAFRAS } See { GUAIACUM. SASSAFRAS.

LIGNUODES, λιγνώδης, from λιγνὺς, Soot. Sooty. This is an Epithet in *Hippocrates* for the Tongue, in ſome acute Diſorders; importing its being brown, or black: And for the Spit, in Diſorders of the Lungs, which is black.

LIGULA, in Anatomy, is the Clavicle, or the Glottis: Or it is a Meaſure of Capacity, of Things liquid or dry; being a Quarter of a Cyathus, equal to one forty-eighth of a Pint. *Arbuthnot.*

Rhodius, in his Notes to *Scribonius Largus*, ſays, that a *Ligula* is half an Ounce, within two Scruples.

Ligula, alſo, is ſometimes uſed to expreſs a ſmall Ligature.

LIGURINUS. The Name of a ſmall Bird. See SPINUS.

LIGUSTICUM.

The Characters are;

The Leaves are lobated, with Inciſions about their Edges, like thoſe of Parſley. The Seeds are like thoſe of the Siler, or Oſier.

Boerhaave mentions three Species of this Plant; which are,

1. Liguſticum; Scoticum; Apii folio. *T.* 324. *Liguſticum humilius, Scoticum a maritimis, ſeu Apium maritimum, dulce Scoticum.* Plukn. Phyt. 96. 2. *Seſeli maritimum, Scoticum.* Par. Bar. *Imperatoriæ affinis, umbellifera, maritima Scotica.* H. Edinb. App. *Siler montanum, Hippoſelini foliis humilius.* M. H. 3. 176.

2. Liguſticum; Græcum; foliis Apii. *T. C.* 13.

3. Liguſticum; vulgare; foliis Apii. *J. B.* 2. 122. *Boerh. Ind. A.* 52. *Leviſticum.* Offic. *Leviſticum, vulgare.* Ger. 855. Emac. 1008. Park. Theat. 936. Raii Hiſt. 1. 437. *Liguſticum vulgare.* C. B. P. 157. *Angelica montana perennis Paludapii folio.* Tourn. Inſt. 313.

The Roots of Lovage are thick, large, and much divided, with many Fibres of a brown Colour on the Outſide, of an hot, ſtrong, aromatic Smell and Taſte. The Leaves are large, and winged, parted into ſeveral Diviſions, but ſomewhat like Smallage, but larger, and of a darker-green Colour. The Stalks are thick, tall, and ſtriated, or chaneled; on the Top of which grow Umbels of five-leav'd, ſmall, yellow Flowers, which are ſucceeded by oblong, ſtriated, brown Seed, two join'd together, as in other umbelliferous Plants. It is cultivated in Gardens, and flowers in *June* or *July*.

The Roots, Leaves, and Seed of Lovage are heating and drying; they warm and comfort the Stomach, expel Wind, provoke Urine and the Menſes, and are uſeful in peſtilential Diſtempers, and all kinds of Agues; but they are ſeldom uſed in the Shops. *Miller's Bot. Off.*

It is cultivated in Gardens, and flowers in *June*; and, in every reſpect, agrees, as to Virtues, with Angelica and Imperatoria. It is alexipharmic, diuretic, and vulnerary. *Dale.*

The Root is oblong, an Inch in Thickneſs, brown on the Outſide, and pale within, of an acrid, aromatic, penetrating, and ſweetiſh Taſte, and of a pleaſant and fragrant Smell, but to ſome ſtrong and offenſive. The Plant is native of *Scotland*, where it grows in the mountainous Parts, and is gathered among other Herbs by the Country-people, and apply'd to medicinal Uſes. They commend this Herb for a purulent and ſanguineous Aſthma, and for all Diſeaſes proceeding from Viſcidity, on account of its attenuating Quality: It is recommended, alſo, as a Pectoral, and for an Aſthma proceeding from Phlegm; for it opens and ſtrengthens the Lungs: For theſe Purpoſes, it is uſual to exhibit a Decoction of the Leaves, ſweeten'd with Liquorice. This Plant is alſo ſuppos'd to be an Alexipharmac, and is well-known to be ſudorific and diuretic. The Root cures all inflammatory and pituitous Diſeaſes, which is no Contradiction, if we conſider, that it has an emollient and reſolvent Virtue, heating, yet not inflaming; and, therefore, may be ſerviceable in both Caſes. The Root boiled and taken, provokes Spitting in a Peripneumony, which is a good Symptom; but, if it be boiled too much, it loſes its Virtue: It is alſo an Ariſtolochic, or Provoker of the Menſes and Lochia, generates Milk in Nurſes, and is reckoned among the Aphrodiſiaca, or Promoters of Venereal Vigour. It increaſes the Semen in Men, as well as Milk in Women; and the Midwives give the Juice hereof as a great Secret for promoting the Lochia, and expelling the Fœtus and Secundines; it is excellent in Hyſterics, and a Suppreſſion of the Menſes; half an Ounce of the Seed, taken in Water, is a Sudorific. It is alſo a potent Carminative, and yields a Spirit, which they call *Lovage-water*, in *Dutch*, *Lavas*; which is much abuſed by our Countrymen [the *Dutch*]. Of the Seeds, which are reckoned among Carminatives, is prepared an heating Oil, free from exceſſive Acrimony. The Juice, taken every Day, is an excellent Nephritic; for it cleanſes the Kidneys of Sand, and putrid Matter. Of the Seeds are prepared a Water and Spirit, which are effectual in Hyſterics; and with the Spirit I myſelf have, in a ſurpriſing manner, relieved hyſteric Women, when under the deplorable Symptom of Spaſms of the Inteſtines. I have exhibited the ſame to melancholy Perſons under the Power of their depraved Imaginations, and with good Succeſs; for they have been greatly exhilarated thereby: But I took care to give it by another Name; for if the Patients ſhould once come to know, that it was Spirit of Lovage that made them ſo chearful, they would always deſire to be in the ſame Humour, and debauch themſelves with it; for it is an agreeable Liquor, and one accuſtomed to it will never be able to forbear it. Lovage is reckoned a Specific in the Jaundice, either by its Sweetneſs, mitigating the Acrimony of the Bile, or by attenuating it, and ſo promoting its Expulſion from the Inteſtines; it is, alſo, diaphoretic, heats, and relieves under Colds. Outwardly, it is much uſed in Baths, and in Cataplaſms appropriated to the Uterus, and Diſorders of that Part. In a Word, it is a Plant of excellent Service in Caſes where a balſamic Stimulus is required; and is reckoned, alſo, among Antiſcorbutics. *Hiſt. Plant. aſcript. Boerhaave.*

LIGUSTRUM.

The Characters are;

The Leaves are conjugated and caducous; the Flower is monopetalous, funnel-ſhaped, tetrapetaloidal, and pentapetaloidal, and ſeated upon a minute Calyx. The Ovary, in the Bottom of the Calyx, becomes a globular ſoft Fruit, full of Juice, and containing four Seeds, which are gibbous on one Side, and flat on the other.

Boerhaave mentions four Species of this Plant; which are,

1. Liguſtrum. *Offic. Ger.* 1208. *Emac.* 1394. *Raii Hiſt.* 2. 1603. *Synop.* 3. 465. *Tourn. Inſt.* 596. *Boerh. Ind. A.* 2. 215. *J. B.* 1. 528. *Liguſtrum vulgare.* Park. Theat. 1446. *Liguſtrum Germanicum.* C. B. P. 475. PRIVET.

Privet is a Buſh or Shrub, which grows not to any great Bigneſs, having many ſmooth, tough, pliant Branches, cloath'd with ſmall, oblong Leaves, broadeſt in the Middle, and ſharp-pointed at the Ends, ſmooth, and without Indentings about the Edges, two at each Joint. The Flowers grow in thick Spikes at the End of the Branches, of a white Colour, each being monopetalous, and divided into four Segments: They are ſucceeded by Cluſters of black Berries. It grows in Hedges, and flowers in *May* and *June*. The Berries are ripe in *September*.

The Leaves and Flowers are cooling, drying, and reſtringent, good for Ulcers and Inflammations of the Mouth and Throat, Bleeding of the Gums, and Relaxation of the Uvula. *Miller's Bot. Off.*

The Leaves of the Privet are aſtringent, bitter, and give a faint Tincture of Red to the blue Paper; the Flowers and Fruit give it a much deeper. We may conjecture by this, and the chymical Analyſis, that there is an aluminous Salt involved in a great deal of Sulphur, in the Leaves of this Plant; but that this Salt is very much diſengaged from it in the Flowers and Fruits. This does not hinder but there may be ſomething urinous in the whole Plant; for, beſide the great Quantity of Oil, and acid Liquors which it yields by Diſtillation, there is, alſo, a little urinous Spirit extracted from it. All theſe Principles, mix'd together, render the Privet very deterſive. The Gargariſms made with the Juice, or diſtilled Water, of this Plant, are good for the Diſeaſes of the Throat; they dry away Ulcers, aſſwage the Inflammations of the Eyes, cure Scalds, ſtop the Spitting of Blood, and Hæmorrhages. *Martyn's Tournefort.*

2. Liguſtrum; foliis e luteo variegatis. *H. R. Par.*

3. Liguſtrum; foliis argentatis. *Breyn. Prodr.* 41.

4. Liguſtro ſimilis arbor; Africana. *Slangenboom, vulgo Batavis. Boerh. Ind. alt. Plant. Vol.* 2. *p.* 215.

LIGUSTRUM INDICUM. See ALCANNA.

LIGUSTRUM NIGRUM. A Name for the *Lilac*; *laciniato folio.*

LIGUSMA, λιγύσμα. A Contorſion of a Joint, not amounting to a perfect Luxation. *Galen, Lib.* 2. *Cap.* 19. *de Comp. M. P. G.*

LILAC. The Pipe-tree.

The Characters are;

The Calyx is monophyllous, tubulous, ſhort, and quadrifid. The Flowers are monopetalous, funnel-ſhaped, quadripartite, or quinquefid, collected into Tufts, and furniſhed with two or three Stamina. In the Centre of the indented Calyx is ſeated the Ovary, which becomes a compreſſed Fruit, ſhaped like a Tongue, and divided into two Cells by an Interciſure, which burſts aſunder when the Fruit is ripe; the two Cells are full of compreſſed marginated Seeds,

Boerhaave mentions five Species of this Plant; which are,

1. Lilac. *Matth.* 1237. *Syringa cærulea.* C. B. P. 398.

2. Lilac; flore albo. *T.* 601. *Syringa; flore lacteo.* H. Æyſt. o. 1. F. 1. Fig. 3.

3. Lilac; flore ſaturate purpureo. *T.* 602.

4. Lilac; folio liguſtri. *T.* 602. *Syringa, Perſica, foliis integris.* H. L. *Jaſminum, Perſicum, foliis non laciniatis.* Suth. 328.

5. Lilac; laciniato folio. *T.* 602. *Syringa, Perſica, foliis laciniatis Liguſtri.* H. L. *Jaſminum, Perſicum, foliis laciniatis.* H. E. Suth. 328. *Liguſtrum nigrum.* Alpin. Exot. 179. *Liguſtrum, foliis laciniatis.* C. B. P. 476. Prodr. 158.

This is an *Arabic* Name; though ſome derive it from the Lily, becauſe its Flowers bear ſome Reſemblance to the Lily: It is, alſo, called by the *Greeks* Συρὶγξ, and by the *Latins Syringa*, becauſe, when the Pith is taken out of its thick Branches, they are made into Pipes.

LILI. The Name of one of *Paracelſus's* Arcana, the Baſis of which is ſuppoſed to be Antimony. See LILIUM.

LILIAGO. A Name for the *Liliaſtrum*; *Alpinum*; *minus*.

LILIASTRUM.

The Characters are;

The Flower is hexapetalous, naked, furniſhed with ſix Stamina, and embracing an oblong Ovary, full of angulous Seeds. The Root is like that of the Aſphodel.

Boerhaave mentions but one Sort of this Plant; which is the

Liliaſtrum; Alpinum; minus. *Tourn. Inſt.* 369. *Boerh. Ind. A.* 2. 134. *Phalangium.* Offic. *Antiquorum.* Ger. Emac. 48. *Phalangium magno flore.* C. B. P. 29. *Phalangium folio Lilii.* J. B. 2. 636. Raii Hiſt. 2. 1192. *Phalangium Allobrogicum.* Park. Parad. 150. SPIDERWORT.

It is cultivated, with us, in Gardens, and flowers in *June*. The Parts in Uſe are the Flowers, and Seeds, which, according to *Dioſcorides*, being taken in Wine, are an Antidote againſt the Poiſon of the Scorpion, and the Phalangium (a venomous ſort of Spider); and cure the Gripes.

LILIO-ASPHODELUS.

The Characters are;

The Root is like that of the Aſphodel, ſhaped like that of the Navew. The Flower is like a Lily, but monopetalous, deeply jagged, with its under Part tubulated. The Fruit is generally oval, and contains roundiſh Seeds.

Boerhaave mentions two Species of this Plant; which are,

1. Lilio-aſphodelus; luteus. *Park. Parad.* 148. *Lilium, luteum, radice Aſphodeli.* C. B. P. 80. M. H. 2. 412.

2. Lilio-aſphodelus; puniceus. *Park. Parad.* 148. *Cluſ. H.* 137. *Lilium, rubrum, Aſphodeli radice.* C. B. P. 80. M. H. 2. 412. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 110.

The Plant is called *Lilio-aſphodelus*, becauſe is partakes of the Nature of both the Lily and the Aſphodel; but I find no Virtues aſcribed to it.

LILIO-FRITILLARIA.

The Characters are;

The Root is bulbous, like that of the Lily, which it reſembles, alſo, in its Leaves and Stalks. The Flower is hexapetalous, bell-ſhaped, pendulous, and embracing an Ovary, which is like that of the Fritillaria.

Boerhaave mentions but one Species of this Plant; which is,

Lilio-fritillaria; quod Lilium Perſicum *H. Eyſt. Vern.* o. 5. *F.* 4. *Fig.* 1. *Dod. p.* 220. *C. B. P.* 79. *M. H.* 2. 406. *Lilium Suſianum.* Cluſ. H. 129, 130. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 141.

LILIO-HYACINTHUS. The Lily-hyacinth.

The Characters are;

It has the Leaves and the ſquamous Root of the Lily; the Stalk is naked, and the Flower hexapetalous, nearly reſembling that of the Hyacinth; and embracing an Ovary, which becomes a Fruit, declining from a globous to an acuminated triangular Figure, conſiſting of three Cells, full of Seeds, which are almoſt of a globular Form.

Boerhaave mentions two Species of this Plant; which are,

1. Lilio-Hyacinthus; vulgaris; flore cœruleo. *T.* 372. *Hyacinthus ſtellaris, foliis & radice Lilii.* C. B. P. 46. M. H. 2. 376.

2. Lilio-hyacinthus; vulgaris; flore niveo. *T.* 372. *Hyacinthus ſtellaris, foliis & radice Lilii, flore niveo.* C. B. P. 46. M. H. 2. 376. *Boer. Ind. alt. Plant. Vol.* 1. *p.* 136.

They are cultivated in Gardens; and they contain a great deal of Oil and Phlegm, and a little eſſential Salt.

Their Roots are ſoftening, digeſtive, and reſolutive. *Lemery des Drogues.*

LILIO-NARCISSUS. Lily-daffodil.

Boerhaave mentions nine Species of this Plant; none of which have any medicinal Virtues attributed to them, at preſent, that I know of.

LILIO-ORNITHOGALUM. A Name, according to *Tournefort*, for the LILIO-NARCISSUS.

LILIUM.

The Characters are;

The Root is bulbous, conſiſting of fleſhy Scales, which are placed one upon another, on the Outſide, almoſt in a circular Order. The Stalks are ſurrounded with numerous Leaves. The End of the Pedicle ſupports a Placenta, to which, circularly diſpoſed, grow ſix Petals, which are reflexed outwards, either moderately, as in the Lily, ſo called, or quite convolved outwards, as in the Martagon. Within theſe Petals, from the ſame Original, ariſe ſix Stamina cloſely united, ſurrounding a Tube, and furniſhed with long Heads. The Ovary grows on the Placenta within the Flower, is of a triangular Shape, ſurrounded within the Petals and the Stamina, by a double Row of marginated Seeds; and ſhoots forth a long Tube from the Centre of the Apex.

Boerhaave mentions nineteen Species of this Plant, none of which have any medicinal Virtues aſcribed to them, at preſent, that I know of, except the firſt, fifth, and ſeventh.

The firſt is the

Lilium; album; flore erecto & vulgare. *C. B. P.* 76. *Boerh. Ind. A.* 2. 135. *Lilium album.* Offic. Ger. 146. Emac. 490. Raii Hiſt. 2. 1109. *Lilium album vulgare.* J. B. 685. Park. Parad. 39. Tourn. Inſt. 369. WHITE LILY.

This is a Flower which grows in every Garden, having a round ſcaly Root, and a Stalk three or four Feet high, with long, narrow, thick Leaves, and on the Top ſeveral large, ſweet, white Flowers, with ſeveral yellow Apices in the middle, flowering in *June*.

The Flowers and Roots are uſed, and that chiefly in external Applications; they are emollient, ſuppling, and anodyne, good to diſſolve and ripen hard Tumors and Swellings, and to break Impoſtumations.

The only officinal Preparation is the *Oleum Liliorum. Miller's Bot. Off.*

The diſtil'd Water of Lilies, with an Addition of Saffron and Caſſia, are, by *Matthiolus*, recommended for promoting Delivery, and the Expulſion of the Secundines; but *Camerarius* thinks the Saffron and Caſſia ſuperfluous. It is, alſo, recommended in Faintings, and Diſorders of the Lungs, as the Aſthma and Coughs; and *Simon Paulli* ſpeaks of it as a Coſmetic, with the Addition of a little Camphire, and Oil of Tartar per Deliquium.

There is prepared, by Inſolation, an Oil of the Flowers; but the Leaves muſt not be left fifteen Days in the old Oil; for the whole Plant abounding with a mucilaginous Juice, the Leaves eaſily putrefy, and the Oil will no longer ſmell of the Lilies, which is the principal Mark of its Goodneſs, but will have a rank and fetid Smell. Three Days therefore will be ſufficient, after which we muſt put in freſh Leaves, and repeat the ſame the third time, which will be ſufficient for the Preparation.

The Oil is of extraordinary Efficacy in all Pains and Affections proceeding from Cold; it relaxes Parts which are too tenſe, ſoftens thoſe which are too hard, and mitigates Pains; for which Reaſons it is of ſervice in the Colic, and nephritic Diſorders, the Pleuriſy, and the like; it is, alſo, of ſingular Uſe in indurated Nerves, in a Scirrhus of the Uterus, and a conſequent Suppreſſion of the Menſes. *C. Hoffman.*

The Root is ſeldom uſed internally, but frequently applied for ſoftening and ripening of Tumors, for removing Corns of the Feet, being mixed with old Lard, for mollifying the Pudenda in Labour, and for Burns, and the like Caſes. The Seeds are exhibited in Water of Vervain, or the like, in order to facilitate the Birth. *Schroder.*

Godorus, Serjeant-ſurgeon to Queen *Elizabeth*, cured many of the Dropſy, as we are inform'd by *Gerard*, with the Juice of the Root mixed with Barley-flower, and baked in Cakes, and ſo eaten ordinarily for a Month or ſix Weeks together with Meat; but no other Bread was uſed during that Time. The ſame Surgeon found by Experience, that the expreſſed Juice of the bruiſed Root, given for two or three Days together in Wine, expels the Poiſon of the Peſtilence, and cauſes it to break out in Puſtules and Bliſters on the Skin. *Raii H. P. p.* 1109.

The fifth is the

Lilium; purpureo-croceum, majus. *C. B. P.* 76. *Tourn. Inſt.* 369. *Boerh. Ind. A.* 2. 137. *Hemerocallis.* Offic. *Hemerocallis, Lilium rubrum.* Mont. Ind. 44. *Lilium aureum.* Ger. 148. Emac. 192. Park. Parad. 38. *Lilium rubens croceum majus.* J. B. 2. 688. Raii Hiſt. 2. 1110. RED LILY.

It is cultivated in Gardens, and flowers in *June* and *July*; the Parts in Uſe are the Root and the Leaves. The Root drank, or made into a Peſſary with Honey and Wool, expels Water and Blood. The Leaves bruiſed mitigate Inflammations of the Breaſts contracted after Childbirth, and Inflammations of the Eyes. The Root and Leaves are very ſucceſsfully applied by way of Cataplaſm to Burns. *Dioſcorides.* The Root is aperitive. *Mont. Ind.*

The ſeventh is the

Lilium; floribus reflexis; montanum. *C. B. P.* 77. *Raii Hiſt.* 2. 1112. *Boerh. Ind. A.* 2. 135. *Martagon.* Offic. *Martagon montanum ſive ſylveſtre minus.* Park. Parad. 31. *Lilium montanum minus.* Ger. 150. Emac. 196. *Lilium flore nutante ferrugineo minus.* J. B. 2. 692. MARTAGON, or TURKS CAP. *Dale, p.* 241.

It is cultivated in Gardens, and flowers in *June*. The Root, which is uſed, is ſubſtituted, in our Shops, in the room of the yellow Aſphodel. *Boxb.* The common People hang it about the Necks of Infants, to facilitate Dentition. *Rupp.*

LILIUM is, alſo, a Name for ſeveral Sorts of *Corona Imperialis.*

LILIUM CONVALLIUM.

The Characters are;

The End of the Pedicle runs into a monopetalous, bell-ſhaped, pendulous, ſpiked Flower, divided at the Top into ſix Segments. The Ovary grows on the Apex of the Pedicle within the Flower, and becomes a ſoft, globular Berry, full of ſmall round Seeds, cloſely compacted; the Leaves reſemble thoſe of Plantane, or the Lily.

Boerhaave

Boerhaave mentions three Species of this Plant; which are,

1. Lilium Convallium; album. *C. B. P* 304. *Tourn. Inſt.* 77. *Boerh. Ind. A.* 2. 64. *Lilium Convallium.* Offic. Ger. 331. Emac. 49. Raii Hiſt. 1669. Synop. 3. 264. *Lilium convallium flore albo.* Park. Parad. 349. *Lilium Convallium vulgo.* J. B. 3. 531. LILY OF THE VALLEY.

The Lily of the Valley, or *May* Lily, has a ſlender creeping Root, that runs upon the Surface of the Earth, ſhooting out two or three Leaves oblong, round, and full of Nerves, five or ſix Inches long, from the middle of which riſes a Stalk, about a Span high, angular and ſlender, bearing ſix or ſeven Flowers in a Spike, one above another, and looking all one Way; they are ſmall, hollow, and round, of one Leaf cut into five Parts, of a pleaſant, grateful Scent, which are ſucceeded by ſmall round Berries.

Lilies of the Valley are of great Service in all Diſorders of the Head and Nerves, as Apoplexy, Epilepſy, Palſy, Convulſions of all Kinds, Vertigo, Swimming in the Head; and are frequently uſed in Errhines, and cephalic Snuff; a large Quantity of them are put in the *Aqua Pœniæ compoſita*, and in the *Spiritus Lavendulæ compoſitus. Miller's Bot. Off.*

The Flowers, being analyſed, after a long Maceration, yield ſeveral acid Liquors, a good deal of concreted volatile Salt, and a great Quantity of Oil: Thus we may believe they contain a good deal of Sal Ammoniac and Sulphur, allayed with a little Earth.

Theſe Flowers are aperitive, good for the Palſy, Epilepſy, and Vertigo; a Conſerve is made of them, and they are diſtilled. *Tragus* macerated them in Wine, before he diſtilled them. *Camerarius* put them in a Pot, well ſtopt, and buried them in an Ant-hill. About a Month afterwards he gathered an oily Liquor, which he much eſteemed for the Gout and the Sciatica. The Spirit of the Flowers, drawn with Spirit of Wine, is excellent to make the Tincture of Ambergriſe. Every body knows, that the Root and Flowers, being powdered, cauſe one to ſneeze. *Martyn's Tournefort.*

In *Germany* they make a Wine of the Flowers, by drying them in the Summer, and, in the Time of Vintage, mixing them with their Grapes when preſſed: This Wine is preſcribed in cephalic Diſorders; and, alſo, as a Cordial in the cardiac Paſſion, and Lipothymy. Some diſtil the freſh Flowers in old generous Wine, either by themſelves, or with the Flowers of Lavender and Roſemary, *in Balneo Mariæ.* They who would have it ſtronger than ordinary, repeat the Infuſion, and diſtil it over again: The Water thus prepared is called by *Matthiolus Aqua aurea*, "Golden "Water," being reſerved in Gold and Silver Veſſels, againſt all dangerous Diſorders. The Flowers, as well as the Root, dried and pulverized, are a celebrated Ptarmic. *Raii Hiſt. Plant.*

2. Lilium convallium; flore rubente. *C. B. P.* 304. *J. B.* 3. 533.

3. Lilium convallium; latifolium; flore pleno variegato. *Didac. T.* 77. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 65.

LILIUM LUTEUM. A Name for the *Lilio-aſphodelus*; *luteus.*

LILIUM RUBRUM ASPHODELI RADICE. A Name for the *Lilio-aſphodelus*; *puniceus.*

LILIUM SUSIANUM. A Name for the *Lilio-fritillaria*; *quod Lilium Perſicum.*

LILIUM ZEYLANICUM. A Name for the *Methonica*; *Malabarorum.*

The LILIUM PARACELSI is thus directed in the *Collectanea Chymica Leidenſia.*

Take of the Regulus of *Mars*, rightly prepar'd; diſſolve it in equal Parts of *Aqua-fortis*, and Spirit of Salt. Pour into this Solution the Sulphur procur'd from the Regulus of Antimony, by boiling, till a Precipitation is made; the Precipitate will be of a yellowiſh Red, which edulcorate, and reſerve for Uſe. The Doſe is from four to ſix Grains.

If this Powder operates too violently, it may be mitigated, and fix'd thus:

Take of the *Lilium Paracelſi*, prepar'd as above, one Part; of common decrepitated Salt, two Parts. Let them be rubbed together, and calcin'd over a gentle Fire, for an Hour, ſo as not to melt: Then let it be edulcorated, and dried.

It is given in the Venereal Diſeaſe; in obſtinate Itches; in Fevers, Dropſies, and deep-rooted Obſtructions, mixed with Mithridate, or Diaſcordium.

In order to check its emetic Quality, it ſhould be given with Sudorifics.

LIMA. A File, or Raſp, uſed in Pharmacy, to reduce hard Subſtances to fine Particles; whoſe Conſiſtences will not admit of powdering.

LIMANCHIA, from λιμὸς, Famine, and ἄγχω, to kill, or ſtrangulate. Exceſſive Abſtinence from Aliment.

LIMATURÆ. Filings, or Raſpings.

LIMAX TERRESTRIS. The Shell-ſnail.

LIMAX ATER. Offic. Liſt. Animal. Angl. 131. Ejuſd. Hiſt. Conch. 1. N. 102. *Limax tertia tota nigra.* Aldrov. de Inſect. 702. Jonſ. Hiſt. Inſect. 38. *Limax.* Mer. Pin. 207. THE BLACK SNAIL.

Bruiſed, and applied to Ulcers, they have a lenient Effect in an extraordinary Meaſure, according to *Enzelius. Dale.*

LIMAX RUBER. Offic. Schrod. 5. 284. *Limax quartus ſubruſus, montanus.* Liſt. Hiſt. Animal. Angl. App. 6. *Limax ſubruſus.* Ejuſd. H. Conch. 1. N. 103. *Limax magna Germanis colore ruſa.* Aldrov. de Inſect. 702. Jonſ. de Inſect. 138. THE RED SNAIL.

It is found in the Fields. The Liquor of Snails, which is what is uſed in Medicine, is prepared by cutting the Snails in ſmall Pieces, then mixing them with an equal Quantity of Salt, and afterwards putting them into *Hippocrates's* Sleeve, and leaving them in a Cellar, or cool Place, where they diſſolve, and paſs off in a Liquor. This Liquor is uſed to anoint the Parts affected with the Gout, and to extirpate Warts, being firſt ſcraped with a Penknife; it alſo cures a Prolapſus or Falling down of the Anus. *Dale.*

LIMBUS, in *Paracelſus*, ſeems to mean the Univerſe.

LIMNITIS. This is, according to *Paulus Ægineta, L.* 7. *C.* 19. the ſame as ADARCES. But *Oribaſius, de Loc. Affect.* makes it ſomewhat different.

LIMNOPEUCE. A Name for the *Equiſetum*; *paluſtre*; *brevioribus foliis, polyſpermum.*

LIMOCTONIA, from λιμὸς, Hunger, or Famine; and κτείνω, to kill. Exceſſive Abſtinence, ſufficient to deſtroy a Patient.

LIMODORUM. A Name for the *Orobanche*; *major*; *Caryophyllum olens.*

LIMON.

The Characters are;

The Leaves, Flowers, and Fruit, are like thoſe of the Citron; only the Fruit is leſs, and its Pulp of a much thinner Subſtance.

Boerhaave mentions ten Species of this Plant; which are,

1. Limon; vulgaris. *Ferr. Hiſp.* 193. *Tourn. Inſt.* 621. *Boerh. Ind. A.* 2. 240. *Malus Limonia.* Offic. Ger. 1278. Emac. 1462. Park. Theat. 1507. Raii Hiſt. 2. 1656. J. B. 1. 96. *Malus Limonia acida.* C. B. P. 436. *Limon.* Aldrov. Dendr. 491. THE LEMON-TREE.

The Lemon-tree pretty much reſembles the Orange in its manner of growing, having ſeveral ſharp Thorns in the Branches, which are cloathed with perennial green Leaves, larger and rounder than thoſe of Oranges, and want that Heart-like Foot-ſtalk which they have. The Flowers are white, and in Colour and Shape like them; but the principal Diſtinction is in the Fruit, which is of a paler yellow, and an oval Shape, with a Nipple-like Proceſs at the End, of a very grateful Smell, and full of pleaſant, very ſour Juice.

Lemons are cooling and grateful to the Stomach, quenching Thirſt, and increaſing an Appetite, uſeful in Fevers, as well common as malignant and peſtilential; they provoke Urine. The Juice, mixed with Salt of Wormwood, is an excellent Medicine to ſtop Vomiting, and to ſtrengthen the Stomach. The Peel is of the Nature of Citron-peel, but of leſs Virtue, and therefore not ſo much uſed.

The only officinal Preparation is the Syrup of the Juice. *Miller's Bot. Off.*

Lemons have a more acid Taſte than Oranges or Citrons, and therefore, probably, have a more cooling Juice. They are uſeful for the ſame Purpoſe as Citrons; but, as they are of leſs Efficacy againſt Poiſons, ſo they are eſteemed more effectual againſt hot Diſtempers. Lemons, as *J. Bauhine* ſays, are not eaten entire, but deprived of their Peel, and then cut into Slices, and well ſprinkled with Sugar; thus prepared, they are extremely palatable, potently extinguiſh Thirſt, and allay feveriſh Heats. The Juice of Lemons is very effectual in diſſolving the Stone, and deterging the Parts, as we are aſſured by *Herman Grube, Crato*, and other celebrated Phyſicians. Syrup of the Juice of Lemons is reckoned an excellent Remedy againſt the Stone, and Obſtructions of the Kidneys, and, alſo, againſt Thirſt and Heat in burning Fevers; it ſtrengthens the Heart and Stomach, and allays the Effervеſcence of the Bile; on which Accounts it is exhibited with good Succeſs in Weakneſſes, Lipothymies, Faintings, Vomitings, and the Hickups, Symptoms commonly attendant on burning Fevers. For nephritic Diſorders,

Take Shavings of Wood of Oak, one Ounce; Spring-water, ſix Pints; Juice of Lemons, four Ounces: Infuſe them all, for twenty-four Hours, over hot Aſhes; and boil them afterwards to the Conſumption of a third Part, and ſtrain off the Liquor. The Doſe is half a Pint.

It is very good for a hot Diſtemperature of the Liver, for Ulcers of the Kidneys, and Heat of Urine, but principally for evacuating ſalt and viſcid Phlegm from the Kidneys, which is the Cauſe of the Dyſury and Strangury. *Raii H. P.*

Of late Years, the Juice of Lemons, perfectly neutralized with Salt of Wormwood, has been very much given in Fevers, and

with very good Effect, in the Quantity of about half an Ounce, repeated at due Intervals.

2. Limon; dulci Medulla; vulgaris. *Ferr. Hiſp.* 229.

3. Limon; acris. *Ferr. Hiſp.* 331.

4. Limon; dulcis. *Ferr. Hiſp.* 331.

5. Limon; folio anguſtiori; ſpinoſo. *Ind.* 264.

6. Limon?

7. Limon; folio anguſtiſſimo; folio & fructu variegatis.

8. Limon; folio Ceraſi.

9. Limon; fructu Aurantii. *Pomum Adami.* Ferr. Hiſp. 313. *Malus Adami.* C. B. P.

This Fruit agrees in Figure, Colour, and Medicinal Virtues, with the Orange.

10. Limon; flore pleno. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 240.

LIMONADA Limonade.

LIMONIA MALUS. The Lemon. See LIMON.

LIMONIUM. Sea Lavender.

The Characters are;

The Root is fibrous; the Stalks naked and ramous; the Calyx long, tubulous, and expanded at the Top, into a kind of pentagonal Flower; within which are again incloſed other Flowers, like Clove-gilliflowers; or elſe monopetalous, Funnel-ſhaped, multifid, furniſh'd with five Stamina, generally united two together, often prolific, and joined near the Stalks. The Ovary lies concealed after a very artificial Manner, in the very Bottom of the Calyx; and at laſt becomes an oblong Seed, involved in a ſquamous Calyx, as in a Capſule. The Calyx, Flower, and Ovary, in theſe Plants, are of ſo perplexed and amazing a Structure, that they are not as yet perfectly diſcover'd by the moſt diligent Inquirer.

Boerhaave mentions fourteen Species of this Plant, none of which have any medicinal Virtues attributed to them, except the firſt; which is,

Limonium; maritimum; majus. See BEHEN RUBRUM. *Boerh. Ind. alt. Plant.*

LIMONIUM MAJUS. A Name for the *Statice.*

LIMONIUM MINIMUM. A Name for the *Statice*; *montana*; *minima.*

LINAGROSTIS. The Name of a Plant, of which *Tournefort* mentions three Species; which are,

1. Linagroſtis panicula ampliore. *Inſt.* 664. *Linagroſtis.* Tabern. Hiſt. 559. *Gramen tomentarium, Linum pratenſe.* Tabern. Icon. 230. *Gnaphalium Tragi ſive. Juncus bombycinus.* J. B. 2. 514. COTTON-GRASS. Common on boggy Places.

2. Linagroſtis panicula minore. *Inſt.* 664.

3. Linagroſtis Spica ſingulari, Alopecuroides. *Juncus capitulo lanuginoſo, ſive Schœnolaguros.* C. B. P. 12. Juſſ. 2. 426. Vaill. 117. HARES-TAIL RUSH.

On *Elſemere-Meers* in *Shropſhire*, and *Pillinmoſs* in *Lancaſhire*; on the great Bog beyond *Joan Cote's*, towards *Croydon*, in great Plenty. Mr. *J. Sherard. Syn. Ed.* 3. 436.

LINAMENTUM. Scraped Lint.

LINARIA.

The Characters are;

The Leaves grow alternately, or three together, and are of an oblong Figure: The Calyx is monophyllous, and divided into five long acute Segments: The Flower is tubulated in the lower Part; and, running out into a long Spur, which is extended beyond the Tube contained within the Calyx, has its upper or fore Part perſonated, and bilabiated, the upper Lip being cut, and the lower diſpoſed in a grinning Form, and divided into three Parts. From the Bottom of the interior Part of the Tube of the Flower ariſe four Stamina. The Ovary, which grows to the Placenta in the Bottom of the Calyx within the Flower, produces a long Tube, and becomes a round Fruit, divided by an Incloſure into two Cells, which open in various Manners, and contain Seeds, which are either compreſſed and marginated, or angulated and roundiſh.

Boerhaave mentions twenty-two Species of this Plant, none of which have any particular medicinal Virtues aſcribed to them, except the 6th, 17th, and 19th.

The 6th is the

Linaria; vulgaris; lutea; flore majore. *C. B. P.* 212. *Tourn. Inſt.* 170. *Boerh. Ind. alt.* 231. *Linaria lutea vulgaris.* Ger. Emac. 550. Raii Hiſt. 1. 752. Synop. 3. 281. J. B. 3. 456. *Linaria vulgaris noſtras.* Park. Theat. 458. TOAD-FLAX.

Toad-flax has a white, ſlender, creeping Root; from which ariſe ſeveral Stalks, a Foot or more in Height, covered all over with long, narrow, ſharp-pointed Leaves, of a bluiſh-green Colour; on the Tops of the Stalks grow ſeveral pretty, large, yellow Flowers, of a ſingle Leaf, the fore Part having the Figure of a gaping Mouth, and the hinder Part, a Heel or Spur; the under Lip is largeſt, downy or hairy in the Middle, and of a Saffron-colour: The Seed is ſmall, black, and flattiſh, growing in a round bicapſular Seed-veſſel. It grows every-where upon Banks and Hedges; and flowers in *July.*

The whole Herb is uſed, and is of an aperitive and diuretic Nature; opening Obſtructions of the Liver and Spleen, helping the Dropſy and Jaundice, which it carries off by Urine. The Ointment, made with Hogs-lard, and a good Quantity of this Herb, is accounted excellent for the Piles, applied to the Part; being mixed with ſome of the Yolk of an Egg at the Time of uſing it.

The only officinal Preparation is the Unguentum Linariæ. *Miller's Bot. Offic.*

The Toad-flax has an herby ſaltiſh Taſte; being rubbed, it ſmells like Elder: Its Leaves give no Tincture of Red to the blue Paper, but the Flowers give it a pretty deep one; which makes us believe, that its Leaves contain an acid Salt, approaching to that which is natural in the Earth, but mixed in this Plant with a conſiderable Quantity of fetid Oil: The Flowers, alſo, have a diſagreeable Smell; but the Sal Ammoniac is more diſengaged there, which is the Reaſon that they ſtain the blue Paper.

This Plant, applied outwardly, is very lenitive and reſolvent, Qualities inſeparable from the fetid Oil of Tartar, Vipers, Hartshorn, and ſuch-like. I don't know any better Remedy to aſſwage the Pain of a Cancer, than to anoint it with freſh Butter, mixed with ſome Oil of this Plant, which has been drawn by the Retort. The Toad-flax then reſolves the Blood, or Matter, extravaſated in the porous Parts of the Fleſh; and, at the ſame time, relaxes the Fibres, whoſe extraordinary Tenſion cauſes inſupportable Pains. The Ointment of Toad-flax is excellent to abate the Inflammation of the Hæmorrhoids, and is thus prepared:

> Boil the Leaves in Oil, in which Beetles or Woodlice have been infuſed; then ſtrain the Oil through a Linen Cloth; and add to it the Yolk of an hard Egg, and as much new Wax as will give it the Conſiſtence of an Ointment.

Others boil the Toad-flax with Lard, till it becomes of a fine green Colour, and add to it the Yolk of an Egg, when they would make uſe of it. *Horſtius* relates, that a Landgrave of *Heſſe* gave *John Vulſius*, his Phyſician, a fat Ox every Year, for diſcovering this Secret to him. Some fill little Bags with dried Chamomile and Toad-flax, boil them in Milk, and apply them to the Piles. The Juice, and the diſtilled Water, of this Plant are good for Inflammations of the Eyes. *Cæſalpinus* commends it for the Cancer, and for the St. *Antony's* Fire; *Tragus*, for the Cancer and Fiſtula: He affirms, that it is diuretic; and that its diſtilled Water is laxative, and aperitive, good for the Jaundice, and Obſtructions of the Liver. *Martyn's Tournefort.*

The common yellow Toad-flax diſturbs the Belly, as *Tragus* obſerves; it is a very potent Diuretic. A ſmall Glaſs of the Water, with a Dram of the pulverized Bark of the Dwarf-elder, provokes Urine in an extraordinary manner; for which Reaſon this Medicine is to be given only to hydropic Perſons. The ſame Water, being drank, looſens the Belly, and cures the Jaundice: The Decoction of the Herb in Wine is very effectual in the ſame Diſorder; and opens Obſtructions of the Liver. The ſame Water, or the Juice, inſtilled into the Eyes, removes an Inflammation, or Redneſs; which *Tragus* ſays he had obſerved by long Experience. Linen Cloths, moiſten'd in the ſame Water, are very proper to waſh and cleanſe all Sorts of Ulcers, and the Juice removes Spots, and all cutaneous Blemiſhes of the Face. *Trag.* It is not only a moſt ſpeedy and effectual Remedy in a recent Jaundice, but for all ſuch as are diſpoſed to a Dropſy. Some, as *Lobel* obſerves, apply the Herb to the Bottoms of their Feet, within their Shoes, in order to expel a Quartan. *Raii Hiſt. Plant.*

The 17th is the

Linaria; hirſuto folio; ſubrotundo; flore ex herbido flaveſcente. *Hiſt. Oxon.* 2. 503. *Boerh. Ind. alt.* 232. *Elatine, Veronica fœmina.* Offic. *Elatine folio ſubrotundo.* C. B. P. 252. Park. Theat. 553. *Elatine mas folio ſubrotundo.* J. B. 3. 372. *Veronica fœmina Fuchſii ſive Elatine.* Ger. 501. Emac. 625. *Linaria ſegetum, Nummulariæ folio villoſo.* Tourn. Inſt. 169. *Linaria Elatine dicta folio ſubrotundo.* Raii Hiſt. 1. 759. Synop. 3. 282. FEMALE FLUELLIN.

This is a ſmall low Plant, creeping upon the Ground, with ſlender hairy Branches, ſeldom exceeding a Span in Length, on which grow alternately many ſoftiſh and hairy Leaves, roundiſh, but yet a little pointed at the Ends, on ſhort Foot-ſtalks: At the ſetting on of the Leaves ſpring ſmall Flowers, on long, ſlender, hairy Footſtalks, in Shape like the Flowers of Toad-flax, the upper Lip being yellow, and the lower purple, with a Heel in the hinder Part; theſe are ſucceeded by bicapſular Seed-veſſels, containing ſmall black Seed. The Root is ſmall and fibrous, periſhing every Year; it grows in Corn-fields, ſeldom flowering till the Corn is cut down.

Tho' *Moriſon*, *Ammanus*, Mr. *Ray*, and others, make this a Species of Linaria; yet *Rivinus* will not allow it to be one, becauſe the Seed-veſſel, when ripe, opens in a different manner from the Linaria; but his Diſtinction ſeems to be too nice.

Fluellin is a vulnerary Plant, and accounted good for old Ulcers, and ſpreading cancerous Sores, and uſeful in Fluxes and Hæmorrhages of all Sorts, and for Inflammations of the Eyes. *Miller's Bot. Off.*

The

The Flowers of this Plant are no-where well repreſented; its Leaves are very bitter, a little ſtyptic, and have a Smell a little oily; they hardly give any Tincture of Red to the blue Paper: Whence we may conjecture, their Salt very much reſembles the natural Salt in the Earth, being joined with a great deal of Sulphur, and terreſtrial Parts: This Plant is vulnerary, ſweetening, and deterſive; it cleanſes the Blood, and is reſtorative: *Cæſalpinus* eſteem'd it for ſcrophulous Tumors, and the Leproſy. *Pena* and *Lobel* relate, that a Barber cured by it a carcinomatous Ulcer in the Noſe of a certain Perſon, ſo eat away, that ſeveral Phyſicians adviſed to cut it off. Three Ounces of the Juice, or ſix Ounces of the Water, of this Plant, diſtilled in Balneo Mariæ, drank twice a Day, is good for the Cancer, Gout, Tetters, Leproſy, and Dropſy. There may be a Tincture drawn from it with Spirit of Wine; and an Extract of it prepared, the Doſe of which is a Dram.

The following Ointment is good for Ulcers, the Piles, the King's-evil, and for all the Diſeaſes of the Skin.

Macerate the Leaves of this Plant for twenty-four Hours, in as much White-wine as is ſufficient to cover them: Squeeze out the Juice, and boil it to the Conſumption of one Third, and add as much Lard as will give it the Conſiſtence of an Ointment. *Martyn's Tournefort.*

The 19th is the

Linaria; folio glabro, ſubrotundo; Hederæ folio Clematitis. *Hiſt. Oxon.* 2. 503. *Boerh. Ind. alt.* 232. *Cymbalaria.* Offic. C. B. P. 306. *Cymbalaria Italica.* Ger. Emac. 529. *Cymbalaria Italica hederacea.* Park. Theat. 681. *Cymbalaria floſculis purpuraſcentibus.* J. B. 3. 685. *Linaria Cymbalaria dicta.* Raii Hiſt. 1. 759. *Linaria hederaceo folio glabro ſeu Cymbalaria vulgaris.* Tourn. Inſt. 169. Raii Synop. 3. 232. IVY-LEAVED TOAD-FLAX.

It grows at *Baſil*, in *Switzerland*, on the very Walls of the City; and nothing is more frequent on moiſt Walls, looſe Piles of Stone, and Rocks, in *Italy*. The Plant is of a cold and humid Quality, mixed with ſomewhat of Aſtringency; and it is certain from Experience, that this Herb has the ſame Virtues as the common Navelwort. Some, as *Matthiolus* informs us, preſcribe the Herb to be eaten in Sallads, for the Fluor albus; but for thoſe of our Country, where Sallads are not ſo commonly eaten, *Parkinſon* recommends a Conſerve of the Leaves. *Raii Hiſt. Plant.*

LINARIA AUREA. A Name for the *Coma aurea*; *Germanica.*

LINARIA SCOPARIA. A Name for the *Chenopodium*; *Lini folio villoſo.*

LINARIA, in Zoology, is a Linnet; which is thus diſtinguiſhed:

Linaria. Offic. Aldrov. 2. 824. Geſn. de Avib. 530. Charlt. Exer. 88. Jonſ. de Avib. 69. Mer. Pin. 176. *Linaria vulgaris.* Raii Ornith. 258. Ejuſd. Synop. A. 90. *Linote.* Bellon. des Oyſe. 356. THE COMMON LINNET.

The Fleſh is recommended by ſome as an Analeptic, or Reſtorative; it, alſo, expels Stones from the Kidneys and Bladder.

LINCTUARIUM. A Linctus.

LINCTUS. A Linctus is a Medicine of a Form ſomewhat more thin than an Electuary, and thicker than a Syrup: It is called *Eclegma*, *Ecleictos*, and ſometimes *Lohoc*, or *Loch*: It is generally order'd to be lick'd from a Stick of Liquorice, (whence its Name) or to be taken out of a Spoon; and is principally directed in Diſorders of the Mouth, Fauces, Oeſophagus, Larynx, Aſpera Arteria, and Lungs; and is uſually prepared of emollient and demulcent, but ſometimes of aſtringent, Ingredients, Electuaries, Syrups, Oils, Conſerves, Pulps, Powders, and other Subſtances, which are of an agreeable Taſte.

LINEA ALBA.

The Linea alba is a white Line, which runs from the Cartilago Enſiformis to the Os Pubis, dividing the Abdomen exactly in the Middle; and is formed out of the Tendons of the oblique and tranſverſe Muſcles.

LINGUA. The Tongue. A previous Knowledge of the Os Hyoides is neceſſary, in order to underſtand the Anatomy of the Tongue.

The Os Hyoides, or Bone of the Tongue, is ſituated in the middle Space between the Angles of the lower Jaw. It is a little Bone, and reſembles, in ſome meaſure, the Baſis of the lower Jaw, or a ſmall Bow. The antient *Greeks* compared it to one of the Vowels in their Language, and from thence came the Name of *Os Hyoides*, *Yoides*, or *Ypſiloides*.

It is diſtinguiſhed into the Baſis, which is the anterior Part; two large Cornua, which are the lateral Parts; and two ſmall Cornua, or Appendices, which are the ſuperior Parts; to the upper End of which other Appendices are frequently joined.

The Baſis is the broadeſt and thickeſt Part. It is ſituated tranſverſly, and two Sides may be diſtinguiſhed in it, one anterior unequally convex, and one poſterior unequally concave: It has, likewiſe, two Edges, one ſuperior, and one inferior; and two Extremities, one to the Right, and one to the Left: The Angles might, likewiſe, be diſtinguiſhed.

In the Middle of the fore Side is a perpendicular Eminence, which divides it into Right and Left Portions, and which terminates above in a ſmall pointed Tubercle, with a ſmall hollow Impreſſion on each Side. At the lower End of this Eminence there are, alſo, two ſuch Impreſſions, but much larger. Near each Extremity we find Inequalities, which end in Angles of the Baſis. The back Side, as has been already ſaid, is hollow. The large Cornua are joined to the Extremities of the Baſis, by cartilaginous Symphyſes; which, in Adults, become long. In each Cornu we diſtinguiſh the Root or anterior Extremity, the Point or poſterior Extremity, and the middle Portion. The Length of each Cornu is near double that of the Baſis. The Roots are thick and broad, and by them the Cornua are joined to the Baſis. The lower Part of the middle Portion is a little crooked, and, alſo, broader than the reſt. The Points end in a little cartilaginous Head; and, in the natural State, a ſhort Ligament, with a little round Bone, or Cartilage, runs down from each of theſe Heads.

The ſmall Cornua are placed on the Symphyſes of the large ones, almoſt perpendicularly, being only inclined a little outward and backward. They are joined by a cartilaginous Symphyſis peculiar to them; and are themſelves Cartilages in young People; but they afterwards oſſify, though not always at the ſame Age, and at laſt their Symphyſis is loſt. The Length of theſe Cornua varies pretty much; and, at the upper Extremity of each of them, we ſometimes meet with one or more additional Portions, in the Shape of little oblong Pearls, or of little Pillars, ſet upon one another, and held together by a kind of Ligament, more or leſs cartilaginous. The Subſtance of theſe Appendices is different in different Ages, in the ſame manner as that of the Cornua themſelves.

The Os Hyoides is connected, by a ligamentary Symphyſis, with the Styloide Apophyſis, the Cartilago Thyroides of the Trachea Arteria, and the Epiglottis. It is, alſo, connected by Muſcles with other Parts.

The principal Uſe of this Bone is to be the Baſis and Support of the Tongue. The Pliableneſs of the ſmall Cornua is likewiſe believed to contribute to the Perfection of Singing.

Every one knows, that the Tongue is a ſoft fleſhy Body, which fills all that Part of the Cavity of the Mouth, that is ſurrounded by the alveolary Border and Teeth of the lower Jaw, and extends ſtill farther back. All this Space is, therefore, in a manner, the Mould and Meaſure of the Length and Breadth of the Tongue, as well as of its Thickneſs and Figure.

The Tongue is divided into the Baſis and Point, the upper and under Sides, and the lateral Portions or Edges. The Baſis is the poſterior, or thicker Part; the Point, the anterior and thinneſt Part. The upper Side is not quite flat, but a little convex, and divided into two lateral Halves, by a ſhallow depreſſed Line, called Linea Linguæ Mediana. The Edges are thinner than the other Parts, and a little rounded as well as the Point. The lower Side reaches only from the middle of the Length of the Tongue to the Point.

The Tongue is principally compoſed of very ſoft fleſhy Fibres, intermixed with a particular medullary Subſtance, and diſpoſed in various Manners. Many of theſe Fibres are confined to the Tongue, without going any farther; the reſt form ſeparate Muſcles, which go out from it in different Ways, and are inſerted in other Parts. All the upper Side of the Tongue is covered by a thick Membrane of a papillary Texture; upon which lies another very fine Membrane, like a kind of Epidermis, which is likewiſe continued over the lower Side, but without Papillæ.

Three Sorts of Papillæ may be diſtinguiſhed in the upper Side of the Tongue; Capitatæ, Semi-lenticulares, and Villoſæ: Thoſe of the firſt Kind are the largeſt, reſembling little Muſhrooms with ſhort Stems, or Buttons without a Neck: They lie on the Baſis of the Tongue, in ſmall ſuperficial Foſſulæ.

They reſemble ſmall conglomerate Glands, ſeated on a very narrow Baſis, and each of them has ſometimes a ſmall Depreſſion in the middle of their upper or convex Side: They occupy the whole Surface of the Baſis of the Tongue; and they are ſituated near each other, in ſuch a manner, as that the moſt anterior form an Angle: They are glandular Papillæ, or ſmall ſalival or mucilaginous Glands, of the ſame kind with thoſe which are to be deſcribed hereafter.

We often obſerve, about the Middle of this Part of the Tongue, a particular Hole of different Depths; the inner Surface of which is entirely glandular, and filled with ſmall Papillæ, like thoſe of the firſt Kind. It is called Foramen cæcum *Morgagnii*, as being firſt deſcribed by that Author: Since that time, *Vaterus* has diſcover'd a kind of ſalival Ducts belonging to it; and *Heiſter* found two of theſe Ducts very diſtinctly, the Orifices of which were in the Bottom of the Foramen Cæcum, near each other: He obſerved the Ducts to run backward, divaricating a little from each other; and that one of them terminated in a ſmall oblong Veſicle, ſituated on the Side of the ſmall Cornu of the Os Hyoides.

The Papillæ of the ſecond Kind, or Semi-lenticularis, are ſmall orbicular Eminencies, only a little convex, their circular

Edge not being ſeparate from the Surface of the Tongue. When we examine them in a ſound Tongue, with a good Microſcope, we find their convex Sides full of ſmall Holes or Pores, like the End of a Thimble.

They lie chiefly in the middle and anterior Portions of the Tongue, and are ſometimes moſt viſible on the Edges, where they appear to be very ſmooth and poliſhed, even to the naked Eye, and ſometimes in living Subjects. They ſoon loſe their Conſiſtence after Death, ſo that, by rubbing them ſeveral times, they may be drawn out in Form of ſmall ſoft Pyramids, inclined to one Side.

The Papillæ of the third Kind, or Villoſæ, are the ſmalleſt, and moſt numerous. They fill the whole Surface of the upper Side of the Tongue, and even the Interſtices between the other Papillæ. They would be more properly named Papillæ Conicæ, than Villoſæ, from the Figure which they appear to have, when examined thro' a Microſcope, in clear Water. They are naturally ſoftiſh, but they become extremely flaccid after Death; ſo that, by handling them, they may be made ſhort and thick, whereas they are naturally long and ſmall.

The fleſhy Fibres, of which the Tongue is compoſed, and which go no further than the Tongue, may be termed Muſculi Linguæ Interiores, or the intrinſic Muſcles; and they are the ſame which *Spigelius* named Muſculi Linguales. The Fibres theſe Muſcles conſiſt of, are of three general Kinds, longitudinal, tranſverſe, and vertical; and each of theſe Situations admits of different Degrees of Obliquity. The longitudinal Fibres point to the Baſis and Apex of the Tongue, and ſeem partly to be Expanſions of the Muſculi Stylo-gloſſi, Hyo-gloſſi, and Genio-gloſſi. The vertical Fibres ſeem likewiſe to be in Part produced by the ſame Genio-gloſſi, and the tranſverſe by the Mylo-gloſſi.

Beſides theſe mixed Productions, there is a diſtinct Plane of longitudinal Fibres, which run near the Surface of the upper Side of the Tongue, and a diſtinct tranſverſe Plane under them. All theſe Fibres are partly interwoven, one Portion of them terminating at the two Edges of the Tongue, and the other at the Baſis and Point, without going to any other Part; and they lie immediately above thoſe which belong to the Genio-gloſſi. To diſcover all theſe different Fibres, and their different Degrees of Direction, we need only cut the Tongue longitudinally, after it has been boiled, or long macerated in ſtrong Vinegar.

The extrinſic Muſcles, or Muſculi exteriores, are thoſe which, by one Extremity, make a Part of the Body of the Tongue, and are fixed by the other in ſome Part, without the Tongue. Of theſe we commonly reckon four Pairs; Mylo-gloſſi, Stylo-gloſſi, Hyo-gloſſi, and Genio-gloſſi.

The Muſcles which move the Os Hyoides belong, alſo, to the Tongue, and are the principal Directors of its Motion. Their Names are, Mylo-hyoidæi, Genio-hyoidæi, Stylo-hyoidæi, Omo, or commonly Coraco-hyoidæi, and Sterno-hyoidæi; the Deſcription of which may be ſeen in their proper Places.

The Mylo-gloſſi are ſmall fleſhy Planes ſituated tranſverſely; one on each Side, between the Ramus of the lower Jaw, and the Baſis of the Tongue. Their Inſertion in the Jaw is immediately above the poſterior Half of the Mylo-hyoidæus between the prominent oblique Line on the Inſide of the Bone, and the Dentes Molares. Thence they run toward the Baſis of the Tongue, and are loſt there on one Side of the Gloſſo-pharyngæi. Theſe Muſcles are often wanting.

The Stylo-gloſſi are two long ſmall Muſcles, which run down from the Styloide Apophyſes, or Epiphyſes, and form two Portions of the lateral Parts of the Tongue. Each Muſcle is fixed in the Outſide of the Apophyſis Styloides, by a long Tendon, being the uppermoſt of the three Muſcles fixed in that Apophyſis; which, at *Paris*, go by the Name of *Riolan's* Noſegay. The Stylo-hyoidæus is the loweſt, and the Stylo-pharyngæus is in the Middle, but more backward.

As it runs down almoſt oppoſite to the Inſide of the Angle of the lower Jaw, it ſends off a pretty broad and ſhort lateral aponeurotic Ligament; which, being fixed in that Angle, ſerves for a Frænum, or Ligamentum Suſpenſorium, to the Muſcle in this Part of its Courſe. From thence it paſſes on to the Side of the Baſis of the Tongue, where it firſt of all adheres cloſely to the lateral Portion of the Hyo-gloſſus, and then forms, together with that Muſcle, a large Portion of the Side of the Tongue.

The Hyo-gloſſi are each inſerted in three Parts of the Os Hyoides, that lie near each other; in the Baſis, in the Root of the great Cornu, and in the Symphyſis between theſe two; and on this Account the Hyo-gloſſus has been divided by ſome into two or three diſtinct Muſcles, called Baſio-gloſſus, Cerato-gloſſus, and Chondro-gloſſus. In ſome Subjects they may eaſily be ſeparated, the three Portions being ſimply contiguous to each other; but it is needleſs to burden the Memory with ſo many uſeleſs Names, and therefore I deſcribe them all as one Muſcle, by the Name of the Hyo-gloſſus.

It is ſituated on the Inſide, and a little lower than the Stylo-gloſſus, with which it forms the lateral Part of the Tongue. The Portion inſerted in the Baſis of the Os Hyoides lies more anteriorly, and is larger than the other two; that which is inſerted in the Symphyſis, is the leaſt; and that inſerted in the great Cornu, the moſt poſterior.

This Muſcle is partly ſuſtained by the Mylo-hyoidæus, or by a Girth; and the anterior Portion is diſtinguiſhed from the reſt, by the Paſſage of the Nerves of the Fifth Pair, and of the Arteries which accompany them.

The Genio-gloſſi are ſituated cloſe to each other on the lower Side of the Tongue. Each Muſcle is inſerted in the inner, or back Side of the Symphyſis of the lower Jaw, immediately above the Genio-hyoidæus. Thence it runs backward toward the Os Hyoides, to which the loweſt Fibres are connected by a ligamentary Membrane; and in this Courſe, its Fibres are ſpread through the Subſtance of the Tongue, in a very ſingular manner.

Of theſe Fibres ſome run directly to the Os Hyoides, all the Way to the Baſis of the Tongue; ſome are inflected forward, and go to the Point of the Tongue; and the reſt are diſtributed in a radiated Manner, forward, upward, and backward, in the Subſtance of the Tongue; and the middle Fibres expand laterally, towards the Edges of the Tongue.

The two Genio-gloſſi run cloſe to each other, as if they formed but one Maſs; but they are evidently divided by a very thin cellular Membrane, or middle Septum, which penetrates a good way between the two lateral, or Right and Left Halves of the Tongue, lying in the ſame Plane with the Linea Mediana of the upper Side of the Tongue.

When we ſeparate theſe two Muſcles from the Chin, they preſently contract ſo much, that their anterior Extremities, which lie under the Point of the Tongue, are as far back as the Middle of it. It is in this preternatural Situation that we ſee theſe Muſcles repreſented in Figures, given by very great Anatomiſts, and drawn and engraved by very good Artiſts, in which Figures the whole Beauty of their true Mechaniſm is loſt.

Theſe two Muſcles, by their poſterior ſtrait Fibres, which go to the Baſis, can draw the Tongue out of the Mouth, and bring it back again, by their anterior bent Fibres, which go to the Point. They can either ſucceſſively, or all at once, make the Tongue longitudinally hollow, or like a Groove; and they can, at the ſame time, contract it, by the lateral Expanſion of their middle Fibres. I paſs over many other Motions, which theſe Muſcles are capable of performing; whence I formerly uſed to call them Muſculi polychreſti.

When either of the Stylo-gloſſi acts, it turns the Tongue toward the Cheek, and forces the Aliment between the upper and lower Molares. When they act jointly with the lateral Portions of the ſuperior fleſhy Plane of the Tongue, they turn the Tongue obliquely upward to the Teeth of the upper Jaw, and near the Cheeks; as when we bring down any Part of the Food that hath ſtuck there after Maſtication. When they act jointly with the lateral Portions of the Hyo-gloſſi, they turn the Tongue downward between the lower Teeth and the Cheek.

When all the Parts of the Hyo-gloſſi act together, they ſhorten the Tongue. They likewiſe turn the Point of the Tongue between the Teeth and the under Lip, and make it paſs over that Lip. The ſuperior fleſhy Plane of the Body of the Tongue bends it upward toward the Palate, and makes it paſs along, or lick the upper Lip. The Mylo-gloſſi ſerve as a Frænum to one Side of the Baſis, while the Point is turned to the other Side. The Ligamenta Suſpenſoria of the Stylo-gloſſi may anſwer the ſame Purpoſe, and even ſupply the Want of the Mylo-gloſſi.

Beſides the Membranes of the Tongue already deſcribed, it is cuſtomary to mention another, called Membrana Reticularis, which is commonly demonſtrated from the boiled Tongues of Oxen or Sheep; and ſome pretend to have ſhewn it in the human Tongue, which I own I have never been able to do. Long ago, I ſhew'd what they take from the Tongues of Oxen and Sheep, to be not a true Membrane, but a kind of a clear mucilaginous Subſtance, which lies between the papillary and external Membranes, and which, by boiling, becomes white, and acquires Solidity enough to be taken out in large Portions; and that the Holes found in it are owing to the ſmall pyramidal Papillæ.

The Tongue is fixed in the Mouth, not only by Muſcles, but alſo by Ligaments, which are for the moſt part membranous. The principal Ligament is that called the Frænum, which is the prominent Fold that appears firſt under the Tongue, when we raiſe it, with the Mouth opened; and is no more than a Continuation, or looſe Duplicature, of that Membrane, which covers the inferior Cavity of the Mouth. It covers the Curvature of the anterior Portion of the Genio-gloſſi from the Point of the Tongue, almoſt as high as the middle Interſtice between the lower Dentes Inciſorii.

The other Ligaments of the Tongue are the ſmall membranous Fold which runs along the Middle of the convex Side of the Epiglottis to the Baſis of the Tongue; and the membranous Folds which cover the inferior half Arches of the Septum Palati. Theſe three Folds are Continuations of the Membrane which covers the neighbouring Parts. The aponeurotic Ligaments of the Stylo-gloſſus may be looked upon as true lateral Ligaments of the Tongue; and they adhere a little to the lower Part of the Muſculus Pterygoidæus Internus, or anterior.

The principal Blood-veſſels of the Tongue are thoſe which appear ſo plainly on its lower Surface, on each Side of the Frænum; and they conſiſt of one Artery, and one Vein, which accompany

company each other, and are called Arteriæ & Venæ Sublinguales, or Raninæ. The Veins lie next the Frænum, and the Arteries on the other Side of the Veins. The Arteries are Ramifications of the ſecond internal, or anterior Branch of the external Carotid on each Side, and communicate with the firſt external, or poſterior Branch of the ſame Carotid. The Veins are commonly Ramifications of a Branch of the external and anterior Jugular Vein.

We obſerve four nervous Ropes to go very diſtinctly to the Baſis of the Tongue, and to continue their Courſe through its whole Subſtance, all the Way to the Point. Two of theſe Ropes are Ramifications of the inferior maxillary Nerves, or of the third Branch of the Fifth Pair, from the Medulla oblongata. The other two are the Nerves of the Ninth Pair. The two firſt I name Linguales, or Hypogloſſi minores, and the other two Linguales, or Hypogloſſi majores. The Majores are inferior and internal; the Minores, ſuperior and external, or lateral. The ſmall Portions, or firſt Branch of the Nervus ſympatheticus Medius, or of the eighth Pair, ſend, alſo, a Nerve on each Side of the Tongue.

The great lingual Nerve, on each Side, runs forward between the Muſculus Mylo-hyoidæus and Hyo-gloſſus, under the Genio-gloſſus, and is diſtributed to the fleſhy Fibres, all the Way to the Point of the Tongue, communicating by ſeveral ſmall Filaments with the Lingualis minor, and with the Nerve from the Eighth Pair.

The ſmall lingual Nerve, on each Side, goes from the Maxillaris inferior, ſometimes at, and ſometimes before its Paſſage between the Pterygoide Muſcles. Afterwards, ſeparating more and more from the Trunk, it paſſes under the lateral Part of the Tongue, over the ſublingual Gland. It ſupplies the neareſt Parts of the Tongue as it paſſes, and then, entering its Subſtance, terminates at the Point, having ſent a great Number of Filaments to the papillary Membrane. It communicates, as has been ſaid, with the Lingualis major, and with theNerve from the Eighth Pair.

This lingual Nerve, a little after it leaves the Maxillaris inferior, is accompanied by a ſmall diſtinct Nerve, which runs upward and backward, towards the Articulation of the lower Jaw, in Company with the lateral Muſcle of the Malleus; paſſes through the Tympanum, between the Handle of the Malleus, and the long Leg of the Incus, by the Name of Chorda Tympani; and afterwards, perforating the back Side of the Tympanum, unites with the Portio Dura of the auditory Nerve. This ſmall nervous Rope has been looked upon by Anatomiſts as a kind of ſmall Recurrent of the Nervus lingualis; but as in ſome Subjects it appears to make ſimply an acute Angle with the lingual Nerve, and as this lingual Nerve is ſomething larger after this Angle, it ought rather to be believed to come from the Tympanum, and to unite with the lingual Nerve, than to ariſe from this Nerve, and run up to the Tympanum. In ſome Subjects the Union of this Nerve with the Lingualis is, in a manner, plexiform, and very difficult to be unfolded.

The lingual Nerve of the Eighth Pair, which is its firſt Branch, runs firſt on the Inſide of the digaſtric Muſcle of the lower Jaw, and ſupplies the Genio-hyoidæi, the neighbouring Muſcles of the Baſis of the Tongue, and thoſe of the Pharynx. Afterwards it ſends out the Ramifications, and forms the Communications deſcribed under the Article NERVUS; and, laſtly, goes to the lower Part of the Tongue, where it communicates with the lingual Branch of the Fifth Pair, and with the lingual Branch of the Ninth.

The Tongue is the Organ of the Senſe called Taſte, by means of the Papillæ, eſpecially the Villoſæ, or Pyramidales. It is not as yet diſcovered in what manner the Papillæ Semilenticulares contribute to the Taſte; and the Capitatæ ought to be looked upon as ſalival Glands.

The Tongue is, likewiſe, one of the principal Inſtruments of Speech, and of the Articulation of the Voice. *Riolan*, in his *Anthropographia*, mentions a Child, of five Years of Age, who, though he had loſt his Tongue by the Small-pox, but not the Uvula, continued ſtill to ſpeak almoſt as diſtinctly as before. Probably the Baſis of the Tongue ſtill remained. M. *de Juſſieu* has publiſhed an Obſervation in the Memoirs of the *Royal Academy*, concerning a little Girl, who could ſpeak, though ſhe was born without a Tongue, in room of which there was only a kind of ſmall Tubercle.

The Tongue ſerves, alſo, to collect all the Morſels, which we chew, to turn them in different manners, and to different Parts of the Mouth, and to rub off whatever ſticks to the Palate; and it is uſeful in ſpitting and ſucking. It bears a great Part in Deglutition, being aſſiſted by the digaſtric Muſcles, which by contracting, at the ſame time that the other Muſcles preſs the lower Jaw againſt the upper, raiſe the Os Hyoides, and fix it at a convenient Height, that the Stylo-gloſſi, and Hyo-gloſſi, may make the Baſis of the Tongue bear back upon the Morſel, which is to be ſwallowed, and ſo force it into the Pharynx, the Portions of which, that are, at that time, immediately above the Morſel, do inſtantly contract, and puſh it into the Oeſophagus.

Of the Diſorders of the Tongue, which require Chirurgical Operations.

The Method of Depreſſing the Tongue.

Diſorders of the Mouth and Palate, Inflammations of the Tonſillæ and Uvula, a Polypus and Abſceſs of the Mouth, a ſmall Bone, or the Bone of a Fiſh, ſticking in the Fauces, and the like, frequently require a Depreſſion of the Tongue, before they can be remedied. For this Purpoſe an Inſtrument has been contrived, called *Specillum Linguæ* (See *Tab.* XXII. Fig. P). But Patients of greater Delicacy prefer the flat Handle of a clean Spoon, which is both neater, and more convenient. But in uſing this Inſtrument Care muſt be taken to move it gently, to prevent increaſing the Pain and Inflammation. If Injections are neceſſary, the Syringe is to be conveyed into the Mouth, over the Handle of the Specillum or Spoon. But if an Ulcer of the Mouth, a Diſorder of the Tonſils, or a Polypus in the Noſe, happen, but without Inflammation or Convulſions, in which the Mouth cannot be ſufficiently opened, the Speculum Oris may be cautiouſly applied. See *Tab.* XLI. *Fig.* 12. or 13.

The Method of cutting the Frenulum of the Tongue.

Sometimes, in Infants, the Tongue is ſo firmly connected, by the Frenulum, with the Bottom of the Mouth, that they cannot ſufficiently move or put out the Tongue in ſucking. This Tying, or Shortneſs of the Tongue, is, likewiſe, obſerved ſometimes in Adults, who cannot, upon that account, ſpeak articulately. This Diſorder is far from being ſo frequent as is generally imagined, not one Infant of a thouſand being affected with it, and is not near ſo common as the Hare-lip. When the Child can put his Tongue out of his Mouth, the Frenulum requires no Operation; for the Child will ſoon learn both to ſuck and ſpeak, when there is no other Impedient. But if the Child can ſcarcely move the Tongue, or extend it beyond his Teeth, it may then be neceſſary to free it by Inciſion. But this Operation, if raſhly performed, is ſometimes productive of very bad Conſequences, and even of Death itſelf.

Take hold of the End of the Tongue with a Linen Cloth between it and the Fingers, leſt it ſhould ſlip, as in *Tab.* XLII. *Fig.* 1. or the Tongue may be elevated by the Left Hand, with a ſmall Fork, made for the Purpoſe (See *Fig.* 2. 3. and *Tab.* XXII. O. P.) Then as much of the Frenulum of the Tongue, running between the ranular Veins, and the lower ſalival Glands, may be divided with an obtuſe-pointed Pair of Sciſſars, (*Tab.* XXII. C.) or a Knife, as appears to be ſufficient for freely permitting Suction, or Speech; but great Care muſt be taken in the Operation, to avoid wounding the ſalival Ducts, the ranular Veins, or the Nerves of the Tongue; for ſuch Wounds may be attended with very fatal Conſequences: Thus *Dionis*, in his Surgery, gives an Inſtance of an Infant which died after the Operation, by the Effuſion of Blood from the wounded ranular Veins. If a Vein ſhould be accidentally cut, which in a ſhort thick Frenulum may readily happen, a Compreſs, dipt in Vinegar, muſt be applied to the Tongue, till the Hæmorrhage be ſtopt. If, by the firſt Inciſion, the Tongue is not ſufficiently freed, after ſome Days, or even Weeks, the Remainder of the Frenulum muſt be cut, but with the greateſt Caution. After the Operation anoint the Wound with Honey of Roſes, or Syrup of Violets, applied by the Fingers, and repeat this frequently, in order to hinder the divided Parts from reuniting.

Hence it not only appears, that Caſes of this kind are uncommon, but that the Cure is dangerous. How wretchedly, then, are thoſe Midwives deceived, who, with the greateſt Ignorance, aſſert, that almoſt all Infants are born with this Diſorder! Upon this Suppoſition, therefore, they thruſt their Fingers into the Mouth of the new-born Infant, and, with their Nails, cruelly lacerate the Frenulum. Such raſh, and ſuch rude Treatment can ſcarcely fail to induce Inflammations of that Part, Convulſions, and even Death itſelf, on the moſt tender Infants. *Hildanus*, in *Cent.* 3. *Obſ.* 28. has given an accurate Account of the Nature and Cure of this Diſorder, and of the many bad Conſequences which attend the raſh or unskilful Performance of the Operation.

Of a Ranula, or Tumor, and a Stone under the Tongue.

A Ranula is a Tumor, or Abſceſs, under the Tongue, near the ranular Veins, either on the Right Side, Left Side, or Middle. The contained Matter is of different Sorts; ſometimes it reſembles a tough mucilaginous Lymph, ſometimes it is thicker, ſometimes it is purulent, and inclinable to Denſity, and ſometimes it is of a ſtony Conſiſtence. Sometimes the Tumor grows ſuddenly, and not only impedes Speech and Deglutition, but likewiſe excites very acute Pains. Sometimes hard fleſhy Tubercles are produced in this Part, which, the more

Pain they excite, are the more dangerous, and I have ſometimes ſeen them degenerate into a Cancer. Tumors under the Tongue are more frequent in Children than in Adults; nor can they be eaſily reſolved, as Medicines for that Purpoſe cannot be conveniently applied to them. The ſame Reaſon makes it equally difficult to bring them to a Suppuration; ſo that no Relief can be expected, except from chirurgical Operations.

As theſe Tumors are nearly of the ſame Nature with the encyſted Kind, they ought to be treated in the ſame manner, which is by far the readieſt, were it not attended in this Caſe with very great Difficulties. For the Bag is not only extremely thin, but the Crying of the Child extremely expoſes the Nerves, Blood-veſſels, or ſalival Ducts, to dangerous Wounds; whence may ariſe intenſe Pain, Spaſms, Inflammations, or violent Hæmorrhages. It will, therefore, be ſafer to turn the Tongue upward with one Hand, and, with a Knife, make a tranſverſe Inciſion in the Tumor, carefully avoiding the Nerves, Veſſels, and Ducts already mentioned; thus may the morbid Matter, whether it be viſcid, inſpiſſated, or purulent, be diſcharged; but, if it be very thick, it muſt be expreſſed by the Fingers. In order to prevent the remaining Bag from generating a new Tumor, which frequently happens, apply, to the very Bottom of the Wound, Lint dipt in Honey of Roſes, conſiderably acidulated with Spirit of Vitriol; thus deterging the Wound daily, till the Bag be entirely conſumed. Then may the Wound be ſafely healed, by applying Oil and Sugar, Honey of Roſes alone, or Oil of Myrrh *per Deliquium*. Sometimes the Tumor burſts ſpontaneouſly; and then the Ulcer muſt be deterged and healed as is above directed. Sometimes the ſmall Glands, under the Tongue, appear ſwelled with Pain and Inflammation. When this happens, the Patient ſhould often keep warm Milk in his Mouth, frequently applying a half-roaſted Fig to the Part affected, and under the Chin emollient Cataplaſms and Plaiſters, till the Tumor be either diſcuſſed or ripened. If it ripens, it ought to be laid open, deterged, and healed, like an Abſceſs of the Gums. But when, as I have ſometimes obſerved, the Tumor is ſituated under in the Middle of the Tongue, or where the ſalival Ducts terminate in the Mouth, Inciſion muſt never be attempted, becauſe of the Danger of wounding theſe Ducts, with the Nerves and Blood-veſſels. It is ſafer, therefore, to wait till Nature opens the Ulcer, which may then be treated as before. When a Tumor of this kind inclines towards a Cancer, it will ſubmit to none of the Methods here propoſed. If a Stone appears in this Part of the Tongue, the Part muſt be laid open; and, if the Stone does not fall out ſpontaneouſly, it muſt be extracted with a Probe, or Forceps, and the Wound may be treated as we have already adviſed.

Of a Scirrhus, Ulcer, and Cancer in the Tongue.

If Part of the Tongue is ſeized with an Hardneſs, and ſwells without Pain, it is ſaid to be affected with a Scirrhus. But, as ſoon as it becomes painful, and emits a purulent Matter, or fetid Sanies, it gradually degenerates into a Cancer. This Tumor is at firſt ſmall, not unlike a Pea, or a Philbert; ſometimes it a little enlarges itſelf, and ſometimes overſpreads the greateſt Part of the Tongue. Sometimes it is moveable, and ſometimes entirely fixed. Sometimes it is covered and occult, and ſometimes open and ulcerated, emitting, like other Cancers, a moſt fetid putrid Humour, and gradually conſuming the Tongue. Sometimes this miſerable Diſorder ariſes ſpontaneouſly, without any manifeſt Cauſe; but more frequently from the pricking Wounds of a ſharp, rough, broken Tooth; from which Cauſe I have ſometimes ſeen one Side, and ſometimes the Point of the Tongue corroded and deſtroy'd.

When, therefore, this Diſorder is thus occaſioned by a Tooth, it ought either to be drawn immediately, or at leaſt the pricking Point or Roughneſs ſhould be carefully abraded with a proper Raſp, like that in *Tab.* XLI. *fig.* 22. for, till this be effected, no Remedy can be expected. Then the morbid Part of the Tongue muſt be plentifully anointed with Oil of Myrrh per Deliquium, or with Honey of Roſes mixed with *Peruvian* Balſam, or Balſam of Mecca. If the Diſorder proceeds from internal Cauſes, internal Medicines, proper for a Scirrhus or Cancer, ſhould be exhibited; but if theſe, and other Remedies, have little Effect, the morbid Part muſt, with all Expedition, be removed by Inciſion, leſt, by Delay, the Diſorder ſhould increaſe, and the Operation become dangerous. It is, however, to be obſerved, that ſometimes ſmall Tubercles ariſe in the Tongue like Peas, or larger, which not only retain the ſame Size, but continue without Pain or Inconvenience many Years, even to the End of Life. The Cure of theſe Tubercles ought never to be attempted; for the more they are treated with Medicine, the more they are irritated, and even degenerate into an open Cancer, and bring the Patient to a miſerable Death. If the Tumor increaſes, excites Pain, and is moveable, an Inciſion muſt be made with the Knife, ſo as to ſeparate the morbid Parts from the ſound. But if it be fixed, and not very large, the neareſt ſound Parts ought to be removed with it. But, when the Tumor is greatly increaſed, and ſo ſituated in the Roots of the Tongue, that it is impoſſible to cut it entirely out, it is better to abſtain from the Operation, than to torment the Patient to no Purpoſe, or perhaps kill him: For, unleſs the Whole can be extirpated, it becomes worſe by the Inciſion. For the more convenient Performance of the Operation, it will be neceſſary to have an Aſſiſtant at the Back of the Patient for holding his Head; and another on one Side, to extend or hold faſt the Tongue, with his Fingers covered with a Piece of fine Linen, or with Forceps, or ſuch Inſtrument as is repreſented in *Tab.* XL. *Fig.* 9, 10. The Scirrhus or Cancer being thus extirpated, the Wound may be healed with Honey of Roſes, and a little of the Balſam above recommended; or with the Oil of Myrrh, or Oil of Olives; or with a Liniment made of Sugar, and the Oil of Sweet Almonds. After the Cure is completed, the Patient muſt be ſtrictly injoined to lead a regular Life, and to uſe a proper Regimen, and Medicines ever after, otherwiſe he will be in danger of a Relapſe *Ruyſch*, in his *Obſervat.* 76. relates a remarkable Caſe of this kind, in which, after having removed the ulcerated Tumor by Inciſion, he cured the Patient by applying the actual Cautery; which, without Cauterization, could not be effected, though the Tumor had been before ſeveral times extirpated.

Of Prognostics in acute Diseases taken from the Tongue.

The Inſpection of the Tongue, in acute Diſeaſes, is ſometimes of no ſmall Moment for predicting the Fate of the Patient. *Hippocrates*, 6 *Epid. Sect.* 5. *Aph.* 13, 15. ſays, that "that the "Tongue is of the ſame Colour with the predominant Humour," which he explains in the following Words. "The Tongue in-"dicates the Urine [either properly ſo called, or the ſerous Part "of the Humours. *Galen.*] a paliſh-yellow Tongue [χλωραὶ "γλῶσσαι] proceeds from Bile, which is the Effect of a pin-"guious Matter; a red Tongue from Blood; a black Tongue "from black Bile; a very dry Tongue from a fuliginous, aduſt "Matter; and a white Tongue from Phlegm." Hence it appears, that it is eaſy to know the predominant noxious Humour; for the Colour of the Tongue denotes the particular Humour, which cauſes the Diſorder. But we are to diſtinguiſh here, and conſider whether ſuch an Alteration of the Tongue proceeds from a Vapour or Humour, or from Meat or Drink, or Medicine, or a Diſtillation from the Head; for it may be owing to any one of theſe Cauſes. It will be neceſſary, therefore, to be well aſſured, that ſuch a Colour is not the Effect of any of the Cauſes abovementioned, but proceeds from Vapours or Humours convey'd from the Veins and Arteries to the Tongue, which is the more eaſily ſuſceptible of any Colour, becauſe it conſiſts of a flaccid, lax, and ſoft Subſtance, furniſhed with large Veins. *Galen*, on this Subject, ſays very well in his Comment on the Place above quoted: "For the Tongue, being furniſhed with large Veins, "and conſiſting of a looſe ſpongy Subſtance, is more adapted "than hard and denſe Bodies for the Admiſſion of ſerous Hu-"mours, and for the Reception of any Colour from them after "the Manner of Wool." Thus much being premiſed, we come to conſider the Prognoſtics, which may be drawn from the Tongue.

In all acute Diſeaſes, it is beſt to have the Tongue like that of a Perſon in Health, provided it does not appear ſo from ſome external Cauſe, as Meat, Drink, Medicine, or a Defluxion from the Head. When the Body is in a due Temperament, the Tongue is moderately red, ſoft, of a well-proportioned Magnitude, and void of all Defects, both with reſpect to Taſte and Speech. In acute Diſorders therefore, and eſpecially in burning Fevers, and a Synochus, for the Tongue to appear after that Manner, is a good Sign; for its rediſh Colour indicates the noxious and morbific Humour to be neither much in Quantity, nor very putrid and inflammatory; for, in either of theſe Caſes, the Tongue, of neceſſity, would be either yellow, or Saffron-colour'd, or black, or intenſely red; ſince, as we have obſerv'd from *Hippocrates*, the Tongue cannot but be ting'd and ſtained with the Vapours and Exhalations of the Humours, which are moſt predominant in the Body, whether they are bilious, aduſt, or pituitous. A ſoft Tongue, if its Softneſs be not immediately owing to Meat, Drink, Medicine, or ſome Diſtillation from the Head, ſignifies that the Viſcera are not much affected with an Exceſs of Heat; for which Reaſon, alſo, the Patient is not very thirſty. A Softneſs of the Tongue, proceeding from a pituitous Diſtillation from the Head upon the Fauces, is known and diſtinguiſhed by proper Signs; the principal whereof are the immoderate Sleepineſs of the Patient, attended with an extraordinary Degree of Heat. A Diſtillation of this Kind, by irrigating the Tongue and Fauces, not only prevents the Tongue from being dry, but even mitigates its Thirſt. For this Reaſon it is ſaid by *Hippocrates*, 4 *Aph.* 54. that they who are affected with a Cough, are not very thirſty, and for the ſame Cauſe they ſpeak readily and freely: Thus you have the Deſcription of a Tongue not bad in acute Diſeaſes.

Sometimes the Alteration of the Tongue, from its natural State, is an Indication of a good Criſis; as, for Inſtance, in a ſevere Quinſey, when it appears highly inflamed, and very much ſwelled, by the Tranſlation of the Humours upon the Fauces and Tongue, or when it is affected with Convulſions and Tremblings on the ſame account. But ſuch Alterations are to be judged by proper critical Signs, which ought to precede them: And ſo much for a good Tongue; we come now to ſpeak of a bad one.

A Tongue any way changed and vitiated, in Colour, Bigneſs, or Subſtance, is bad. In acute Diſeaſes that Tongue is bad with reſpect to Colour, which is white, groſs, and feculent: Theſe Symptoms of the Tongue, ſays *P. Alpinus*, I obſerv'd in an epidemic Fever, which raged at *Genoa* ſome time ago, and they were a good Proof to me of a Redundance of pituitous and groſs Humours, and alſo of a great Heat in the Viſcera; nothing, however, with reſpect to Life or Death, could, with Certainty, be predicted from this Appearance. Wherefore, tho' this be no good Sign, as indicating the Diſeaſe to be fomented by a Redundance of groſs and pituitous, mixed with bilious and putrid Humours, yet, from this alone, without any other bad Symptoms, we can by no means prognoſticate the Death of the Patient.

The next bad Tongue, with reſpect to Colour, is the yelloviſh Tongue, which *Hippocrates* calls χλωρὰ, *Chlora* [See CHLOROS]. This indicates the Diſeaſe to proceed from a Redundance of Bile, and that putrefied, and by ſo much the more dangerous.

But this is not ſo dangerous as the black Tongue, which indicates an Abundance of aduſt Blood, which is more difficult to be corrected by Nature, than other Humours. Such a Tongue as this is proper to igneous and burning Fevers, attended with the higheſt Squalidneſs; and is always to be dreaded, but moſt of all when in Conjunction with other pernicious Signs: It is, alſo, a Symptom of peſtilent burning Fevers. Wherefore it is juſtly eſteemed a Symptom proper to acute Diſeaſes, as may very well be gather'd from *Coac.* 229. where it is ſaid, "that an extraordinary Blackneſs of the Tongue indicates a Criſis in fourteen "Days." It is added, "The moſt dangerous is the black and chlo- "rous or yelloviſh Tongue." Perhaps he means the chlorous inclining to black, and for good Reaſons, ſince it indicates, that the Bile, which before uſurped the Place of Blood, and tinged the Tongue with a yellow Colour, is, by an Increaſe of the Inflammation, now become black, and the Blood aduſt, which is the worſt State of all.

Again, a black Tongue attended with a Trembling, is condemned by the Author of the *Coac.* 233. where he ſays, that "Tremblings of the Tongue, in ſome Patients, are Cauſes of "a Looſeneſs; but, if the Tongue, alſo, becomes black, it "prognoſticates ſpeedy Death."

But a Tongue of a livid Colour is the moſt mortal Prognoſtic of all, becauſe ſuch a Colour is cauſed by an Alteration from a yellow, or red, to a black, on account of an high Inflammation of ſome Bowel, and an Exceſs of extraneous Heat, attended with a Deficiency or Extinction of the innate natural Heat.

A great Redneſs of the Tongue is, alſo, obſerved by Phyſicians to be ſometimes a very bad Sign in Quinſeys and Peripneumonics, but its Malignity is increaſed and confirmed by other bad Signs. Such was the Tongue of the Woman labouring under a Quinſey, who lived with *Ariſtion*, 3 *Epid. Sect.* 1. *Ægr.* 7. and died on the fifth Day of her Illneſs; and ſuch was, alſo the Caſe of the Son of *Balis*, 7 *Epid. Text.* 19. who died on the ninth Day.

In a Quinſey, the Tongue ſometimes increaſes in Bulk to ſuch a Degree, as hardly to be contained in the Mouth; but the Patient, in ſuch a Caſe, by a right Method of Treatment, has been often cured, though not a few have been ſuffocated. Many, on the contrary, have had their Tongues very conſiderably diminiſhed, their Moiſture being almoſt totally exhauſted by an exceſſive Heat; which ſhews the Fever to be very intenſe, and the Caſe very dangerous: But, to make a right Judgment, other Signs muſt, alſo, be conſidered.

A great and black Tongue is mortal, as indicating an Extinction of the natural Heat. This was the Caſe of the young Woman, 5 *Epid. Text.* 53. who, in the twentieth Year of her Age, took a Medicine to procure Abortion, and died on the fourth Day.

As to the Subſtance of the Tongue, ſome are remarkably ſoft, from imbibing much Humidity; others are very dry, rough, uneven, rugged, chapt, ulcerated; ſome appear with ſmall Tumors, ſome are hot, others cold to the Touch; ſome appear in a State anſwerable to the Meaſure of Thirſt, others are accompanied by no Thirſt at all.

The Tongue is dry and parched in all Fevers, but moſt of all in burning Fevers, and no leſs in ſuch as are accompanied with a Phrenſy. A dry and rough Tongue ſeems proper to burning Fevers, as *Galen* obſerves, *Com. in Prorrhet.* and a Tongue vehemently dry is a Sign of an intenſe Heat. In ſuch Caſes the Tongue firſt becomes dry and parched, then rough and uneven, ſoon after hard and rugged, and, at laſt, by the Violence of the Heat, chapt and ulcerated, in the ſame manner as the Earth is affected with Chaps and Fiſſures, when immoderately dried by the vehement Heat of the Sun.

An hard and rugged Tongue is very bad, and proper to a Phrenſy, as it contracts a vehement Degree of Drineſs from the Vicinity of the Inflammation. Hence the Author of the *Prorrhet. Lib.* 1. *T.* 3. calls denſe, or hard, and dry Tongues, phrenitic; and of ſuch we read in *Coac.* 229. where it is ſaid, "that a "Tongue, which in the Beginning grows rugged, but maintains "its Colour, but, in the Progreſs of the Diſeaſe, becomes "rough, livid, and chapt, is mortal." A Drineſs of the Tongue, however, without the Concurrence of other Signs, is of no Importance towards prognoſticating the Death of the Patient; for many who have had ſuch Tongues, when labouring under ſevere Diſtempers, have yet recovered. Inſtances of this we have in 1 *Epid. Sect.* 7. *Ægr.* 14. in the Virgin of *Lariſſa*.

If the Tongue be black, as well as dry, it is a more pernicious Sign: But we muſt not preſume from hence to predict the Death of the Patient without the Concurrence of other Signs; of which Nature were thoſe obſerved in conjunction with a Blackneſs of the Tongue, by *Hippocrates*, in the Wife of *Dromeades*, 1 *Epid. Sect.* 3. *Ægr.* 11. and in him, who, being ſomewhat feveriſh, went to Supper, and drank freely afterwards, *Ægr.* 12. and in *Hermocrates*, 3 *Epid. Sect.* 1. *Ægr.* 2. and in many others. To have the Tongue thus dried in a Quinſey in a very bad Sign, as it indicates the Greatneſs of the internal Inflammation, which is what ſuffocates the Patient. Thus did the Tongue of the Woman, who died of a Quinſey on the fifth Day, appear to *Hippocrates*, 3 *Epid. Ægr.* 7.

The Tongue appearing with Chaps and Ulcerations is an Indication of a more pernicious and malignant Inflammation. I have obſerved, ſays *P. Alpinus*, in malignant Fevers, a ſqualid, chapt, and puſtulous Tongue, but the Patient did not always die; tho' *Rhaſis*, *Lib.* 10. *Cap.* 3. writes, "When Puſtules appear on the Tongue, "of the Bigneſs of Chiches, and the Fever is violent and acute, "the Patient will die on the Beginning of the next Day." We may conclude, therefore, that a dry, hard, and very black Tongue, appearing with other bad Signs, is a fatal Preſage; and, moſt certainly, when the Patient, at the ſame time that his Tongue is thus dried and exaſperated, is inſenſible of Thirſt; for this, in burning Fevers, is a moſt pernicious Sign, as indicating, according to *Galen*, *in* 1 *Epid.* either a Delirium, or an Extinction of the Faculty.

Whenever, then, we obſerve a dry and aduſt Tongue, without Thirſt, we may venture to predict a Delirium, or Death; and the laſt of theſe, if ſuch a Tongue be attended with pernicious Signs, of ſuch a Nature as thoſe which were obſerved by *Hippocrates*, in the Perſon who ſupped when he was feveriſh, and in *Hermocrates*, before-mentioned, who both died. Of the firſt of theſe, he ſays, "A certain Perſon, being ſomewhat feveriſh, "went to Supper, and drank pretty freely; in the Night he "vomited up every thing, had an high Fever, attended with a "Pain of the Right Hypochondrium, and a ſlight [ὑπολάπα- ρος] "Inflammation of the internal Parts; he was very reſtleſs "all the Night; his Urine, at firſt, was thick, red, and depo- "ſited no Sediment; his Tongue was very dry, but he had no "great Thirſt." As to the Caſe of *Hermocrates*, after he had told us, that his Tongue, in the Beginning, was very much parch'd, was deaf, ſleepleſs, but not very thirſty, and that his Urine was thick, and turbid, he adds afterwards, "On the twentieth Day, "he had another Criſis [ſpoken with relation to the imperfect Criſes on the eleventh and fourteenth Days], "was free from a "Fever, and had no Sweat, was averſe to Food all the time, "and in his perfect Senſes, but could not ſpeak; his Tongue "was very dry, but he had no Thirſt; and he was ſleepy, and "ſomewhat affected with a Coma. About the twenty-fourth "Day the Fever returned; he had a Looſeneſs upon him, and "voided Abundance of thin Matter by Stool; he had an high "Fever the following Days, his Tongue was extremely parch'd, "and on the twenty-ſeventh Day he died." That the dry and aduſt Tongue of this Patient, unattended with Thirſt, was one of thoſe Symptoms, which indicate an Extinction of the Faculty, was demonſtrated by thoſe other ill Signs which attended it, as a perpetual Loathing of Food, and the reſt. An aduſt, or extremely parched Tongue, therefore, in acute Diſeaſes, portends, as we ſaid, either a Delirium or Death. We, ought however, to be cautious in paſſing our Judgment on the Life of the Patient from theſe two Signs alone, ſince, as we before hinted, the Tongue may appear very dry and aduſt, and the Patient not be thirſty; and yet no Delirium, nor Extinction of the Faculty, be obſervable. This is owing to a Diſtillation of pituitous Humours from the Head, by which the Fauces are irrigated, and the Thirſt extinguiſhed. And we are certain, that this is the Cauſe, if there were no other Reaſon for it, than that the whole Tongue, in ſuch Caſes, is not dry; for, when in a Diſtillation of pituitous Humour, the whole Subſtance of the Tongue is not dried, but only the Part next the Root, and the Tongue, after an Ablution with Humour, ſoon grows ſoft. To this may be added, that the Sick, in ſuch Caſes, are not perpetually wakeful, but have the Conveniency of Sleep; becauſe the ſuperior Parts of the Body abound with Humidity. Sometimes

times the Diſtillation upon the Fauces plainly diſcovers itſelf by the Patients frequent hauking and ſpitting, which are occaſioned by the copious Humour deſcending from the Head. To conclude, therefore, upon the Whole, when the Tongue, in a burning Fever, where there is no Diſtillation of Humour from the Head, appears dry, rough, and aduſt, and theſe Symptoms are unattended with Thirſt, we may ſafely venture to predict a Delirium, or an Extinction of the Faculty.

A dry Tongue feels ſometimes hot, ſometimes cold, to the Touch; the latter is a mortal Sign, becauſe it never happens but in violent Inflammations. A Tongue which feels hot and rough, is not ſo dangerous; but moſt threatening when it happens in the Beginning, as it did in the Caſe of *Hermocrates* before-mentioned.

A tremulous or trembling Tongue is, alſo, a Symptom in acute Diſorders; and if it be conſequent upon a moſt intenſe Drineſs of the ſame Part, is mortal in the laſt Degree. A Trembling of the Tongue is an uſual Symptom in mortal Phrenſies, agreeably to the Author of the *Prorrhet. Lib.* 1. *T.* 20. who ſays, that "a trembling Tongue is a Sign of a diſturbed Reaſon." For when the Brain labours under a Phrenſy, which is an hot Affection, the Tongue cannot be at Reſt; on which account it frequently happens, that the Sick ſtammer, and are not able to ſpeak out their Words, a little before their Death: And theſe two Symptoms, I mean Tremblings and Convulſions of the Tongue, are uſually obſerved by Phyſicians in pernicious Phrenſies. Convulſions of the Tongue are a Conſequence of the Drineſs of the Muſcles of that Part, which are affected together with thoſe of the Head; as a Trembling of the Voice is owing to a Weakneſs contracted from a Diſtemperature of the Humours; and all thoſe before-mentioned Symptoms, which proceed from an intenſe Drineſs of the Brain, indicate a diſordered Mind. When this Trembling and Stammering of the Tongue proceeds from an univerſal Induration of the Muſcles, it is the more pernicious, as being cauſed by the immoderate Drineſs of the Brain.

But here again, that we may not be miſtaken in our Prognoſtics, we are to make a Diſtinction between the Cauſes of thoſe Tremblings and Convulſions of the Tongue; for, if they proceed, as was obſerved, from an immoderate Drineſs of the Muſcles, and their Heads, and of the Nerves, it is certainly mortal; but, if the Tongue trembles, and ſuffers Convulſions, when the muſcular and nervous Parts are replete with ſome Humour, it is no fatal Sign: For ſuch a Repletion is frequently the Cauſe of thoſe Tremblings and convulſive Motions of the Tongue, which happen in the Beginnings of Diſeaſes, and muſt be aſcrib'd to the Redundance of Humours, as it happen'd in the Caſe of *Pythion*, in the Beginning of the third Book of the Epidemics; and as it is ſometimes obſerved before a Criſis, in which Circumſtance they are juſtly reckon'd among critical Signs. A Diſtinction, therefore, is to be made, with reſpect to our Prognoſtication, between thoſe Tremblings and Convulſions of the Tongue, which proceed from Drineſs, and are always fatal; and thoſe very Symptoms, when cauſed by a Repletion; for thoſe latter happen in the Beginnings of Diſtempers, or are attended with other critical Signs; but the other are only conſequent upon a very hot and dry Diſorder. *Proſper Alpinus de Præſag. Vit. & Morb.*

LINGUA AVIS. A Name for the *Doria*; *quæ Jacobæa*; *foliis integris & mucronatis.*

LINGUA CERVINA.

The Characters are;

The Seed-veſſels are in the under Face of the Leaf, diſpoſed in a vermicular Series, or like the Track of a Worm, and cover'd with a thin Membrane, which is pierced by the Fruit when ripe. Theſe Veſſels conſiſt of a thin, hollow, orbicular, lenticular Pellicle, ſurrounded with an elaſtic Ring, which, breaking the mature Fruit, cauſes an Exploſion of very thin Seeds. The Leaves are ſimple, long, entire, or jagged, and in exotic Kinds ſometimes, tho' very rarely, branched.

Boerhaave mentions fifteen Species of this Plant; which are,

1. Lingua Cervina; Officinarum. *C. B. P.* 353. *Tourn. Inſt.* 544. *Boerh. Ind. A.* 143. *Lingua Cervina & Phyllitis.* Offic. *Phyllitis.* Ger. 976. Emac. 1138. Raii Hiſt. 1. 134. Synop. 44. *Phyllitis ſive Lingua Cervina vulgi.* J. B. 3. 756. *Phyllitis ſive Lingua Cervina vulgaris.* Park. 1046. HART'S-TONGUE.

The Hart's-tongue is ſmall, blackiſh, and ſtringy; from which ſpring long, narrow, ſmooth Leaves, ending in a ſharp Point, near a Foot long, and about two Inches broad; that Part next the Stalk, terminating in two round-pointed Auricles. The Seed grows in broad oblique Lines on each Side of the Stalk, on the under Part of the Leaves, being ſmall and duſty, like the Seed of other capillary Plants. It grows in ſhady Lanes, and on old Stone Buildings, being green all the Year.

Hart's-tongue is principally uſed for Diſorders of the Liver and Spleen, being good to diſſolve hard, ſcirrhous Tumors in either; it is alſo ſerviceable for the Rickets in Children, and for Spitting of Blood, and the Bloody-flux. *Dioſcorides* commends it againſt the Bitings of Serpents; and Mr. *Ray* praiſes it either given in Powder, or a Conſerve of the green Leaves, as particularly uſeful for hyſteric and convulſive Fits, and the Palpitation of the Heart. *Miller's Bot. Off.*

Externally apply'd, it cleanſes Wounds, and Ulcers. *Schroder.* Boiled in Wine, it is good againſt the Bite of a mad Dog, and Obſtructions of the Viſcera. *Dioſcorides.*

Boerhaave looks upon all this Plant to be reſolvent and aperient.

2. Lingua Cervina; anguſtifolia; lucida; folio ſerrato. Phyllitis criſpa. *J. B.* 3. 757.

3. Lingua Cervina; majore folio, in duas treſve lacinias & profundius diſſecto.

4. Lingua Cervina; maxima; folio auriculato, parum undulato, in duas treſve lacinias ſecto.

5. Lingua Cervina; maxima; undulato folio, auriculato per baſin. *M. H.* 3. 557. *Phyllitis, ſeu Lingua Cervina, maxima undulato folio, auriculato per baſin.* Plukn. Phyt. 248.

6. Lingua Cervina; minima; folio undulato.

7. Lingua Cervina; folii magni, criſpi, nervo exterius aculeato.

8. Lingua Cervina; medio folii nervo in aculeum abeunte. *M. H.* 3. 557.

9. Lingua Cervina; medio folii fimbriati nervo in aculeum abeunte. *Vaill.*

10. Lingua Cervina; multifido folio. *C. B. P.* 253. *M. H.* 3. 557. *Sect.* 14. *T.* 1. *Phyllitis, Polyſchides.* J. B. 3. 757.

11. Lingua Cervina; quæ Phyllitis; major ex uno pedunculo quandoque bifolia. *M. H.* 3. 557.

12. Lingua Cervina; minor ex uno pedunculo quandoque trifolia.

13. Lingua Cervina; ramoſa; folio per ſummum in orbem convoluto.

14. Lingua Cervina; ramoſa; major; foliis multifidis & criſpis.

15. Lingua Cervina; folio maximo, infra auriculato, ſupra in amplas lacinias foliaceas explicato. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 23.

LINGUA MAJOR. A Name for the *Doria*; *quæ Jacobæa*; *foliis integris & mucronatis.*

LINGUALIS MUSCULUS. *Douglas* takes notice of a Muſcle of the Tongue, which he calls by this Name. It ariſes, ſays he, pretty large and fleſhy from the Baſis of the Tongue laterally, and runs ſtrait forwards between the Cerato and Genioglooſſus, to its Tip, where it is hard to determine whether it ends there, or if it returns circularly after the ſame manner on the other Side to the Root of the Tongue again.

Its Uſe is to contract or narrow the Subſtance of the Tongue, and at the ſame time to bring it backwards and downwards.

LINGULA. The ſame as LIGULA.

LINIMENTUM. Oils, Unguents, and the Fats of Animals, or whatever any Part is anointed with, are comprehended under this Name. But a Liniment, in Pharmacy, is a Compoſition of a Conſiſtence ſomewhat thinner than an Unguent, and thicker than an Oil, us'd for anointing different Parts of the Body, in various Intentions. There are many Sorts of Liniments directed in Pharmaceutical Writers; but the College have thought fit to direct only one in their Diſpenſatory, which is the *Linimentum Arcei*; for a Deſcription of which, ſee ELEMI.

The Materials proper for the Compoſition of a Liniment, are Oils, Fats, Balſams, and whatever enters the Compoſition of Unguents and Plaiſters. The beſt way of uſing Liniments, is to apply them after the Pores have been opened by Frictions, or Fomentations.

LINOSYRIS. A Name for the *Coma aurea*; *Germanica.*

LINOZOSTIS, λινόζωσις. The Name by which *Hippocrates* calls Mercury, a Decoction of which he frequently directs to procure Stools. It is the BONUS HENRICUS; which ſee.

LINTEUM. Linen. In Surgery it comprehends Lint, Tents, Compreſſes, and Rollers.

LINUM.

The Characters are;

The Leaves are generally alternate; the Calyx is monophyllous, tubulated and quinquefid. The Flower is like a Clove-gilly-flower, pentapetalous, and furniſhed with five Stamina. The Ovary, which is ſeated in the Bottom of the Calyx, is of an oblong Figure, covered with a thin Membrane, ſhoots forth five long Tubes, and becomes a globular, acuminated Fruit, conſiſting of many Capſulas, five or ſix perhaps, which are full of a flat Seed, of a Figure almoſt oval, being acute at one End, and obtuſe on the other.

Boerhaave mentions eight Species of this Plant; which are,

1. Linum; arvenſe. *C. B. P.* 214. *M. H.* 2. 573.

2. Linum; ſativum. *C. B. P.* 214. *Ger.* 444. *Emac.* 556. *Raii Hiſt.* 2. 1072. *Tourn. Inſt.* 339. *Park. Theat.* 1335. *Boerh. Ind. A.* 284. *Linum.* Offic. J. B. 3. 450. Raii Synop. 3. 362. FLAX.

Flax has round ſlender unbranched Stalks, a Yard or more high, cloathed with many long, narrow, ſharp-pointed, glaucous Leaves; on the Tops of the Stalks grow a great many ſmall, five-leav'd, blue Flowers, ſoon falling off; and are follow'd by round Heads, or Seed-veſſels, each divided into about ten Partitions, containing as many oblong, flatiſh, ſhining, brown Seed. The Root is ſmall and woody, as ſoon as the Seed is ripe. Of the Bark of the Stalks of this Plant, which is tough, and made up of a great

a great many ſlender Filaments, is made Linen Cloth. It is ſown in Fields, and flowers in *June*. The Seed only is uſed.

This Seed, which is uſually called Linſeed, is emollient, digeſting, and ripening, of great Uſe againſt Inflammations, Tumors, and Impoſtumes, and is frequently put into Fomentations and Cataplaſms, for thoſe Purpoſes. Cold-drawn Linſeed-oil is of great Service in all Diſeaſes of the Breaſt and Lungs, as Pleuriſies, Peripneumonies, Coughs, Aſthmas, and Conſumption. It likewiſe helps the Colic and Stone, both taken at the Mouth, and given in Clyſters.

The Oil, by Expreſſion, is the only officinal Preparation. *Miller's Bot. Off.*

In pleuritic Pains, ſays *Raygerus*, *Ephem. Germ. An. 6. & 7.* I have often experienced Linſeed-oil to be the moſt ſucceſsful Medicine I could preſcribe; for it immediately facilitated Reſpiration, and promoted Spitting. In an Hæmoptoe, alſo, I exhibit the ſame Oil, with the deſired Succeſs; for, by its balſamic and emplaſtic Virtue, it conſolidates the affected Parts.

Linſeed-oil is of ſo ſubtile Parts, as not to be kept in earthen Veſſels, without Tranſudation. *Meyerus de Luſu ſerio.* Tumors of the Belly are very happily cured by the Uſe of Linſeed-oil. *Ephem. German. An.* 3.

This Plant has a more oily Taſte than the Mallow, and is the chief of the emollient Tribe. The Seeds afford an excellent Medicine, ſince from them is expreſſed an Oil, which is anodyne, demulcent, and extremely adapted to all manner of Aſperities; it relaxes, and involves Acridities, whence it is of extraordinary Service in the moſt deſperate Colics. The ſtiff and rigid Limbs, being anointed with this Oil, are relaxed and rendered flexible. This Oil, when freſh-drawn, and taken at the Mouth, is very good in a Pleuriſy, and a Cough, to help Expectoration; and, injected in Clyſters, is very proper in the Hæmorrhoids, and indurated Fæces, whence proceeds the Colic; mixed with ſealed and Japan Earth, it is a great Arcanum in the Dyſentery. An Emulſion of the Seeds is of Service in the Pleuriſy and Peripneumony; the Oil is a very good Remedy againſt the Stone: The Seeds reduced to a Meal, and boiled and prepared in the Form of a Cataplaſm, are apply'd to Tumors and Abſceſſes, in order to mollify and ripen them. The Seed, boiled in Water, makes a *mild oily Decoction*, preſcribed to be drank as an Anodyne in Inflammations of the ſmall Inteſtines, the Diarrhœa, the Dyſentery, nephritic Pains, and Retention of Urine. The Oil, boiled with Honey, clears the Face and Skin of Spots, and all cutaneous Blemiſhes. The Leaves are emollient, and the Smell of the Flowers is not poiſonous, as ſome Authors have written. To cloſe all, we ſhall obſerve, that whereas Cotton can never be uſed about Wounds, on account of its denticulated Parts, which diſpoſe to Inflammations; Linen, the manufactured Produce of this Plant, is, by its extraordinary Softneſs, Smoothneſs, and Flexibility, of all other Things, the beſt adapted to ſuch Purpoſes. *Hiſt. Plant. aſcript. Boerhaave.*

Flax has one Quality, which I do not find taken notice of by botanical Writers, which is, that the Herb infuſed in Water, as Ponds or Rivers, as it is practiſed in order to rot the Stem, and procure the Bark for mechanical Uſes, communicates to the Water a very poiſonous Nature, inſomuch that Cattle, which drink of it, die; and the Fiſh, in ſuch Waters, are poiſon'd. And I am inform'd, that there is an Act of Parliament now in Force, which forbids the Steeping of Flax in Ponds or Rivers, where it can have this Effect.

3. Linum; ſativum; humilius; flore majore. *Bobart.*

4. Linum; ſativum; latifolium; Africanum; fructu majore. *T.* 339.

5. Linum; perenne; majus; cœruleum; capitulo majore. *M. H.* 2. 573.

6. Linum; perenne; majus; cœruleum; capitulo minore. *M. H.* 2. 573.

7. Linum; maritimum; luteum. *C. B. P.* 214. *M. H.* 574. *Linum ſylveſtre.* Dod. p. 534.

8. Linum; Africanum; luteum; foliis conjugatis. *Ind.* 120. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 284. See ÆGYPTIUM LINUM.

LINUM MINIMUM. A Name for the *Lyſimachia*; *annua*; *minima*; *Polygoni folio.*

LINUM UMBILICATUM. A Name for the *Omphaloides*; *Luſitanica*; *Lini folio.*

Beſides the foregoing Species of *Linum*, *Dale* mentions the following.

LINUM CATHARTICUM. Offic. *Linum ſylveſtre Catharticum.* Ger. Emac. 560. Raii Hiſt. 2. 1076. Synop. 362. *Linum pratenſe floſculis exiguis.* C. B. P. 214. Tourn. Inſt. 340. *Chamelinum Cluſii flore albo, ſive Linum ſylveſtre Catharticum.* Park. Theat. 1336. *Alſine verna glabra floſculis albis vel potius Linum minimum.* J. B. 3. 435. PURGING FLAX, or MILL MOUNTAIN.

This is but a little Plant, ſeldom growing above a Span high, with ſlender round Stalks, having two ſmall oblong Leaves at each Joint; the Tops of the Stalks are much branched, bearing ſeveral ſmall, five-leav'd, white Flowers, which are ſucceeded by Seed-veſſels, in Shape of the common Flax, but a great deal leſs, including very little Seed. The Root is ſmall and fibrous, periſhing every Year. It grows frequently upon dry hilly Places, flowering in *June* and *July*.

This Herb is grown of late in great Requeſt among the Vulgar; a Handful of it, boiled in Wine or Ale, and the Decoction drank, purges ſtrongly; and is much commended againſt rheumatic Pains in the Limbs; as alſo for tertian and quartan Agues, and the Dropſy. *Miller's Bot. Off.*

This Plant is very bitter, and gives a faint-red Colour to the blue Paper: It is purgative, and a Febrifuge. *Marcyn's Tournefort.*

The entire Plant, with the Stalks and Heads, infuſed at Night in White-wine, over hot Aſhes, purges ſerous Humors with ſufficient Strength.

The Herb may be taken, either bruiſed, or dried, and pulverized with a ſmall Quantity of Cream of Tartar, and Aniſeeds; and, thus prepared, it purges without Perturbation. *Raii H. P.*

I once knew an Inſtance of a Man, who took a Purge from a Quack, of an Infuſion of this Plant; which, in a few Hours, ſwell'd him to ſuch a Degree, that his ordinary Cloaths were not by much ſufficient to cover him; and it was with ſome Difficulty, that he was recovered by more gentle Evacuations.

LIOBATOS. The ſame as LEVIRAIA.

LIPA, λίπα. This Word is frequently uſed by *Hippocrates*, ſometimes join'd with ἔλαιον, and ſometimes alone, to expreſs Fat, or Oil. Fat Stools are, by this Author, eſteem'd a Sign of Colliquation; and fat Subſtances, ſwimming in the Urine, in the form of a Spider's-Web, are condemn'd as Preſages of a Conſumption.

LIPARIS, λιπαρὶς. The Name of a Fiſh, ſo pinguious, that it appears to conſiſt of ſcarce any thing but Fat.

LIPODERMOS. The ſame as LEIPODERMOS.

LIPOPSYCHIA, λειποψυχία, from λείπω, to leave, and ψυχὴ, Life. A fainting Fit. See SYNCOPE.

LIPOTHYMIA, from λείπω, to leave, and θυμὸς, the Mind. The ſame as LIPOPSYCHIA.

LIPPA. The Sordes of the Eyes.

LIPPIA. This Plant was ſo named by the late Dr. *William Houſtoun*, who diſcovered it at *La Vera Cruz*, in Honour to Dr. *Auguſtus Lippi*, a famous Botaniſt, who travelled to *Egypt*, and diſcovered many new Plants.

The Characters are;

It hath an anomalous Flower, conſiſting of one Leaf, which is divided into four Parts, and reſts on the Embryo, which afterwards becomes the Fruit, having two Seeds, which are incloſed in a ſmall Covering.

We know but one Species of this Plant at preſent;

LIPPIA *arboreſcens, foliis conjugatis, oblongis, Capitulis ſquamoſis & rotundis. Houſt.* Tree Lippia, with oblong Leaves, growing by Pairs, and having round ſcaly Heads.

This Plant, in the Country of its native Growth, commonly riſes to the Height of eighteen or twenty Feet, and has a rough Bark: The Branches come out by Pairs oppoſite, as alſo the Leaves, which are oblong, pointed, and a little ſawed in the Edges. From the Wings of the Leaves come out the Foot-ſtalks, which ſuſtain many round, ſcaly Heads, about the Size of a large Grey-pea, in which are many ſmall yellow Flowers appearing between the Scales, which are ſucceeded by the Seed-veſſels.

LIPPITUDO. Lippitude. *Celſus* means by this an Ophthalmy, or Inflammation of the Eyes. See OPHTHALMIA.

LIPYRIA. A Species of Fever, in which the external Parts are cold, whilſt the internal Parts ſeem exceſſively hot.

LIQUAMEN. The ſame as GARUM.

LIQUAMUMIA. Human Fat. *Rulandus.*

LIQUIDAMBRA. See the laſt Part of the Article AMBRA.

LIQUIRITIA. The ſame as GLYCYRRHIZA.

LIQUOR MINERALIS ANODYNUS. *Frederic Hoffman* frequently recommends this Liquor of his own Invention, which is very much celebrated in ſome Parts of *Germany*. I don't know, that he ever diſcover'd his Method of preparing it; but *Burggrave*, in his *Lexicon*, ſuppoſes it to be thus made:

Take of the beſt Oil of Vitriol, and *Indian* Nitre, each four Ounces: Diſtil the Spirit from a Retort by a Fire, gradually rais'd to a great Briſkneſs, about the End of the Proceſs: Pour two Ounces of this Spirit cautiouſly and ſucceſſively into fifteen Ounces of highly rectified Spirit of Wine; then, by a careful Diſtillation, we obtain a highly fragrant and aromatic Spirit. But, in this Proceſs, great Care is to be taken, that we neither fall ſhort, nor exceed, in extracting the ſulphurous Spirit, but endeavour to obtain the Whole of it as pure and genuine, as we poſſibly can; for, as ſoon as the Phlegm is about to riſe with the crude acid Spirit, the Receiver is to be chang'd with all Expedition. But, as this ſulphurous Spirit is not yielded entirely pure, and free from a Mixture of the crude and acid Spirit, it is to be rectified with an equal Quantity of Water, and duly ſhaken; by which means the acid Principle will ſubſide in the Water, and the ſulphurous Spirit be diſtil'd pure and unadulterated. When all

all this Spirit is obtained, and the Phlegm juſt ready to come over, the former is to be immediately removed, and kept in a Veſſel carefully clos'd. The mild and ſoporiferous Virtue of this Spirit may be ſtill heighten'd, if, before the Rectification with Water, we add to it ſome Quantity of the Oil of Cloves, which is to be duly mixed with it, by ſhaking both together in a glaſs Veſſel, cloſed with a glaſs Stopper; for, by this means, the Acrimony of the Oil of Cloves is deſtroyed, eſpecially if afterwards both are mixed with Water, and duly incorporated by ſhaking; for thus the gentle, mild, and ethereal Quality is intimately united with this Spirit. 'Tis a matter of no Importance, whether this Compoſition is the genuine, anodyne, mineral Liquor of *Hoffman*, ſince the former is equally efficacious with the latter, in its gently ſtimulating, carminative, antiſeptic, diaphoretic, and anodyne Virtues.

LIRION, λείριον. The Lily.

LITE, λιτή. The Name of a Plaiſter in *Galen*, *L.* 2. *C.* 2. *de Comp. M. per G.* conſiſting of Verdegriſe, Wax, and Roſin.

LITHAGOGUS, from λίθος, a Stone; and ἄγω, to bring away. An Epithet for Medicines which expel the Stone.

LITHANTHRAX. A foſſile Coal. See CARBO.

LITHARGIRITES ACETUM. Vinegar of Litharge. See ACETUM.

LITHARGYRUS. Offic. Schrod. 459. Worm. 135. Charlt. 55. Aldrov. Muſ. Metall. 18. *Lithargyrium.* Schw. 383.

LITHARGE.

Litharge, *Lithargyrus*, *ſive Spuma Argenti Officinalis*, was of two Kinds among the *Greeks*, differing only in Colour. One was yellow, called *Chryſitis*, or *Lithargyrus Auri*; the other white, called *Argyritis*, or *Lithargyrus Argenti*; and the ſame Diſtinction is ſtill kept up. It is commonly made in thoſe Furnaces in which Lead is ſeparated from Silver, or where Silver is refined by Lead from the other Metals mixed with it.

When the Workmen deſign to ſeparate Silver from the Lead or Copper contained in the ſame Ore with it, they firſt make a kind of Trough of Bone-aſhes, in which they melt a great Quantity of Lead; and into this melted Lead they throw the Silver Ore to be purified, and continue to blow with Bellows, till all the Lead, mixed with the Copper or Lead contained in the Silver, ſwims on the melting pure Silver like Oil. Then they gradually blow this Lead toward the Sides of the Trough, and afterwards, cutting the Sides, the vitrified Lead runs down to the Ground; and there becomes Litharge, ſometimes of a Gold, and ſometimes of a Silver Colour; whence the Dealers in theſe Commodities have given out, that the one was made from Silver, the other from Gold; whereas the Difference conſiſts only in having been more or leſs expoſed to the Fire, or in having a greater or leſs Mixture of Copper.

Litharge is therefore nothing but vitrified Lead, either alone, or mixed with Copper: it is frequently uſed in Phyſic in outward Applications, being mixed with oily Subſtances to make the Baſis of moſt Plaiſters, by reaſon of the emplaſtic Conſiſtence, which this and other Recrements of Lead acquire, by being mixed and diſſolved in Oils. It is of a drying, detergent, and gently aſtringent Quality; and for this Reaſon is uſed in incarning and cicatrizing Ulcers. It is prepared by being well levigated in a Mortar with clear Water, till all the Lead, which is not perfectly calcined, or other metallic Fæces, fall to the Bottom, leaving the finer Parts incorporated with the Water, which, ſubſiding by Reſt, are ſeparated from the Water, and dried. This pure Litharge is uſed in the *Unguentum Nutritum*, *Deſiccativum*, *Rubrum*, and *Apoſtolorum*; in the *Emplaſtrum Palmeum*, *Diachylon ſimplex & compoſitum*; *Polychreſtum* of *Charas*; and in Plaiſters and Ointments of many other Diſpenſatories. *Geoffroy.*

LITHIASIS, λιθίασις. The Stone. It, alſo, ſignifies a Diſeaſe of the Eye. See CHALAZA.

LITHOBRYON. A Name for the *Coralloides*; *Cornua Cervi referens*; *corniculis brevioribus.*

LITHOCOLLA. Offic. Matth. 1390. THE STONE-GLUER.

Lithocolla, λιθόκολλα, from λίθος, a Stone, and κόλλη, Glue, Stone-gluer, is a Mixture of Marble, or *Parian* Stone, with Bulls-glue. It is of Service, being applied with a heated Probe, in laying hold of the Hairs which incommode the Eye [τείχας ἀνακολλᾷν τὰς ἐν ὀφθαλμοῖς]. *Dioſcorides*, *L.* 5. *C.* 164.

LITHOCOLUM. This ſhould ſeem to imply the Method of making the Stone paſs through the urinary Paſſage; or the Diſſolution of it in theſe Parts.

LITHODENDROM. A Name for Coral.

LITHOEIDES, λιθοειδής. An Epithet for that Bone of the Skull called *Os Petroſum.*

LITHOLABON, λιθόλαβον, from λίθος, a Stone, and λαμβάνω, to lay hold of. A Name for the Forceps uſed in Lithotomy, for extracting the Stone.

LITHONTRIPTICUS, from λίθος, a Stone, and θρύπτω, to break. Lithontriptic. An Epithet for Medicines, which either have, or are ſuppoſed to have, the Virtue of breaking Stones in the Urinary Paſſages

LITHOPÆDION ſeems to import an Infant-ſtone; that is, a recent calculous Concretion.

LITHOPHYTON. See the Explication of Terms under the Article BOTANY. White Coralline is called *Lithophytum*, *marinum*, *albicans.*

LITHOREOLEUCOIUM *minimum*, *ſupinum Valvenſium.* A Name, in *Ray*, for the *Leucoium ſaxatile*, *Thymi folio*, *hirſutum*, *cæruleo-purpureum.*

LITHOSPERMUM.

The Characters are;

The Calyx is quinquefid, being cut to the very Baſe, into five long and narrow Segments. The Flowers are ſmall, monopetalous, Funnel-ſhaped, multifid, with wide Margins. The Seeds are very hard, ſmooth, poliſhed, ſhining, and of a roundiſh Figure.

Boerhaave mentions two Species of this Plant; which are,

1. Lithoſpermum; majus; erectum. *C. B. P.* 258. *Tourn. Inſt.* 137. *Boerh. Ind. A.* 190. *Lithoſpermum*, *ſive milium Solis.* Offic. J. B. 3. 590. Raii Hiſt. 1. 503. Synop. 3. 228. *Lithoſpermum minus.* Ger. 486. Emac. 609. *Lithoſpermum vulgare minus.* Park. Theat. 432. GROMWELL.

The common Gromwell has a thick woody Root, ſhooting forth rough hairy Stalks, divided into ſeveral Branches, bearing rough, oblong, ſharp-pointed Leaves; and among theſe a great many ſmall monopetalous white Flowers, cut into five Segments, as are, alſo, the rough Calyces they are ſet in, in which, when the Flowers are fallen, grow four hard, ſhining, white Seeds. It grows in dry Fields and Hedges, and flowers in *May*. The Seed only is uſed.

Gromwell-ſeed is accounted a powerful Diuretic, and a Cleanſer of the Reins and Ureters, being boiled in Wine or Water; and is of great Service againſt the Stone, Gravel, or Stoppage of Urine; as, alſo, againſt the Heat of it, and a Gonorrhœa. *Matthiolus* commends two Drams of the Powder to be given in Womens Milk, as a ſpeedy Help in hard Labour. *Miller's Bot. Off.*

This Plant gives hardly any Tincture of Red to the blue Paper; it is aſtringent and glutinous; the Fruit ſtains it a little.

The Leaves of Gromwell, by chymical Analyſis, yield no volatile concrete Salt; but an urinous Spirit very much loaded with it, and a great deal of Oil and Earth: All that is obtained from the Seeds is alkaline; they yield ſome volatile concrete Salt, and a great deal of Oil and Earth; they are very diuretic: Emulſions are made of it with Dog's-graſs Water; infuſe half an Ounce of the Seeds, bruiſed, a whole Night, in a Glaſs of White-wine, and give it to drink in a Morning faſting. *Martyn's Tournefort.*

2. Lithoſpermum; minus; repens; latifolium. *C. B. P.* 258.

LITHOSPERMUM, ARVENSE. A Name for the *Heliotropium*; *minus*; *anguſtifolium*; *arvenſe*; *ſeu hirſutum.*

LITHOSPERMUM, PALUSTRE. A Name for the *Heliotropium*; *minus*; *anguſtifolium*; *paluſtre*, *ſeu glabrum.*

LITHOSPERMUM ARUNDINACEUM. A Name for the *Lachryma Jobi*; which ſee.

LITHOTHLASPI. A Name for the *Thlaſpi*; *parvum*; *ſaxatile*; *flore rubente.*

LITHOTOMIA, λιθοτομία, from λίθος, a Stone, and τέμνω, to cut. Lithotomy, that is, Cutting for the Stone. See CALCULUS, CATHETER, and CATHETERISMUS.

Mr. *Sharp* lays down the following Method of ſearching for the Stone: The Patient being laid on an horizontal Table, with his Thighs elevated, and a little extended, paſs the Sound with the concave Part towards you, till it meets with ſome Reſiſtance *in Perinæo*, a little above the Anus; then, turning it without much Force, puſh it gently on into the Bladder; and, if it meets with an Obſtruction at the Neck, raiſe its Extremity upwards, by inclining the Handle of it towards you; or, if it does not then ſlip in, withdraw it a Quarter of an Inch, and, introducing your fore Finger into the Rectum, lift it up, and it will ſeldom fail to enter: There is ſome Art in turning the Sound in the proper Place of the Urethra, which Surgeons, not vers'd in this Operation, cannot ſo well execute, therefore they paſs the Inſtrument, with the concave Side always to the Abdomen of the Patient, obſerving the ſame Rule at the Entrance into the Bladder, as in the other Method. The Cauſe of this Obſtacle is frequently a ſmall Projection of the Orifice of the Bladder, like that of the *Os Tincæ* in the *Vagina*, which occaſions the End of the Sound to ſlip a little beyond it.

'Tis not to be ſuppoſed, that, by ſearching, one can poſitively judge of the Size and Form of a Stone; and indeed the Frequency of the Fits, and Violence of the Symptoms, are a better Rule to go by; though whoever ſhall think himſelf capable of diſtinguiſhing, abſolutely, the Difference of Stones, even by theſe Circumſtances, will ſometimes be miſtaken; ſince the Frequency and Violence of the Pain depend not always merely upon their Magnitude or Shape; and there are ſome Inſtances where a Stone

of

of ſix Grains Weight has, for ſeveral Months, given more Pain in one Perſon, than a much larger has in another, though, no doubt, *cæteris paribus*, a large or a rough Stone is worſe than a ſmall or a ſmooth one.

Though, upon ſearching, we are aſſured of a Stone in the Bladder, we are not, without farther Inquiry, to operate immediately, ſince there are ſometimes Obſtacles that forbid the Operation, either abſolutely, or only for a certain time: Among theſe that of greateſt Conſequence is the Gravel, or Stone in the Kidneys, which is known by the Pain in the Loins, Vomitings, Retractions of the Teſticles, Numbneſs of the Thighs, and often by Matter which the Inflammation produces in the Kidneys. The Objections of leſs Weight, and which frequently are removed, are a Fit of the Stone, a Cough, a Hectic, and being emaciated by long Pain; exceſſive hot or cold Weather are likewiſe Hindrances; but, in Extremity of Danger, theſe laſt Conſiderations may be diſregarded, though no doubt very hot Weather is more inconvenient and dangerous than cold, as lying in Bed is more troubleſome, and the Urine much ſalter.

Difference of Age makes an extreme Difference in Danger, Infants and young People almoſt always recovering; but ſtill the Operation is adviſeable in thoſe advanced in Years, though it is not attended with near the ſame Succeſs.

Before the Operation is performed, it will be proper to prepare the Patient with a gentle Purge the preceding Day, and a Clyſter early in the Morning, which will be of great Service in cooling the Body, and making the Operation leſs dangerous, where the Rectum is liable to be wounded, when full. *Sharp.*

The ſeveral Methods of Lithotomy.

With reſpect to the ſeveral Methods of performing Lithotomy for the Stone in the Bladder, they are four. The firſt and moſt antient, is the *Apparatus minor*, called likewiſe the *Celſian* or *Guidonian* Method. The ſecond the *Apparatus magnus*, or *Marianus*'s Method. The latter is likewiſe termed the New, and the former the Old Method. The third is the *Apparatus altus*, or *Sectio Hypogaſtrice*, or *Franconica*: By this the Inciſion is made at the lower Part of the Abdomen, in the anterior Side of the Bladder, immediately above the *Os Pubis*, whereas, in the reſt, it is made in the *Perinæum*, between the *Anus* and *Scrotum*. The fourth, and moſt modern, was invented towards the End of the laſt Century, and is termed the lateral Operation, Frere *Jaques*'s, or, ſometimes, *Rau*'s Method. We ſhall treat more particularly of each in its proper Place.

The moſt convenient Seaſon for the Performance of this Operation is Spring, or Autumn; though when the Patient is in exquiſite Torment, and, perhaps, his Life in Danger, a prudent Surgeon will embrace the preſent Opportunity.

The Patient ſhould obſerve a regular Courſe of Diet for ſome time; and, if an Adult, of a full Habit, be bled, which is unneceſſary in Boys; though the Body ſhould be kept open in both. The Adminiſtration of a Clyſter the Evening before, or on the ſame Morning, will prevent any Impedient from a Diſcharge of the Fæces. A weak Patient ſhould be ſupported by proper Medicines, and a nouriſhing Diet. Three or four Hours before the Operation, he may have a Couple of new-laid Eggs, poached ſoft, with ſome Wine, but one is ſufficient for a Boy. Laſtly, if there are any Hairs on the Perinæum, they muſt be ſhaved off.

Of the Apparatus.

The *Apparatus minor* requires a Knife, (*Tab.* XLVIII. *Fig.* 8.) or Razor, an Hook, (*Fig.* 10.) or Forceps, the T Bandage, a thick ſquare Compreſs, about four Fingers broad, ſome Lint, and ſtyptic Powder, or rather highly rectified Spirit of Wine, to ſuppreſs an Hæmorrhage, and a crooked Needle and Thread.

The Poſture of an Adult, in this Method, is repreſented *Tab.* L. *Fig.* 5. If a Child, therefore, is to be cut after this Method, he is to be ſecured in that manner, or held by two Aſſiſtants; the ſtrongeſt muſt be ſeated on an high Chair, holding on his Knees a Pillow, covered with a Linen Cloth, three or four times double, and hanging down to his Feet. The Boy muſt be placed on this Pillow, and ſecured, as we have repreſented at *Tab.* XLIX. *Fig.* 1. from *Tolet*: If he is ſtrong, another Aſſiſtant may hold his Arms, to prevent his moving. If tall, or near Fourteen, let him be placed as at *Tab.* L. *Fig.* 5.

The Patient being thus diſpoſed, the Surgeon dips the middle and fore Finger of his Left Hand in Oil; then introduces them into the Anus, thruſting it upwards, whilſt, with his Right Hand, he preſſes on the Region of the Pubes, and, having found the Stone, protrudes it to the Left Side of the Perinæum, near the Anus, and there holds it, in ſuch a manner as to form by it a Tumor in the Perinæum (ſee *Tab.* L. *Fig.* 5. A). He then makes an Inciſion into the moſt prominent Part, with his Knife, dividing the Integuments and Bladder, ſufficiently for the Extraction of the Stone: But Care muſt be taken, to leave none of the intermediate Parts cohering, that the Stone may have a free Paſſage, and the Patient not be unneceſſarily tormented, nor an Inflammation or Convulſions excited, from a Contuſion and Laceration of the Parts. The Bladder being thus divided, a ſmall Stone may be thruſt out by the Fingers in the Anus; a large or rough one, partly by them, and partly by the Hook B, *Fig.* 6. applied to the upper Part. If it ſlips back, or ſticks in the Wound, it may be extracted by the Forceps.

When the Stone is thus extracted, a Finger, Catheter, or Probe, ſhould be introduced into the Bladder, (*Tab.* XLVIII. *Fig.* 11.) to ſearch whether any Fragments remain there; for this will often happen, when the extracted Stone appears to be ſmooth, or is broken in the Operation. If any thing is left, it muſt be extracted by the Fingers, an Hook, Forceps, or the Extractor: If all is found clear, the Patient is put to Bed. For the ſubſequent Treatment, the Reader may find Directions under the *Apparatus magnus.*

Heister's Opinion of this Method.

This Method is now entirely laid aſide, though, in my Opinion, it is practicable on Boys under Fourteen, the Time limited by *Celſus* and *Aleucaſis*; becauſe in them the Stone may be brought to the Perinæum: Beſides, the Simplicity of it, with its Succeſs, is to me a Recommendation; for it has many Advantages over the Apparatus major, and lateral Operation, as it may be always performed with fewer Inſtruments, and often with the Knife only; and then the Urethra is not injured by the Catheter, nor the Bladder vellicated by the Forceps; and the Stone is more eaſily found and extracted; whereas, in the others, the moſt experienced Lithotomiſts ſometimes cannot find it: And, laſtly, it gave Birth to the lateral Operation. For *Celſus* directs the Inciſion to be made in the Integuments, near the Anus; and *Albucaſis* ſays, the Stone muſt be protruded to the Root of the Coxa, and the Inciſion muſt be afterwards made there. In theſe Caſes, therefore, I ſtill practiſe it on Children; and *Marinus* recommends it: It may, alſo, be performed on Adults, when the Urine is ſuppreſſed by an Adheſion of a Stone in the Neck of the Bladder, or in the Perinæum, which cannot be removed, either by internal Medicines, or the Catheter: Otherwiſe it is dangerous, in Adults.

Mr. *Sharp*'s Opinion.

This Way of Cutting was attended with many Difficulties, for want of proper Inſtruments to direct the Inciſion, and extract the Stone, when it lay beyond the Reach of the Fingers, which in a large Bladder was frequently the Caſe; ſo that it is ſtrange *Celſus* confin'd the Operation to the Age between Nine and Fourteen, ſince it is much eaſier to be performed in Infancy than at thoſe Years; and it plainly appears, from his Account of it, that many died from the Violence done to the Bladder, in endeavouring to bring the Stone forwards, though the Operators failed in their Attempt, and the Patients were not cut.

The Wound of the Bladder in this Operation is made in the ſame Place as is now practiſed in the lateral Method; but its being impracticable on ſome Subjects, and uncertain in all others, has made it univerſally exploded; ſo that nobody now makes an Inciſion without the Direction of a Staff, unleſs a Stone entirely prevents the Introduction of it, by preſſing againſt, and ſtopping up the Neck of the Bladder; and in this Caſe, when we cut directly upon the Stone, it is much ſafer to puſh it back farther into the Bladder, and lay hold of it with the Forceps, than to endeavour with the Scoop, or Fingers, to force it outwards; which Circumſtance alone makes it different from *Celſus*'s Method. It muſt be diſtinguiſhed, however, when I ſpeak of puſhing the Stone back, that I ſuppoſe it in the Neck of the Bladder; for it frequently happens, that it lies at the Extremity of the Urethra, on the Outſide of the Bladder; in which Caſe the Wound of the Urethra may be made large enough to turn it out with the Fingers, or the End of ſome ſlender Inſtrument.

Of Nephrotomy.

The Generality of Writers on this Subject ſeem to think Nephrotomy impracticable, and therefore abſolutely reject it, though we have many Inſtances of Perſons who have been cured of Wounds of the Back, penetrating to the Kidneys. I ſhall only mention one, of a Man wounded in his Back, on the Region of the Right Kidney, in the Year 1735. who for ſeveral Days voided Blood, and bloody Urine, through the Wound and Urethra: When he came afterwards under my Care, I cured him in four Weeks. Wounds, therefore, of the Kidneys, eſpecially thoſe inflicted on the Back, without penetrating into the Cavity of the Abdomen, are often curable: And tho' *Hippocrates* prohibits his Pupils from practiſing Lithotomy; yet, in treating of Diſorders in the Kidneys, in his Work *de intern. Affect.* he directs to make an Inciſion near the Kidney, when it is tumefied and elevated; and, after extracting the Pus, to diſcharge the Gravel by Diuretics; for this Opening may preſerve the Patient, who muſt otherwiſe die: And again he ſays, when the Kidney, being ſuppurated, tumefies near the Spine, a deep Inciſion ſhould be

be made upon the Tumor near the Kidney, or into the Kidney itſelf: Hence it is manifeſt, that a Wound in theſe Parts did not appear ſo formidable to him. *Rouſet*, *Riolanus*, and others, think Nephrotomy may be practiſed with Succeſs, if the Opening is made, where the Stone is perceptible, and neither the emulgent Artery, Vein, nor Ureter, wounded, nor the Cavity of the Abdomen penetrated: But, beyond all Diſpute, it muſt be reaſonable, when Nature points out the Place by a Tumor, or Abſceſs in the Loins, proceeding from a Stone in the Kidneys. We are farther ſupported in this Opinion by *Schenchius*, *Wedelius*, *Meekren*, and *Lavaterus*; the laſt of whom ſays, "I "perform Nephrotomy, when Nature dictates, by an Abſceſs." I, therefore, recommend it in theſe Caſes, as it preſerves Life, and prevents exceſſive Pains ariſing from the Stone, which may be extracted by the Fingers, an Hook, or Forceps. See *Fontan. Exemp.* 42. *Fol.* 117. *Hildan. Cent.* 6. *Obſ.* 44. *Tulpius*, *Lib.* 4. *Obſ.* 28. *Heiſter.*

It is plain from what *Serapion* and *Avicenna* ſay of Nephrotomy, that it was practiſed by ſome in their Times, tho' they both think the Operation extremely hazardous, and moſt likely to end in Death. And whatever has been ſaid, concerning the Fatality of thoſe Wounds, which penetrate the Pelvis of the Kidney, we find it clearly contradicted by the late learned Mr. *Bernard*, in the Caſe he gives us of Conſul *Hobſon*, who had a Stone cut out of his Kidney, by the famous *Dominico Marchetti*, at *Padua*, and lived many Years after in perfect Health. The Caſe is very accurately deſcribed, and the Reflections upon it worth peruſing: The ſame Account informs us, that the *Arabians* mention indeed ſuch an Operation; but think it the Attempt of a Madman, or a Mountebank, and that *Rouſet* was the firſt who ever ſeriouſly adviſed it. However, beſides the Inſtance alleged, there is one more to be met with of this Operation of Nephrotomy being actually performed; and that is in *Mezeray's* Hiſtory of *France*, where the Fact is related thus:

"The Doctors of the Faculty of Phyſic at *Paris*, knowing "that an Archer of *Bagnolet*, who had been very much afflicted "with the Stone, lay under Sentence of Death, begged of the "King, that he might be put into their Hands, to make an Ex"periment, whether they could open the Kidney, and take out "the Stone. The Operation ſucceeded ſo well, that the Man "lived many Years after in good Health."

This was done in the Reign of *Charles* the Eighth, who died in 1498. near 100 Years before *Rouſet* wrote, and when the *French* Surgery was juſt in its Dawn. *Tulpius* is of Opinion, that the Advice of *Rouſet* was founded upon what has been obſerved ſometimes, of a Stone's making an Abſceſs in the Kidney, and working its Way out, as, in the Caſe he deſcribes, it did in the Loins; and which indeed *Hippocrates* takes notice of. But it is as probable, he might have taken his Notion from this Matter of Fact, which, no doubt, had made a Noiſe in his own Country; and which *Rouſet* himſelf relates, though he tells the Story (from the Supplement to *Monſtrelet*) otherwiſe, in one or two Particulars. Tho' theſe two Inſtances (which, perhaps, are the only two upon Record) will ſcarce recommend the Practice; yet thus much at leaſt may be concluded from them, that the Operation, tho' dangerous, may poſſibly ſucceed, and is allowable, at leaſt, in Caſes otherwiſe deſperate, where the Way is pointed out by an Abſceſs. The Arguments drawn from Analogy, by *Rouſet*, are worth peruſing. *Freind.*

Of the Apparatus major.

The preceding Method is practicable on Infants only, but attended with great Danger and Difficulty, when attempted on Adults: For an unequal and rough Stone, protruded to the Side of the Perinæum, puts the Patient to exquiſite Torture; and frequently cauſes a violent Inflammation, with a ſubſequent Gangrene; and, by making the Wound uneven, renders the Extraction difficult. Beſides, the Operator may perforate the Rectum, or hurt his own Fingers, and be thereby diſabled from feeling the Stone, and cutting upon it. Again, if the Patient is corpulent, the Size of the Bladder, and its Diſtance from the Anus, will make the Protruſion of the Stone to the Perinæum a very great Difficulty, eſpecially if it ſlides back; and the Retention of it there (conſidering the Lubricity of the Bladder and Rectum) for a proper time will not be an eaſy Task. Theſe Inconveniences, to omit the Poſſibility of wounding the ſeminal Veſſels on the Left Side, induced the Surgeons, about the Year 1520. to invent another Method, with new Inſtruments, which has been practiſed with ſuch Succeſs, that it is generally preferred, unleſs the Stone is lodged in the Perinæum, or in the Neck of the Bladder, or poſterior Part of the Urethra, and can neither be repelled, nor diſcharged forward. This Invention is aſcribed to a celebrated *Italian* Phyſician of *Crembna*, *Franciſcus de Romanis*, or *Romano*, and improved by *Marianus*, in a Treatiſe *de Lapide Veſicæ per Inciſionem extrahendo*, *Venet.* 8vo. 1532. and *Paris*, 4to. 1540. From him it is called *Marianus's* Method, and, from the Number of Inſtruments, the *Apparatus magnus*; but it is now ſometimes termed the *vulgar* or *old Method*.

The Cauſe of this Invention may be aſcribed to an Obſervation, how eaſily large Stones are voided by Women, either naturally, or by Art: For *Romanus*, conſidering the Shortneſs and Dilatibility of the Urethra in them, imagined, that, by an Opening made in the Urethra of Men, near the Bladder, it might be dilated, and the Stone extracted with equal Eaſe; for at that time, from the Authority of *Hippocrates*, it was eſteemed mortal, and, therefore, criminal, to cut into the Bladder. See *Aph.* 18. *Lib.* 6. and *Celſus*, *Lib.* 6. *Cap.* 26. Tho' *Falconet*, a Phyſician of *Paris*, thinks it was not the Author's Intention to cut into the Urethra, but into the Neck and Bladder itſelf. This Operation, with regard to the Urethra, converts the Male Subject into a Female, and he is treated as ſuch: For a longitudinal Inciſion is made into the Perinæum, from the Scrotum to the Anus, reſembling, as it were, the Entrance of the Vagina, or, at leaſt, ſerving inſtead of it. A Paſſage for the Urine is then opened in the Perinæum, from D to F, or I, *Tab.* L. *Fig.* 1. ſo that there remains but a ſhort Part, I L, entire, between the Lips of the Wound and the Bladder, as in Women; which Part being ſufficiently dilated with proper Inſtruments, the Stone may be extracted out of the Bladder by convenient Hooks, or Forceps. It was neceſſary, therefore, to contrive a Set of Inſtruments for the dextrous Performance of this Operation: Accordingly the Author invented the groov'd Catheters, to make the Inciſion ſafe; then Conductors, and dilating Inſtruments, to make way into the Bladder; and a Forceps, for the Extraction of the Stone. All which, as appears from *Marianus*, and is uſual in the Beginning of moſt Inventions, were but indifferently fitted for their Offices; but, from many ſubſequent Improvements, they ſeem to have acquired a great Degree of Perfection: Though ſome of the Inſtruments employed in the Apparatus minor may be uſed in this Method.

In the Apparatus major the following Inſtruments are principally neceſſary; Copper or Silver Catheters of various Sizes and Diameters, according to the different Age and Make of the Patient, to ſearch for the Stone (ſee CATHETERISMUS, and the Explanation of *Tab.* XLVIII. *Fig.* 2, 3, 4, 5.): But there are, alſo, required grooved Catheters made of Steel of various Sizes, (*Tab.* XLVIII. *Fig.* 12, 13, 14, 15.) and a particular ſort of Knife, (*Fig.* 8.) for the Inciſion, which ſhould be wrapped up in Linen, (as at *Fig.* 9.) leaving its Point only uncovered, and two enſiform Conductors (*Tab.* XLIX. *Fig.* 2, 3.): One has a Beak A, and is called the Male; the other is divided at one End B, and termed the Female; each has two Handles C C. Some prefer the ſimple-groov'd Conductor of *Hildanus*, called a *Gorget* (*Fig.* 4). There is, likewiſe, wanting a particular kind of Forceps, (*Fig.* 5. 6, 7.) of different Sizes and Figures; ſome ſtrait at the Mouth, (*Fig.* 5.) others crooked (*Fig.* 6.); and an Hook, (ſee *Tab.* XLVIII. *Fig.* 10.) ſmooth externally, but internally rough, which is to intercept the Stone: To theſe muſt be added an oblong Spoon, *Fig.* 11 A A) with a Button B, inſtead of a Probe; ſome call this *Lapidillum*, but *Marianus*, *Verriculum*; becauſe it cleanſes the Bladder from any ſmall Fragments. Laſtly, When the Stone is large, ſome will uſe a Dilatator; but as this is not very common, out of the various Kinds I have only delineated one (at *Tab.* XLIX. *Fig.* 8.): Some put all theſe Inſtruments into a Pouch, and tie it round their Waiſt (*Tab.* L. *Fig.* 9. H.): Others place them in a Diſh, full of warm Water, in the moſt convenient Order, or only dip them into it before they uſe them: A Sponge likewiſe is neceſſary, for clearing away the Blood from the Wound; with an Apron and Sleeves, to keep the Operator clean. The Dreſſings may be the ſame as we directed for the Apparatus minor: Laſtly, There ſhould be at hand a Cup with Olive-oil to lubricate ſome of the Inſtruments, that they may paſs with more Eaſe into the Bladder.

In moſt Hoſpitals there is a particular kind of Table for this Operation (*Tab.* XLIX. *Fig.* 9). The Manner of placing the Patient is repreſented from *Alghiſi*, an *Italian* Author, *Tab.* L. *Fig.* 9. Sometimes a proper Chair, one or two of which are repreſented by *Tolet*, is uſed inſtead of the Table: But, if neither of theſe is at hand, a common oval or ſquare Table, about four Feet long, and three broad, will anſwer the End; upon this ſhould be placed a kind of inverted Chair, with the Back thereof depreſſed, and the Legs elevated, and not only the Edge of the Table B, (*Tab.* XLIX. *Fig.* 9.) but the whole inclined Part C, ſhould be covered with Pillows and Linen, for the Patient's Eaſe: He is to be ſeated on the Edge B, which I make ſemilunar, whilſt the inclined Part C ſupports his Back: Then his Legs are to be bent in ſuch a Poſture, that his Heels may reach his Buttocks A A, and his Hands tied, either to his Ankles, or after *Rau's* Method, to the Outſide of his Knees (ſee *Tab.* L. *Fig.* 9. 10.).

Four ſtrong Aſſiſtants are neceſſary for this Operation, two of whom C C are to ſecure and open the Legs, each holding a Foot in one Hand, and a Knee in the other; the third is to confine his Shoulders cloſe to the Table; and the fourth to be ſo ſituated on his Right Side, that he may hold up the Scrotum with one Hand, and the Catheter in the other: A fifth may ſtand on the Right Hand of the Surgeon, to give and receive the Inſtruments. Sometimes three are ſufficient, (*Tab.* L. *Fig.* 9.)

two to hold the Legs, and a third to elevate the Scrotum, and extend the Skin of the Perinæum.

There ſhould be a Veſſel to receive the Blood and Fæces; near that a Cup of Oil, with a Pan of hot Water, to lubricate, warm, and waſh the Inſtruments; and a Sponge to cleanſe the Wound.

Mr. *Sharp*'s Directions for the Situation of Patients are thus: Having laid the Patient on a ſquare horizontal Table, three Feet four Inches high, with a Pillow under his Head, let his Legs and Thighs be bent, and his Heels made to approach his Buttocks, by tying his Hands to the Bottom of his Feet, with a couple of ſtrong Ligatures about two Yards long; and, to ſecure him more effectually from ſtruggling, paſs a double Ligature under one of his Hams, and carry the four Strings round his Neck to the other Ham; then, paſſing the Loop underneath it, make a Knot, by threading one of the ſingle Ends thro' the Loop: After this the Thighs are to be widen'd from each other, and firmly ſupported by proper Perſons. *Sharp.*

The Operator dipping the Beak of a ſizeable, ſteel, grooved Catheter in Oil, he conveys it through the Urethra into the Bladder; and, being aſſured there is a Stone, turns the crooked Part of the Catheter in the Bladder and Urethra, towards the Left Side of the Perinæum, but the Handle and Penis, which contains it, towards the Right Inguen; then delivers it to the Aſſiſtant, who holds up the Scrotum in the other Hand; for the crooked Part of the Catheter, thus elevated in the Perinæum, renders that Part of the Urethra, which is to be divided, ſufficiently perceptible to the Sight and Touch. He next lays hold of the Integuments of the Perinæum with the Fingers of his Left Hand, holding in his Right the Knife, wrapped in Linen (*Tab.* XLVIII. *Fig.* 9.) as you would a Pen for Writing: With this he makes a longitudinal Inciſion downwards, about the Middle of the Left Side of the Perinæum, near the Suture, thro' the Fat; then he again feels for the Catheter with his Finger, and then he divides the Urethra in a direct Line downwards, ſo that the End of the Knife may paſs into the Groove of the Catheter; for thus there will be no Danger of injuring any Part beſides the Urethra; for the Neck of the Bladder muſt not, in this Method, be injured. Some make their Inciſion from the Middle of the Perinæum downwards, and others proceed in the contrary Direction; but this ſeems indifferent. The external Orifice ſhould be proportion'd to the Patient's Habit, and the Size of the Stone; tho' it is generally about two Inches long in Children, and three or four in Adults. The Opening in the Urethra is continued (*Tab.* L. *Fig.* 1.) from D thro' the Bulb E to the Beginning of the Neck of the Bladder F or I. When this inferior Part of the Urethra is to be divided, not only the Hand and Knife muſt be moved, but the Catheter, which had hitherto been preſſed downwards, muſt, according to *Cheſelden* and *Le Dran*, be elevated, and the Beak preſſed ſtrongly againſt the Juncture of the Oſſa Pubis; for this ſeparates the Urethra, as much as poſſible, from the Rectum, which might otherwiſe be wounded. Care muſt be taken, that the Point of the Knife does not ſlip out of the Groove of the Catheter. Some hold the Catheter in their Left Hand themſelves, while the Aſſiſtant, who draws up the Scrotum, extends the Integuments of the Perinæum. But this is left to Diſcretion.

After a proper Inciſion, the Surgeon parts with his Knife, inſerting in the Groove of the Catheter, if an Aſſiſtant holds it, the Nail of his Left fore Finger or Thumb; then he takes a Male-conductor, dips it in warm Oil, and, having paſſed it through the Groove of the Catheter, and Neck of the Bladder, into the Bladder itſelf, extracts the Catheter. Some leave the End of the Knife in the Groove, till they have directed the Conductor thither; for in corpulent Perſons the Catheter may be buried in Fat. The Male-conductor being thus paſſed, a Female-conductor is introduced upon it in ſuch a manner, that the latter receives the prominent Back of the former in its Groove B, (*Tab.* XLIX. *Fig.* 2, 3.) and conveys it ſafely into the Bladder thro' its Neck. After this, the two Conductors are gently ſeparated by their Handles C C, which dilate the Neck of the Bladder; then a ſtrait Forceps warm, dipt in Oil, and ſhut very cloſe, is carefully conveyed into the Bladder between the Conductors: This, in ſome meaſure, dilates the Neck again. But I introduce my Right fore Finger dipt in Oil, before the Forceps, and gently enlarge the Neck of the Bladder, which facilitates the Admiſſion of them. If the Forceps will open eaſily, it is a certain Indication, that they are in the Bladder. Some, before the Introduction of the Female-conductor, paſs their Right fore Finger into the Bladder upon the Male, turning it with the flat Side upwards, and prominent Side downwards; and by that means endeavour to dilate it. But *Le Dran* juſtly obſerves, that the precipitate Method of doing this, which ſome, thro' an Affectation of Dexterity, are drawn into, frequently lacerates the Part, already filled with the Conductor. Others proceed in a different manner, uſing only the grooved Conductor (*Tab.* XLIX. *Fig.* 4.): Theſe paſs the Beak of that Inſtrument thro' the Groove of the Catheter, into the Bladder, as we directed for the Male-conductor; only ſome aſſiſt it with their Finger. If the Inſtrument is paſſed into the Bladder, what Urine there is, will diſcharge itſelf thro' its Cavity. Upon this Diſcharge, the Catheter is extracted out of the Urethra, and the Operator, moving the Inſtrument gently in all Directions, gradually dilates the Neck of the Bladder; then he takes the Handle B B in his Left Hand, and with his Right carefully conveys the cloſed Forceps thro' the Groove C C.

Le Dran, who prefers the grooved Conductor, having paſſed it into the Bladder, gently thruſts his Right fore Finger through the Wound and Neck into its Groove, and with that gradually dilates the Neck, for the more commodious Paſſage of the clos'd Forceps, which he afterwards introduces, as I had before recommended; though, perhaps, he might be the firſt who obſerved, in his Diſſections, that the whole Neck of the Bladder was not only expanded, but conſtantly ſlit and lacerated in the Apparatus major; which yet was attended with no ill Conſequences, when done gently and cautiouſly, as it opens a freer Paſſage for the Admiſſion of the Forceps, and Extraction of the Stone*. And this Laceration is leſs to be feared, ſince we are convinced by opening dead Bodies, that either by the Introduction of the Forceps, or the Expanſion of the Parts, or the Extraction of the Stone, there is a more violent and dangerous Laceration of the Neck, and Proſtate Gland.

The Forceps, after it is introduced, and the Conductors withdrawn, muſt be opened ſeveral times to dilate the Wound, and then ſhut again to ſearch for the Stone: During which Search, they muſt be kept cloſe, leſt they injure the Bladder; for which Reaſon they muſt not meet at the End (*Tab.* LII. *Fig.* 12.). When the Stone is found, they muſt be opened with both Hands, in ſuch a manner, that one Jaw, if poſſible, may lay hold under the Stone, and the other above it. When the Stone is thus intercepted, the Forceps, by a gentle Motion from Side to Side, muſt be brought towards the Rectum, and the Stone extracted downwards, becauſe the Parts dilate and yield more eaſily that way, while upwards they meet with a Reſiſtance from the Oſſa Pubis. This is no Difficulty, when the Stone is neither large, nor unequal. But if it lies concealed in any Pit of the Bladder, and cannot be laid hold of by the Forceps, the Operator muſt paſs the two firſt Fingers of his Left Hand into the Anus, elevate the Stone, and force it into them. If it is ſituated in the upper Part of the Bladder, behind the Oſſa Pubis, the inferior Part of the Abdomen muſt be preſſed down by the Hand, that it may be commodiouſly taken hold of, and drawn out by the ſtrait or crooked Forceps. But if it is lodged on either Side, the crooked Inſtrument (ſee *Tab.* XLIX. *Fig.* 6.) is moſt convenient. Since it is always beſt to extract the Stone whole, if poſſible, the Surgeon, by putting his Fingers between the Handles, may prevent too violent a Compreſſion of the Forceps. When *Le Dran* cannot immediately find the Stone with the Inſtrument, he withdraws that, and introduces his Finger; then, having found it, places it at the Mouth of the Urethra, and, paſſing his Forceps, extracts it.

If the Handles of the Forceps D D, after intercepting the Stone, open too wide, it cannot be extracted without imminent Danger of lacerating the Bladder, particularly its Neck, and the Proſtate Gland. The Surgeon muſt then introduce his Finger, and, if that is not ſufficient, the Probe, with a Button (*Tab.* XLVIII. *Fig.* 11. B); and examine between the Jaws of the Forceps, whether the Stone is oblong or oval, and whether the Inſtrument takes hold tranſverſely, or longitudinally. If it is intercepted tranſverſely, it ſhould be let looſe, and, after moving it with the Finger or Probe, taken hold of in its leaſt Diameter, and extracted: If the Inſtrument ſtill opens too wide, he muſt take the Handles D D in his Right Hand, and the Part next the Wound in his Left; then, by a gentle Motion downwards, as thoſe Parts dilate more eaſily, endeavour to extract the Stone. When it is too large to be extracted whole, it muſt be broken by a Forceps with Teeth, (*Tab.* XLIX. *Fig.* 7.) which may be as large again as the Figure, and the Fragments may be drawn out one after another. Laſtly, if the Stone is too large, and too hard to be either extracted or broken, a prudent Surgeon will deſiſt, and heal the Wound, or leave a Fiſtula for the Diſcharge of the Urine. Some few, but with very little Succeſs, uſe the Dilator (*Tab.* XLIX. *Fig.* 8.) or ſome ſuch Inſtrument, tho' the Moderns reject it as uſeleſs and dangerous: For the Dilatation made by it muſt neceſſarily, by lacerating and contuſing thoſe nervous Parts, augment the Pain, which is already exceſſive, and cauſe an Inflammation, Gangrene, Cancer, or ſome other malignant Symptoms. Sometimes the Stone lodges too near the Joint of the Forceps, (*Tab.* XLIX. *Fig.* 5.) ſo that the Jaws cannot ſufficiently approach each other; in this Caſe the Operator muſt introduce the Button-end of the Scoop (*Tab.* XLVIII. *Fig.* 11.) or his Finger, and thruſt it back near the End of the Jaws: But this may be pre-

* It is not agreed, what Parts are to be divided in the Apparatus major. *Tolet*, and the Generality of Lithotomiſts, are for dividing the Urethra only, without cutting the Bladder, or its Neck. *Falconet* ſays, the Authors of this Method deſigned the Neck, and even the Bladder itſelf, ſhould be cut. *Noelas* expreſly tells us, that the Neck of the Bladder is the Part, where the Inciſion is conſtantly made in this Operation; and that *Frere Jaques*'s Method differs from the Apparatus major only in the Parts externally divided. *Roſa* orders the Sphincter that is, the Neck of the Bladder, to be cut; and *Schoeffer*, not only the Neck, but part of the Bladder itſelf.

vented, by making the Inſtrument ſmooth in that Part, with Teeth only at the End (ſee *Tab.* XLIX. *Fig.* 5, 6. A B); for then the Stone will ſpontaneouſly recede from the Hinge, and ſtick betwixt the Extremities.

Francus de Franckeneau, mentions a Machine uſed by a Lithotomiſt at the *Hague*, inſtead of the Forceps, which was made of Whale-bone and an Ox's Bladder; but he neither deſcribes the Size, Structure, nor Manner of uſing it.

The Stone being thus extracted, the Surgeon muſt, eſpecially if it is a ſmooth one, ſearch with his Finger, or the Probe-end of the Scoop, whether another, or any Fragments ſtill remain, which he could not determine before the Operation. If there is any Remainder, he muſt repeat the former Proceſs, till the Bladder is entirely cleanſed. If there remain only ſome Gravel, or ſmall Pieces of the Stone, they may be extracted by the Scoop, (*Tab.* XLVIII. *Fig.* 11.) or in a weak Patient, the Expulſion of them may be left to Nature, for the Urine will generally diſcharge and waſh them out. When the Bladder is cleared, ſome inſert into the Wound a large Tube (ſee *Tab.* XXIII. *Fig.* P) either flexible or inflexible; others a Tent, applying a Plaiſter, Compreſs, and the T Bandage, by which they imagine the Bladder will be more effectually cleanſed from the Sand and other Fæces. But this appears to *Frere Jaques*, *Rau*, and myſelf, quite unneceſſary; for theſe things retain what the Urine would waſh away, and often produce a Fiſtula, with other bad Symptoms. In extracting the Stone, it ſometimes ſlips out of the Forceps, and lodges in the Wound: The Lithotomiſt ſhould then endeavour to lay hold of it again, without extracting the Forceps; but, if they are out, he muſt immediately introduce his two fore Fingers, dipt in Oil, into the Anus, to preſs it towards the Wound, and then extract it with the Forceps, or an Hook.

Manner of Dressing.

When the Wound is cleaſed with a Sponge, and the Ligatures unty'd, the Patient muſt be put into a Bed covered with an Oil-cloth, or one that has been waxed; over this may be laid a Linen Sheet folded together directly under the Patient, to keep the Bed from being ſpoiled by the Blood or Urine from the Wound, which is now to be dreſſed with ſome Doſſils of ſcraped Lint. If the Patient is ſtrong, and his Wound bleeds, *Celſus* adviſes not to ſuppreſs it for ſome Days, as it may prevent an Inflammation; but, if the Hæmorrhage is too profuſe, it may be ſtopt by Pledgets of Lint dipt in the beſt rectified Spirits of Wine, or ſome other ſtyptic Liquor; or the Wound may be ſprinkled with a ſtyptic Powder, and the Arteries compreſſed with the Fingers, till it abates: Theſe muſt be covered with a Linen Bolſter, and large ſquare Compreſs, without a Plaiſter, ſecuring the Whole by the T Bandage, (*Tab.* XXIII. *Fig. b*) or that with four Heads (*Fig. d*). If they are ineffectual, the Artery may be ty'd up with a crooked Needle and Thread*. Nor is the Practice of the *French* improper, who anoint at Intervals the Scrotum, Perinæum, and Abdomen, for the firſt four Days, with Oil of Roſes, covering the Parts with Linen dipt in Oxycrate; before the Application of the Bandage ſome only apply Oxycrate, with a large Compreſs to the Abdomen. Many make a ſtrict Bandage at the firſt Dreſſing, tho' there is no Hæmorrhage, for this, ſay they, promotes the Agglutination of the Wound; others leave it ſlack for two or three Days, that the Gravel, Fragments, and Blood, may have a free Paſſage; and others, for the ſame Reaſon, uſe no Bandage, unleſs too great an Hæmorrhage renders it neceſſary. They who follow the firſt Method, bind the Patient's Legs together at his Knees, at firſt. But they who follow the laſt, and, in my Opinion, the beſt Method, apply ſuch a Ligature the ſecond or third Day, for fear any Gravel, or ſmall Stone, ſhould be prevented from being diſcharged, which might lay a Foundation for the Generation of another Stone, if retained in the Bladder.

After Dreſſing, the Patient ſhould be ſupplied with Plenty of Ptiſan, Barley-water, or a ſtrengthening and gently compoſing Emulſion, not only to compoſe him to Sleep, and recover his Strength, but to cleanſe the Bladder of all the Relicks. His Diet ſhould be the ſame as for People in Fevers, or after great Wounds, as of Ptiſan, or Barley-water, made pleaſant with ſome cooling Syrup, for his ordinary Drink; afterwards, if there is no Fever, or the Fever is abated, he may be allowed ſmall Beer, or Wine and Water, forbearing every thing ſharp, or ſalt, ſpicy, or too heating. The Air of his Chamber ſhould be very temperate. If he complains of an unuſual Heat, or a Fever, he ſhould be bled, a Clyſter ſhould be adminiſtred, and cooling Medicines taken inwardly. Theſe Difficulties being ſurmounted, the Patient is judged in a fair Way. On the contrary, if a cold Chillneſs and Horror ſeize him on the third, fourth, or fifth Day, followed by an intenſe Fever, Hiccoughs, Nauſea, Vomiting, and convulſive Motions, or the Wound does not ſuppurate, but becomes dry, Death generally enſues. At firſt, the Wound may be dreſſed once or twice in a Day with Lint, and a digeſtive Ointment, over which ſhould be apply'd a Compreſs dipt in warm Spirit of Wine, Oxycrate, or ſome other Fomentation, to prevent an Inflammation; theſe are to be ſecured with a Bandage. After the third or fourth Day, the Bandage, in my Opinion, may be tighten'd; and this may be continued every ſubſequent Dreſſing. When there is a proper Suppuration, and Union of the Parts, inſtead of the digeſtive Ointment, the Wound may be dreſſed with a vulnerary Balſam, as Balſam of *Capivi*, or *Linimentum Arcei*; and the Whole ſecur'd by a ſticking Plaiſter, and Compreſſes on each Side. This muſt be repeated twice daily, till the Wound unites; then dry Lint with a Plaiſter will form a ſtrong Cicatrix. The Agglutination will be promoted, likewiſe, by the Patient's lying on his Right Side, and keeping his Thighs cloſe, tho' he may, in ſome time, change his Poſture, but not open his Legs: It is therefore proper to tie them together, eſpecially if he is a Child, and order him to keep ſtill in his Bed; nor ſhould he be permitted to riſe and walk, till the Urine diſcharges itſelf thro' the natural Paſſage, and the greateſt Part of the Wound is healed. This is ſometimes performed within eight Days in Children, and where the Stone was ſmall and ſmooth. Afterwards, Walking will promote the Diſcharge of the Urine by the common Paſſage, and the Union of the Wound; nor will it be improper for the Surgeon, about the ſixth or ſeventh Day, to compreſs the Wound with his Hand, to ſee if the Urine will flow by the proper Paſſage, if it does not take that Courſe ſpontaneouſly. When the Linen is foul, it muſt be changed, to prevent an Ulceration.

If the Stone cannot be found after a long Search, or, when found, cannot be extracted, and the Patient is weak, the Operator muſt deſiſt, till he has recovered his Strength, and give him corroborating Medicines. But when he is very weak, and a Delirium, or Convulſions, come upon him, he muſt be put to Bed for a Day or two, or longer, till the Wound ſuppurates; nor ſhould the Surgeon proceed, till he recovers his Strength, and the Stone may be felt by the Probe, according to the Advice of *Albucaſis*, *Francus*, *Hildanus*, *Colot*, *Saviard*, and others; for, if he is continued too long on the Table, he may periſh under the Operation. Sometimes a corrupt, ſpongy Subſtance is extracted with the Stone, which is a Sign, that ſome Abſceſs, Caruncle, or fleſhy Excreſcence, is formed in the Bladder, which is attended with Danger, or at leaſt a Fiſtula in the Perinæum is likely to enſue. If the Catheter cannot be paſſed into the Bladder of an Adult, either from an Inflammation, or Stone in its Neck, a Caruncle, or violent Phymoſis, an Inciſion muſt be made by the Apparatus minor; or, according to *Franco*, above the Oſſa Pubis, as we ſhall direct hereafter more at large. If Straining, from the violent Pain, cauſes an inconſiderable Deſcent of the Anus, or Rectum, at the Beginning, it may be reſtored by the Finger, after the Operation; but if it is great, the Inteſtine muſt be immediately reſtored, and ſuſtained by an Aſſiſtant; when it happens in the Middle, or towards the End, it may be deferred till the Operation is finiſhed; for, upon the Ceſſation of Pain, it generally recovers itſelf, or may be aſſiſted with the Fingers. If the Inciſion is to be made on one who has been cut before, it muſt be made in the Cicatrix. Nor ſhould the external Wound ever be too ſmall, ſince a large one heals as ſoon as a ſmaller; but, if the Stone is impeded by the Smallneſs, the Wound muſt be enlarged in the moſt convenient Part, by the Knife, or Sciſſars; and, if the Stone proves ſtill too large, it is better to deſiſt than kill the Patient. When the crooked Forceps are neceſſary, they ſhould be introduced with the End pointing upwards, and the Handle given to an Aſſiſtant, though the ſtrait are generally ſufficient. Inſtead of the common Knife, (*Tab.* XLVIII.) thoſe may be uſed repreſented at *Tab.* LII. *Fig.* 8. 18. The Time of the Wound's healing varies according to the Patient's Habit, and for other Reaſons; being ſometimes fifteen or twenty Days, ſometimes four or five Weeks, or longer. When the Forceps is introduced, it ſhould be guided by the Finger, the Director, or the Handle of the Scoop, that it may not miſs the Way, and wound the adjacent Parts. If the Stone is flat or broad, it ſhould be laid hold of, not laterally, but on its upper and lower Part. Laſtly, if the Patient, after the Operation, is afflicted with violent Pains in his Bladder, it will be proper to inject ſome warm Milk, or other Decoction, by a Syringe; but if the Stone, from its Roughneſs or Largeneſs, has injured the Bladder, it may be filled with Barley-water, or a Decoction of vulnerary Herbs, warm, and mixed with Honey of Roſes, or *French* Wine, with Myrrh boiled in it, and an Addition of Honey of Roſes. For the reſt conſult *Tolet*, *Greenfield*, and *Alghiſi*. For the Conveniency of this Method, above any other, ſee *Le Dran's Parallelle des Methodes*. On the contrary *Garengeot*, *Dionis*, *Douglas*, *Cheſelden*, and *Morand*, have rejected it.

Mr. *Sharp* gives the following ſhort Account of the Method of performing this Operation in our Hoſpitals.

Introduce the Staff, having firſt dipt it in Oil, which muſt be held by your Aſſiſtant, a little leaning on the Left Side of the Seam in Perinæo; and, beginning the external Wound juſt below the Scrotum, (which muſt be held out of the way) you continue it downwards, to within two Fingers-breadth of the Anus;

* *Colot* ſtopt an obſtinate Hæmorrhage of this Kind by Phlebotomy, three or four times repeated in twenty-four Hours. He adviſes the Continuance of it *ad Deliquium Animi*.

Anus; then, leaving that Direction, you ſlip the Knife forwards in the Groove, pretty far into the bulbous Part of the Urethra; or, as there is ſome Danger of wounding the Rectum, in the Continuation of the Inciſion, you may turn the Knife, with the Back towards it, and make this Part of the Inciſion from within, outwards. Should a very large Veſſel be cut, it will be adviſeable to tie it, before you proceed any farther in the Operation. When the Wound is made, ſlide the Gorget along the Groove of the Staff, into the Bladder; and, to do it with more Safety, when the Beak of it is received in the Groove, it will be proper to take the Staff yourſelf, in your Left Hand; for if the Aſſiſtant ſhould unwarily either incline the Handle of it too much towards you, or not reſiſt enough to the Force of the Gorget, it is very ready to ſlip out of the Groove between the Rectum and the Bladder, which Accident is not only inconvenient to the Operator for the preſent, but is attended, for the moſt part, with very bad Conſequences. The Gorget being paſſed, dilate the Urethra and Neck of the Bladder with your fore Finger, and introduce the Forceps into the Bladder, keeping them ſhut till you touch the Stone, when you muſt graſp it with a moderate Force, and extract it by pulling downwards towards the Rectum.

The High Operation.

Beſides the two preceding Methods of Lithotomy, there is a third, aſcribed to *Pierre Franco*, a *French* Surgeon, as its firſt Inventor, and after him called *Methodus Franconica*; and from the Place of the Inciſion, which is the Middle of the Hypogaſtrium, it is likewiſe termed the Hypogaſtric Section, and commonly the *Apparatus altus*, becauſe the Operation it performed above the Oſſa Pubis, in the ſuperior and anterior Part of the Bladder; whereas in the *Apparatus major*, *minor*, and the lateral Operation, the Inciſion is made below the Scrotum in the Perinæum. However, this new Method was ſcarce ever once performed by its Author, ſoon rejected by the Surgeons, and never mentioned but with a Deſign to explode it. For though *Franco* met with Succeſs upon a Child of two Years old, at *Lauſonne*, in the Year 1560. he only undertook it, becauſe the Stone, being as big as an Hen's Egg, was too large to be extracted at the Perinæum, and the Parents inſiſted upon it; and he is ſo far from recommending it, that he attributes his Succeſs to Accident, rather than Art, and pronounces it dangerous to the Patient, and raſh in the Surgeon. This was inſiſted upon the more, becauſe a Wound in the upper or membranous Part of the Bladder was always judged by the Antients, after *Hippocrates*, to be mortal. But ſince that time ſeveral Phyſicians and Surgeons have thought, from the anatomical Structure of the Parts, and Experience, that an Inciſion above the Oſſa Pubis might be expeditious, eaſy, and ſafe, to one acquainted with the true Situation of the Bladder, without-ſide of the Peritoneum, and its Conformation and Connection with the adjacent Parts, and the Method of cutting into it, without injuring its Fundus. The Poſſibility of this appeared, becauſe its accidental Inventor actually performed it. *Tolet*, alſo, tells us, that *Bonet*, a Surgeon, at *Paris*, performed it ſucceſsfully. He deſcribes it almoſt in the ſame manner, as *Franco* propoſed it, which is this: An Aſſiſtant ſhould introduce his two fore Fingers into the Anus, to protrude the Stone forward towards the upper Part of the Bladder, and retain it there; then the Operator makes an Inciſion into the Skin, Fat, Muſcles, and Bladder itſelf, near the Bottom of the Linea Alba, above the Juncture of the Oſſa Pubis; and afterwards, dilating the Aperture with a proper Inſtrument, he extracts the Stone with the Forceps, healing the Wound with a vulnerary Balſam, as in other Wounds of the Abdomen. *Tolet* makes no mention of filling the Bladder with Water, or ſome other Liquor, though *Roſſet* propoſed it long before. To *Franco* and *Bonet* we muſt add *Greenfield* as a Performer of the High Operation; for, he ſays, he was obliged to extract a Stone, by making an Inciſion above the Oſſa Pubis, which ſucceeded; but we are left in the Dark for the Reaſon of this Neceſſity, though probably it was the Largeneſs of the Stone. And *Hildanus*, who, at firſt, diſſuades from this Operation, afterwards declares, if the Stone ſhould be of an exceeding great Size, that he prefers the Method of *Franco* before the *Apparatus major*; for if, by its Largeneſs, it be preſſed towards the Inguen, (he would, or ought to have ſaid, the Pubes) I am convinced, ſays he, it may be extracted with leſs Pain and Danger at the Pubes, than by forcing it through the Neck of the Bladder: If this holds true of a large Stone, certainly a ſmall one may be extracted with more Eaſe, leſs Pain and Danger. It is, alſo, much recommended by *Petræus*; and *Riolanus* evidently proves it practicable from the Situation and Structure of the Bladder, and ſays, it was performed within his Knowledge.

Dionis, an eminent *French* Surgeon, is of the ſame Opinion; and ſays, that if the Bladder is filled with warm Liquor, he ſhould prefer it to the Apparatus major and minor, provided it would anſwer upon Experience: He aſſerts, too, that *Fagon*, then firſt Phyſician to the King of *France*, had the ſame Sentiments. Hence it is plain, that many of the *French* wrote and contended for it. There is, likewiſe, a remarkable Inſtance in the *Philoſophical Tranſactions* for the Year 1700. where a Surgeon, whoſe Name was *Proby*, extracted a Stone from a Maid, by the High Operation. But of this more particularly, when I treat of the Methods for extracting the Stone from Women. I am ſurpriſed, that none of the *Engliſh* ſhould mention this in their Writings, and am therefore inclined to think it was unknown to them, tho' publiſhed in the Tranſactions, and the ſecond *German* Edition of my (*Heiſter's*) Surgery, *Ann.* 1724. and *Falconet* is the only *French* Author, who has taken any Notice of it. It is very extraordinary, that ſo many *French* Surgeons ſhould reject this Operation, ſince it has been ſeveral times performed with Succeſs, and appears, on many Accounts, more eaſy, ſimple, and liable to fewer Inconveniencies, than the others, as there is no Danger of wounding the Parts of Generation, the Sphincter of the Bladder, the Ureter, Urethra, Rectum, or any of the larger Blood-veſſels, or of a Fiſtula in the Perinæum, or Incontinence of Urine, or Impotence, or an Hæmorrhage. Which Advantages, and many more, are proved by *Roſſet*, in his Treatiſe *de partu Cæſareo*, where he recommends the High Operation, and demonſtrates, that if the Inciſion does not communicate with the Cavity of the Abdomen, ſo as to tranſmit the Urine thither, it is not mortal.

Dr. *James Douglas* revived this Method, after it had been long buried in Oblivion; for he, partly by reaſoning on the Situation, Structure, and Connection of the Bladder, and partly from the Authorities of others, in a Meeting of the Royal Society, *Anno* 1718. demonſtrated, that the Stone may be ſafely extracted by cutting into the ſuperior and anterior Part of the Body of the Bladder, when the Inciſion is skilfully performed; and accordingly his Brother, *John Douglas*, in the Year 1719. performed this Operation on a Man troubled with the Stone; and, in the Year following, publiſhed a Treatiſe, intitled *Lithotomia Douglaſiana*, wherein he confirms the Reaſonableneſs of this Practice from Anatomy, relates the ſuperior Advantages of it, and corroborates the Whole by an Inſtance of his own Succeſs upon a Lad of ſixteen Years of Age, which was done at the very time he firſt publicly propoſed this Method. Soon after this *Cheſelden*, *Douglas*, and ſeveral *Engliſh* Surgeons, frequently practiſed it with Succeſs.

Mr. *Cheſelden* ſays, that ſoon after Mr. *Douglas* had perform'd this Operation, a Surgeon of *St. Thomas's* Hoſpital cut two, who both recovered; but the ſame Gentleman afterwards cutting two more, who miſcarried by the cutting or burſting the Peritonæum, ſo that the Guts appear'd, this Way immediately became as much decried, as it was before commended; upon which the Surgeons of *St. Bartholomew's* Hoſpital, who had prepared to perform this Operation, altered their Reſolution, and went on the old Way. The next Seaſon, ſays he, it was my turn in *St. Thomas's* Hoſpital, I reſumed the High Way; and, cutting nine with Succeſs, it came again in Vogue; after that, every Lithotomiſt, of both Hoſpitals, practiſed it; but the *Peritonæum* was often cut or burſt, twice in my Practice, though ſome of theſe recovered, and ſometimes the Bladder itſelf was burſt, from injecting too much Water, which generally proved fatal in a Day or two. Another Inconvenience attended every Operation of this Kind, which was, that the Urine's lying continually in the Wound, retarded the Cure; but then it was never followed with an Incontinence of Urine. What the Succeſs of the ſeveral Operators was, I will not take the Liberty to publiſh; but, for my own, excluſive of the two before-mentioned, I loſt no more than one in ſeven, which is more than any one elſe that I know of could ſay; whereas in the old Way, even at *Paris*, from a fair Calculation of above 800 Patients, it appears that near two in five died. And, though this Operation came into univerſal Diſcredit, I muſt declare it my Opinion, that it is much better than the old Way, to which they all returned, ſays *Cheſelden*, except myſelf, who would not have left the High Operation, but for the Hopes I had of a better, being well aſſured, that it might hereafter be practiſed with greater Succeſs; theſe fatal Accidents having pretty well ſhewn how much Water might be injected, and how large the Wound might ſafely be made.

For my own Part, ſays *Heiſter*, as I thought this new Method ſupported both by anatomical Reaſons, and Experience, I performed the High Operation without any Fear, *April* 17. *Ann.* 1723. upon a Man above thirty Years of Age, when I could not extract a large Piece of the Stone by the Wound in the Perinæum, according to the Method of *Rau*; for it could not be laid hold of, and conſequently not extracted, by the Forceps, becauſe, perhaps, it was concealed in ſome Cavity of the Bladder, ſuch as Lithotomiſts have ſometimes obſerved. This I did in the Preſence of many Surgeons and Students in Phyſic, the Day after I had performed the other Operation without Succeſs; nor did I inject any Liquor into the Bladder, for the Wound in the *Perinæum* prevented that; but making an Inciſion into the Body of the Bladder, purſuant to the Directions of *Roſſet* and *Douglas*, above the *Oſſa Pubis*, I enlarged it upward and downward by the crooked Knife, armed with a Button at the Point (ſee *Tab.* XXVI. *Fig.* 5.); and, introducing my Fingers, extracted the Stone with great Eaſe and Expedition. For the Patien

tient preferred the Hazard attending this, to the intenſe Pains he ſuffered. He continued, during the firſt Days, very well; but, about the fifth or ſixth Day, he was ſeized with a Shivering, followed by a feveriſh Heat: Theſe I mitigated; but he was ſtill afflicted with Pains in his Back and Loins, attended with a Nauſea and Faintneſs, as before the Operation. The Wounds were free from Pain, but the ſuperior, in particular, could not be brought to ſuppurate and unite, though I applied ſticking Plaiſters, and the broad uniting Bandage, (*Tab.* XXVI. *Fig.* 8.) as in other Wounds of the Abdomen, a good vulnerary Balſam, and long thick Compreſſes on each Side, which did not prevent the Urine from eſcaping thereby, though very little paſſed through the Wound in the Perinæum, and none through the Urethra. In about a Month, being exhauſted by Weakneſs and Reachings, he died. Upon opening him, the inferior Wound was found partly in the Neck, and partly in the Body of the Bladder; but the ſuperior was right in all reſpects; for there was no Diviſion of the Abdomen or Peritonæum, nor any Injury of the Inteſtines; nor was any Blood or Urine found in the Cavity of the Abdomen, but the Kidneys were greatly diſtended with Ulcers, and a purulent Matter, which was the true Cauſe of the Pains in his Back and Loins, with the other Symptoms, and indeed of his Death.

But this Method ſeems to me attended with more Difficulties, than one would imagine from *Roſſet* and *Douglas*, particularly with regard to healing the Wound, which, for many good Reaſons, can never prove a very eaſy Task: For, as Anatomy demonſtrates, that the inferior Part, or Neck of the Bladder, is armed with a ſtrong Sphincter, and as the Urine does not ſpontaneouſly flow out, but is expreſſed by the contractile Force of the muſcular Coat, it is no Wonder that the Bladder, irritated by the collected Urine, ſhould contract itſelf, and expel that Excrement with more Eaſe through the divided contracted Part above, than the natural narrow Paſſage, which is always contracted by a Sphincter; and this muſt hinder the Agglutination. To this we may add, that the external Wound of the Abdomen is no leſs difficult to heal and unite, becauſe the Lips are conſtantly drawn from each other, by the oblique and tranſverſe abdominal Muſcles, ſo that they perpetually recede from the *Linea alba*, towards the *Vertebræ* and *Oſſa Ilei*.

Beſides the Difficulty ariſing from the continual Diſtraction of the Lips, the Dreſſings, alſo, are immediately ſpoiled, and rendered ineffectual, by the conſtant Efflux of the Urine: For though I took all poſſible Care to renew them, and brought the Lips of the Wound, two or three times in a Day, very cloſe to each other, treating it with a good vulnerary Balſam, and long ſticking Plaiſters, almoſt ſufficient to cover the whole Abdomen, and then applied long, thick Compreſſes on each Side of the Wound, ſecuring the Whole by a very long and ſtrong uniting Bandage, yet it proved inſufficient; for the Plaiſters, Compreſſes, and Bandage, were ſoon wetted and looſened by the Urine, ſo that I was obliged to repeat the Dreſſings many times in a Day, and nevertheleſs the Union of the Wound was not in the leaſt forwarded. But, to prevent the Imputation of Neglect, I muſt obſerve, there is no better Courſe propoſed than what I followed; for *Douglas* and *Greenfield* do not mention a Word about the means of healing the Wonnd, but only, in general, tell us, that they cured their Patients in four Weeks.

From what has been ſaid, it is manifeſt, how much they are miſtaken who prefer this Method, becauſe, as they ſay, the Wound is more eaſily and expeditiouſly healed: For, as to what they aſſert, that, by the Laws of Fluids, the Urine will paſs much more eaſily through the Aperture in the lower Part of the Bladder, than that above, and, conſequently, the Fiſtula in the *Perinæum*, ſo frequently cauſed by a conſtant Flux of Urine thro' the Wound, will not be ſo likely to happen, this cannot influence Men of Judgment: For, as the Urine is expelled out of the Bladder, not by its own Weight, but by a proper Contraction of that Receptacle, aſſiſted by the Diaphragm, it muſt neceſſarily follow, that it will more eaſily diſcharge itſelf through a Wound in the upper Part, than through the Neck, which is contracted by a ſtrong Sphincter. And this ſeems to me the Reaſon why ſo many neglected it, though it had met with ſome Succeſs; and the antient Writers upon this Subject might deſignedly omit the Mention of Difficulties attending the Agglutination of the Wound, leſt the World ſhould attribute their want of Succeſs to their want of Skill. For very few, like *Hippocrates*, publiſh their good and bad Succeſs indifferently, though it may be of Service to Poſterity; but fear, with ſome Reaſon, that the Patient's Death may be imputed to their Ignorance, though the Diſorder was abſolutely incurable. *Tolet* tells us, but it is from the Relation of others only, that *Bonet* performed the High Operation on ſeveral, though neither he, nor *Bonet*, ſay one Word of the Method of healing the Wound. And, as we are aſſured from Experience and Hiſtory, that *Bonet*, and the greater Part of the *French* Surgeons, ſtill continue the Apparatus major, we may reaſonably ſuppoſe he never performed the other, but, when the Stone could not be extracted by that; and it might, perhaps, ſeem a Reflection on his Character, that he could not, without Difficulty, if at all, cure a Wound, which ſeemed ſlight to others. Now what could induce theſe great Men to reject the High Operation, but the Difficulty that occurred in healing the Wound? eſpecially when they allowed it many Advantages over the other Methods. Becauſe *Douglas* ſucceeded on a ſtout young Subject, muſt we, therefore, conclude, that there is a Neceſſity for performing this Operation on Patients advanced in Years, and of a bad Habit? I muſt then declare this not to be the beſt Method, till more ſpeedy and effectual Means are diſcovered for uniting the Wound, and till ſuch Methods are confirmed by repeated Inſtances of Succeſs. As for *Tolet*'s Opinion, that it may be cured as eaſily as other Wounds of the Abdomen; this ſeems founded only on Conjecture. Nor am I convinced, that Gaſtroraphy, recommended by *Roſſet* and *Solingen*, may be ſucceſsfully practiſed, ſince the Puncturation of the Bladder induces bad Symptoms, and ſeveral expert Surgeons have tried it without any Advantage.

Thus I judged in the Year 1724. and will now declare my preſent Opinion: After having conſidered the Nature and Performance of the Operation, with the Inſtances of Succeſs from *Douglas*, *Cheſelden*, *Thornhill*, *Smith*, *Pye*, *Macgil*, *Morand*, myſelf, and others, I rather aſcribed the Difficulty of healing the Wound to an ill Habit, ſince it is not ſo in young Subjects, eſpecially Children, when a proper Bandage is uſed with a digeſtive Ointment, and vulnerary Balſam, as Balſam of *Capivi*, or *Linimentum Arcei*, and a regular Diet is obſerved. And I am the more confirmed in this Opinion, by many living Inſtances, who have been cured by *Douglas*, *Cheſelden*, myſelf, and others. Upon the Whole, therefore, I muſt recommend the High Operation, in Boys and young Men, who are otherwiſe of a good Habit of Body, as none of theſe have died under it, and eſpecially when the Stone is lodged ſo high in the Bladder, or is ſo rough and ſharp-pointed, that it cannot be extracted by the Apparatus minor, though I prefer the latter, as more certain and ſafe, in Infants who are ſubject to cry violently, ſo that their Bladder cannot be filled with Liquor, if the Stone is not rough, and can be forced to the Perinæum.

I am ſenſible many have died under this Operation, (nor have all eſcaped under the other Methods) but that was rather owing to a bad Habit or Weakneſs; for ſeveral, upon opening them after Death, have been found to have Ulcers in their Bladder and Kidneys; and, therefore, I do not recommend this for Perſons upwards of Thirty, as they, for the generality, have been long afflicted with the Stone; for in ſuch I ſeldom met with Succeſs, nor do *Douglas* and *Morand* encourage it; for they obſerve, that ſome have periſhed from the preceding Diſorders; others from an Abſceſs in the cellular Membrane covering the Bladder; and others from a Cancer in the Bladder; conſequently the High Operation ſhould not be performed upon Perſons advanced in Years, unleſs there is ſome urgent Neceſſity, as, particularly, when the Stone cannot be extracted through the Perinæum. Care ſhould be therefore taken, not unjuſtly to attribute the Patient's Death to this Operation; though, to vindicate this innocent Method from ſuch falſe Aſperſions, the Surgeon ſhould never perform it but on Boys, and young Men, amongſt whom I have never met with one Miſcarriage, and very few have been loſt under the Hands of others, but ſuch as were above Thirty, and reduced by other Diſeaſes. Laſtly, as *Douglas* obſerves, it is a bad Preſage, and an infallible Forerunner of Death, when the Wound can neither be ſuppurated nor cleanſed, whereas the contrary leaves no Room to doubt of a certain Cure.

Thus much for the Operation itſelf: We ſhall now proceed to the Method of performing it, eſpecially my own Practice; but it will be neceſſary, for the ſake of young Beginners, to deſcribe the Diſpoſition, Situation, Connection, and Structure of the Bladder, as an accurate Knowledge hereof is highly neceſſary. Upon opening the dead Body of a Male Subject, the Bladder, being empty, and collapſed, lies concealed under the Oſſa Pubis and Inteſtines, ſo that ſcarce any Part of it can be ſeen; but if it is inflated, or Water injected into it, by a gradual Extenſion it expands itſelf conſiderably above the Oſſa Pubis, towards the Navel, ſo that the large and ſuperior Part, call'd the Body and Fundus, may be plainly viewed. To make this more intelligible, I have (in *Tab.* LI.) exhibited ſeveral Figures from *Cheſelden*. *Fig.* 1. repreſents a dead Subject in an oblique Poſture, a little inclined to the Right, principally to ſhew the Abdomen, in which the common Integuments, and abdominal Muſcles, being laid aſide, we have a View of the Peritonæum, including the Inteſtines, and of a large Part of the Bladder A, which ſhews its Body and Fundus filled with ten Ounces of Water; B the Urachus, which connects the Bladder to the Navel; C C the umbilical Arteries, D D the Oſſa Pubis cover'd with the Integuments turned down to ſhew that Part of the diſtended Bladder, which riſes up into the Abdomen, above the Oſſa Pubis.

Fig. 2. is the Abdomen entirely open, the Peritonæum being removed, or cut off, which ſhews the Bladder filled with twenty Ounces of Water; but here the internal Lamina of the Peritonæum A A A A is left adhering to the Bladder, while the exterior,

terior, near the abdominal Muſcles, is removed. B B ſhew the Part of the Bladder next the Muſculi pyramidales and Recti of the Abdomen, the exterior Lamina being removed, ſo that the muſcular Fibres may be ſeen. C C C C C repreſent the Margin of the internal Lamina of the Peritonæum, which covers principally the Fundus of the Bladder, where the Inteſtines touch it, and where it is excluded from the Cavity of the Abdomen*: D D the Oſſa Pubis, E E the Inteſtines, B B the Middle of the Body of the Bladder, which is divided in the High Operation. *Fig.* 3. repreſents the Right Half of the Abdomen, opened in an erect Situation, the Inteſtines and Integuments being removed: A A the upper Part of the Bladder, properly termed the *Fundus*, inveſted with the Peritonæum, which lies next the Abdomen, and which touches the Inteſtines, whoſe Limits in the diſtended Bladder are *a a a a*. B B B the Body of the Bladder on the Right Side, greatly diſtended, joined to the abdominal Muſcles, which does not communicate with the Cavity of the Abdomen, but is ſeparated from it by the Limits of the Peritonæum *a a a a*; ſo that, if the Bladder is divided within the Bounds *a a a a*, the Urine cannot enter into the Cavity of the Abdomen, but runs without the Body, and over the Oſſa Pubis, in the High Operation, where *b b* denote the Part of the Bladder divided, in which Part Wounds are not mortal. C C C the Right umbilical Artery; D D the Urachus; E the Os Pubis, covered with Part of the Integuments; F the broad Ligament of the Liver; G Part of the Liver; H Part of the Right Kidney; I Part of the Right Ureter; K the Membrana adipoſa; L the Left pyramidal Muſcle; M M the Left Rectus Muſcle. *Fig.* 4. repreſents the Abdomen opened, and the Bladder but moderately diſtended. A A A A A the Body of the Bladder, inveſted with the Peritonæum, the wounding of which is fatal; B B B the Part of the Bladder without the Peritonæum, the Bounds of which, being terminated by the Line C C C, and the Oſſa Pubis D D, take in but a ſmall Compaſs; which ſhews how cautiouſly the Lithotomiſt ſhould proceed in the High Operation, when the Bladder is but little diſtended, and that he ſhould make the Inciſion with a ſmall narrow Knife. For if the Bladder is wounded in the upper Part, which is covered with the Peritonæum, ſo that the Urine may paſs into the Cavity of the Abdomen, as at A A A, *Fig.* 2, 3, and 4. the Wound is incurable. The Bladder, therefore, ſhould be only ſeparated, where it is uncovered with the Peritonæum B B B. E E the Inteſtines.

Having premiſed this, we ſhall proceed to deſcribe the Operation itſelf: The Patient, being duly prepared, is to be laid on a Table, or Bed, in ſuch a Poſture, that his Buttocks may be ſomewhat higher than his Head; his Hands, Arms, Legs, Breaſt, and Head, muſt be ſecured by ſtrong Aſſiſtants, not uſing Ligatures, on account of the Terror they ſtrike into ſome Men; for this Reaſon the Bed is often preferred to the Table. A Pillow ſhould be placed under his Head, that his Back may be a little bended, and the abdominal Muſcles in ſome meaſure relaxed. Then an hollow Silver Catheter, with a flexible Leathern Tube at one End, (ſee *Tab.* LI. *Fig.* 5. A A, D D D) is to be gradually and ſlowly introduced into the Bladder. Inſtead of which Tube, according to *Douglas*, the Wind-pipe of an *Indian* Cock may be uſed; or, according to *Cheſelden*, the Ureter of an Ox. To this the Tube C muſt be faſtened, and afterwards fitted with a large Syringe; by which means ſo much warm Water, Barley-water, or Milk, muſt be injected into the Bladder, as the Patient can bear without Pain or Uneaſineſs, or rather till the Bladder is full, and ſufficiently diſtended†. When this is done, the Catheter is extracted from the Bladder, and the Penis, with the Urethra, held tight by an Aſſiſtant, or depreſſed to the Perinæum, or tied with a broad Tape. Then, ſtanding on the Right Side of the Patient, I order a prudent Aſſiſtant to introduce his two fore Fingers into the Anus, to elevate the Stone and Bladder: In the mean time I make an Inciſion with the ſmall Knife, (ſee *Tab.* XXXIII. *Fig.* 14.) or one like it, wrapped in a Piece of Linen, firſt through the Skin and Fat, and then, by degrees, through the abdominal Muſcles, in a right Line, immediately above the Oſſa Pubis, or near the Bottom of the Linea alba, or in the Linea alba itſelf‡ (ſee *Tab.* LI. *Fig.* 3. *b b*, or *Fig.* 4. B, C). The external Wound ſhould be three Fingers-breadth long in Children, and four in Adults. Then, introducing the Fingers of either Hand into the Wound, particularly the Left Index, I feel for the Liquor which diſtends the Bladder above the Margin of the Oſſa Pubis, at their Juncture; which is not eaſily to be diſcovered, when the Bladder is not much diſtended, either by reaſon of Convulſions of the wounded Parts, the unuſual Hardneſs of the Bladder, or ſome other Cauſe. I then make an Inciſion with the ſame, or an hooked ſharp Knife, into the Bladder immediately above the Juncture of the Oſſa Pubis; or elſe, as I once practiſed ſucceſsfully, make an Aperture in that Part, with the Trocar, without the Cannula (*Tab.* XLV. *Fig.* 2.). But where the Bladder is but moderately diſtended, this ſhould be done with Caution, for fear of wounding the Fundus; and, therefore, I introduce my Left Index into the Perforation, and gently ſeparate the Peritonæum from the Oſſa Pubis, on which it lies, to avoid injuring either that, or the Fundus. I then paſs a ſmall Knife, or the Trocar, obliquely behind the Oſſa Pubis, into the Body of the Bladder (but not the Fundus) towards its Neck, ſo as to make a ſmall Wound with the Point only. After this, Part of the injected Liquor, or the Urine contained in the Bladder, immediately flows through the Wound. Through this Aperture I paſs a crooked or ſtrait Knife, armed with a Button at its Point (ſee *Tab.* XXVI. *Fig.* 3, 4, 5.); and, elevating the Button towards the Fundus, I enlarge the Wound upwards, for the Breadth of one or two Fingers, according to the Size of the Patient: By this the Peritonæum, and Fundus of the Bladder, can ſcarcely be injured, and only the Body of it, (ſee *Tab.* LI. *Fig.* 2. B B) about the Middle, and near its Neck, is opened; but the Peritonæum A A A, *Fig.* 2, 3, 4. remains entire. Some condemn this Method, which I took from *Roſſet* and *Douglas*; and direct the Inciſion to be made from the upper Part of the Bladder, a little below the Urachus, and to be continued to the Os Pubis, at one Section. They ſay, that the greateſt Danger of the Operation conſiſts in this Inciſion; which I readily grant. But ſince we are generally uncertain how far the Bladder is diſtended, and what Part under the Urachus they would have divided, I muſt give the Preference to the Method here propoſed, eſpecially when the Inciſion is prudently made, with a blunt-pointed Knife, which ſome of them reject. By this means, even where the Bladder had little or no Diſtention, I never wounded the Peritonæum, whereas they, by their Inciſion downwards, generally do, though the Bladder is properly diſtended; and thus the Patient dies. This Method ſucceeds with or without a Diſtention, but theirs is only practicable with a very great one; and, therefore, as we are informed by *Winſlow* and *Morand*, mine was preferred by *Thibaut*. When I have perforated the Bladder enough to admit my Finger by the Side of the Knife, I introduce my Left Index, and, bending it in the Form of an Hook towards its Fundus, gently draw the upper Part of the Bladder towards the Navel, and then enlarge the Wound downwards, by directing the Inſtrument towards the Oſſa Pubis, and Neck of the Bladder; this makes the Aperture ſufficiently large. Immediately after, I introduce the fore Finger of my other Hand into the Bladder, and examine the Size and Situation of the Stone, and whether a larger Wound is requiſite: If the laſt is required, leaving my Finger in the Bladder, I elevate and enlarge the Wound, either upward, or downward, or both, till I think it ſufficient for the Extraction of the Stone, without injuring its Fundus, which may be ſecurely performed with the obtuſe-pointed Knife. But, if the Inciſion is large enough, I lay aſide the Inſtrument, and deſire the Aſſiſtant, whoſe fore Fingers are in the Patient's Anus, to preſs the Stone forwards, as much as poſſible, during which time I endeavour to extract it with my Fingers, when it is ſmall: If they are inſufficient, I introduce the Hook, (*Tab.* XLVIII. *Fig.* 10.) or the Forceps, as I judge proper. To ſome Patients, who dreaded the Introduction of the Catheter, and the Injection, I preſcribed large Quantities of Tea, keeping a Stricture upon the Urethra, by the Inſtrument (*Tab.* XLVII. *Fig.* 9.), that the Bladder might be ſomewhat diſtended; and thus have I made a proper Inciſion, and extracted the Stone, though ſome deny it to be poſſible‖. When I could not extract the Stone through the Perinæum, which has happened twice to me, and when the inferior Wound prevented a Diſtention of the Bladder, either by Injection, or retaining the Urine, (which occurred to *Greenfield*, and, perhaps, *Franco*) having carefully divided the Skin and Fat from the Muſculi recti of the Abdomen, I introduce my Left Index between the Os Pu-

* *Garengeot* ſays, the Bladder is without the Abdomen; which, in my Opinion, is a Miſtake. The Bladder, indeed, when collapſed, is without the Peritonæum, but not without the Abdomen; becauſe it is ſituated in the Pelvis, which is the lower Cavity of the Abdomen, formed by the Oſſa Innominata and Sacrum, which, by general Conſent is allowed to be Part of the Abdomen; and, therefore, any Part ſituated in the Pelvis, is ſituated in the Abdomen.

† Some Surgeons, and particularly *Garengeot*, aſſert, that the Bladder ſhould be diſtended, till there is a viſible Tumor above the Oſſa Pubis. This may be right in dead Subjects; but I have found, by Experience upon the Living, it can ſcarcely be perceived by reaſon of Spaſms and Pains. And *Cheſelden* gives an Inſtance, where the Bladder was burſt, by injecting too much Water. The Diſtention of the Bladder, by blowing in Wind with a Pair of Bellows, as *Solingen* adviſes, is rejected by *Roſet*, as uſeleſs and pernicious.

‡ Some Surgeons, particularly *Garengeot*, ſay, it is dangerous to make an Inciſion in the Linea alba; and, therefore, to be avoided. But my own Experience, with the Teſtimony of many others, convinces me, that the Inciſion will heal in this Part as well as the muſcular. *Winſlow* pronounces it an uſeleſs and vain Caution.

‖ *Roſſet* propoſed filling the Bladder, particularly by drinking Spaw-water, or ſome other Diuretic; but I know none, either among the *Engliſh* or *French*, who have followed his Advice. But, that it will ſucceed, appears, not only from my own Practice, but from *Proebiſch*, who cured a Lad of twelve Years old by this Method; though he wounded the Peritonæum to ſuch a degree, that the Inteſtines fell down. But *Winſlow* adviſes the Patient to retain his Urine, after plentifully drinking for ſeveral Days before the Operation; and by that means to cauſe a gradual Extenſion of the Bladder.

bis and Membrane of the Peritonæum (ſee *Tab.* LI. *Fig.* 4. B B; and *Bedlow's Tab.* XLI.) and thruſt it gently back from the Oſſa Pubis, that I may firſt make a ſmall Inciſion, and then a larger, into the Body of the Bladder, and extract the Stone, without wounding its Fundus, or the Peritonæum. The performing the High Operation, without diſtending the Bladder, is taken notice of by no one, that I know of; though it may be uſeful, and even neceſſary in ſome Caſes. Repletion of the Bladder, therefore, is not always requiſite; yet it muſt be owned, that without it more Caution and Diligence is required.

Some ſay that the Fundus of the Bladder is to be divided in this Operation, and the Stone extracted that way, among whom is *Garengeot*; but this muſt proceed from an imperfect Knowledge of the Parts; nor does he in his *Splanchnologia*, when he treats of the Bladder, ſay one Word of its Parts, and the Manner of dividing it, tho' it is of the laſt Importance to Beginners, in every Operation where that is concerned, and particularly in the ſeveral Methods of Lithotomy. Others improperly divide the Bladder into two Parts only, its Neck and Fundus; and theſe, in deſcribing the hypogaſtric Section, tell us it is to be ſeparated in its Fundus; whereas a Wound in that Part is fatal, becauſe the Urine then flows into the Cavity of the Abdomen, there putrefies, and deſtroys the Patient. The Bladder, therefore, ſhould be divided into its Neck, Body, and Fundus, conſidering it as a Pitcher, (for to this *Riolanus*, and others, have juſtly compared it) in which there is the Neck, the Body, and the Bottom; but it would be abſurd to call the Body of the Pitcher, which follows the Neck, the Bottom of it, ſince by that Name we underſtand the loweſt Part, oppoſite to its Neck: In the ſame manner, we may reaſon on the Bladder, though it repreſents a Pitcher inverted, (ſee *Tab.* L. *Fig.* 8. or *Tab.* LIII. *Fig.* 1, 2.). A A, therefore, (in *Tab.* L. *Fig.* 8.) denote the Neck of the Bladder; B B the Body, or Bladder itſelf; C the Fundus, though that Part, when we ſtand erect, is uppermoſt; D D the Proſtate Gland; E E part of the ſeminal Veſſels in a Boy. But, if we conſider the Bladder out of the Body, that Part where the Butcher inflates it is the Neck; that oppoſed to it, the Fundus; and the intermediate Part, the Bladder itſelf; which, as *Roſſet* obſerves, is to be cut, and not the Fundus. As, in the High Operation, the Bladder is divided in the middle and lower Part of its anterior Surface, (ſee *Tab.* L. *Fig.* 8. B B; and *Tab.* LI. *Fig.* 2. B B) ſo, in the *Celſian* and Lateral Operation, is it divided in the lateral lower Part, which ſome not improperly call the Baſis (ſee *Tab.* L. *Fig.* 1.). But in no Method is the Fundus ſeparated: For, as this would open a Paſſage for the Urine into the Abdomen, the Wound muſt prove incurable. We muſt not, therefore, pay any Regard to thoſe who eſpouſe this Method, tho' they falſely aſcribe their Opinion to *Roſſet*. It is ſurpriſing, ſince *Roſſet* has diſtinguiſhed ſo accurately between the Parts of the Bladder, that the modern *French* Surgeons ſhould raſhly declare, as a Matter of no Conſequence, that the Fundus may be divided: On the contrary, moſt of the *Engliſh*, with *Roſſet*, and myſelf, adviſe the Inciſion to be made in the Body, as appears from *Middleton*, when he ſays, "If the Inciſion in the Body of the Bladder is ſufficiently large," *&c.*

When the Stone is extracted, according to the Directions given above, the Operator introduces his Fingers into the Bladder, to ſearch if any thing remains which ought to be extracted; which may be done better this way than any other. If nothing is left, the Wound being covered with a Linen Cloth, or a Compreſs, the Patient is put to Bed, and ſome dry Linen Cloths laid on that Cloth, for Lint might ſlip into the Bladder; the Whole is then ſecured with a Compreſs, and a large folded Napkin brought round the Abdomen, as in other Wounds of that Part. Some few Hours after, the Wound ſhould be dreſſed with Lint ſpread with digeſtive Ointment, over which ſhould be laid a Plaiſter, and thick Compreſs, moiſten'd with warm Lime-water; to which add Spirits of Wine and Camphire, with a little of the medicinal Stone, or Sal Armoniac, or Oxycrate, or a Decoction of ſome of the vulnerary Herbs in Red-wine, which ſhould be often applied round the greater Part of the Abdomen, and ſecured by a Napkin faſten'd tight about the Body. A Continuation of this for four or five Days will prevent an Inflammation; and it may be ſometimes laid on the Abdomen, whilſt the Wound is uncover'd, that any noxious Contents may diſcharge themſelves. By this means, in young Men and Boys, and ſometimes in old Men of a good Habit, the Wound will ſuppurate, and be perfectly cleanſed, in ſeven, nine, ten, or twelve Days: Then it ſhould be dreſſed once or twice every Day with Balſam of Capivi, or, what is better, Linimentum Arcei; and the Lips muſt be approximated, and held together by a narrow ſticking Plaiſter, as in the dry Suture; for a more early Uſe of theſe Plaiſters is even pernicious, as they impede the Cleanſing of the Wound, and Bladder. Over the Plaiſter it will be proper to apply an uniting Bandage, or to tie the Napkin, before in Uſe, tighter round the Abdomen; this is to be repeated, till there is a perfect Agglutination, and the Urine diſcharges itſelf entirely through the natural Paſſage. The Wound heals ſooner or later, according to the Patient's Conſtitution; in ſome in three Weeks, in others a Month, and ſometimes longer.

Further Observations.

When the Patient is able to riſe, ſit, and walk, and ſeemingly deſirous of it, I indulge him; or, if he chooſes to lie on his Side, I do not poſitively confine him to his Back, as ſome do, to his great Uneaſineſs. I am encouraged in this by a Patient of mine, about thirteen Years old, who left his Bed the ſeventh Day after the Operation, and walked about, without my Conſent: This was of no ill Conſequence; for the Wound was completely healed the fourth Week. Sometimes the natural Paſſage of the Urine is obſtructed by a ſandy mucous Matter: The Patient ſhould then be laid on one Side, and ſome warm Water ſhould be injected through the Urethra into the Bladder, by which the Matter may be expelled through the Wound; or it may, by the Introduction of a Pipe into the Urethra, be blow'd into the Bladder, and ſo ejected through the Wound. By either of theſe Methods, the Urine paſſes afterwards in its proper Courſe. This *Rungius*, a Surgeon of *Bremen*, practiſed after me. If the Stone breaks in the Extraction, the Fragments may be taken out with the Fingers; but, when they are inſufficient, *Roſſet* has contrived a convenient Inſtrument, like a narrow Spoon, and curved in a particular manner, which will extract both the Pieces and Sand, if there are any. For promoting the Agglutination, *Roſſet* adviſes the Introduction of a Catheter through the Urethra into the Bladder, that the Urine may diſcharge itſelf there, without paſſing through the Wound. *Morand*, in Imitation of this, uſed a ſhort Catheter, and from that found great Advantages.

That this Method may not be thought an unneceſſary Invention, I ſhall briefly conſider its principal Advantages above the preceding: And firſt, as in this Operation neither the Sphincter, or Neck of the Bladder, Urethra, nor Proſtate Gland, are wounded by the Knife, Forceps, or any Inſtrument, nor injur'd by the Extraction of the Stone, there is no room to fear an Incontinence of Urine, or a Fiſtula in the Perinæum or Urethra, which are the uſual Conſequences of the Apparatus major, and even the Lateral Operation. 2. When the Stone is large, rough, angular, or prickly, in either of them the Neck of the Bladder, and Proſtate Gland, are violently lacerated and wounded, which is followed by intenſe Pains, Inflammation, Gangrene of the Bladder, Convulſions, and Death; whereas in this, ſince the Inciſion is made in the anterior Part of the Body of the Bladder, immediately above the Oſſa Pubis, no ſuch Symptoms in the Neck and Urethra are to be apprehended. 3. For the ſame Reaſon, the Parts of Generation, as the Muſcles of the Penis, the Proſtate Gland, and the ſeminal Veſſels, with their excretory Ducts, are not injured; whereas a Wound in thoſe Parts by the Apparatus major, or in the Lateral Operation, frequently renders a Man impotent, or, at leaſt, not ſo capable of Procreation. 4. Since there are only a few ſmall Blood-veſſels diſtributed in the upper Part of the Bladder, and the Rectum with the Ureters are at a Diſtance from the Wound, neither they, nor the large Blood-veſſels, can be injured, as they frequently are in the other Methods; whence a dangerous Hæmorrhage, and other bad Symptoms, are induced. 5. If the Stone is rough, or ſharp-pointed, (which may be known by the violent Pains, and frequent Diſcharge of bloody Urine, as well as by the Touch of the Finger in the Anûs) the Extraction is ſcarcely practicable by the Apparatus major, minor, or Lateral Operation; but in this Method it is very eaſy, as the Wound may be enlarged to any Degree neceſſary. 6. This is performed with fewer Inſtruments than the Apparatus major, or Lateral Operation; and the Stone may be often extracted with the Fingers only; but ſimple Methods are always preferable to complex and difficult ones. 7. Neither the Bladder nor Urethra are moleſted or irritated by Catheters, which *Tolet*, and others ſay, produce an Inflammation. 8. If the Male or Female Conductor be thruſt into the Bladder too violently or deeply, in the Apparatus major, or the Lateral Operation, it is frequently wounded, or entirely perforated; which, according to *Garengeot*, is mortal: But theſe Inſtruments are not uſed in the High Operation. 9. It is not neceſſary to bind the Patient in ſo formidable a Poſition, as the Apparatus major requires, which has almoſt deſtroyed ſome weak Perſons before the Operation. 10. By this Method we can paſs our Fingers further, and with more Eaſe, into the Bladder, than by any other; and, conſequently, judge better of the Size, Figure, or Number of the Stones, with the moſt convenient Manner of extracting them, and whether the Bladder is thoroughly cleanſed. *Denys*, the greateſt Advocate for *Rau's* Method, confeſſes, that it is difficult by that to find the ſmall Stones; and this, ſays he, is common to the reſt: But the High Operation is not liable to that Defect, as we are aſſured from Experience, and as he himſelf acknowledges. If the Stone is ſo ſmall, that it cannot be taken hold of by the Forceps, in the Lateral Operation, he adviſes the Surgeon to deſiſt; whereas he might eaſily extract it by the High Operation. Nor have we any one Inſtance, where it could not be extracted this way, and the Operator was obliged to relinquiſh his Work. And therefore it is preferable to the Apparatus major, or Lateral Method. 11. If the Stone adheres or grows to the Bladder, which *Roſſet*, *Douglas*, and others, deny, tho' it is confirmed by the Experience of *Middleton*,

dleton, *Thornhill*, and myſelf, it may be often ſeparated by the Fingers: And, when it is too large to be extracted, we do not torture the Patient to Death, as in other Methods; but prudently deſiſt in time. 12. The Stone is not ſo ſubject to break in the Extraction, as in the Apparatus major, becauſe the Aperture is large, and capable of being further enlarged, as the Bladder is more dilatable in its Body, than its Neck: And, if it ſhould break, the Pieces may be eaſily extracted by the Fingers, Scoops, or ſome proper Inſtruments. 13. Longitudinal Stones, ſituated tranſverſly in the Bladder, cannot, without Danger and Pain, if at all, be extracted by the other Ways; whereas, in this, there is neither Difficulty nor Hazard; for they may be ſecurely laid hold of, in their leaſt Diameters. 14. If the Stone cannot be found or extracted in the Apparatus major, or lateral Operation, either from a Concealment in ſome Fold of the Bladder, as *Riolanus* has obſerved, or any other Cauſe; or if the grooved Catheter cannot be paſſed into the Bladder, on account of an Inflammation or Tumor in its Neck, or at the Proſtate Gland, or the exquiſite Pain, or a Cicatrix, Hardneſs, Tubercle, or Stone in the Urethra, or Neck of the Bladder, or a Phymoſis, or an Averſion in the Patient to the Catheter, Inſtances of which are not uncommon, in all theſe Caſes the High Operation is the only Method of Relief; and, therefore, preferred by *Cheſelden*, *Greenfield*, *Morand*, and others; though the Apparatus minor will anſwer all theſe Purpoſes in Boys, and Adults of a low Stature. 15. One of the principal Advantages, according to *Pietrus* and *Roſſet*, is, that any young Beginner may undertake it, becauſe the Inciſion is of no great Depth, and directly down through the Integuments and Muſcles into the Bladder, without regarding the Windings of the Urethra. This perhaps is true, when the Bladder is previouſly diſtended with a convenient Liquor: But, when this cannot be done, it is not ſo eaſy, and becomes dangerous, from the ſmall Space between the Oſſa Pubis and Peritonæum, where the Inciſion is to be made; for the leaſt Slip will wound the Fundus of the Bladder, which is fatal, eſpecially if the Inciſion is made from above downwards, as ſome adviſe; this therefore would require a skilful Anatomiſt and Surgeon: For which Reaſon, from *Roſſet's* Time, we have been adviſed to diſtend the Bladder. And for the ſame Reaſon, *Tolet* adviſes a frequent Performance of this Operation on dead Subjects, before we undertake it on the living, and eſpecially (which is worth notice) after a Diſcharge of the Urine.

Before we finiſh this Head, it may not be amiſs to obviate ſome of the principal Objections againſt this Method. *Denys*, a ſtrenuous Defender of *Rau's* Method, tells us, that the High Operation is, in many Caſes, impracticable upon many Accounts; and that thoſe who could not be cured by that, might by the lateral Operation. But, as he has produced no one of theſe many Caſes, nor mentioned a ſingle Inſtance where his Method effected a Cure, which the High Operation could not, and as my own Experience convinces me to the contrary, I ſhall not, upon his bare Aſſertion, ſubſcribe to that Opinion. He relates indeed a Caſe, where *Rau* could not extract the Stone by the High Operation; and another, which happened to *Bertelius*, whom I have often ſeen practiſe this very Method dextrouſly. He allows, indeed, that it will cure ſome young Children, (and, of conſequence, does not abſolutely diſapprove of it) but not all. Here again I could wiſh he had ſpecified ſome particular Inſtances, ſince the Advocates for the contrary Opinion are armed with ſo many.

His ſecond Objection is, that it is longer in the Performance than the Lateral Method: But this is falſe, if we except the previous Diſtention of the Bladder, which is not the Operation, but only one of the preparatory Requiſites; and *Denys* himſelf owns there are many Obſtacles in *Rau's* Method, and the Apparatus major, which prolong the Operation, particularly that *Rau* himſelf was once three Quarters of an Hour in ſearching for and extracting the Stone. I will, therefore, boldly aſſert, that the High Operation is, in many Caſes, more expeditious than the Lateral; as when the Stone lies concealed in ſome Cavity, or on either Side of the Bladder, or under the Oſſa Pubis, or when it is ſmall; for, by this Method, there is Room enough to ſearch every Part of the Bladder with the Fingers, which are the beſt Inſtruments both for ſearching and extracting; eſpecially if an Aſſiſtant protrudes the Bladder and Stone forwards with his Finger in the *Anus*. So that in this Way the Stone may be often extracted by the Fingers only; or, if it is large, by them, with the Aſſiſtance of a Forceps, or Hook; while, in the Lateral Method, the Operator is often a long time ſearching for it in the Dark with his Forceps, and longer in extracting it.

The third Objection is, that it is more painful. But this is not certain; for I have ſeen Children, who, upon other Occaſions, cry violently, make but little Noiſe from the Pain of this Operation. I muſt confeſs, that a large, rough Stone gives exquiſite Torment, and this Inconvenience is common to all the Methods; but the High Operation is leaſt ſubject to it.

Further, *Denys* objects, that it cannot be performed on all Subjects, eſpecially Children and Infants, from the Smallneſs of their Bladders. But this is ſo far from being true, that *Douglas*, *Cheſelden*, *Middleton*, *Morand*, and others, have practiſed it upon Children of three or four Years old; and it generally ſucceeds beſt at that Age under a judicious Hand. He objects too (from *Pag.* 99. to 105.) with *Garengeot*, and ſome others, that the Bladder muſt neceſſarily be diſtended with Water to ſuch a Degree, that it may aſcend a good Way above the Oſſa Pubis; but this is impracticable in ſmall and thick Bladders, and therefore it does not ſucceed with all. I own the Operation may be performed with more Expedition and Safety, when the Bladder is greatly diſtended; but muſt deny the abſolute Neceſſity of this Diſtention, ſince a skilful Surgeon may perform it, even when the Bladder is entirely collapſed. This Inconvenience, therefore, ſhould not be imputed to the Operation, but the Operator. And the Reader may remember, there was no Diſtention, where *Franco* and *Roſſet* could not extract the Stone by the Wound firſt made in the Perinæum; and yet they took it from the collapſed Bladder, without wounding its *Fundus*, or the *Peritonæum*. Thus *Proebiſch*, and myſelf, performed it, by a ſlight Compreſſion of the Urethra, and a Retention of the Urine, after drinking Tea plentifully, without any Injection; to omit the Inſtances given by *Berriere*, deſcribed by *Morand*, and other Inſtances where the Clamours of Children rendered the Repletion impoſſible.

He objects (*pag.* 101.) that, when the Bladder has been filled, the *Penis* muſt be ſtrongly compreſſed by the Finger, or a Ligature, leſt the Water ſhould return, before the Inciſion is made into the Bladder, which cauſes Tumors, an Inflammation, and other dangerous Symptoms. Theſe never occurred to me; nor can I conceive it poſſible they ſhould; for a very ſlight Compreſſure will retain the Liquor, and it may be performed by the Inſtrument (*Tab.* XLVII. *Fig.* 9.) which I recommend for an Incontinence of Urine. *Winſlow* has, likewiſe, propoſed an Inſtrument for the ſame Uſe, which *Nuck* has exhibited in his *Operat. Chir. Fig.* 11. and may be ſeen (in *Tab.* XLVII. *Fig.* 10.). The next Objection is, that the Patient is obliged to lie conſtantly on his Back. This is not true; for he may lie on his Side or Belly, if he pleaſes, which *Douglas*, *Winſlow*, *Morand*, and others, adviſe after Suppuration, as it promotes the uniting of the Wound. Laſtly, he objects, (*pag.* 108. and 116.) that the Fragments and Sand may be more eaſily extracted by the Lateral Method. Now, as I have already proved, the principal Advantage of the High Operation is, that the Bladder may be more perfectly cleanſed by that, than any other Way. For *Denys* himſelf acknowledges the Difficulty of it in the *Apparatus major*, and Lateral Operation; whereas in this, when the inferior Part of the Bladder is elevated by an Aſſiſtant, they may be eaſily found and extracted by the Fingers, or proper Inſtruments. *Denys* aſſerts, that this Method of Cure produces an Incontinence of Urine; but this is overthrown by common Experience. In a Word, all the Advantages which he aſcribes to *Rau's* Method (*pag.* 119.) may be juſtly attributed to the High Operation. And *Le Dran* and *Cheſelden*, on many Accounts, prefer it to the *Apparatus major*.

But to obviate the Imputation of approving the High Operation only, and deſpiſing all other Methods, I ſhall briefly enumerate the Caſes, in which it is leſs convenient. And, firſt, it is unſucceſsful in old Men, and even after the thirtieth Year of Life; for, according to *Middleton* and *Douglas*, ſuch Subjects generally die; and *Smith* ſays, that all above thirty or forty Years old, on whom he performed this Operation, have died, except one. And I myſelf have cut four, who exceeded that Age, and not one recovered. Further, it ſeldom ſucceeds, when the Patient is afflicted with other Diſeaſes, eſpecially an Ulcer in the Kidneys, or Bladder; or is debilitated by a Conſumption, or has a ſchirrous Bladder; for, in theſe Caſes, all Writers prefer the Section in the *Perinæum*, becauſe the Bladder may be more eaſily cleanſed, and the Wound better healed by it, which is confirmed by Experience. Laſtly, the High Operation is more difficult in ſmall Bladders, which may be known partly from the ſmall Quantity of Urine they are capable of containing, and partly from the Difficulty of moving the Catheter in them. And here I would adviſe the Surgeon, unexperienced in performing this Operation on collapſed Bladders, to chooſe any other Method, for fear of wounding the *Peritonæum* and *Fundus* of the Bladder, though it is not abſolutely impracticable, even in ſmall Bladders. From hence it is manifeſt, that a prudent Surgeon will ſometimes prefer one Method, ſometimes another, according to the different Conſtitution of the Patient, the State of the Bladder, the Stone, and other Circumſtances. If the Reader would know more, let him conſult *Douglas*, *Middleton*, *Cheſelden*, *Roſſet*, *Morand*, *Le Dran*, and *Garengeot*; to which he may add *Heiſter's Diſſertation de Apparatu alto*, publiſhed at *Helmſtadt*, in the Year 1728.

The Lateral Operation.

About the End of the laſt Century, there was a famous *French* Lithotomiſt, named *Frere Jaques*, whoſe unuſual Method of cutting for the Stone attracted the Eyes of every body on him; and even to this Day he is ſo much talk'd of, that we think ourſelves obliged to ſay ſomething of him, and his Method. About the Year 1697. this obſcure Monk came to *Paris*, from ſome of the remote Parts of *France*, deſtitute of Clothes, Money, and Victuals;

Victuals; but of an open Temper and Simplicity of Mind. He produced Teſtimonies of his Succeſs in ſeveral Provinces, by his new and unknown Way of Lithotomy. He asked no more Reward, than would repair his Inſtruments, and mend his Shoes. At length, addreſſing himſelf to the King's Phyſicians, and the principal Surgeons at *Paris*, he beg'd he might be permitted to cut and cure ſuch Patients as were afflicted with the Stone in that City, and the Hoſpitals, aſſuring them, that he came thither only to teach them a better Method. This they at firſt looked upon as a Piece of Inſolence; but, being taken with the Novelty of the thing, and partly out of Curioſity, gave him leave to make an Experiment on a dead Subject, which had a Stone conveyed into the Bladder. It is ſaid that *Jaques's* Name was *Beaulieu*, and that he came either from *Beſançon*, or *Beaufort*.

The dead Subject being ready, he began his Operation in the Preſence of ſeveral Surgeons and Phyſicians. Firſt, when the Body was laid, and ſecured, in the uſual Poſture, upon the Table, he introduced a round, not grooved, Catheter into the Bladder in the uſual Method, and with that preſſed the Bladder to the Left Part of the Perinæum; then he made an Inciſion near the Perinæum, but a little different from the common Practice, with a Knife ſomewhat longer, too, than the common Knife. He directed this upwards from the Anus, and divided the Parts almoſt in a right Line, on the Left Side of the Perinæum, about two Fingers-breadth from its Suture, the Inciſion aſcending upwards, to about the Middle of the Perinæum; by which he cut whatever was between the Skin and Catheter, with the Neck of the Bladder, and the Bladder itſelf, leaving the reſt of Urethra entire. Next, paſſing his Finger through the Wound into the Bladder, he ſearched for the Seat of the Stone; having done this, he introduced an Inſtrument, like a Spoon, which ſerved for a Conductor, and, by the Help of that, introduced the common Forceps; then he drew out the Conductor, laid hold of the Stone with his Forceps, and extracted it very dextrouſly, to the great Surprize of the Spectators, though it was as big as an Hen's Egg.

Upon Examination, the Surgeons found he had firſt cut thro' the common Integuments of the Perinæum, about the Length of two Fingers-breadth; that the Wound paſſed between the Accelerator Urinæ and Erector Muſcle of the Penis, on the Left Side of the Perinæum, without wounding either of them, till it penetrated the Neck of the Bladder, and the Bladder itſelf, in a right Line, for about an Inch; and that he had extracted the Stone through this Aperture. Having duly conſidered theſe Particulars, ſeveral of them, and eſpecially *Mery*, preferred this Method to the Apparatus major, as attended with leſs Danger: For, in that, it is not only neceſſary to divide the Urethra, but the narrow Neck of the Bladder, and its Sphincter, with the Proſtate Gland, muſt be forcibly dilated, and, if the Stone is large, receive further Injury by the Violence uſed in the Extraction. However, as the Majority are not fond of introducing new Methods, it is no Wonder he was prohibited to perform his Operation on a living Subject.

Upon this cold Reception, *Jaques* applies to the King's Surgeons and Phyſicians at *Fontainebleau*; to them he ſhews his Letters of Recommendation, and Teſtimonials of Cures, begging Leave to perform his new Method of Lithotomy on a young Man, a Taylor. His Requeſt was immediately granted. He performed it in the preceding Manner, before the King's Phyſicians and Surgeons, with ſuch Succeſs, that the Patient was about the Streets in three Weeks time, without one of the uſual bad Symptoms attending the common Method.

This procured him the Reſpect of every body, not excepting the King himſelf; and the *Pariſians* thought him ſent from Heaven for the Relief of the Diſtreſſed. In the following Spring, *Anno* 1698. he returns, with the King's Licence, to *Paris*; and performs on a great Number of Patients, amidſt ſuch a Crowd of Spectators, that it became neceſſary, at laſt, to diſperſe them by Soldiers.

It is to be obſerved, that he never prepared his Patient by Bleeding, Purging, or Diet; nor did he uſe any Ligatures, as in the other Methods: For, when he was laid on the Table, his Legs were bent upwards, and he was only ſecured by ſtrong Aſſiſtants. In his Extraction of the Stone, he was, by the Report of *Dionis*, and others, ſo cruel, that the moſt intrepid Surgeons were ſtruck with Horror, and lamented the Misfortune of thoſe unhappy Wretches who fell under his Hands. And he was no leſs unconcerned afterwards, either about dreſſing the Wound, or ordering the Patient a proper Regimen; for, if he deſired his Care in thoſe Reſpects, his Anſwer was, It is ſufficient, that I have extracted the Stone; God will cure you. He treated Men and Women indiſcriminately; but generally wounded the Vagina, ſaying, that Wound was of no Conſequence.

But, to form a true Judgment of his whole Proceedings, we muſt conſider the ultimate Event of them; and this, in general, will appear with no very good Aſpect: For, if we may credit what *Mery* ſays, in his Diſſertation, publiſhed at *Paris*, 1710. out of ſixty Patients whom he cut in the Spring of that Year, twenty-five died, thirteen only were cured, and the reſt were troubled with a Fiſtula, or an Incontinence of Urine. And *Dionis*, ſeven Years after, in his Surgery, aſſures us, that above half *Jaques's* Patients died of the various ſupervening Symptoms; and that it was wonderful any one ſhould ſurvive the Cruelty and Imprudence of his Method: In Confirmation of which, he alleges the Taylor of *Fontainebleau*, by whoſe means he acquired his Reputation, who was not only ever afterwards troubled with a Fiſtula in the Perinæum, but found a continual Decay of Conſtitution; and, within two Years, exchanged a miſerable Life for Death. On the contrary, he affirms, that out of twenty-two Patients, cut in the ſame Spring by others, three only died, and almoſt all the reſt were reſtored to perfect Health.

Upon inſpecting his dead Patients, theſe reputable Authors frequently found the Bladder cut quite off from the Urethra; in others they found a Cancer or Sphacelus in the Bladder, or Inteſtines. In others the Muſcles of the Penis, Nerves, and Blood-veſſels, were often divided by the Knife. In ſome, the Elevator of the Anus, with the hypogaſtric Veſſels, were ſeparated. And, again, in ſome, the Part of the Bladder towards the Cavity of the Abdomen was obſerved to be perforated three or four times; in others the Wound of the Bladder appeared very unequal, and in ſome Places lacerated and diſtorted. They ſometimes found the Rectum cut, and conſequently the Fæces were diſcharged through the Wound; and in ſeveral Women, beſides the Injury of the Rectum, he wounded, together with the Bladder, the Vagina, which muſt make a Paſſage for the Fæces through the latter. And laſtly, by wounding ſome of the large Blood-veſſels, there followed ſuch an Hæmorrhage, that the Patient died under the Operation, or ſoon after it.

Nor was he conſtant in making his Inciſion in the ſame Place; for at one time he would divide the Perinæum an Inch higher, or lower, than at another; thro' which Inconſtancy and Negligence ſometimes one Part, ſometimes another, muſt be wounded. Beſides, he was often ſo unprovided with Inſtruments, that he uſed a common Razor inſtead of the proper Inciſion-knife. And I myſelf, in *Holland*, have heard the *Dutch* aſſert, that for want of his own Inſtrument he has often uſed a common blunt Knife, which muſt expoſe his Patients to the greateſt Dangers. While he was in *Paris*, he obſtinately cut a Lad near the Anus, though the Stone was fixed in the Urethra, behind the Scrotum, in the Perinæum, though it would have been more prudent to have done it in that Part where the Stone ſhewed itſelf. This Behaviour is the leſs to be wonder'd at, becauſe he was utterly ignorant of Anatomy and Surgery, unleſs that he would, upon every Occaſion, undertake the Cure of Ruptures by the Knife. But as in that Operation he deprived even a Child of its Teſticle, without any Neceſſity, it is more than probable, that he was the Diſciple of ſome Mountebank, eſpecially as he never would own where he learnt his Art.

By this inconſiderate and unſucceſsful Treatment of his Patients, and the Danger of Death, that threatened the *Marſhal de Lorge*, the Day after he was cut, though *Fagon* preſerved him, the Reputation of our new Lithotomiſt began to decline, and at *Paris* they pronounced him an ignorant, impudent Operator. He, therefore, ſhifted his Quarters, travelled through moſt Parts of *France*, and came at laſt to *Holland*; from thence he went thro' moſt of the principal Cities in *Germany*, performing his Operation in all of them, but generally with his uſual ill Succeſs: So that, for the firſt Years, he gained no Character in thoſe Countries. However, it is worth obſerving, though known to few, what *Saleman*, a celebrated Phyſician and Surgeon of *Straſburg*, tells me, in a Letter, that *Jaques* had improved upon his old Method of Lithotomy, and in the Year 1712. and the Beginning of 1713. had ſucceſsfully cut ſixteen Patients in that City, uſing a grooved Catheter; adding, that he ingenuouſly confeſſed to him, that he had abſtained from his former raſh Method for about a Year, and now treated his Patients in a more judicious manner. I mention this Circumſtance, as it is taken no notice of by others, to complete the Hiſtory of this Man. Agreeable to this is the Account *Febrius* gives of him, when he ſays, that out of ſixteen, lately cut by *Jaques* at *Strasburg*, one only died, who was an old Man, and this he predicted. In the laſt-quoted Author we have a very exact Deſcription of *Rau's* Method, long before it was publiſhed by *Albinus*, as he ſays he had often ſeen him perform it. *Schaffer* gives us pretty near the ſame Account of *Jaques*. And *Weisbach* ſays, that, out of twenty, ſcarce one miſcarried, and that they were all cured without any Fiſtula; but he neither mentions the Time, or Place, where he ſaw this, though I ſuppoſe it was at *Strasburg*, as that was his Place of Reſidence.

But, however raſh or imprudent this Method was in itſelf, it certainly ſupply'd more expert Surgeons and Phyſicians with an Hint for the Improvement of their Practice: For by this, as *Dionis* obſerves, are we improved in the Puncture of the Perinæum for the Cure of a Suppreſſion of Urine. For the Bladder may be more ſafely and commodiouſly perforated by the Trocar, than its Neck, as the Practice was before *Jaques* perforated that Part. And further, he ſays, this very Method might be followed by an able Surgeon well-ſkilled in Anatomy, though it ſucceeded ſo ill in the Hands of an ignorant Operator. But he gives us no Directions for avoiding the Errors of *Jaques*.

Mery thought it worth while to publiſh a Treatiſe, wherein he perſuaded the Surgeons to come into this Practice, though he ſoon after uſed his utmoſt Endeavours to diſſuade them from it again. But, inſtead of the cylindrical, he recommended the grooved Catheter. This, ſays he, being paſſed into the Bladder, and then held in the Left Hand, muſt be thruſt towards the Left Side of the Perinæum, as *Jaques* did. The Operator muſt then, by the Direction of the Cathether, cut thro' the Perinæum, with a proper Inciſion-knife, ſuch as is uſed in the Apparatus major, ſo as to divide the Neck of the Bladder, and the Part which lies next it, continuing the Inciſion, with Caution, obliquely downwards towards the Left Os Iſchii, till the Aperture is large enough for the Extraction of the Stone. Through this Wound, an hollow Conductor, as in the Apparatus major, muſt be introduced into the Bladder, and the Stone extracted by a convenient Forceps. But though we here allow *Mery* to be the firſt and real Improver of Frere *Jaques's* Method, yet he never tried it on any living Subject, but rather exclaimed againſt it very ſoon after, and gave the Preference to the Apparatus major. However, after this Improvement, *Mareſchal* cut with Succeſs at *Paris*, as *Liſter*, after his Return home, was informed by *Proby*, who ſtill continued there, and ſaw Frere *Jaques* cut for the Stone, in the Year 1698. *Auguſt* 2. The Surgeons of *Paris*, ſays he, in his Letter, decry Frere *Jaques*, though they follow his Method; for *Mareſchal*, from that time, differed from him in nothing but uſing the grooved Catheter. *Le Rue* at the ſame time cut in the old Way, but his Succeſs was far ſhort of *Mareſchal's*; for all, who were cut by the latter, were alive and well, while *Le Rue* loſt one or two, and the Survivers did not recover ſo ſoon as thoſe cut by *Mareſchal*.

Rau's Method.

This Method was afterwards corrected and practiſed in *Holland*, by *Rau*, whoſe Character the Phyſical World can be no Stranger to. He had not only ſeen Frere *Jaques* perform it in *Holland*, as *Albinus* the Father and Son inform us, with *Ruyſch*, and many others, at *Amſterdam*, but probably was acquainted with the Improvements of *Mery*, and *Mareſchal's* Succeſs. He with a chirurgical Boldneſs, and great Skill in Anatomy, like Frere *Jaques*, and the Antients, cut firſt through the Perinæum, then the Neck of the Bladder (*a*), and Bladder itſelf, which *Mery* aſſures us, was Frere *Jaques's* conſtant Practice, and what I have frequently ſeen him do at *Amſterdam* (*b*). *Rau* uſed the grooved Catheter, recommended by *Mery*; but, like Frere *Jaques*, had it ſomewhat thicker than common (*c*). Then inſtead of the grooved he uſed two enſiform Conductors, Male and Female (*Tab.* XLIX. *Fig.* 2, 3.); but his Knife and Forceps were the ſame, as in the common Method. He laid his Patients on their Backs, almoſt in the ſame manner as Frere *Jaques*, with their Buttocks elevated; but he faſtened them with a Ligature different from the common, and leſs terrible. Inſtead of the two long Bandages, which others put about the Neck and Limbs, in ſo ſhocking a manner, *Rau* applied two ſhort, flat Bandages made of Woollen (but they may be of Linen or Silk) each about four Feet long. Having made a Nooſe, he faſtens the Right Wriſt to the Right Knee with one of them (ſee *Tab.* L. *Fig.* 10. A); and with the other ſecures the Left Wriſt in the ſame manner.

This Method of Lithotomy was ſo peculiar to *Rau*, that he, and not *Mery* or *Mareſchal*, has been eſteemed the Author of it, and from him it has been generally called *Rau's* Method of Lithotomy. But from the Year 1726. when Dr. *James Douglas* publiſhed his Treatiſe on the Lateral Operation, and *Cheſelden* improved it farther, it has been called the Lateral Operation, becauſe the Inciſion is made rather on one Side of the Perinæum and Bladder, whereas, in the Apparatus major, it is only in the Urethra.

In the Year 1709. I, ſays *Heiſter*, performed this Operation on a Boy of about Fifteen, in the Preſence of *De Quavre*, and others, extracting a Stone that weighed two Ounces. In 1712. I cut another of ſeven Years old, and both with Succeſs. From whence, I think, it appears, ſays he, that I performed it firſt after *Rau*.

In the Year 1694. *Rau* went from *France* to *Leyden*, there took his Doctor's Degree regularly, and, ſettling at *Amſterdam*, read private Lectures on Phyſic and Anatomy. Soon after Frere *Jaques's* Departure he applied himſelf more cloſely to Lithotomy, and, meeting with extraordinary Succeſs, was honoured with the Title of The States Lithotomiſt.

Cheſelden improved upon *Rau*, though before him *Bamber* had made one Improvement, by filling the Bladder with Water. But *Douglas*, who gives us this Account, does not mention, how the Water, which was undoubtedly conveyed through the common Catheter, was retained in the Bladder, between the Extraction of that, and the Introduction of the grooved Catheter; for at that time it is probable it would flow out, and conſequently the Diſtention could be of little or no Service. *Cheſelden*, however, varied from *Rau*, in ſeveral Points, and proceeded in the following manner.

Cheselden's Method.

He uſed a ſquare Table, higher at that End where the Patient's Buttocks are placed than at the other (*e*); and, laying him on his Back, puts a Pillow under his Head, and another under his Hips, ſo that his Abdomen is lower than either of them: He, next, draws his Buttocks a little over the Edge of the Table, divaricates his Knees, and bends them in a convenient Poſture; then ties his Wriſts to his Ankles: In this Poſition two Aſſiſtants ſecure his Legs and Feet, while a third holds down his Shoulders, to prevent his moving. *Cheſelden* then paſſes a Steel grooved and cannulated Catheter (*f*) through the Urethra into the Bladder, and thereby conveys as much Water into it as the Patient can bear without an Exceſs of Pain. But, to prevent a Reflux, he compreſſes the Penis with a Woollen Ligature, the Catheter ſtill remaining in the Bladder (*g*). The Handle of this Catheter he gives to an Aſſiſtant, who retains it there. After this, *Cheſelden* ſeats himſelf in a Chair, of a proper Height, and performs the Operation. He firſt makes an Inciſion with a Knife having a convex Edge, beginning an Inch above the Anus, on the Left Side of the Suture of the Perinæum, between the Accelerator Urinæ, and the Erector Penis; and, deſcending obliquely to the Outſide of the Sphincter of the Anus, he divides the Skin, Fat, and Part of the Levator of the Anus, by one Inciſion, (contrary to *Rau*) of two, three, or more Inches, according to the different Age and Size of the Patient. When this is done, he introduces the fore Finger of his Left Hand into the Wound, and thruſts the Rectum aſide, that it may not be injured by the Inſtrument: Then he takes a crooked Knife, and with his Right Hand paſſes the Point (directed upwards) near his Left fore Finger into the Bladder, betwixt the ſeminal Veſſel and the Os Iſchium; then, preſſing down his Right Hand, he continues a ſecond Inciſion upwards, till the Point comes out again at the upper Part of the Wound. The Bladder being thus open'd, he introduces the fore Finger of his Left Hand into its Cavity: With that he feels, and fixes the Stone, then paſſing a Forceps, without any other Conductor, over his Finger, he endeavours to lay hold of the Stone with them; which being done, he draws out his Finger, and, graſping the Forceps with both Hands, extracts it with more or leſs Violence, in proportion to the Bulk and Shape of the Stone, and the Size of the Wound. If there are more Stones, he again introduces his fore Finger, and the Forceps, proceeding as before. During this whole Operation the Catheter remains in the Bladder, and the Aſſiſtant's Employment, who holds it, is only to prevent its ſlipping; and in this manner *Cheſelden* thinks the Bladder ſufficiently depreſſed for the Introduction of the Forceps over his Finger, without any Conductor; and, as it is previouſly diſtended with Water, he judges it impoſſible and unneceſſary to cut into the Groove of the Catheter; and that there is no Danger of laying hold of the Catheter with the Forceps, if the leaſt Care is taken. In this Method only one or two Ramifications of the Arteries, from whence there can be any Danger of an Hæmorrhage, are divided, and that very ſeldom. But if, after the Wound is cleanſed with a wet Sponge, a Profuſion of Blood continues, he ties up the Arteries with a crooked Needle and Thread (ſee *Tab.* LII. *Fig.* 14.); then, dreſſing the Wound with Lint, either dry, or ſpread, over with a reſolvent Ointment, and ſecured with proper Bandages, he puts the Patient to Bed.

By this Method, if he meets with no extraordinary Impediment, the whole Operation, from the firſt Inciſion to the Extraction of the Stone, is completed in one Minute.

(*a*) As *Albinus* the Father ſays, though the Son and *Dionis* will have it, that he divided only the Bladder itſelf.

(*b*) When I, at that time, and afterwards, performed the Operation on dead Subjects, I always found both the Neck, and Bladder itſelf, cut through; which I imputed to my own Ignorance in the Art of dividing the Bladder only.

(*c*) The Reaſon, as he told me, was, that the Knife might paſs more readily into its Groove, and not eaſily ſlip out again. It is repreſented in *Tab.* LII. *Fig.* 1. and, notwithſtanding what *Albinus* the younger ſays, I do not find it more incurvated than the common Catheter; for the Apparatus major requires a very crooked Catheter.

(*d*) The Poſture in which *Rau* placed his Patients is, perhaps, beſt deſcribed by *Erndelius*, in his *Iter Anglic.* and *Batav. p.* 119. He ſometimes laid the Patient on a little Cheſt, which I myſelf have ſeen, for Want of a Table. *Garengeot*, therefore, is miſtaken, when he ſays, he placed and bound his Patients, as in the Apparatus major.

(*e*) This Table was three Feet and an half long, two and an half broad, and three high.

(*f*) It were to be wiſhed *Douglas* had delineated this Catheter; for it is not eaſy to conceive, by this ſhort Deſcription, how it could be hollow and cannulated at the ſame time.

(*g*) But *Douglas* has not told us, how he ſtopt the Reflux of the Water through the Catheter; which muſt certainly be cloſed by the Aſſiſtant's Finger, or ſome proper Ligature.

Cheſelden is ſometimes obliged to vary his Method: Firſt, When he finds by a ſtrong Reſiſtance, or any other Token, that the Stone is very large, leſt he ſhould torture the Patient, or lacerate the Parts, he enlarges the Wound by a ſecond Inciſion upwards with Sciſſars, or downwards with his Knife. Secondly, If, after this Inciſion, upon paſſing his Finger into the Bladder, he finds the Catheter has ſlipt into the Wound, he draws back his Finger, and introduces the Gorget into the Groove of the Catheter, over which he paſſes the Forceps in the uſual manner; and, upon account of this Accident only, he gives the Preference to the grooved Catheter. Thirdly, If the Aſſiſtant, who holds the Catheter, finds the Forceps has laid hold of it, either with or without the Stone, which *Cheſelden* affirms to be very uncommon, he immediately orders the Catheter to be drawn out, endeavouring to lay hold of, and extract the Stone, without the Advantage, which that might afford him, by depreſſing the Bladder, and facilitating the Introduction of the Forceps over the Finger, or by a Conductor, when there is, on account of ſome Accident, Occaſion to repeat this more than once. Fourthly, When from the Smallneſs or Situation of the Stone he judges it more eaſy and ſecure, he introduces his Fingers into the Patient's Anus, preſſes the Stone towards the Wound, and extracts it, as in the Apparatus minor, with his other Hand. Fifthly, When he perceives an Impediment, either from the Ureter, or the Membranes and unuſual Folds of the Bladder, he paſſes his Fingers into the Anus, endeavours to protrude that Part to the Mouth of the Wound; then divides the Membranes, or whatever obſtructed the Paſſage, and extracts the Stone. Theſe are the Improvements *Cheſelden* has made on *Rau's* Method of Lithotomy: However, *Douglas*, on ſome Occaſions, prefers a Forceps ſomewhat incurvated; for, ſays he, I have often obſerved, that the Stone is extracted with more Eaſe, when it lies near the Wound, than when it is on the oppoſite Side; eſpecially if there is a preternatural Sinus in that Part: In theſe laſt Caſes he thinks the crooked Forceps will perform the Work better than the ſtrait ones.

Another Method of *Cheselden's*.

But, however advantageous this Method appeared at firſt, *Cheſelden* ſoon rejected it; becauſe the Urine, lying in the cellular Membrane near the Rectum, often produced a fetid Ulcer. In the room of it he ſubſtitutes the following: He ſecures the Patient, as in the Apparatus major; but lays him upon an horizontal Table, three Feet high, and cover'd with ſeveral Cloths, in ſuch a manner that his Head only is a little elevated: After this, he makes an Inciſion of a proper Length, beginning where they end in the Apparatus major, and continuing it downwards between the Accelerator Urinæ, and the Erector Penis, on the Left Side of the Inteſtinum Rectum; next, he ſearches for the Catheter in the Wound, and, having found it, divides the Proſtate Gland in a direct Line towards the Bladder, depreſſing the Rectum with a Finger of his Left Hand, that the Knife may not wound it: The Remainder is perform'd after the manner of the Apparatus major; with this only Difference, that, if any Blood-veſſels are ſeparated, he ſecures them with a crooked Needle and Thread.

Douglas has given us a more particular Deſcription of this Method, than *Cheſelden* himſelf. Firſt, he ſeats the Patient on a Table, and ſecures him with Ligatures; then he introduces his Catheter, (*Tab.* LII. *Fig.* 5.) ſomewhat different from the common Sort, into the Bladder. When the external Wound is ſufficiently large, he directs the Point of his Knife, of a peculiar Size and Figure, (ſee *Tab.* LII. *Fig.* 8.) towards the Catheter, furniſhed with a Groove, as is repreſented *Fig.* 4. and 7. which is ſtill in the Bladder, in ſuch a manner, that he makes a rectilinear Inciſion through the poſterior Part of the Urethra, immediately behind the Bulb, the Neck of the Bladder, and Proſtate Gland, and Part of the Bladder itſelf: This is done on one Side (ſee *Tab.* L. *Fig.* 1. I K L). After this, he riſes from his Seat, and gradually dilates the Wound with the fore Finger of his Left Hand; then calls for the Gorget (*Tab.* LII. *Fig.* 9.) with a crooked Handle A A; the Beak C he paſſes through the Groove of the Catheter into the Bladder, to feel for the Stone; then takes the Handle in his Left Hand, and, after extracting the Catheter, introduces his Forceps, (*Fig.* 12.) whoſe Handles A A vary from the common ones; he paſſes theſe cautiouſly, with the plain Side upwards, through the Groove of the Gorget, into the Bladder; then, having drawn out the Gorget, he takes the Handle in both Hands, and, keeping them ſhut, ſearches for the Stone; which being found, he opens them, and endeavours to take Hold of the Bottom of it with the lower Jaw: When he has hold of it, he applies his Left Hand to the Middle, and his Right to the End of the Handle; then moves them gently in various Directions to expand the Parts, and facilitate the Extraction of the Stone, taking particular Care, that it does not ſlip out; but, if this happens, he endeavours to lay hold of it again, without drawing out the Forceps. If the Stone is large and ſmooth, lying near the Wound, he extracts it without the leaſt Difficulty; but if it is ſmall, or in an inconvenient Situation, he draws out the Forceps, paſſes his Fingers into the Bladder, and endeavours to diſengage it from the Folds; then he introduces his Gorget once more over his Finger, and, withdrawing that, turns the concave Part of the Gorget upwards, through which he again paſſes the Forceps, ſearches for the Stone, and extracts it very cautiouſly and ſlowly. Laſtly, To prevent the Stone from breaking, he puts one or two of his Fingers between the Cheeks of the Forceps, that they may not compreſs it too violently: But if it does break, or there are more Stones than one, he extracts them, by repeating the former Operation; and aſſures us, there is no Danger, if it is performed with Caution. He makes his external Inciſion almoſt in the ſame Part as *Jaques* and *Rau*; but continues it both upwards and downwards; by which means he paſſes the Inſtruments, and extracts large Stones, with more Eaſe; and internally he makes an Inciſion in the End of the Urethra, the whole Neck of the Bladder, and that Part of the Body neareſt to it; by which he avoids wounding the Rectum, and promotes the Extraction of the Stone. If an exterior ſmall Artery bleeds too profuſely, he ties it; but, if it is too deeply ſituated for a Ligature, he applies a Styptic. Having extracted the Stone, he dreſſes the Wound with a digeſtive Ointment, and proper Bandage; then puts the Patient to Bed. This is generally ſaid to be partly compoſed of the *Ravian* Method, and partly of the Apparatus major, though, in my Opinion, it is entirely the former.

Cheſelden ſtill made farther Improvements, particularly with reſpect to the internal Inciſion: After the external Inciſion, he firſt directs his Knife to the poſterior Part of the Catheter, through the inferior and lateral Part of the Bladder, behind the Proſtate Gland, and above the ſeminal Veſicles (ſee *Tab.* L. *Fig.* 1. L.); then he continues it forwards through the Sphincter of the Bladder, and the Left Side of the Proſtate Gland, into the membranous Part of the Urethra, even to its Bulb, K I F, which preſerves the Rectum better than the *Ravian* or Lateral Method. Beſides, he affirms, that the Bulb of the Urethra hinders the Groove of the Catheter from being found, more in the other Method of Cutting than in this. Laſtly, Among *Cheſelden's* Emendations, *Douglas* enumerates theſe: 1. If he finds the Patient's Pulſe low after the Operation, he applies Bliſters to his Arms, which effectually raiſe his Spirits. 2. If the Wound grows callous, he lays on a Piece of Bliſter-plaiſter to erode it; by which new and ſound Fleſh pullulates, and the Wound unites. 3. If the Wound is putrid, he mixes a little Verdegriſe with ſome digeſtive Ointment.

LeDran, after an accurate Examination of the various Methods of Lithotomy, prefers one to the other, according to the different Circumſtances of the Caſe; though he ſeems to think the Apparatus major beſt on many Accounts, if performed with Judgment: Particularly if the Neck of the Bladder is gently dilated and divided as far as its Body, with the fore Finger and a Conductor; for here the Finger, with more Security, and leſs Pain, performs the Office of the Knife in the Lateral Method, though a precipitate Introduction of the Finger will lacerate the Parts, cauſe exquiſite Torment, and ſometimes ſeparate the Neck of the Bladder from the Urethra; which neceſſarily induces an Inflammation, Gangrene, Convulſions, and perhaps Death: He therefore condemns thoſe, who, out of an Affectation of Dexterity, perform with an uncommon Expedition.

He does not, however, diſapprove of the High or the Lateral Operation; but only ſhews, that in the latter the Proſtate and the Neck of the Bladder is divided by the Knife, which in the Apparatus major is done gently by the Finger; and, conſequently, the Difference between them is of no Importance. He prefers the High Operation, where the Bladder is large, and can be ſufficiently dilated; and this, he ſays, we may be ſure of, when the Patient has not been afflicted with the Stone for any conſiderable time, and can retain a large Quantity of Urine: But he rejects it, when the Bladder is ſmall, or callous, and cannot be ſufficiently diſtended. He gives the Preference to the Method of *Rau* and *Cheſelden*, when the Stone is very large; as they make their Inciſion in the Body of the Bladder, and dilate it diſcretionally: He objects, however, againſt *Rau's* Catheter, (which he has indeed repreſented much ſhorter, and very different from that delineated by *Albinus*) and ſays it is unfit for the Operation, as it will ſo eaſily, and ſo often, ſlip out; he therefore exhibits one, (ſee *Tab.* LII. *Fig.* 17.) in his Opinion, better adapted to the Purpoſe: This is ſulcated to *e e*, by means of which the Bladder may be divided near its Neck, and through this Aperture, by the Aſſiſtance of the grooved Conductor, may the Forceps be introduced, and the Stone extracted. He exhibits, likewiſe, a Knife ſharper-pointed than the common ones, which he recommends in the Apparatus major, and the Method of *Rau* and *Cheſelden*. See *Tab.* LII. *Fig.* 16.

He condemns the Apparatus minor, as unworthy of being ranked among the Methods of Lithotomy, and abſolutely pernicious, unleſs for extracting the Stone out of the Urethra, or the Neck of the Bladder. But if we conſider, 1. That the Wound is made through the Neck and Body of the Bladder, as in the Lateral Operation; and that theſe two Methods differ only in the Inſtruments; we ſhall find the Apparatus minor to be an advantageous Improvement upon the Antients. 2. That it was the only Method practiſed for above ſixteen Centuries, and is

ſtill continued, though the Apparatus major is ſo well known. 3. Experience convinces us, that it is ſucceſsfully performed, even at this Day, upon Children and Infants. 4. Nor is there any material Objection, except a poſſible Roughneſs of the Stone, againſt practiſing it on Boys under Fourteen, and Men of a low Stature. 5. It requires the feweſt Inſtruments; for the Knife alone is frequently ſufficient. I therefore recommend it for its Simplicity, and, with *Paulus Ægineta* and *Albucaſis*, adviſe the Improvement of it, eſpecially if the Inciſion is made in the ſame Parts as in the Lateral Operation. In Adults, and tall Men, it is attended with various Inconveniences: Wherefore *Celſus* judges it ſuitable only for Boys under Fourteen; tho' *Morand* ſays, it is ſometimes ſucceſsful in Adults.

Garengeot attributes the Honour of inventing and improving the Lateral Operation to his own Country; though it is abſolutely certain, that many eminent Men of ſeveral Nations may juſtly claim a Share in the Improvement of this Method; and that *Rau* was really the firſt, after the *French* had rejected it, who reviv'd and practiſed it on living Subjects, which he continued with Improvements, as long as he lived. After him, myſelf, then *Denys*, and, at length, the *Engliſh*, embraced and improved it; otherwiſe it might have been buried in perpetual Oblivion. In about thirty Years, the *French* were induced to receive it; and *Morand*, with a Condeſcenſion not very common to his Countrymen, came to *London* to ſee it performed by *Cheſelden*; and, upon his Return to *Paris*, practiſed it on ſeveral Patients, with Succeſs. During his Abſence, the *French* tried it on dead Subjects; and *Perchet*, as we are informed by *Garengeot*, having qualified himſelf ſufficiently, attempted it in the following Manner, on living Subjects.

An Hour or two before the Operation, he orders a Clyſter; then places the Patient oppoſite to the Light, on a Table about two Feet and an half high, which is firſt covered with Linen ſeveral times double; and, putting one Pillow under his Head, with another under his Buttocks, he binds him as in the Apparatus major. His Legs are then ſecured by two Aſſiſtants, whilſt a third, and ſometimes a fourth, confines his Shoulders cloſe to the Table. Next, a dextrous Perſon is placed on the Left Side, after the manner of *Cheſelden*, to hold up the Scrotum, and retain the grooved Catheter, (which *Rau* did himſelf) that the Operator may have both his Hands diſengaged. After this, he introduces into the Bladder a very crooked Steel Catheter, dipt in Oil, with a deep Groove, long Beak, and large Handle: When he perceives it is entered, he gently moves the Handle with his Left Hand towards his Right Inguen, and ſearches between the Suture of the Perinæum, and the Tubercle of the Iſchium, with the fore Finger of his Right Hand, for the Beak, taking care that it does not come to the Iſchium: He then gives the Handle to an Aſſiſtant, who fixes his Right Thumb upon the anterior Part, and his Fingers upon the poſterior, holding it very ſteady, while he elevates the Scrotum with his Left Hand, and inclines it towards the Right Side, which extends the Skin of the Perinæum. Then the Surgeon protrudes the Suture of the Perinæum obliquely towards the Right Thigh, with his Left fore Finger, and with his Right Hand makes the firſt Inciſion obliquely through the Integuments, beginning about a Finger's-breadth from the Suture of the Perinæum, and a Line above the moſt prominent Part of the Beak of the Catheter, deſcending obliquely to the Tubercle of the Iſchium, after *Rau*; for *Jaques* made his Inciſion in the oppoſite Direction. This Operation may be performed at once on lean Subjects; but, if they are corpulent, two or three Inciſions may be requiſite, tho' that depends on the Dexterity of the Surgeon. After this, the Operator paſſes his Left fore Finger into the Wound to ſearch for the Groove of the Catheter, (not to put aſide the Inteſtinum Rectum, as *Cheſelden* directs) that, if it happens to be moved, he may replace it in a proper Situation. He then makes an Inciſion, having firſt ordered his Aſſiſtants to ſecure the Patient, into the Urethra, directing his Knife into the Groove, by the Nail of his Left fore Finger, then into the Neck of the Bladder laterally; and, laſtly, by elevating his Hand, ſo that the Back of the Point may lie in the Groove of the Catheter, and the Edge towards the Bladder, he divides its Body, about a Finger's-breadth or more; for in this the principal Advantage conſiſts; but the fore Finger ſhould always follow the Knife, to keep it in the Groove. When the Inciſion is made ſufficiently large, that is, when he finds the Groove of the Catheter bare, about two Fingers-breadth, he withdraws the Knife, ſtill leaving the Finger in it, and with his Right Hand paſſes the Beak of a Conductor over the Nail of the Left fore Finger into the Groove of the Catheter; he, next, draws out his Finger, and with that Hand graſps the Handle of the Catheter, which hitherto an Aſſiſtant held, and, inclining it ſomewhat towards himſelf, at the ſame time conveys the Conductor into the Bladder; which, if duly performed, is followed by an Efflux of Urine out of the Wound. When this is done, he moves the Catheter gently from Side to Side, and extracts it; then he takes the Handle of the Conductor in his Left Hand, and paſſes his Right fore Finger through its Cavity into the Bladder, dilates the Wound, and opens a Paſſage for the Forceps, which he introduces with his Right Hand through the Conductor into the Bladder; then, with his Left, extracts the Conductor, and opens the Forceps to dilate the Wound, which he cloſes again to ſearch for the Stone, and, having laid hold of it, extracts it. After this, he introduces his fore Finger once more into the Bladder, to ſearch if any thing remains; and, if there is any Remainder, he introduces the Catheter over his Finger, or a Conductor with a Button at the End; he extracts it. Thus you have *Garengeot*'s Directions for performing this Operation; though we muſt obſerve, that the Bladder alone cannot be divided by this Method, but that there muſt be a Separation of its Neck, and the Proſtate Gland, laterally, and only of a ſmall Part of its Body, as *Morand* obſerves: He, alſo, repreſents a ſmall Knife for this Purpoſe, (ſee *Tab.* LII. *Fig.* 18.) from *Cheſelden*; though *Albucaſis*, long ago, recommended the Uſe of ſuch a Knife.

SENFFIUS's METHOD OF PERFORMING THE LATERAL OPERATION.

Senffius, a Surgeon of *Berlin*, who was as equally well skilled in all chirurgical Operations as in Lithotomy, preferred the Lateral Method, and performed it in the following manner. The Patient is placed upon a Table, of ſuch an Height, that the Surgeon, when upon his Knees, may reach up to his Navel. Upon this he lays two Pillows, one under his Head, and another under his Buttocks; then fixes him upon the Edge oppoſite to the Light, bends his Legs to his Hips, and ſecures them by two Aſſiſtants, and a Cord (he omits the Ligature in Children); a third holds down his Shoulders, a fourth kneels over him, (as *Tab.* L. *Fig.* 9.) holding up his Genitals with his Right Hand, and with his two fore Fingers extending the Skin of the Perinæum, that the Inciſion may be more accurate, and the Catheter more perceptible in the Perinæum: He had, alſo, a fifth, to give and receive the Inſtruments. After theſe Preparations, he introduced into the Bladder a Silver grooved Catheter, more ſlender and incurvated than uſual, (ſee *Tab.* XLVIII. *Fig.* 15. *a a a*) dipt in Oil; with this he ſearches for the Stone, till he convinces both himſelf, and the Spectators, that there is one. He then kneels down upon his Right Knee, like *Rau*; and, with his Left Hand, turns the Handle of the Catheter towards the Right Inguen, and its Beak towards the Tubercle of the Iſchium, holding it himſelf; he next cuts through the Integuments, betwixt the Anus, and this Tubercle, with a Knife broader than common, and involved half Way in Linen. After this, he puts the Knife in his Mouth, and, with his Right fore Finger, ſearches in the Wound for the Catheter: When he has found it, he cuts into its Groove, as *Rau* did, and, retaining the Knife there, moves the Handle of the Catheter with his Left Hand towards himſelf; and, holding the Knife in his Right, follows the Beak of the Catheter as it moves inward; and thus dilates the Wound of the Bladder. He then gives the fourth Aſſiſtant the Catheter to hold in this Poſition, while he himſelf, with his Left Hand, introduces a male Conductor, near the Knife, into the Bladder; then extracts the Knife, and paſſes a female Conductor (made of Silver as well as the other) over that; and, withdrawing the Catheter, he, after *Rau*'s Method, conveys a Forceps between the Conductors, with which, after the Extraction of the Conductors, he ſearches for the Stone, and extracts it ſo dextrouſly, that the Whole is completed in two or three Minutes. His Reaſon for uſing this ſlender Catheter, was becauſe it paſſed more eaſily into the Bladder; and he made it of Silver for Neatneſs. An Inſtrument ſo much inflected muſt thruſt the Urethra, and Neck of the Bladder, more towards the Perinæum; which induces me to think, that he divided not only the Bladder, but its Neck too.

MORAND's SENTIMENTS OF LITHOTOMY.

Morand reaſons very juſtly on the ſeveral Methods of Lithotomy, and concludes, that the Multiplicity of them is ſo far from being an Incumbrance, that it is a real Advantage, as different Circumſtances will require a different Practice; aſſuring us, that he had examined and performed each of them. In his Treatiſe on the High Operation, he promiſes another on the Lateral; but, as he had heard of *Cheſelden*'s extraordinary Succeſs, he came to *London*, that he might be an Eye-witneſs of his Practice, and converſe with him on the Subject. He informs us, likewiſe, that *Cheſelden*'s ſole View in relinquiſhing the High Operation was to endeavour at an Improvement upon *Rau*, and, if poſſible, to render his Method preferable to the other. He then enumerates many Experiments, which *Cheſelden* had made, partly after *Rau*'s Method, as deſcribed by *Albinus*, and partly by a previous Diſtention of the Bladder with Water; but ſays, that the Urine always inſinuated itſelf into the cellular Subſtance, which inveſts the Rectum; and cauſed foul, putrid Ulcers, of which ſeveral dy'd. He, alſo, forbids the Aſſiſtant, who holds the Catheter, to protrude it forward, as this may eaſily divide the whole Sphincter; nor ſhould the Wound in the Membrana Adipoſa, near the Rectum, be too deep (perhaps, leſt the Urine ſhould lodge and putrefy there). He further tells us, that an ulcerated Bladder may be better cleanſed this way, than any other; and laſtly, which he eſteems the greateſt Recommendation, that, by dilating the Wound

Wound after his Method, *Cheſelden* extracted a large Stone, which another Surgeon could not by *Marianus*'s. This Method, he ſays, was attended with ſuch Succeſs at *Paris*, in the Year 1730. that out of ſixteen Patients, eight of whom *Perchet* cut, and the reſt himſelf, one only miſcarry'd, when, out of twelve, who were cut at the ſame time by the Apparatus major, five dy'd. He eſteems it more eaſy and effectual, than *Marianus*'s, as the fore Finger is the beſt Conductor; and that the Operation is more ſhort, and leſs painful, as large Stones may be more eaſily extracted. Laſtly, he pronounces *Rau*'s Method too intricate and difficult; and therefore doubts with *Douglas*, *Garengeot*, and *Falconet*, whether he did really perform it in the manner which *Albinus* has deſcribed.

As I have been a long time deſirous, that the Hiſtory of this Method, and particularly of *Jaques*, as the firſt-known Author of it, might be fairly ſtated, I muſt beg Leave to make ſome Obſervations on *Morand*'s Account of him. *Morand*, contrary to the received Opinion, endeavours to prove, that, after the Emendations made by *Mery*, *Fagon*, and *Felix*, *Jaques* always cut his Patients ſucceſsfully in *Cheſelden*'s Method. And this, ſays he, is manifeſt from the ſixty he cut at *Aix la Chapelle*, in the Year 1699. the greateſt Part of whom recovered; the thirty at *Verſailles*, in 1701. who were all cured; and the twenty-three at *Paris*, in 1703. amongſt whom the Marſhal *de Lorge* only miſcarried. But, for my own Part, I muſt confeſs, I have ſeveral Scruples about all theſe Accounts; and more particularly the firſt, as it is ſupported by no Teſtimonies; ſo far from it, that we are aſſured by *Mery*, *Jaques* was ſent for to *Aix la Chapelle*, to cut a certain Patient, that is, one. Beſides, it is notorious to all, who are in the leaſt acquainted with *Germany*, that the Stone in the Bladder is a very uncommon Diſtemper; and, conſequently, that one City could never afford him ſo many Subjects. As for his Performances in *France*, they ſtand upon the ſame Foot of Probability with me; ſince *Saviard* and *Dionis*, his Cotemporaries, rather mention him as a raſh, imprudent Operator; the latter of whom could not certainly have the Confidence to publiſh a falſe Aſſertion in a Book approved by the Cenſors, and dedicated to the King, while *Jaques*'s Exploits were in the Mouth of every body, and *Fagon*, the very Perſon he appealed to, ſtill alive. He cites, alſo, a Manuſcript of one *Hanold*, dedicated to *Fagon*, in which the Author defends *Jaques* againſt *Mery*; but, ſince *Fagon* was ſo great an Encourager of medicinal Knowledge, and, being afflicted with the Stone, applied to *Mareſchal* for Relief, rather than *Jaques*, I muſt call the Truth of this in queſtion. On the contrary, I am convinced by *Launeau*'s Diſſertation, that he looked upon *Jaques* as an imprudent, raſh Operator, and commended *Fagon* for oppoſing him, and putting an End to his Impoſtures; which is agreeable to what *Mery*, *Saviard*, *Dionis*, *Colet*, and common Fame, have all declared. He, further, ſays, it is a Misfortune, that this Method has been examined only by *Mery*: Which is another Miſtake; for *Baſſiere*, *Liſter*, *Saviard*, *Launeau*, and *Dionis*, who were all, at that time, reſident at *Paris*, and Eye-witneſſes of his Performances, have, alſo, conſidered it. It is, therefore, plain, that all the Writers of that Time unanimouſly agree in condemning this Method.

As to his Succeſs in *Amſterdam* in 1703. which *Morand* extols ſo greatly, and ſays he was rewarded by the Magiſtrates with a Golden Medal, inſcribed, PRO CIVIBVS SERVATIS; during my whole Reſidence in that City, in 1706. I could never get the leaſt Information either of his Succeſs, or the Preſent. I could, therefore, have wiſhed, that *Morand* had informed us where he picked up this Intelligence. On the contrary, in *Albinus*'s funeral Oration on *Rau*, we are aſſured, that he had no better Succeſs than at *Paris*, in the Year 1698. and ſtill continued in his Errors. By a private Letter, which I received from a *Dutch* Phyſician in 1737. I find his Reputation was but ſhort-lived, and that he was really preſented with a Medal relating to his Profeſſion, with this Inſcription, OB CIVES SERVATOS. From thence he went to *Leyden*, where he reigned, too, for a ſhort time; but *Rau* ſoon drove him thence. However, the Populace ſtill adored him, partly for his Eccleſiaſtical Habit, and partly for his Generoſity, in performing Cures *gratis*, as a Perſon ſent from Heaven; ſo that the Magiſtrates, to prevent any Tumult, which *Rau*'s Repreſentations might cauſe, made him this Preſent.

Verduin, in a Letter to me, ſays, that *Jaques Beaulieu* was born of mean Parents, and never learned Surgery, but was Servant to an itinerant Mountebank, who uſed to cut for the Stone, and for Ruptures, whom he attended in ſeveral Campaigns; which gave him an Opportunity (as he himſelf confeſſed to *Verduin*) of frequent Experiments upon dead Subjects. After his Succeſs in *France*, and at *Aix la Chapelle*, he was invited, by a Perſon of Diſtinction, to *Zutphen*, in order to cure him of a Sarcocele. He, from thence, went to *Amſterdam*, where, upon Examination, *Guerelle*, and ſeveral other judicious Men, found his Catheter to be without a Groove. Afterwards he performed his Operation on a Boy, with ſo much Dexterity, that *Bernargius*, and the principal Phyſicians of the City and Hoſpital, recommended him to the Senate, at whoſe Expence he was ſupported.

About this time he procured ſome grooved Catheters; and, travelling through the Southern Parts of *Holland*, performed ſeveral Operations for the Stone, and for Ruptures. After his Return to *Amſterdam*, his Stay was very ſhort; and *Verduin* attended him in his Journey from thence to *Paris*, as far as *Boiſleduc*, where he continued three Weeks, and cut ſeveral for the Stone. At this Place, ſays *Verduin*, the Senate of *Amſterdam* preſented him with a Golden Extractor, engraved on the Back with the Arms of the City, and a Crown adorned with Oak-leaves, over which were theſe Words, OB CIVES SERVATOS.

At *Verduin*'s Return, he found *Jaques*'s firſt Patient, who had procured him ſo great Reputation, not perfectly cured; ſeveral were dead; ſome had a Fiſtula in the Perinæum, others an Incontinence of Urine, and ſome other bad Symptoms. From one Patient he extracted three Stones, but left two behind. In others, the Fæces were diſcharged through the Wound and Perinæum. But, what was ſtill worſe, upon ſearching, he found a Stone in a Perſon of Diſtinction, at the *Hague*; and, after Ten the ſame Night, proceeded to his Operation, but then could find none; though, upon opening this Nobleman, ſome few Days after, there proved to be ten large Stones in his Bladder. Thus far *Verduin*.

Saltzmannus informed me, that at *Strasburgh* *Jaques* uſed a Knife like a common Table-knife, and a very crooked groov'd Catheter, with a cannulated Conductor, different from the common one, only in having a Button at the End, inſtead of a Beak; and a Ring, inſtead of a cruciform Handle. When he had paſſed his Right fore Finger into the Bladder, he conveyed this Inſtrument over it; then withdrew his Catheter, and introduced the Forceps by it. When he had examined the Situation, Figure, and Size of the Stone, he choſe a Forceps ſuitable to the Patient, flatter than the common Inſtrument, with a large Ridge internally near the Edge, and without Teeth, that they might not intercept or hurt the Bladder. Dr. *Trew* ſent me the Figure of the Conductor and Forceps.

Another Error of *Morand*'s, who ſays, that *Jaques* retired to his native Place *Beſancon* in the Year 1712. and died there in 1714. is confuted by *Saltzmannus*, who ſaw him perform his Operation at *Strasburg* in 1715. which is confirmed by *Le Maire*, who ſays, that he lived a long time after this at *Beſancon*, even till he was ſeventy Years of Age.

Authors differ very much about the Time of *Jaques*'s being in *Holland*; but I am aſſured by an eminent *Dutch* Phyſician, and *Verduin*, that he came firſt into *Holland* in the Year 1699. Since we are ſo ignorant of the Life of this great Man, who gave Birth to ſo remarkable an Operation, it is to be wiſhed, that the *French*, who muſt be furniſhed with the beſt Materials for it, as he was a Native of that Country, reſided moſt Part of his Days, and ended them there, would oblige the World with a more particular Account.

INCONVENIENCES OF THE LATERAL METHOD.

Though the Lateral Operation has acquired ſo great a Name, it is not without its Inconveniences and Difficulties, any more than the Apparatus major: For, firſt, it is ſubject to produce a Fiſtula in the Perinæum. Secondly, The tranſverſe Situation of an oblong large Stone, which cannot be known before the Operation, expoſes the Patient to violent Pains, and the Danger of Death without extracting it, which may be effectually done by the High Operation. Thirdly, The Situation of the Stone above the Os Pubis, being fixed there in the Form of an Hook, may render the Extraction both difficult and dangerous; a fatal Example of which *Sermes* gives in his Tranſlation of *Douglas*'s Lithotomy. Fourthly, When the Stone is lodged in ſome Fold of the Bladder, or is very ſmall, or broke to Pieces, the Apparatus major is preferable: *Rau* often met with this Difficulty in that Operation, according to *Sermes*. Fifthly, This Method cannot be performed, unleſs the Catheter can be paſſed into the Bladder. Sixthly, The Bladder is liable to be perforated, pinched, and lacerated, by the Inſtruments. Seventhly, This Operation can ſcarcely be performed on Women, eſpecially Adults, without perforating the Vagina; and we are furniſhed but with one Inſtance to the contrary, which *Rau* mentions.

Upon the Whole, then, Lithotomy appears to be a dangerous and precarious Operation; nor can we depend upon one Method alone, but the Surgeon muſt be determined in his Choice by the particular Circumſtances of the Caſe.

The Apparatus minor is improper, when the Stone is rough and ragged, or too large to be held by the Fingers, or the Patient is tall, becauſe in ſuch an one the Diſtance of the Bladder from the Anus prevents the Stone from being felt and protruded to the Perinæum. I, in this Caſe, prefer the Lateral Method, or the High Operation. But in Boys, and Adults of a ſmall Stature, when the Stone is ſmall and ſmooth, and can be forced to the Neck of the Bladder, and particularly when it is lodged in the Neck of the Bladder, the Apparatus minor is eligible. In old weak Perſons, or where the Bladder is ulcerated, the High Operation is dangerous; but in Children, and young Men, it may be performed

formed with great Safety, though the Stone is large; or when it is too small to be found by other Methods, or brittle, or where there are several, they may all be extracted this way: But great Care is required not to wound the Fundus of the Bladder. Though the Incision in the Apparatus major is less dangerous than that in the High or Lateral Operation, because in that the Urethra only is wounded; yet I would not recommend it when the Stone is large, ragged, or unequal, because it may probably be attended with a violent Extension, Laceration, or Contusion of the Neck of the Bladder; but, in an ulcerated Bladder, where the Stone is small and smooth, this Operation is proper, as the Bladder may be better cleansed downwards. The Lateral Method, as it is now improved, excels the Apparatus major, because it is performed more readily, and larger Stones may be extracted by it; but the Wound is certainly more dangerous and difficult, since it is deeper than in the other, where the Urethra only is divided in the Perinæum; whereas in this the Incision must be made through the Parts which invest the Bladder, and, of consequence, in fat Subjects particularly, the Rectum, with the seminal Vessels, may be injured by the Knife slipping out of the Catheter, or the Bladder itself may be perforated on both Sides, as it often happened in *Tagaut*'s Operations.

The Apparatus major is hazardous and difficult, because a Stone of a moderate Size, especially if somewhat rough, cannot be extracted by it, without a violent Extension, or total Laceration of the Bladder, which is usually followed by a profuse Hæmorrhage, Inflammation, Gangrene, Cancer of the Bladder, and Danger of Death; or, at least, Incontinence of Urine, in a Fistula in the Perinæum, and many other bad Symptoms. From what has been said, it appears, that each Method is proper in its Turn; and, therefore, the Surgeon ought to be acquainted with them all, and chuse that which is adapted to the particular Circumstances of his present Patient. In *Marianus*'s Method, the Urethra only is divided; in all the rest, the Incision is made in the Bladder, and even in its Body: In the High Operation, the inferior and anterior Part of it is divided; in the Apparatus minor, and Lateral Operation, the inferior and lateral Part; so that the Difference between these three consists more in the Instruments, than the Place of Incision into the Bladder.

Lastly, Patients, who have been happily cured of the Stone, are liable to a Return, which should not be rashly imputed to the Ignorance of the Operator. For if the original Cause continues, as a vitiated Bladder or Kidneys, it must necessarily produce the same Effect: Nor is it in the Power of the ablest Physician to ensure a Person from a Relapse.

The Method of extracting the Stone out of the Bladder of Women.

Women are less subject to the Stone in the Bladder, than Men: For they are more regular in their Diet, and their urinary Passages are more short and lax; so that, in general, the Stone, being but small, discharges itself with the Urine, and, when it does happen to lodge and increase in the Bladder, we have many Instances of its coming away spontaneously, without the Danger of an Operation. For this Reason, it is generally observed, that fifty Men are cut, to one Woman; and *Molineux* says, an hundred. *Reiffer*.

I was once Witness of a remarkable Case, where a large Stone was expel'd spontaneously. A Gentlewoman, about five Months gone with Child, sent for me to consult me about a Complaint, which I judg'd to be the Stone, and advis'd her to take only some softening mucilaginous Medicines, till such time as she should be deliver'd. I heard no more of her, till she was in Labour; when I was call'd again, and found a Man-midwife with her, who told me, the Stone was so unluckily situated, that it was impossible to deliver her, every Pain bringing the Stone into the Passage; and was of Opinion, that the Stone should be taken away immediately, before she could be delivered. This, however, I opposed, and the Patient was delivered by proper Management. Upon searching her, about two Months afterwards, I found the Stone situated partly in the Urethra; so that, by drawing the Edges of the urinary Passage aside, I could see it. Upon this, she consented to have the Stone taken away, and a Day was appointed for the Operation; but the Morning it was to be performed, her Courage failed, and she determined not to undergo it. About six Weeks after, I was call'd again, and found she had parted with the Stone spontaneously, without much Pain; and afterwards she was, for some few Months, troubled with an Incontinence of Urine, which gradually went off, and she recovered perfectly.

These natural Advantages do not always exempt Females from the Necessity of Extraction: For the Stone is sometimes retained in the Bladder by the Narrowness of its Neck, and increases to such a Size, that all lithontriptic Medicines prove ineffectual.

Women labouring under the Stone are generally more happy than Men afflicted with the same Misfortune, because they are often relieved without the Use of the Knife, or any dangerous Incision, only by the Dilatation of the Urethra, and Neck of the Bladder. And this Attempt is the rather to be made, because we know from Experience, that the Neck of the Bladder in Women may, without any subsequent Damage, be almost incredibly dilated. This is sufficiently proved not only by the Instances of large Stones spontaneously discharged by Women, but, also, by the Testimonies of many celebrated Physicians, Surgeons, and Lithotomists; such as *Hildanus*, *Tolet*, *Greenfield*, *Alghisi*, and some others. Of this we have a memorable Instance, in *Miscell. Nat. Curios. Obs. Decad.* 2. *An.* 10. where we are told, that a certain Woman was happily freed from a Stone situated in the Neck of the Bladder, and weighing five Ounces and an half, only by the Dilatation of the Urethra. In the *Philosophical Transactions*, N° 202. 236. and elsewhere, we have remarkable Instances, where the just-now specify'd Method has succeeded happily in many Women, both young and old, tho' the Attempts have been generally more successful in the former, than in the latter.

For this Reason, a far smaller Apparatus of Instruments is requisite for the Cure of the Stone in Women, than in Men: There are, however, various and even more Methods invented of extracting the Stone from Women, than those we have described for freeing Men from the same Misfortune. But, for the sake of Distinctness, the general Method of extracting the Stone from Women, as well as from Men, may be divided into those performed by *the smaller*, *the greater*, *the high*, and the *lateral Apparatus*: Each of these may again be performed in different Manners. We shall now treat of the first of these, which is to be performed in different Manners, according to the Variety of Circumstances and Symptoms. But, since there are various Ways of performing this Operation, we ought carefully to deliberate which of them is most safe and commodious. The most antient is that described by *Celsus*, and generally known by the Name of the *lesser Apparatus*.

Celsus says, when the Stone is small, the Knife is unnecessary, because the Urine generally forces it into the Neck of the Bladder; and, if it lodges there, it may be safely extracted with an Hook. When it is large, the Surgeon should introduce his Fingers into the Anus of a Virgin, or the Vagina of a Woman, and make his Incision at the Bottom of the Left Side of the Perinæum, and extract the Stone, as in Males. *Albucasis* advises to pass two Fingers into the Anus or Vagina, to search for the Stone, and then protrude it gradually towards the Perinæum, and, as much as possible, downwards, towards the Left Side of the Anus, or Tubercle of the Ischium, till it is perceptible to the Touch; then an Incision may be made down to the Stone, without wounding the Bladder, till the Stone becomes visible, when it should be expelled by the Fingers in the Anus, or extracted, as in Men. *Meekren* too, when the Stone sticks in the Urethra, orders it, by introducing two Fingers into the Vagina, to be protruded forward, and extracted with an Hook. These have been the common Methods, except that some first dilate the Urethra with proper Instruments; others, when it is requisite, divide it; and then extract the Stone with an Hook or Forceps, if the Fingers will not accomplish it. But this Operation should be referred rather to the Apparatus major. *Jo. Douglas* has proposed a new Way, by dilating the Urethra gradually with Tents made of Gentian-root, or prepared Sponge, till a free Passage is opened for the Admission of the Forceps, and Extraction of the Stone. We may be assured there is a Stone, as well by the common Symptoms attending that Disorder, as by passing the Catheter and Fingers. The Woman is to be placed in the same Posture, as a Male Patient, the Labia Pudendi, and Nymphæ, are to be held asunder by the Assistant, who should hold up the Scrotum in a Man, that the whole urinary Passage below the Clitoris may be visible to the Operator (see *Tab.* L. *Fig.* 2. D); then he may proceed in the Method he judges most proper. When the Stone is extracted, he must search for more, and the Remainder must be extracted in the same manner. It is seldom necessary to tie the Patient; and the Operation may be in the same manner performed, while the Patient lies cross a Bed.

The Apparatus major requires more Instruments; and in this, as well as the former, the Methods are various, tho' the general Practice among the Moderns is, to place the Woman on a Table, securing her by proper Assistants, one of whom is to hold open the Labia Pudendi, and Nymphæ, while the Surgeon introduces a male Conductor, (see *Tab.* XLIX. *Fig.* 2.) and then a female (*Fig.* 3.) through the short Urethra into the Bladder: These he opens gradually to dilate the Urethra with the Neck of the Bladder (*Tab.* L. *Fig.* 2. B C); and between them he conveys a Forceps, (see *Tab.* XLIX. *Fig.* 5.) with which he gently enlarges the Dilatation, till the Passage is sufficiently opened for the Extraction of the Stone. No Difficulties occur, when the Stone is smooth, small, or of a moderate Size; but, when it is large, the Task is not quite so easy, tho' he must then dilate the Urethra gradually, till the Stone follows. When the Stone cannot be laid hold of with the Forceps, two Fingers should be pass'd into the Vagina of a Woman, and one into the Anus of a Girl, to press it into the Instrument. When it is too large to be extracted this Way, the Surgeon must endeavour to break it with a strong Forceps with large Teeth, (see *Tab.* XLIX. *Fig.* 7.) that he may extract it in Pieces: If it cannot be broke, or he is willing to extract it whole, he must divide the Urethra, on one or both Sides;

Sides; and, in my Opinion, he need not ſcruple to make an Inciſion thro' the whole Neck of the Bladder into part of its Body, ſince this is done in Men without the leaſt Danger. And *Paré* ſeems to approve of this Practice, as he has recommended and delineated a grooved Catheter for dividing the Urethra of Women, when there is Occaſion; which *Colot*, likewiſe, commends, and we have repreſented (*Tab.* LIII. *Fig.* 7.). Some paſs the Forceps thro' a narrow cannulated Conductor. As too great an Extenſion of the Neck of the Bladder may produce an Incontinence of Urine, it is proper to apply a ſtrengthening Fomentation for a few Days. But old Women are more ſubject to this, than young. When the Parts are wounded, vulnerary Medicines will be ſerviceable.

Marianus adviſes to leave the Expulſion of ſmall Stones to Nature, as the Urethra in Women is ſhort and lax: A large one, he thinks, ſhould be extracted, as in Men. But the proper Place for the Inciſion, he ſays, is between the Os Femoris, and Urethra. When, therefore, he has introduced a grooved Catheter into the Bladder, an Aſſiſtant draws the Labrum Pudendi on that Side, where the Wound is to be made, till the Operator has a diſtinct View of the Part: He then makes an Inciſion about a Finger's-breadth from the Os Femoris, and proceeds as in Men: Nor ſhould the Surgeon be terrify'd at a profuſe Hæmorrhage. Tho' *Marianus* has not diſtinctly pointed out the Part, I am inclined to think, he made his Inciſion in the ſame Place with Frere *Jaques*, and *Rau*. Some paſs a Dilatator between the Conductors, to diſtend the Neck of the Bladder; and then extract the Stone with a Forceps. For my own Part, I never uſe that formidable Inſtrument, but introduce my fore Finger, inſtead of it. Others recommend a Diviſion of the Urethra, and even of the Body of the Bladder, as leſs dangerous than a violent Dilatation: Others oppoſe this; and, in favour of their Opinion, allege the many Inſtances of large Stones diſcharged ſpontaneouſly, by the Aſſiſtance of Nature alone, or by the Help of Diſtention: Which Opinion is countenanced by *Molineau*, and confirmed by Caſes, which he enumerates; but we muſt obſerve, that all thoſe Stones were ſmall, the largeſt ſcarce bigger than a Pigeon's Egg: Theſe, indeed, and larger, may be extracted without the Knife; but certainly all cannot. We may therefore conclude, that the Method of extracting the Stone from Women ſhould be varied according to its different Size. Some introduce a grooved Catheter before the male Conductor (ſee *Tab.* LIII. *Fig.* 7.); and then paſs that, with the other Inſtruments, through its Groove.

Frere *Jaques* uſually cut Women in the ſame Manner as Men: But he has been followed only by *Rau*; for the Generality of Lithotomiſts have preferred the preceding Method, though, in my Opinion, when the Stone is too large to be extracted through the Urethra, without injuring the Neck of the Bladder, and the Bladder itſelf, this will be ſerviceable to the Patient; nor is there any Danger of weakening the Neck of the Bladder, but very particular Care is required to avoid the raſh Practice of *Frere Jaques*, who wounded the *Vagina*, or *Rectum*; which Accident Women, who have born Children, are very ſubject to. *Falconet* ſays this Method of Lithotomy in Women requires more Caution than any other, and therefore recommends the High Operation, when the Stone is large; or adviſes to cut the Vagina, Bladder, and its Neck upon the Catheter, which *Buſſiere* would have done upon the Stone itſelf, brought to the Neck of the Bladder. *Mery*, in order to avoid a Laceration, and Incontinence of Urine, propoſes to paſs a grooved Catheter into the Bladder, and cut thro' its Neck, with Part of the Vagina, as in Males; which is leſs hazardous than a violent Diſtention or Laceration: For, even in the Time of *Celſus*, it was a received Axiom, that Inciſions are leſs dangerous, and more eaſily cured, than Contuſions or Lacerations. And, therefore, it is no Wonder, that *Hildanus*, by cutting almoſt in the ſame Method, through the Bladder, and Part of the Vagina, and dilating the Wound partly with his Finger, and partly with a Knife, to the Neck of the Bladder, ſhould extract a Stone as big as a Hen's Egg. He likewiſe produces a Caſe, where ſeveral Stones eſcaped through an Ulcer of the Parts, which was afterwards healed; and, conſequently, ſuch Wounds are not incurable.

Douglas propoſes to extract a ſmall Stone, by dilating the Urethra with a Tent of Gentian-root, or prepared Sponge. But, when the Stone is large, he approves of the High Operation, diſtending the Bladder with warm Water, and compreſſing the Urethra by an Aſſiſtant's Finger in the Vagina, and then making an Inciſion into the Bladder, immediately above the Os Pubis. This is a very proper Method, when the Stone is very large, and the Patient young and healthy, as there is no Danger of wounding or weakening the Sphincter of the Bladder, ſo as to cauſe an Incontinence of Urine; but, with *Morand*, when the Stone is ſmall, I muſt prefer the Apparatus major, or minor.

It is to be obſerved, that Stones are ſometimes formed in the Bladders of Women, by an Incruſtation on large Needles, Hairbodkins, or ſome ſuch Bodies ſlipping into it: For, when there are foreign Bodies in the Bladder, the earthly Parts of the Urine will adhere to their Surface, and in time form a very large Stone. And we are furniſhed with numberleſs Inſtances of this Kind, but the moſt ſurpriſing of all is that in the *Philoſophical Tranſactions*, N° 260, of a Girl about twenty Years old, from whom *Proby* extracted a Stone by the High Operation, without a previous Diſtention of the Bladder; the Baſis of which Stone was a Hair-pin, about ſix Finger's-breadth long, and of a proportionable Thickneſs. *Heiſter's Surgery.*

LITHOTOMUS. A Lithotomiſt, or Surgeon who cuts for the Stone.

LITIM. A Thread ſeveral times doubled. *Rulandus.*

LITOS, λιτὸς, ſimple, not very compound. Some Preparations are thus called, as the *Diamoron*, and *Diacodium*, by *Galen*.

LITRA, λίτρα. The ſame as LIBRA.

LITRON, λίτρον, in the Attic Dialect, is the ſame as νίτρον, Nitre.

LITTERISTUM. An obſcure Word in *Paracelſus*, which ſeems to import a kind of magical Cure, or Charm, for a particular Fever.

LITUS. A Liniment.

LIVIDUS *Muſculus*. The PECTINÆUS; which ſee.

LIXIVIUM. A Lye, that is, Water impregnated with the Salts of burnt Vegetables.

LIXIVUM. An Epithet for Oil, which flows ſpontaneouſly without Preſſure; or for Muſt, which runs in the ſame Manner.

LOBELIA.

The Characters are;

It hath a tubulous anomalous Flower, conſiſting of one Leaf, which is divided into many Parts, each being ſhaped ſomewhat like a Tongue, and are ſpread open like an Hand; this is incloſed in the Cup, which, afterwards, becomes a ſoft oval Fruit, which is full of Juice, and ſurrounds a Nut of the ſame Shape, which has a hard Shell.

Miller mentions but one Sort of this Plant; which is,

Lobelia fruteſcens, portulacæ folio. *Plum. Nov. Gen.*

This Plant was named by Father *Plumier*, who diſcovered it in *America*, in Honour to *Lobel*, a learned Botaniſt.

LOBELLUS, or LOBULUS. A ſmall Lobe. Thus the Cells of Fat are called *Lobuli Adipoſi*; and the Extremities of the *Bronchia*, which end in little Knobs, are call'd *Lobuli Pulmonum*. *Winſlow* calls the ſmall Lobe of the Ear, *Lobulus*.

LOBUS, λοβὸς, in Botany, ſignifies a Pod; and ſometimes the *Ungues*, or white Part of the Leaves of Roſes.

In Anatomy, the Diviſions of the Liver, and Lungs, are call'd Lobes; and the Tip of the Ear is named its Lobe.

LOBUS ECHINATUS.

The Characters are;

The Leaves are equally pinnated; the Flower conſiſts of one Leaf, which is cut into many deep Segments, and is almoſt of an anomalous Figure: From the Cup ariſes the Piſtillum, which becomes a rough, prickly Pod, in which are contained one or two hard roundiſh Seeds.

Miller mentions two Species of this Plant; which are,

1. Lobus Echinatus; fructu flavo, foliis rotundioribus. H. L. The yellow Nicker-tree.

2. Lobus Echinatus; fructu cæſio, foliis longioribus. See BONDUCH.

Theſe two Plants are very common in *Jamaica*, *Barbadoes*, and all the *Caribbee Iſlands*, where they climb upon the Shrubs and Trees which grow near them. The Leaves, Branches, Stems, and every Part of them, are greatly beſet with Prickles; which renders it very troubleſome to paſs between them, where they grow pretty cloſe.

LOCALIA *Medicamenta* are Medicines deſtin'd to operate upon particular Parts; or, more frequently, external Applications. *Localis Membrana* is the *Pia Mater*.

LOCH. The ſame as LINCTUS.

LOCHIA, λόχια, or λόχεια. The Purgations of the *Uterus* after Childbirth. Theſe conſiſt, generally for the two firſt Days, of a kind of bloody Serofity, and gradually become more white, and leſs in Quantity; which, during the whole Time, cannot be determin'd, ſome Women having more, others leſs: Nor can the Duration of this Flux be limited to any particular Time; for, in ſome, it continues fifteen or twenty Days only; in others, forty.

In general, however, the *Lochia* may be eſteemed to flow regularly, when the Colour gradually changes from rediſh to white; when the Flux is equal as to its Conſiſtence, and at laſt becomes ſomewhat viſcid; when it has no ill Smell; and when it gradually decreaſes in Quantity.

The *Lochia* ſometimes flow in too large Quantities, either on account of ſomething retain'd in the *Uterus*, which prevents it from contracting duly; or a too great Fluidity or Agitation of the Blood. In this Caſe, the Patient is frequently ſeized with fainting Fits, and Convulſions; and an extraordinary Paleneſs, Weakneſs, and Swelling of the Legs, ſhew that the *Lochia* are redundant. If, therefore, it proceeds from a Retention of ſomething in the Uterus, this muſt, if poſſible, be brought away by the Hand. But, if it proceeds from a too great Fluidity or Agitation of the Blood, temperating Decoctions of Barley, Jellies, Emulſions, Opiates, and Aſtringents, are to be adminiſter'd.

But a Deficience in the *Lochia*, or their utter Suppreſſion, occurs more frequently, being generally brought on by taking Cold, a Stricture of the uterine Veſſels from any Cauſe whatever, a Diarrhœa, Depreſſion of the Mind, Hyſterics, or an imprudent Uſe of Opiates or Aſtringents.

The Conſequences of ſuch a Suppreſſion are, a Phrenitis, Pleuriſy, Peripneumony, Paraphrenitis; an Inflammation of the Breaſts, Liver, Stomach, Omentum, Meſentery, Spleen, Kidneys, and Inteſtines; a Dyſentery, Colic, Iliac Paſſion, Apoplexy, or Palſy; Difficulty of Breathing, Palpitation of the Heart, Faintings, and Convulſions; which are not eaſily cur'd, unleſs the Flux of the Lochia can be reſtor'd; but ceaſe ſpontaneouſly, if this returns. The Phyſician, therefore, muſt always have a View to the *Lochia*, and, by all poſſible means, endeavour to procure this ſalutary Diſcharge. For this Purpoſe, mild Antiacids are to be exhibited, in order to correct the Tendency of the Serum to Acidity, ſuch as the *Teſtacea* mentioned under the Article ACIDA; and mild Diluters are to be given, as Decoctions of Barley, Oats, and Almonds, and ſmall Broths: To theſe may be added mild Aperients, which are eſteemed ſpecifically to promote the *Lochia*, and conſiſt of moderately cardiac and uterine Ingredients. But great Streſs is to be laid on aperient and relaxing Topics, Clyſters, Fomentations, Plaiſters, Liniments, Cupping-glaſſes applied to the inferior Parts, Peſſaries, and Suppoſitories, which much contribute to relax the uterine Veſſels, and invite a Return of the *Lochia*.

Boerhaave adviſes not to bleed in the above-mentioned Diſorders, proceeding from a Suppreſſion of the *Lochia*, without the utmoſt Neceſſity; and cautions againſt treating the Symptoms, as original Diſtempers proceeding from other Cauſes.

La Motte ſays, that, upon a Suppreſſion of the *Lochia*, there is generally a Fever, and the Belly becomes hard, diſtended, ſwell'd and painful; and to theſe are join'd Anxieties, and hyſteric Symptoms.

The Method of Cure, recommended by the ſame Author, is to give an emollient Clyſter without Cathartics; to bleed in the Arm, not in the Foot, for fear of loading the Uterus, and Parts adjacent, more, and to repeat Bleeding occaſionally.

He recommends a Cataplaſm, which is to be renew'd as it grows cold, made in the following Manner:

Take of the Leaves of Mallows, Marſhmallows, Violets, and Groundſel, of the Flowers of Chamomile and Melilot, of Linſeed and Fenugreek-ſeed, and of Wheaten-flour, of each one Handful: Boil them in Water.

He, alſo, adviſes a Clyſter, or rather a half Clyſter, of this Decoction, four times a Day.

He, farther, adviſes gentle Purges towards the laſt.

In caſe of a violent Looſeneſs attending, which ſometimes happens, the ſame Author directs Bleeding, repeated according to the Exigencies; a Decoction made with the Roots of Couchgraſs, and wild Succory, with an Ounce of the Shavings of Hartſhorn and Ivory, with a little Cinnamon; and two half Clyſters a Day, made of a Sheep's-head Broth, boil'd with the Wool on; and with a Handful of Mullein, Flowers of Chamomile and Melilot, and as much Wheat-flour.

He ſays this Method always ſucceeded very well.

In this Caſe, the Diet he directs is Broths of Beef, or Fowl, with a little of the Shavings of Hartſhorn and Ivory boiled in it.

Neither the Quantity of the *Lochia*, nor the Time of their Duration, can be determin'd, being both different, according to the Differences of Age and Conſtitution in the Women. *La Motte* knew two Women, in whom they ceaſed the very Day after their Delivery, without being followed with any Swelling of the Belly, or Pain, or any other Accident. The ſame Author knew two, who were left as dry the fifth Day after their Delivery, as before it; but, as there was neither Fever, Tenſion of the Belly, nor Pain, he told them they had no ill Conſequences to fear from it.

In others the *Lochia* continued five, ſix, or ſeven Weeks, and always red.

But, whether their Duration is ſhort or long, 'tis of no Conſequence, provided it is the Work of Nature, and no Accidents enſue.

A Suppreſſion of the *Lochia* is often cauſed by exceſſive Anger, Joy, Fear, or other Paſſions; and ſometimes by a ſingle Word, ſpoke by ſomebody in the Room inadvertently, and of no Importance; by the Smell of a Flower, a very little Cold, a ſlight Fear, or a ſudden Noiſe: The Conſequence of ſuch a Suppreſſion is a Fever, great Tenſion and Pain in the Belly, Delirium, and often Death; inſomuch that the Woman is very happy, if ſhe comes off for a very large Abſceſs in ſome Part or other.

La Motte, *Obſ.* 409. gives the Hiſtory of a Lady's Caſe, who, upon taking Cold, about eight Days after Delivery, was ſeized with a Shivering, which was ſucceeded by a Fever, and an entire Suppreſſion of the *Lochia*, with a Pain in the Left Groin; where, two Days after, there appeared a Tumor, with Redneſs, Heat, Tenſion, and Pulſation.

He firſt endeavoured to divert the Fluxion, and diminiſh the Fever, by Bleeding in the Arm, Clyſters, and a proper Regimen; and then tried to eaſe the Pain by anodyne Cataplaſms of the Crums of white Bread, freſh Milk, the Yolk of an Egg, Saffron, and Oil of Chamomile; which were ſucceeded by emollient and maturative ones, as the Pulp of Mallows, Marſhmallows, Linſeed, Rye-meal, Flowers of Chamomile and Melilot, Ointment of Marſhmallows, and Oil of Lilies and Chamomile; but, as the Symptoms increaſed, inſomuch that nothing was to be expected but Suppuration, he changed theſe Cataplaſms for others, as old Leaven, Onions roaſted under the Aſhes, Pigeons-dung, Ointment of Marſhmallows, and the Suppurative, by which laſt I ſuppoſe he means the Baſilicon: By the Uſe of theſe Remedies good Pus was form'd in the Tumor in eight Days; which, being let out by Inciſion, the Wound was incarn'd and cicatriz'd in a Fortnight after.

La Motte utterly diſapproves Bleeding in the Foot in theſe Caſes; and gives a very good Reaſon for his Opinion, that it muſt neceſſarily increaſe the Flux of Humours, already too large, upon the Uterus, and the adjacent Parts.

The ſame Author, *Obſ.* 412. gives another Hiſtory of a Lady, who had a great Diſcharge of the *Lochia* for the three firſt Days; which, afterwards, diminiſhed by little and little, till the fifth Day, when they entirely ceaſed, without any manifeſt Cauſe: He found her on the ſixth Day in a violent Fever, with her Belly hard, diſtended, and ſo painful, that ſhe could not bear her Shift upon it, attended with a violent Looſeneſs. He began the Cure by giving her a Clyſter of Whey, without any Addition; and, two Hours after, let her Blood at the Arm; then he applied ſoft Napkins to her Belly, dipt in the following Decoction, as hot as ſhe could bear it, which were conſtantly chang'd for others, as they grew cold. The Decoction was made with the Leaves of Mallows, Marſhmallows, Violets, Groundſel, Flowers of Chamomile, and Linſeed: Strain it, and then add one third Part of new Milk.

Of this Decoction, alſo, he gave her Clyſters in half the uſual Quantity, that ſhe might retain them the longer. Twelve Hours after he took away ſome more Blood, and ſtill continued theſe Fomentations and Clyſters; and, twelve Hours after, repeated Bleeding again. By theſe means the Fever left her, her Belly become ſoft and eaſy, the *Lochia* return'd, and ſhe recovered in eight Days.

Her Regimen, during this Courſe, was of Veal and Chicken-broths, and Water, impregnated a little with Cinnamon, with a ſmall Quantity of Wine.

La Motte accounts for the good Effects of this Method very rationally, from its relaxing and moiſtening both the Solids and Fluids.

The ſame Author, *Obſ.* 413. gives an Inſtance of a Woman, who contracted a Diſorder much like the former, by getting out of Bed in a violent Fright, after ſhe had lain-in five Days: He tried the Method recommended above; her Pains diminiſhed, but, however, continued for more than forty Days; mean time her Belly grew larger, than it was before ſhe was deliver'd; after this ſhe was ſuddenly ſeized with an exceſſive Pain in the Belly; and, in a few Hours, a vaſt Quantity of Matter was diſcharged from an Aperture, which opened itſelf about four Fingers-breadth on one Side of the Navel. He dreſſed with a Tent of Lint, armed with a common Suppurative; and cured the Wound perfectly in about eighteen Days.

In caſe of a Tumor, which will not yield to reſolvent Fomentations, *La Motte* adviſes Cataplaſms made of the ſame Ingredients as the above-mentioned Fomentation, with an Addition of Flowers of Melilot, Fenugreek-ſeed, and Marſhmallow-roots, with which he orders Bags to be filled, and applied to the Part. As ſoon as he perceives any Signs of Suppuration, he applies the Mucilage and Melilot-plaiſter; and, when Matter is perfectly form'd, he lets it out with a Lancet at the moſt depending Part.

Obſ. 416. This Author gives an Inſtance of a very large Tumor happening after Delivery, attended with but very little Pain, without any manifeſt Cauſe; there having been no Suppreſſion of the *Lochia*, or any other bad Accident: This he brought to Suppuration by the above-mentioned Cataplaſms and Plaiſters, and cur'd her in about two Months.

LOCULAMENTA. Loculaments are little diſtinct Cells, or Partitions, within the Seed-veſſels of Plants.

LOCUS. A Name for the *Pſeudo-acacia*; *ſiliquis glabris*.

LOCUSTA. A Name for the *Valerianella*; *arvenſis*; *præcox*; *humilior*; *ſemine depreſſo*.

LOCUSTA ALTERA. A Name for the *Valerianella*; *arvenſis*; *præcox*, *humilis*, *foliis ſerratis*.

LOCUSTA. Offic. Jonſ. de Inſect. 62. Schrod. 5. 543. Mer. Pin. 200. Aldrov. 404. Mouff. Inſect. 117. Charlt. Exer. 44. *Locuſta Anglica minor*, *vulgatiſſima*. Raii Inſect. 60. THE GRASSHOPPER.

It is a winged Inſect, of a green Colour, living in the open Fields. Locuſts in a Suffumigation relieve under a Dyſury, eſpecially ſuch as is incident to the Female Sex. The *Locuſta*, called *Aſiracus*, or *Onos*, has no Wings, but large Members, while recent. This dried, and taken in Wine, is a very good Antidote againſt

against the Poiſon of the Scorpion. The *Africans*, who inhabit about *Leptis*, feed plentifully on this Kind of Locuſts. *Dioſcoridis, Lib.* 2. *Cap.* 57.

LOCUSTA MARINA is a Shell-fiſh, of the Lobſter Kind.

LOEMOS, λοιμὸς, the Plague. See PESTIS.

LOGAPORUM *Oleum*. An Oil prepar'd of Lizards.

LOGAS. The White of the Eye. *Gorraus.*

LOLIGO. The Name of a Sea-fiſh, of which there are two Sorts, the greater, and the leſs.

LOLIUM.

The Characters are;

The Seed is almoſt naked, being ſlightly covered only with two glumaceous or huſky Leaves. The Spike is compreſſed, thin, without a Beard, conſiſting of ſmall Collections of Grains and Huſks, growing alternately to the Stalk between them, defended by a carinated Leaf, and lying in the ſame Plane.

Boerhaave mentions five Species of this Plant; which are,

1. Lolium; verum; Geſneri; Lolium album. See AIRA.

2. Gramen; Lolliceum; folio & ſpica anguſtiore. *Tourn. Inſt.* 516. *Boerh. Ind. A.* 2. 157. *Raii Hiſt.* 2. 1263. *Synop.* 3. 395. *Phœnix.* Offic. *Lolio ſimilis.* J. B. 2. 436. *Lolium rubrum.* Ger. 71. Emac. 78. *Lolium rubrum ſive Phœnix.* Park. Theat. 1145. *Gramen Lolliaceum anguſtiore folio & ſpica. Phœnix Dioſcoridis.* C. B. P. 9. Theat. 128. RAY-GRASS, DARNEL-GRASS.

It grows in Paſtures, and by the Sides of Paths; it is drying and aſtringent; ſtops a Looſeneſs, and the Menſes; and reſtrains the Urine: In ſome Places they ſow it as Food for Cattle.

3. Gramen; Lolliaceum; ſupinum. *C. B P.* 9. *Theat.* 130.

4. Gramen; Lolliaceum; minus; Ulielandicum. *H. L.* 303. *Commel. Ind.* 53.

5. Gramen; paluſtre; locuſtis Erucæformibus. *Barr.* 105. *Adverſ. Ic.* 2. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 157.

LOLIUS. The ſame as LOLIGO.

LOMENTUM. Properly the Meal of Beans, according to *Rhodius*, in his Notes upon *Scribonius Largus*, or Bread made of the Meal of Beans. Alſo a kind of Chalk made uſe of by the Fullers.

LONAN CAMBODIA. See ESULA *Indica Bontii.*

LONCHITIS.

The Characters are;

The Leaves reſemble thoſe of Fern, but the Pinnulæ are ear'd at the Baſe; the Fruit is like that of Fern.

Boerhaave mentions but one Species of this Plant; which is,

Lonchitis; aculeata; major. *T.* 538. *Filix aculeata, major.* C. B. P. 358. *Filix mas, aculeata, major.* C. B. Prodr. 151. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 25.

It is called *Lonchitis* from λόγχη (*Lonche*) a Lance, becauſe its Leaves are ſharp-pointed, reſembling the Head of that Weapon. The Root is aperient and diuretic. *Hiſt. Plant. aſcript. Boerhaave, p.* 41.

LONCHITIS MINOR. A Name for the *Polypodium*; *anguſtifolium*; *folio vario.*

LONCHITIS PRIMA. A Name for the *Hermodactylus*; *folio quadrangulo.*

LONCHOTON. The beſt Species of Vitriol. *Oribaſius, Collect. Medic. L.* 13.

LONGANON, and LONGAON. Names for the *Inteſtinum Rectum.*

LONGISSIMUS DORSI. This is a very complex, long, and narrow Muſcle, ſomething like the *ſacro-lumbaris*, but more fleſhy, and thicker, ſituated between the ſpinal Apophyſes, and the Muſcle juſt mentioned, from which it is divided by a ſmall, fatty, or cellular Line; but, at the lower Part, they are confounded together. It covers the *Semi-ſpinalis*, or *Tranſverſo-ſpinalis Dorſi*, and the *Semi-ſpinalis Lumborum.* Its upper Part lies between the *Sacro-lumbaris*, and *Tranſverſalis Colli.*

Its inferior Inſertions are partly by diſtinct tendinous Portions, and by a broad Aponeuroſis common to it with the *Sacro-lumbaris*, and partly by large Faſciculi of fleſhy Fibres, which, at firſt Sight, ſeem to compoſe one uniform Maſs. It is fixed by the long, flat, tendinous Portions of different Breadths, to the laſt ſpinal Apophyſis of the Back, to all thoſe of the Loins, and to one or two of the ſuperior Spines of the *Os Sacrum.* Theſe Portions lie at different Diſtances from each other, but are all connected by a thin Aponeuroſis fixed to their Edges.

Thence they run up obliquely, diverging from the Apophyſes, and beginning to be fleſhy at their inner or anterior Sides; they terminate above in ſmall roundiſh Tendons, inſerted in the Extremities of the ſeven upper tranſverſe Apophyſes of the Back, and in the neighbouring Ligaments of all the true Ribs. Sometimes one Inſertion in the Vertebræ of the Back is wanting, and ſometimes there is one in the tranſverſe Apophyſes of the laſt Vertebra of the Neck.

The other inferior Inſertion, wholly fleſhy, is partly in the inner or fore Side of the Aponeuroſis of the *Sacro lumbaris*, and partly in the upper Portion of the *Os Sacrum*, being from thence continued to the great Tuberoſity of the *Os Ilium*; ſo that the Aponeuroſis of the *Sacro-lumbaris* ſeems to afford a third Inſertion to the *Longiſſimus Dorſi.*

Thence this uniform Maſs of fleſhy Fibres runs up in a Courſe almoſt direct, croſſing the tendinous Portions which are more oblique; and join the inferior Fibres of the *Sacro-lumbaris* by large Faſciculi, inſerted in the tranſverſe and oblique Apophyſes of the Vertebræ of the Loins. The Fibres of this Portion go afterwards to the Ribs, being inſerted by Planes, more or leſs fleſhy, in the lower convex Edge of all the falſe Ribs, between the Condyles, or Tuberoſities, and the Angles.

At the ſixth or ſeventh Vertebra of the Back, one or more of the tendinous Portions often communicate with ſome Faſciculi of the Semi-ſpinalis or Tranſverſo-ſpinalis Dorſi. By this Deſcription we ſee, that the Longiſſimus Dorſi is in part a great Semi-ſpinalis Divergens or Spino-tranſverſalis, much in the ſame manner as the inferior Portion of the Splenius.

In examining the dorſal Inſertions of this Muſcle, we meet with ſeveral muſcular Faſciculi, which croſs the tendinous Portions near the Spine; but without adhering ſo ſtrongly to them as thoſe already mentioned do to the Sacro-lumbaris, which they reſemble in every other Circumſtance: Theſe Faſciculi are fixed above, to the tranſverſe Apophyſes of the three or four firſt Vertebræ of the Back, and below to thoſe of the ſixth and ſeventh.

I have obſerved other ſuch Faſciculi fixed in the tranſverſe Apophyſes of the Back, from the firſt to the ninth inclusively, and ſituated between the Extremities of the Tranſverſalis major Colli, and of the Longiſſimus Dorſi, with which they communicate at the third Vertebra, or thereabouts.

Theſe Faſciculi might be reckoned a Muſculus acceſſorius Longiſſimi Dorſi, or a Tranſverſalis Dorſi, in the ſame manner as that of the Sacro-lumbaris.

Some Anatomiſts imagine, that the Longiſſimus Dorſi is continued all the way to the Apophyſis Maſtoidæa of the Cranium, taking the Complexus minor, or Maſtoidæus lateralis, to be a Portion of this Muſcle.

This Muſcle, and the Sacro-lumbaris, are common to the Back and Loins.

The Longiſſimus Dorſi is an Aſſiſtant to the Sacro-lumbaris, eſpecially to the vertebral Portion of that Muſcle, which it helps very powerfully, both by the Multiplicity and Inſertions of its Fibres, in ſuſtaining the Vertebræ of the Back and Loins while extended, whether in Sitting or Standing; and in preventing their ſinking under the Weight of the Body, or of any additional Burden: It aſſiſts in performing, or in counterbalancing, all the Motions and Inflections, of which theſe Vertebræ, eſpecially thoſe of the Loins, are capable in all Poſtures of the Body; and in this it bears, alſo, ſome Reſemblance to the inferior or vertebral Portion of the Splenius; and it muſt here be remember'd, that theſe two Muſcles on each Side, and the Sacro-lumbares, are of the Number of thoſe called *Vertebrales obliqui divergentes. Winſlow's Anatomy.*

LONGITUDINALIS. Longitudinal.

Longitudinal Veſſels, in Plants, are ſuch as are extended in Length through the woody Parts of Trees and Plants, into which the Air is ſuppoſed to enter, and mix with the Juices of the Plant, and thereby augment its Bulk.

LONGURIUS. A Piece of Iron, which, when heated, is put into an Æſtuarium, or Stove, and thus applied to various Parts of the Body, in order to convey Heat. *Paré.*

LONGUS COLLI. The Name of a Muſcle of the Neck.

This vertebral Muſcle is made up of ſeveral others, ſituated laterally along the fore Side of all the Vertebræ of the Neck, and ſome of the upper Vertebræ of the Back.

It may be divided into two Portions; one ſuperior, conſiſting of oblique converging Muſcles; and one inferior, compoſed of oblique diverging Muſcles.

The ſuperior Portion is cover'd by the Rectus anticus Longus of the Head: The Muſcles, of which it conſiſts, are fixed below, to all the tranſverſe Apophyſes that lie between the firſt Vertebra and the laſt: Thence they run up obliquely, and are inſerted in the anterior Eminence of the firſt Vertebra, and in the Bodies of the three following. The Inſertion in the Eminence is ſo cloſely united to the Ligament which goes to the Os Occipitis, that it can hardly be diſtinguiſhed from it.

The inferior Portion appears almoſt ſtrait; and yet all the Muſcles, which compoſe it, are diverging, or directed obliquely outward: They are fixed below, to the anterior lateral Part of the Body of the laſt Vertebra of the Neck, and of the firſt three of the Back; and ſometimes of more: From thence they run upward, and a little obliquely outward; and are inſerted near the tranſverſe Apophyſes of all the Vertebræ of the Neck, except the firſt and laſt.

Though theſe two Portions ſeem to be confounded with each other; they may, nevertheleſs, be eaſily diſtinguiſhed by an oblique Line, which runs between them, from the tranſverſe Apophyſis of the ſecond Vertebra to the Body of the ſixth. All the Inſertions of this Muſcle are more or leſs tendinous.

The Longi Colli bring the Neck forward by the lower Part of their inferior Portions. When one of them acts alone, or acts more than the other, this Motion is more or leſs oblique.

The

The remaining Part of theſe Muſcles are not concerned in theſe Motions, which ſeem to be peculiar to the laſt Vertebræ of the Neck, or the firſt of the Back.

By the upper and greateſt Part of the lower Portion, they counterbalance the poſterior Muſcles of theſe Vertebræ, and hinder the Neck from bending backwards, by the Contraction of the Sterno-maſtoidæi, when, lying on the Back, we raiſe the Head.

It muſt here be remember'd, that the natural Situation of the Bones of the Neck is oblique on the fore Part; and that the Neck is bent in ſuch a manner, as that the convex Side of the Curvature lies forward, and the concave Side backward. Therefore, when we would hold the Neck ſtreight, and bridle it, as it is called, this Curvature muſt be deſtroy'd: This is done by theſe two Muſcles, which in this Caſe make an Extenſion, in a manner, in oppoſite Directions; and fix all the Vertebræ of the Neck cloſe to each other, as if they were but one Bone.

The Longus Colli of one Side performs theſe Motions obliquely, and may likewiſe co-operate in the lateral Inflexions of the Neck, with the Scaleni, and other Muſcles, which perform theſe Motions. *Winſlow's Anatomy.*

LONKET. Spirit of Turpentine.

LOPA. A Scale, or Scoria, of any Metal.

LOPADES, in *Oribaſius, Collect. Medic. Lib.* 2. *Cap.* 58. imports a Sort of Shell-fiſh, which, he ſays, are generally ſmall; but that in ſome Places, as *India*, they are produced large, not unlike Oyſters.

LOPHADIA, or LOPHIA, λοφαδία, or λοφία. A Name for the firſt Vertebræ of the Back. Lophia, alſo, ſometimes ſignifies the upper Part of the Back of the Neck.

LOPOS, λοπός. Bark, or Scale. In *Hippocrates's* Treatiſe, intitled *Mochlicus*, it ſignifies a thin Piece of Leather; *Galen* ſays, the hard external Part of it.

LOPPA. The metallic Maſs, which reſults from a cementatory Calcination, either with or without Regulus.

LORA. Secundary Wine, made by macerating the Husks of Grapes, after the Juice is preſſed out, in Water, and expreſſing them again. *Dioſcorides, Lib.* 5. *Cap.* 13. and *Galen, de Aliment. Facultat. Lib.* 2. *Cap.* 9. give Directions for making this Wine.

LORDOSIS, λόρδωσις, from λορδὸς, bowed or bent inward, (in Oppoſition to ὐδὸς and κυφὸς, gibbous, as *Galen* writes, *Com. Aph.* 46. *Lib.* 6.) is an Affection of the Spine, in which it is incurvated, or bent inwards, towards the anterior Parts, mentioned by *Galen*, in the Place above-quoted, and *Com. ad Aph.* 35. *Lib.* 4. and *Com.* 3. *in Lib. de Art.* where he defines a Lordoſis to be εἰς τὰ πρόσω τῆς ῥάχεως διαστροφὴν, "A Diſtortion of "the Spine towards the anterior Parts:" And ſays, it is occaſioned, εἰς τὰ πρόσω ἰόντων τῶν σφονδύλων, "By an Inclination "of the Vertebræ towards the anterior Parts." *Hippocrates* uſes indifferently λόρδωσις (*Lordoſis*) and λόρδωμα (*Lordoma*), as he uſes ὔβωσις (*Hyboſis*) and ὔβωμα (*Hyboma*), κύφωμα (*Cyphoma*) and κύφωσις (*Cyphoſis*), to ſignify the contrary Affection, Gibboſity. *Lib. de Artic. & in Mochlico.* See HYBOMA and CYPHOMA.

LORICA. A kind of Lute for coating Glaſs Retorts, made of Glaſs, and broken Retorts powder'd, worked with Potters-clay, and then moiſten'd a little with warm Water. The Glaſs Veſſel is to be cover'd with this about a Finger's-breadth thick, and then is ſuffer'd to dry gradually, that it may not crack; but, if it ſhould, the Cracks are to be filled up with freſh Lute of the ſame Kind. *Collect. Chym. Leidenſ. Cap.* 229.

LORINDE, in *Paracelſus*, is the Sound and Agitation of ſtagnant Lakes.

LORIND *Matricis*, is an Epilepſy, or convulſive Diſorder, proceeding from the Uterus.

LORUM. A Strap, or Thong, of frequent Uſe in Surgery. The *Lorum Hildani* is deſcribed under the Article FRACTURA, and repreſented *Tab.* XXIX. *Fig.* 17. *Lorum Vomitorium* is a Thong of Leather, impregnated with the Juice of ſome nauſeous Vegetable, which the Antients directed to be thruſt down the Fauces, with a View of exciting Efforts to vomit. *Scribonius Largus*, N° 180. adviſes this Method, in order to diſcharge Opium from the Stomach, when it has been taken in too large Quantities.

LORUS. Mercury. *Rulandus.*

LOT. Urine. *Rulandus.*

LOTA. See MOTELLA.

LOTIO, or LAVATIO. Lotion, or Waſhing. This Word is uſed to expreſs either univerſal or particular Baths, or Bathing. Lotion is, alſo, ſometimes applied to Medicines, which require Waſhing.

LOTIUM. Urine.

LOTO AFFINIS. A Name for the *Medicago; vulnerariæ facie; Hiſpanica*; and for the *Vulneraria ruſtica.*

LOTURA. The ſame as PLYMA; which ſee.

LOTUS.

The Characters are;

The Ovary becomes a Pod, which is ſometimes divided by tranſverſe Partitions, as it were into Cells, full of Seeds, which are for the moſt part of a roundiſh Figure. The Leaves grow by Threes, and, at the Origin of the Pedicle, have two Wings like little Leaves at their Sides.

Boerhaave mentions ſixteen Species of this Plant; which are,

1. Lotus; polyceratos; fruteſcens; incana; alba; major; latifolia; ſiliquis curtis, tenuibus erectis. *M. H.* 2. 177.

2. Lotus; polyceratos; fruteſcens; incana; alba; ſiliquis curtis; craſſioribus, brevioribus, erectis. *Boerh. Ind. alt.* 2. 37. *Trifolium Hæmorrhoidale.* Offic. *Trifolium rectum album hirſutum valde.* J. B. 2. 360. *Lotus Hæmorrhoidalis major ſive Trifolium Hæmorrhoidale majus.* Park. Theat. 1100. *Lotus pentaphyllos ſiliquoſus villoſus.* C. B. P. 332. Raii Hiſt. 1. 968. Tourn. Inſt. 403. *Lotus incana ſive Oxytriphyllum Scribonii Largi.* Ger. 1022. Emac. 1191. PILE TREFOIL.

It grows ſpontaneouſly in *Sicily, France*, and other Countries: The Seed is in Uſe, which is commended, by *Riverius*, in the Hæmorrhoids.

3. Lotus; πολυκέφαλος; fruteſcens; Cretica; argentea; ſiliquis longiſſimis, propendentibus, rectis. *M. H.* 2. 177.

4. Lotus; pratenſis; ſiliquoſus; luteus; minor; & mollior. *C. B. P.* 332.

5. Lotus; ruber; ſiliquâ angulosâ. *C. B. P.* 332.

6. Lotus; ruber; ſiliquâ angulosâ folio variegato.

7. Lotus; luteus; ſiliquâ angulosâ.

8. Lotus; pentaphyllus; flore majore; luteo; ſplendente. *C. B. P.* 332. *Trifolium corniculatum, tertium.* Dod. p. 570.

9. Lotus; pentaphyllos; anguſtioribus foliis; luteus; minor; fruticoſior. *Raii Synop.* 150.

10. Lotus; ſiliquis Ornithopodii. *C. B. P.* 332. *J. B.* 2. 358.

11. Lotus; pentaphyllos; minor; hirſutus; ſiliquâ anguſtiſſimâ. *C. B. P.* 332.

12. Lotus; pentaphyllos; ſiliquâ cornutâ. *C. B. P.* 332. *Trifolium, ſive Lotus Hierazunte, edulis, ſiliquoſa.* J. B. 2. 365. *Trifolium, corniculatum, Creticum.* Proſp. Alpin. Exot. 268.

13. Lotus; latifolia; atroviridis; hirſuta; ſiliquâ craſſâ; carinatâ.

14. Lotus; anguſtifolius; flore luteo purpureo; ex Inſula Sancti Jacobi. *H. A.* 2. 165.

15. Lotus; ſiliquis geminis; peregrina. *Ind.* 156.

16. Lotus; hæmorrhoidalis; humilior; & candidior. *T.* 403. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 37.

Theſe Plants are commended againſt the Hæmorrhoids; the Leaves being bruiſed and applied; for they are emollient and relaxing: On which account they are uſed by our Surgeons for the Intentions of mollifying, relaxing, and maturating, in the room of the Mallow. The firſt and ſecond Species produce a Pea, which is excellent Food. *Hiſt. Plant. aſcript. Boerhaave.*

LOTUS AFRICANA. A Name for the *Guaiacana; anguſtiore folio.*

LOTUS ARBOR. See CELTIS.

LOTUS ENNEAPHYLLOS. A Name for the *Coronilla; minima.*

LOTUS PENTAPHYLLOS. A Name for the *Vulneraria; pentaphyllos.*

LOTUS POLYCERATOS. A Name for the *Dorycnium; Monſpelienſium.*

Beſides the foregoing Species of Lotus, *Dale* mentions the following; which is,

Lotus corniculata glabra minor. *J. B.* 2. 356. *Raii Hiſt.* 1. 967. *Synop.* 3. 334. *Lotus ſive Melilotus pentaphyllos minor glabra.* C. B. P. 332. Tourn. Inſt. 402. *Trifolium ſiliquoſum minus.* Ger. 1022. Emac. 1190. BIRDS-FOOT TREFOIL.

It grows every-where in Paſtures, and flowers in *June.* The Herb is in Uſe, and, as *Monti* ſays, is anodyne, emollient, maturating, and good for Burns.

LOXIA, λοξία. The Name of a Bird, called, alſo, *Curviroſtra.*

The Water wherein this Bird has drank, and its Dung, are ſaid to be good againſt an Epilepſy.

LOZANGA. A Lozenge.

LUBAN. Olibanum.

LUCANUS. The Stag-fly. See SCARABÆUS CORNUTUS.

LUCATELLI BALSAMUM. *Lucatellus's* Balſam. See BALSAMUM.

LUCERNA. The Name of a Fiſh, called, alſo, *Hirundo.*

LUCIUS. Offic. Aldrov. de Piſc. 630. Bellon. de Aquat. 297. Schonf. Ichth. 44. Charlt. de Piſc. 42. Geſn. de Aquat. 500. Jonſ. de Piſc. 109. Mer. Pin. 190. Raii Ichth. 236. Ejuſd. Synop. Piſc. 112. Rondel. de Piſc. 188. Salv. de Aquat. 95. Schrod. 5. 329. THE PIKE or PICKEREL.

It is common in Rivers, and the Parts in Uſe are the Mandible, or lower Jaw, and the Fat: This latter is a common Remedy, and uſed to anoint the Soles of the Feet, and the Breaſts of Infants, in order to make a Revulſion of a Catarrh, or to mitigate a Cough. The Mandible is drying and abſtergent, for which Reaſon it is preſcribed as a Specific in a Pleuriſy: It is of Service, alſo, as well as the other Bones of the Head, in the Stone, the Fluor albus, and difficult Childbirth. The Aſhes,

uſed outwardly, ſtop a Diſcharge of Ichor, cleanſe old Wounds, and dry the Hæmorrhoids. A Water, diſtilled from the Gall, is eſteem'd in Diſorders of the Eyes. *Schroder.*

The Gall of a Pike is much recommended for cold Diſorders, attended with an Inactivity of the Bile. See BILIS. It is, alſo, reckon'd good for Agues, if taken upon the Approach of the Fit; the Doſe is ſeven or eight Drops, in a proper Vehicle. It is, likewiſe, ſaid, that the Heart produces the ſame Effect.

Small Stones are found in a Pike's Head, which are looked upon as ſerviceable for helping Women in Labour; for purifying the Blood, forwarding the Menſes, and provoking Urine; for expelling the Stone from the Kidneys and Bladder; and for the Falling-ſickneſs. The Doſe is from twenty-five Grains to a Dram.

Such as are large, fat, and well-fed, having their Fleſh white, firm, and ſhort, are the beſt; and thoſe catched in Rivers are preferable to thoſe in Ponds, and muddy Places.

The Pike is good and nouriſhing Food, and agrees at all Times, but eſpecially in Winter, with any Age and Conſtitution. Some Authors pretend, that it is hard of Digeſtion, heavy in the Stomach, and always affords bad Juice; but theſe Qualities are only applicable to ſuch as live in Ponds, and marſhy Places, and feed upon Slime and Mud. *Jovius* thinks the Pike has but an ordinary Taſte, and *Auſonius* does not eſteem it; but its Taſte differs according to the Country in which it is bred. The Roe provokes Vomiting, and ſometimes purges violently. The Pike contains much Oil, and volatile Salt. *Lemery.*

LUCUMORIANA DORMITIO. A preternatural Sleep, protracted for ſeveral Days.

LUDUS PARACELSI. Offic. Charlt. Foſſ. 17. *Silex ille, quem Helmont Ludum Paracelſi vocat.* Worm. 39. *Ludus Helmontii.* Grew. Muſ. R. S. 311. WAREN VEIN.

It is a Stone of the Colour of yellow Amber, but more opaque, of different Sizes, diſtinguiſhed by tranſcurrent Lines of a dark Aſh-colour like Veins. It is frequently found in maritime rocky Places; and is recommended by *Paracelſus* for a Lithontriptic. Doctor *Grew* thinks it a good Diuretic, and may be of Uſe for expelling Gravel.

LUES VENEREA.

That the Diſorder called the *Lues Venerea*, which is endemial in the *Weſt Indies*, was not only brought into *Europe*, but alſo propagated thro' the ſeveral Parts of it, when *Chriſtopher Columbus*, in the Year 1492. diſcovered the Iſland of *Hiſpaniola*, is the Opinion of moſt Authors who have treated of this terrible Diſtemper; ſuch as *Rodoricus Diacius Hiſpalenſis*, in his Book *de Morbo Venereo*; and *Nicolaus Monardes*, in his Treatiſe *de Simpl. Med. ex novo Orbe allatis.* Tho' 'tis certain from Experience, that this formidable Diſorder was firſt in *Spain*, then in *Italy* and *France*, and afterwards in *Germany*, propagated by Contagion, in conſequence of Copulation with impure Women, yet there are ſome Authors, and among the reſt, *Menadous*, in his Treatiſe *de Virulentia Venerea*, Cap. 24. *Nicolaus de Blegny*, in his Work, intituled, *L'Art de guerir la Maladie Venerienne*, and *Johannes Baptiſta Synibaldus*, in his Book *de Geneanthropia*, *Lib.* 9. *Tract.* 2. who think, that this Diſorder may, in the Female Sex, be produced without any virulent Contagion, when, for Inſtance, a Woman admits of the Embraces of many Men promiſcuouſly, for which Reaſon they aſſert, that the Diſtemper has always raged among Perſons uncommonly addicted to profuſe Venery, ſince, from the Stagnation and virulent Corruption of the various Seeds, Humours of an offenſive Quality are produced, which infect firſt the Woman, then the Man, whoſe Embraces ſhe admits, and, in Proceſs of Time, the Perſons who lie in Bed with them. Tho' we do not abſolutely reject this probable Opinion, but rather allow, that from this Cauſe a Diſorder, not unlike the *American Lues*, may proceed, yet it cannot be denied, that the Species of the Diſorder brought from *America* by Contagion, is attended with more terrible Symptoms, and is far more violent and malignant, than that produced by promiſcuous Venery; ſo that the Diſorder may be communicated not only by Copulation, but alſo by Contact; by the Hands, for Inſtance, when moiſt with Sweat; by Kiſſes, and, in ſucking Children, by the cloſe Application of the Mouth to the Breaſt and Nipple of the Mother or Nurſe: And ſo virulent and contagious is this Diſorder, that it may, alſo, be communicated to others, by drinking out of the ſame Cup, or wearing the ſame Clothes uſed by an infected Perſon; and the Infection is ſometimes lodged in the Body for ſeveral Years before it diſcovers itſelf, or produces any terrible Effects.

The *Lues Venerea* may be defined, A malignant and putredinous Dyſcraſy of all the Humours, but eſpecially of the Serum and Lymph, ariſing from a Venereal Taint, received into the Body. Its Signs and Progreſs, are as follows: Thoſe who, from impure Venery, have contracted the Diſorder, perceive the Force of the Contagion firſt, and moſt conſiderably, in their Pudenda, which become affected with Inflammations, Tumors, Pains, preternatural Heats, Exulcerations, and Diſcharges of Humours. Then the Virulence of the Poiſon is diffuſed firſt to the moſt adjacent and contiguous Parts, and, in Proceſs of Time, to thoſe which are more diſtant and remote; for as ſoon as the malignant Taint, which gradually acquires freſh Strength, is convey'd to the vital Juices, the Lymph and Blood, all the Parts, both fluid and ſolid, are affected by the Corruption brought on. Thus a preternatura Languor and Wearineſs ſeize the whole Body; the Strength is greatly impair'd; the Countenance, and eſpecially the Forehead, is ſtrangely disfigured with Spots and Puſtules, which are ſometimes larger, and ſometimes ſmaller. Tubercles of various Kinds, dry and moiſt, furfuraceous, or ſcaly, but of different Colours and Bulks, according to the different Parts they poſſeſs, break out here and there all over the Surface of the Body. All the Parts of the Body, being deprived of their due Nouriſhment, waſte away and decay. In the more lax Parts, conſiſting of Fleſh and Fat, malignant Ulcers, which penetrate to the very Bones, are formed. About the Articulations, racking Pains, reſembling thoſe of the arthritic Kind, are felt; in the intermediate Parts, alſo, between the Articulations, intolerable Pains, which rage with greateſt Violence in the Night, are perceived, not only about the Perioſteum, but, alſo, in the Meditullium of the Bones: Tophi and Gummata, Abſceſſes and Caries, are, alſo, frequently formed in the Bones, and ſo affect their Subſtance, and the Texture of their conſtituent Laminæ, that in deſtroying their Coheſion they are corroded, and fall aſunder. Beſides theſe Symptoms, it ſometimes happens, that the Hairs fall off; and the inguinal and axillary Glands, together with thoſe of the Neck, in conſequence of the Stagnation of the contaminated Lymph, contract Tumors, which, if neglected, degenerate either into Ulcers, or a Scirrhus. And theſe Symptoms lay a Foundation for a ſtill greater Number of Misfortunes; ſo that the Lues Venerea, inſtead of being called one Diſtemper, may juſtly be pronounced a fatal Combination of an almoſt incredible Number of Diſorders.

But in no Part of the Body are the Effects of this virulent Infection more conſpicuous than in the Head; for, beſides the intolerable nocturnal Pains with which this Part is afflicted, the Hairs fall off from the Cheeks and Eye-brows; in the Lips, Mouth, and Palate, Puſtules and Tubercles are formed, which degenerate into malignant Ulcers. The Gums are covered with Aphthæ and Ulcers, which not only render the Teeth looſe and carious, but alſo make them drop from their Sockets. The Uvula, the Tonſils, and all the Membranes covering the Fauces, are affected with intenſe Heat, Pain, Inflammation, and Exulceration. The ſpongious Bones of the Noſe, becoming carious, are conſumed; and, being deprived of the Palate, which ſupported them, the Noſe falls; after which, the Patient's Breath is not only putrid and diſagreeable, but his Speech in a great meaſure vitiated, and an incurable Hoarſeneſs brought on. Neither do the Ears and Eyes eſcape the Fury of this Diſorder, ſince, by its means, the latter are externally affected with Pain, Redneſs, Itching, and Lippitude, and internally, being loaded with Humours, their Sight is deſtroy'd, and ſometimes a Suppuration is brought on. The Ears are afflicted with a violent Ringing and Pain, whilſt their internal Subſtance is exulcerated, and rendered carious. The Bones of the Cranium are, alſo, frequently corroded, and deformed with Tophs and Gummata. Thus *Rhodius*, in *Cent.* 1. *Obſ.* 33. gives us an Account of a Countryman labouring under a Lues Venerea, in whoſe Dura Mater he obſerv'd three white Gummata.

Theſe are the principal Symptoms, with which this terrible Diſorder is attended; and how much they are capable of injuring, diminiſhing, and, at laſt, totally aboliſhing the whole Fabric of the human Body, and the various Functions of its Parts, is ſufficiently obvious from what has been ſaid. *Sydenham*, in his Epiſtle *de Lue Venerea*, has given a full and accurate Hiſtory of this Diſeaſe, when beginning, when arrived at its greateſt Height, and when in its Decline; and taught us in what manner it firſt diſcovers itſelf, and afterwards, inſinuating itſelf deeper, and diffuſing its Influence wider, how it affects, weakens, and diſorders the remote Parts. But, in order to prevent Miſtakes, it muſt be obſerved, that all the Symptoms already enumerated are not found in all Patients labouring under this Diſorder; for ſome of them are only to be obſerved in ſome, and others of them in others. Nor are we raſhly, from ſome of the Symptoms, but rather from a conſiderable Number of them, to determine, with reſpect to the Preſence of this Diſeaſe; nor ought we, when at firſt Tumors, Exulcerations, and other Diſorders of the Pudenda, appear, to take the Diſeaſe for a confirmed, but rather a beginning Lues, ſince theſe Symptoms, when duly treated, and ſeaſonably cured, never terminate in a Lues.

Though I am of Opinion, that the Lues Venerea may be eaſily known by the above-mention'd Signs, yet I ſhall ſpecify ſome Diſeaſes, with which it ſeems to have ſome Agreement and Analogy. Of theſe the moſt conſiderable is, the Scurvy; which, as well as the Lues Venerea, is accompanied with a Languor and Torpor of the Body, wandering as well as fixed Pains, which are increaſed in the Night-time, Contractions of the Nerves, Puſtules, hard Tumors, and various Exulcerations both of the Mouth and Penis, as *Eugalenus*, in his Treatiſe *de Scorbuto*, informs us. So that 'tis not to be wonder'd at, that *Charleton*, in *Lib.* 1. *de Scorbuto*, *Cap.* 4. affirm'd, there was ſo great an Analogy between the Lues Venerea and the Scurvy, that there were ſome Symptoms ſo common to both Diſorders, that they could not be diſtinguiſhed by the moſt skilful Phyſician, eſpecially in the maritime

maritime Coaſts of the more Northerly Climates, ſuch as *Denmark*, *Sweden*, and *Holland*. If, therefore, theſe two Diſeaſes ſhould happen to rage in one and the ſame Place, great Diligence is requiſite to form a right Judgment of each Diſeaſe; for there are certain and infallible Marks, by which the skilful Phyſiciun is enabled to diſtinguiſh Venereal Puſtules, Serpigines, and Ulcers, ſeemingly of a cancerous Nature, from ſcorbutic Impurities. But theſe Marks are more eaſily learned from Practice and Experience, than taught by Precept and Inſtruction. *Eugalenus*, however, eſtabliſhes this Difference, that in Venereal Eruptions, when laid open with a Cautery, the Matter is pinguious, and reſembles ſmoked Bacon; whereas the Matter of ſcorbutic Eruptions has no ſuch Appearance. Beſides, the ſcorbutic Spots rarely appear till after the Gums are exulcerated, and the Legs become livid, or black; whereas 'tis quite otherwiſe with the Venereal Eruptions. The Whole of ſcorbutic Ulcers are, alſo, generally livid, whereas thoſe of the Venereal Kind are red about the Edges, whilſt their Cavities are of a whitiſh cineritious Colour. As for ſcorbutic Exulcerations of the Mouth, they firſt affect the Gums, and afterwards, tho' gradually and ſlowly, the Fauces and Tonſils; whereas Venereal Exulcerations generally firſt affect the Fauces, and its Parts, and then the Gums.

We are not, in like manner, to be too forward and precipitant in pronouncing an Herpes, an Impetigo, or other inconſiderable cutaneous Ulcers, a Lues Venerea; but ought rather firſt to inquire, whether the other Signs concur to give the Diſorder that Denomination. But theſe cutaneous Diſeaſes differ principally from thoſe of the Venereal Kind in this reſpect, that the former, after the Eruption, are not attended with Inquietudes and Wearineſs of the Body; are by no means accompanied with ſuch intenſe Pain; and are not in the Night-time ſo augmented by the Heat of the Bed, tho' by that means their Itching is increaſed. The ſame Caution is to be uſed with reſpect to Tophs, Nodes, and Ganglions, which may not only proceed from a Venereal Taint, but, alſo, from any violent Tenſion and Vellication of the nervous Parts, as we ſometimes obſerve after genuine arthritic Pains. Unleſs, therefore, there are ſome other concurring Symptoms to determine our Judgments, we are never too raſhly to ſuſpect a Lues Venerea. Nor are we indiſcriminately to account all Tumors of the Glands Venereal, ſince theſe are frequently ſeen in various Parts of the Body, in Caſes where there is no Reaſon to ſuſpect any Venereal Taint, as is ſufficiently obvious in ſtrumous Caſes. But, in judging of the ſeveral Diſeaſes which bear an Analogy to the Lues Venerea, the Phyſician ought, above all things, to conſider the former Life of the Patient, which, if it has been luxurious, and ſpent among lewd and profligate Women, often affords a pretty ſatisfactory Proof of a latent Venereal Taint, eſpecially when the other Signs concur to prove the ſame. The Patients, alſo, where there is a Suſpicion of a Lues Venerea, are to be ſtrictly examin'd whether they know the particular Manner in which the Contagion was communicated to them; and to be exhorted in a friendly manner to diſcover their own Suſpicions to the Phyſician, though moſt Perſons, either through a Principle of Modeſty, or Fear, conceal the Origin and Progreſs of the Diſeaſe, and are unwilling, when arriv'd at the Years of Maturity, to confeſs themſelves guilty of the Follies of Youth. But if any one confeſſes, that, in conſequence of Copulation, he had before contracted a Gonorrhœa, Exulcerations, and other Diſorders of the Genitals, we are carefully to inquire how theſe Diſorders came to be removed, ſince from this Circumſtance a Judgment of the Diſeaſe may be the more eaſily form'd.

We now come to conſider the Cauſe of the Lues Venerea; and as in *Europe* this Diſorder is only to be aſcribed to Contagion, and a morbific Taint, communicated from thoſe who are infected to thoſe who are ſound, we ſhall here briefly examine by what means this deſtructive and highly ſubtle Poiſon exerts its Violence on the human Body. Now Authors agree, that the Venereal Taint is principally communicated in the following manner, when, for Inſtance, either by Friction or Contact, in ſucking, kiſſing, or ſuckling, the Poiſon inſinuates itſelf into the Pores; or when, exhaling in form of Vapours, it enters the adjacent Parts; or, which moſt commonly happens, when it is communicated by impure Copulation to either of the Parties. Though in theſe Circumſtances Phyſicians are ſufficiently agreed, yet they widely differ with reſpect to the ſpecific Nature and Manner of acting of this Poiſon, ſince ſome derive its Virulence from an acrid, corroding, and coagulating Acrimony; others from an alcaline corroſive Salt; and others from a certain ſpecific Acrimony. But all this is abſurd Jargon, ſince each of theſe Hypotheſes takes the Effects produced by this Poiſon for the Cauſe producing them. But, in my Opinion, an over-curious Inveſtigation of this Matter is not abſolutely neceſſary, ſince there are in Nature many Subſtances of ſo fine and ſubtile a Contexture, that their intimate Nature and Craſis, and conſequently their ſurpriſing Method of acting, entirely ſurpaſs our Comprehenſions. This is ſufficiently obvious in the Plague, the Small-pox, the Leproſy, malignant Itches, the Bite of a mad Dog, and others of a like Nature, in which no one has hitherto been able to explain the Nature and Quality of the Poiſon. But 'tis ſufficient for all the Purpoſes of Medicine, by reſiſting the pernicious Effects of the Poiſon, to prevent its operating on the human Body; eſpecially ſince, in Matters of an abſtruſe Nature, 'tis more expedient to confeſs our Ignorance, than to advance things which cannot be proved.

Fernelius, in a diſtinct and accurate manner, delivers his Sentiments of this Diſeaſe, in the following Words: "In the Venereal Diſeaſe, and others of a venomous Nature, many Phyſicians are groſly deceived, becauſe, when they obſerve theſe "Diſorders diſcover themſelves by a Peccancy, an Acidity, for "Inſtance, or Acrimony, of any of the Juices, they conclude "that the Diſorders are produced by this Acidity or Acrimony "alone, without inquiring whether there is in the Humours any "other Principle which excites the Diſorder. And though, "without doubt, ſuch a Principle cannot be ſubjected to the "Senſes, yet it may ſtill be rationally conceived to exiſt; "otherwiſe we muſt remain in profound Ignorance with re"ſpect to theſe Diſorders." Beſides, if we refer the abſtruſe and ſpecific Energy of this ſpreading Contagion to manifeſt Qualities, ſuch as an acid, a ſaline, or alcaline Acrimony, we muſt certainly commit egregious Blunders in Practice, ſince it would not be difficult to remove the Acrimony of any Humour by proper Medicines, which however cannot be eaſily done in a Lues Venerea. For which Reaſon, thoſe, in my Opinion, ſeem to be in a great Miſtake, who think, that Quick-ſilver, the moſt powerful Antidote againſt this Diſorder, operates by means of a highly penetrating Principle of an alcaline Nature, which ſubdues and corrects the peccant Acid.

But, that I may not be thought to paſs over in Silence every thing relating to the Nature of theſe ſubtle and active Poiſons, I ſhall deliver my Sentiments concerning them. Supported then by a long Courſe of Experience, I affirm, that the Nature of the contagious and Venereal Poiſon conſiſts in an highly ſubtle ſulphureous Fluid, or in a phlogiſtic, ethereal, and fermentative Principle, which, diffuſing itſelf, contaminates the other Juices of the human Body. And there are various Circumſtances from which this Property of the Venereal Poiſon may be deduced; for 'tis well known both to Philoſophers and Phyſicians, that a Sulphureo-ethereal, or oleous, or any other Fluid, may be ſurpriſingly divided, diſſipated, and multiplied, as is obvious in Subſtances furniſhed with ſuch a Fluid as Civet, Muſk, and the Fume of Sulphur, the ſmalleſt Molecules of which are capable of being ſo diffuſed, as to communicate the ſame Smell to an incredible Number of other Bodies. Now, if we conſider the Venereal Poiſon, it is of ſuch a Nature, that it may for many Months, or even many Years, lie concealed in the Body, before it produces any terrible Effects; which certainly could not happen, if it was of another Nature, and, at the ſame time, lodg'd in the Blood and Lymph; becauſe, by the continual Circulation of theſe, it would be brought into Action; ſo that the Venereal Poiſon may be juſtly defin'd, A Ferment of a ſulphureous and oleous Nature, which, being ſheath'd up in a pinguious Subſtance, is, with Difficulty, unfolded, and not eaſily mix'd with the other Juices. This Opinion is confirmed by the Propagation of the Contagion; for whether the Venereal Taint is, through the Pores, communicated to a ſound Perſon, it is only, at firſt, mix'd with the pinguious Fluid lodg'd under the Cuticula; or whether it is convey'd by impure Copulation, it is in like manner, at firſt, only inſinuated into the pinguious Membranes of the Pudenda, or the ſeminal Lymph, which, alſo, conſiſts of oleous Parts, till, at laſt, by means of theſe Juices, as a pinguious Vehicle, it is conveyed to the Lymph and Blood, and infects, contaminates, and vitiates, the whole Maſs of Humours.

This Opinion is ſtill more effectually confirmed, if we reflect on other Diſeaſes communicated by means of Contagion; ſuch as the Plague, the Small-pox, the Meaſles, and petechial Eruptions; the Matter of which is, alſo, of a putrid ſulphureous Nature, and may, for a long time, lie latent, and wrapt up in a pinguious Viſcidity, till, being freed and diſengag'd, it is by other Cauſes put into a multiplicative Ferment, and conveys the ſame Taint to the vital Juices. And the terrible Effects of the Venereal Poiſon, which diſcover themſelves by a putredinous Corruption of the Humours, are to be aſcribed to a Principle of a ſulphureous Nature, ſince 'tis certain from Experience, that pinguious Bodies are far ſooner brought into a State of Putrefaction than others. Thus I have known ſome wounded in the Belly, whoſe Omentum, being very fat, and protuberating from the Wound, ſoon became ſo putrid, that the By-ſtanders could not bear the fetid Smell. The celebrated *Boerhaave* is much of the ſame Opinion, and delivers his Sentiments in the following manner: "The "Venereal Poiſon is firſt lodged in that pinguious Humour of the "human Body, which in ſound Perſons fills what the Antients call'd "the Panniculus adipoſus, and the Moderns Membrana celluloſa, "ſo that the Contagion, entering the Pores of the Epidermis, "paſſes through the Skin to the Cellulæ of the Membrana "adipoſa, where, mixing itſelf with the pinguious Liquor lodg'd "there, it is, by the continual Heat, Motion, and Continuance, "more and more heighten'd in its Quality, corrodes and cor-

"rupts

" rupts the ſuperincumbent Skin and Cuticula, whilſt, in the " mean time, it contaminates the adjacent oleous Cellulæ all " around. Hence the Diſorder is farther ſpread in the Panni- " culus adipoſus, than in the ſuperincumbent Skin, which is " deſtroyed and corroded."

What has been advanced by *Boerhaave*, ſufficiently proves, that the Membrana adipoſa is not only the principal Receptacle of the Venereal Poiſon, but, alſo, that it is principally affected, when the Blood is already tainted, and the Diſeaſe pretty far advanced, as is ſufficiently obvious from the various external Corroſions, and phagedenic Ulcers. But the Truth of this is ſtill more effectually evinced by what the ſame celebrated Author, a little after, advances: For, ſays he, " The Membrana adipoſa, " as it were, ſuppurating, the denudated Muſcles appear beauti- " ful and ſeemly. The Ulcers only prey upon the Tunica adi- " poſa, without affecting the Skin; unleſs it ſhould be deſtroy'd " in conſequence of a Conſumption of the ſubjacent Veſſels." For this Membrane is ſoft, of a lax Contexture, and continually lubricated with a pinguious Juice, which circulates ſlowly, and remains long in that Part. Hence, if the Membrana adipoſa is in any manner corrupted, it is eaſily ſuſceptible of the quick and wide-ſpreading Taint, whilſt, at the ſame time, the ſubjacent Muſcles, and ſuperincumbent Skin, are unaffected; perhaps, becauſe theſe Parts are of a firmer Contexture, and, conſequently, more capable of reſiſting the Corruption.

But as nothing contributes more to ſink the Reputation of a Phyſician, than a wrong Prognoſtic; ſo great Judgment and Circumſpection is requiſite in forming it, leſt we ſhould ſhamefully tread in the Steps of Empirics, who, where there is the ſlighteſt Beginning of a Lues, pretend there is great Danger, and, for that Reaſon, ſubject the Patient to harſh and cruel Medicines; or, when the Infection is great, and the Caſe full of Danger, promiſe an eaſy Cure by their Arcana. The Violence of a Lues Venerea, and the more or leſs dangerous Events depending upon it, ought to be principally eſtimated from the following Circumſtances. Firſt, then, If the Patient is young, or arriv'd at the Years of Maturity, and is of a ſanguine and healthy Conſtitution, he will more eaſily ſupport the Diſorder, than thoſe who are choleric, pituitous, or leſs robuſt, ſuch as Infants, Children, and old Perſons. But this Rule does not hold with reſpect to Women, who, tho' weaker than Men, yet generally ſtand the Shock of this Diſorder better than they, ſo long as their Menſes continue. The Cure of this Diſorder, alſo, ſucceeds better in the Spring and Summer, than in the Autumn and Winter; and better in hot and Southerly Climates, than in moiſt and Northerly Countries, where there are large and frequent Falls of Rain: For this Reaſon, many, who go from *Germany* to *France*, are, by that means, more eaſily freed from this Diſorder: Not becauſe in *France* the beſt Phyſicians are to be found; but, principally, becauſe the mild and temperate State of the Air greatly favours the Cure of this Diſorder. It is, alſo, obvious, that a beginning Lues is more eaſily cured, than one which, being long continued, has taken deep Root. Nor are we, for this Reaſon, ever to deſpair, or deſert the Patients labouring under this Diſorder; but, when milder Medicines prove ineffectual, we are to have recourſe to thoſe of a more draſtic Nature; and, on the contrary, we are ſometimes to deſiſt from ſtrong Medicines, and uſe thoſe of a more mild and benign Nature, according to the State and Conſtitution of the Patient; by which means, Patients, in a deſperate Situation, have been often reſtored to perfect Health: A memorable Inſtance of which is given by *Fernelius*, in *Cap.* 17.

But that the Phyſician may not be deceived, with reſpect to the Event of the Diſeaſe, he is to have a due Regard to the different Stages of the Diſeaſe, or the Violence of its concomitant Symptoms. It is, therefore, to be obſerved, that they, who, in the firſt Stage of the Diſeaſe, are only afflicted with a virulent Gonorrhœa, a Diſcharge of malignant white Matter, Bubos, and Swellings of the Teſticles, nocturnal Pains of the Head and Joints, conſequent thereto, and have the peccant Matter only lodged in their Fluids, are eaſily recovered. In the ſecond Stage, where there are Ulcers of the Penis and Fauces, together with Puſtules and Boils diffuſed all over the Body, which they call the *Great Pox*, and which comprehends other external Ulcers, and where the ſolid Parts are already, in ſome meaſure affected, the Cure is far more difficult, but ſtill poſſible; except other Circumſtances, ſuch as the Patient's Method of Life, his Strength, and the concomitant Diſorders, prevent it. The third and higheſt Stage, which is accompanied with a Caries of the Bones, a profound Exulceration of the Palate, Bones of the Noſe, and Lungs, is ſo highly dangerous, that all Hopes of Recovery are loſt; for the more noble the Parts corrupted are, and the more neceſſary for the Functions of Life, the greater the Danger ariſing from a Lues Venerea is; which, alſo, holds true with reſpect to any other Parts, which, being, in a great meaſure, out of the Reach of Medicines, cannot be extirpated, if there ſhould be a Neceſſity for it. In like manner, if the Patient's Body is impure, and full of ſcorbutic Humours, or if any of the moſt conſiderable Viſcera, ſuch as the Lungs, Spleen, Liver, or Uterus, are corrupted, the Patient's Condition is, in a great meaſure, deſperate; becauſe, in ſuch a Situation, a Salivation can hardly be uſed with Safety. Hence it is, that this Diſeaſe, which, of itſelf, is not always mortal, frequently deſtroys the Patient, in conſequence of various unlucky Circumſtances; for ſome, who labour at once under a Scurvy, and Corruption of the Viſcera of the lower Belly, die of a Dropſy. Some, whoſe Lungs are ulcerated, die of a Phthiſis, or Hectic. Others, whoſe Bones are rendered carious, and corroded by a poiſonous Ichor, fall the unhappy Victims of intolerable Pain; whilſt others die of a Sphacelus, or a Cancer of the Palate and Uterus; and in theſe Caſes the Carcaſe is ſo mangled and putrid, as even to be diſagreeable Food to the Worms.

The Cure.

As, in this terrible and obſtinate Diſorder, the whole Maſs of Blood and Lymph, in conſequence of the malignant Taint, aſſumes a putrid, vapid, and viſcid Craſis, highly unfriendly to Nature, from which alone all the Symptoms of this Diſorder ariſe; ſo, in order to remove this principal Cauſe, no more proper Intention can be purſued, than through all the Emunctories to expel from the Body, and its ſmalleſt Veſſels and Receſſes, the whole Maſs of corrupted Humours; for, by this means, the moſt violent Symptoms, ſuch as Obſtructions of the ſecretory and excretory Glands, together with Inflammations, and Exulcerations of the Bones, and all the ſolid Parts, ſpontaneouſly ceaſe, when their productive Cauſe is removed. But, hitherto, there are only two Methods known of expelling from the Receſſes of the ſolid Parts the whole Maſs of peccant and tainted Humours; the one by a liberal and long-protracted Diſcharge of Sweat, and the other by a Salivation, continued for a ſufficient time.

As for the former of theſe Methods, by means of Sudorifics, we muſt here obſerve, that all Sudorifics are not equally proper for this Intention, but only ſuch as not only open the excretory Ducts of the Skin; dilute, reſolve, and digeſt, the viſcid Humours; but, alſo, and more eſpecially, ſuch, as, by increaſing and augmenting the ſyſtaltic Motion of the Veſſels of the Heart and Glands, put the viſcid and corrupted Humours, lodged there, in Motion, and expel them from the moſt latent Receſſes of the Parts. For this Purpoſe the moſt celebrated Medicines are the Wood and Bark of Guaiacum, the Roots of *China* and Sarſaparilla, together with the Wood and Bark of Saſafras, prepared in Decoctions, which are to be drank in order to excite Sweat. But among theſe the moſt powerful is Guaiacum, and its Bark, with which the *Americans* themſelves happily cure a Lues Venerea; becauſe this Wood is furniſhed with a certain acrid and reſinous Principle, abſolutely neceſſary for irritating the ſolid Parts. Thus, from this Wood, by means of highly rectified Spirit of Wine, a reſinous Eſſence is prepared, which, when mixed with half the Quantity of Spirit of Tartar, and exhibited in a warm Vehicle, effectually promotes Sweat. But it is both ſafer, and more cuſtomary, to uſe a Decoction of this Wood and Bark, prepared by boiling an Ounce of them in three Pints of Water, for an Hour; by which means the ſubtle reſinous and balſamic Part only is extracted, and the groſſer Subſtance of the Reſin left; for the ſame Decoction, when gently evaporated to Dryneſs, leaves a Powder of a browniſh Colour, of a Taſte and Smell reſembling that of the Opobalſamum, and poſſeſſed of ſo penetrating an Acrimony, that half a Grain of it, ſnuffed up the Noſtrils, by exciting a violent Sneezing, powerfully, and without any Diſadvantage, expels the Mucus from the Sinuſes of the Noſe.

From theſe Effects we may juſtly conclude, that Decoctions of Guaiacum, exhibited in due Quantities, and at proper Seaſons, by their acrid, ſubtle, and balſamic Principle, ſtimulate the nervous Fibres and Coats of the Glands and Veſſels, to briſker Motions; and, by increaſing the ſyſtaltic Motion of the Veſſels, excellently promote the Circulation of the Lymph and Humours. Such a Decoction may, according to the Circumſtances of the Patient, be commodiouſly exhibited warm in the Morning, for one, two, or three Months, the Patient, in the mean time, waiting for a gentle Sweat in Bed. By this Medicine alone I have known skilful Phyſicians cure ſeveral Perſons of phlegmatic and ſpongious Habits of Body. Some, alſo, in order more effectually to reſolve the Viſcidity of the Humours, order this Decoction to be uſed with a Laconic Bath, prepared of kindled Spirit of Wine. Nor is this Piece of Practice to be condemn'd, provided it is only uſed with due Caution and Circumſpection.

But, in tender, lean, and delicate Patients, this Decoction of Guaiacum is not always proper for removing a Lues Venerea, becauſe it excites a too violent Motion and Ebullition of the Humours. For Patients of this Kind, Decoctions of more temperate Woods and Roots are far more proper, ſuch as the Roots of Sarſaparilla and China, Saſafras and Juniper-wood, the Roots of Succory, Soapwort, Burdock, Liquorice, and others, which may, for the ſake of a better Extraction, be cover'd with Oil of Tartar *per Deliquium*; the Salt contained in which is highly efficacious in opening the firm, reſinous, and viſcid Texture of theſe Ingredients. But ſuch Decoctions become far more

powerful in removing a Lues Venerea, if crude Antimony, tied up in a Bag, or, which is the Practice of ſome, Quickſilver, is added to them in the boiling. Strong Decoctions of theſe Ingredients may be drank in the Morning; but, for ordinary Drink, if ſuch a Courſe is intended, the Ingredients muſt be boiled in three times the Quantity of Water, adding Currants, according to the State of the Patient, and a little Cinnamon, in order to render the Decoction more palatable.

The following may ſerve as Specimens of the Decoctions to be uſed for ſuch Intentions:

Take of the Shavings of Guaiacum-wood, four Ounces; of the Bark of Guaiacum, one Ounce; of *China* Root, and the Roots of Sarſaparilla, each half a Pound; of the Roots of Succory, and Liquorice, each two Ounces; and of Salt of Tartar, half an Ounce.

An Ounce and an half of theſe Ingredients, together with two Drams of crude Antimony, tied up in a Bag, are to be boiled in three Quarts of Water; and, when the Liquor is ſtrained, the Patient is to drink the third Part of a Quart, in order to promote Sweat. To the Ingredients, left after boiling, add two or three Ounces of Currants, and three Quarts of pure Water; boil all together; and, after ſtraining, let the Patient uſe the Liquor for ordinary Drink. But, if a weaker Decoction is deſired;

Take of the Roots of Sarſaparilla, half a Pound; of *China* Root, and the Roots of Vipers-graſs, each four Ounces; of the Roots of Succory, and Liquorice, each two Ounces; of the Bark of Saſafras, one Ounce; and of Salt of Tartar, three Drams. Let the Quantity of the Ingredients and Water be the ſame as in the former Decoction.

In the Beginning of a Lues Venerea, great Relief is afforded by a due and proper Uſe of theſe Decoctions. Yet, when the Diſorder is deep-rooted and inveterate, and a terrible Train of Symptoms appearing in conſequence of the Infection already conveyed both to the fluid and ſolid Parts, theſe Decoctions do not always anſwer the Expectation of the Phyſicians; and the Violence of the Diſorder, eſpecially in cold and northerly Countries, requires, that their diſcutient and reſolvent Qualities ſhould be increaſed by the Addition of ſome more efficacious Medicines; which Purpoſe I have found, from Experience, to be beſt anſwer'd by exhibiting, in Conjunction with ſuch Decoctions, a proper Doſe of ſome antimonial or mercurial Preparation, the moſt conſiderable of which are Æthiops Mineral, or the Golden Sulphur of Antimony precipitated from a Lixivium of the Scoriæ of Regulus of Antimony, with a Solution of Gold. Three or four Grains of this Preparation are highly efficacious in removing out of the Blood Impurities of every Kind. This Intention is, alſo, anſwered by the Tinctura Antimonii acris, or the ſulphurous Salt of Antimony, prepared from the Scoriæ of ſimple Antimony; or by Powders prepared of two Parts of the Ceruſs of Antimony, and one Part of the Cinnabar of Antimony; all of which, if duly exhibited with theſe Decoctions, in Conjunction with a proper ſudorific Regimen, powerfully reſolve and colliquate the viſcid Humours fixed in the ſmall Veſſels, and copiouſly evacuate them, not only by Urine, but, alſo, by Sweat.

But, that this Cure by Sudorifics may terminate the better, I am of Opinion, that the Body ought to be previouſly prepared for bearing it without any Diſadvantages: For this Purpoſe, when there is a Plethora, a proper Quantity of Blood is to be taken away; then, by proper Purgatives, the Sordes of the Primæ Viæ, and the whole Body, are to be carried off by Stool. But ſince this Intention is not to be promiſcuouſly anſwered by all Medicines of a purgative and laxative Quality, but only ſuch as by their Natures are adapted to this End, we ſhall enumerate the moſt proper, which are reſinous Gums, ſuch as Gum Ammoniac, Sagapenum, Opopanax, and Galbanum, which, when render'd ſtronger by the Extracts of Rhubarb, or black Hellebore, or by Mercurius dulcis, may, by means of the Eſſence of Guaiacum-wood, or *Peruvian* Balſam, be reduced to the Form of Pills; half a Dram of which may be taken for a Doſe: When the Patient is purged, by means of theſe Pills, three or four times exhibited about every other Day, the Cure by Sudorifics is to be begun, and a proper Regimen uſed; which principally conſiſts in the Patient's uſing light and ſlender Food, ſuch as Biſcuits, a ſmall Quantity of roaſted Fleſh, with ſton'd Raiſins, weak Broths of Veal, or Fowls boiled with Lettice, Endive, Aſparagus, and Celeri: They muſt, alſo, as much as poſſible, abſtain from pinguious Subſtances, boiled Fleſh, Fiſh, Preparations of Milk, and farinaceous Subſtances.

The Method of curing the Lues Venerea by Salivation becomes proper, when the Diſorder is deeply rooted, and can neither be remov'd by a ſtrict Regimen, nor the Force of Sudorifics, in which Caſe more efficacious and Herculean Medicines are to be uſed; ſuch as Preparations of Quickſilver, which are the moſt powerful Antidotes in this obſtinate Diſorder; becauſe, for this Purpoſe, there is not in Nature a more infallible and efficacious Medicine than Mercury; ſince, in conſequence of the Subtilty of its Parts, by penetrating into the moſt remote Receſſes of the Body, it not only powerfully reſolves the viſcid, tenacious, and, as it were, coagulated Humours; but, alſo, eliminates them by the Glands of the Palate and Fauces.

There are various Methods of exhibiting Mercury, in order to excite a Salivation. Thus the Antients endeavour'd to cure the Lues Venerea by Suffumigations of Mercury, reſolved into Vapours. But this Method is attended with conſiderable Diſadvantages; becauſe the groſs and thick Fumes of the Mercury are prejudicial and unfriendly to the nervous Syſtem: But Mercury is at once more frequently and ſafely uſed, when killed by proper Ointments, and in that Form applied to the proper Parts of the Body. This Method greatly prevails in *France*, where the Surgeons, in order to excite a Salivation, intimately mix an Ounce of Quickſilver, extinguiſhed in a ſufficient Quantity of Turpentine, with Ointment of Roſes and Pomatum, each an Ounce; adding about ten Drops of Oil of Lavender, and half a Dram of *Peruvian* Balſam. With this Ointment the Ancles, and, if it is neceſſary, the Knees, alſo, are to be anointed in the Morning, with an empty Stomach, before a warm Fire, for three or four Days, till a Diſcharge of the Saliva is excited; not omitting, at the ſame time, the Uſe of a temperate Decoction of the Woods.

But, when the Lues Venerea is very obſtinate, ſome Phyſicians and Surgeons think it more ſafe to excite a Diſcharge of the Saliva, by Preparations of Mercury internally exhibited: For this Purpoſe they exhibit four or five Grains of duly prepared Mercurius dulcis, reduced to a Powder, with the ſame Quantity of diaphoretic Antimony, and Crabs-eyes, with Conſerve of Roſes, either in Water-gruel, or ſome proper Infuſion; increaſing every other Day the Doſe of the Mercury, by an Addition of two or three Grains; and thus gradually aſcending till the Doſe is half a Dram, and a Diſcharge of the Saliva is excited; which in ſome, eſpecially thoſe of tender Conſtitutions, happens on the ſeventh, and, in others, on the ninth or eleventh Day. But if in Patients of languid, torpid, and phlegmatic Conſtitutions, the Mercury ſhould not operate duly, then Mercurial Unctions are for ſome Days to be uſed externally; by which means two or three Quarts of Saliva are often diſcharg'd: Then we are totally to abſtain from the Uſe of Mercurials, whether internal or external; and by no means to repeat their Uſe ſo long as the Salivation proceeds duly; but are rather to be careful to preſerve the Patient from Cold, and keep him moderately warm, a Circumſtance which greatly contributes to the Cure of the Lues Venerea: For which Reaſon we find, that the equable and temperate Heat of the Spring greatly favours the Cure of this Diſeaſe. The Patients muſt, alſo, abſtain from Summer-fruits, leſt a Diarrhœa ſhould be excited: Neither muſt they ever drink cold Liquors, Ale, and much leſs ſpirituous Liquors; but rather, in their ſtead, Decoctions of *China* Root, and the Roots of Vipers-graſs and Liquorice, with an Addition of Raiſins. And this Salivation is to be continued for a Week, two, three, or more, till the Saliva is diſcharged clear and limpid, and there is no longer a fetid Smell of the Mouth obſerved.

But ſince, in order to cure a Lues Venerea by Salivation, it is of great Importance to have the Body duly prepared, we are for this Purpoſe, in plethoric Patients, to take away a ſufficient Quantity of Blood; and the Impurity of the Humours is to be removed by proper Correctors. This Intention is anſwer'd, not only by temperate and diluting Decoctions, and abſorbent Powders, of a gently diaphoretic Quality, but, alſo, and more eſpecially, by the Laxatives above preſcribed, which eliminate the ſuperfluous and ſerous Sordes from the Body.

Practical Cautions.

In order to the due and judicious Cure of every Lues Venerea, the Phyſician is always to have a due Regard to the Condition of the Patient, ſo that by accurately diſtinguiſhing Perſons of weak Conſtitutions, Children, and pregnant Women, from Patients of hardy and robuſt Habits, he may diſcover what Methods of Cure will beſt ſuit their reſpective States and Conditions. It is, alſo, neceſſary, he ſhould carefully diſtinguiſh a recent Lues from one of the inveterate Kind, accompanied with a large Train of violent Symptoms: For different Stages of the Diſorder require different Treatments, either by means of milder or more draſtic Medicines: And, unleſs theſe Cautions are duly and carefully obſerved, we run a riſque, either of diſmiſſing our Patients irreparably miſerable, or of throwing them into ſome more terrible Diſorder.

As a Salivation, unleſs duly managed, is productive of very terrible Effects, ſo there are many Cautions to be obſerv'd, both before it is excited, and under it. When cacochymic and ſcorbutic Patients are infected with a Lues, we muſt be very cautious and circumſpect, before we excite a Salivation; for when we exhibit Mercurials to Patients of ſuch impure Habits, and attempt to excite a Salivation by that means, far more formidable Symptoms are produced; becauſe the Mercury, aſſociating with the Salts contain'd in their Humours, acquire an highly

corroſive Quality. It will in ſuch Caſes, therefore, be more proper to proceed in the following Manner: After having firſt cleanſed the Primæ Viæ by a laxative Preparation of Manna and Rhubarb, the Patient is for a Month to drink ſweet Whey, impregnated with the Juice of antiſcorbutic Herbs; ſuch as Scurvygraſs, Fumitory, Brooklime, and Water-creſſes; or a temperate Decoction of the Woods, mixed with Milk: After which Meaſures, Decoctions of the Woods, or, if it is neceſſary, Preparations of Mercury, may be ſafely uſed. The like Caution is to be uſed in exciting a Salivation in Men ſubject to ſpaſmodic and hypochondriac Diſorders, and in Women diſpoſed to thoſe of the hyſteric Kind; as, alſo, in thoſe of both Sexes, who are ſubject to Congeſtions of Blood, or Evacuations of it through the Noſe, the Lungs, or the hæmorrhoidal Veins. As for all ſuch Perſons a Salivation is improper, ſo it is ſtill leſs to be excited in thoſe whoſe Viſcera labour under any Diſorder, leſt, their Obſtructions being by that means augmented, the Patient ſhould be deſtroy'd.

Beſides, it is generally obſervable, that Patients of dry and lean Habits do not bear Mercurials ſo well as others; ſo that, before a Salivation is excited in ſuch Patients, it is highly expedient we ſhould previouſly render the Humours ſufficiently fluid, and relax the rigid Fibres, which are greatly diſpoſed to ſpaſmodic Conſtrictions. This Intention is moſt commodiouſly and effectually anſwer'd, by uſing temperate Baths of ſweet Water, in Conjunction with mild Decoctions, for two or three Weeks before the Salivation is attempted; by which means we often obſerve the Mercurials to operate in a mild, and, at the ſame time, a ſucceſsful Manner.

A Salivation is ſometimes accompanied with a very terrible Train of Symptoms; ſuch as a Looſeneſs of the Teeth, now of a blackiſh Colour, in conſequence of a too great Relaxation of the Gums; a Swelling of the Tongue and Fauces, accompanied with a Difficulty of Maſtication and Deglutition; a Loſs of Appetite; an Interruption of Sleep by the immoderate Diſcharge of the Saliva, which, alſo, continues in the Night-time; and a very conſiderable Loſs of Strength: All which Symptoms proceed partly from the violent Effuſion of the Saliva, and the ſtrong Impulſe of the Serum, convey'd from the Extremities and inferior Parts to the Fauces; and partly from a Diminution of the Diſcharges by Stool and Urine. For this Reaſon, if the Diſcharge of the Saliva is immoderate, and too much impairs the Strength, it is expedient to derive the Motion of the Humours to the inferior Parts, by bathing the Feet, by Clyſters, and by Laxatives prepared of Manna and Rhubarb; or, if theſe are not ſufficient, by means of the balſamic Pills, heighten'd in their Quality with the Extractum Panchymagogum Crollii; or by means of the Powder of Rhubarb, heighten'd by ſulphurated Diagrydium, and with the Syrup of Succory with Rhubarb, reduced into the Form of an Electuary; which, at the ſame time, greatly corroborates the Gums. Infuſions, alſo, of Paul's-betony, Scabious, Elder-flowers, and Sage, when frequently drank, are of conſiderable Service; becauſe, by their means, the Courſe of the Humours is directed to the external Parts of the Body, and Tranſpiration excellently promoted.

Beſides theſe internal Medicines for procuring a Derivation of the Humours to other Parts, in Diſorders which, under a Salivation, happen in the Mouth and Fauces, Gargariſms may commodiouſly be uſed, prepared of purifying and gently aſtringent Ingredients; the moſt conſiderable of which are, the Berries and Leaves of Myrtle, the Flowers of Balauſtines and red Roſes, the Herbs Mint and Baum; the Bark of Caſcarilla, and Maſtich, which, when boiled in the Waters of Elder-flowers or Plantain, or in Red-wine, may be frequently injected, by means of a Syringe, in order to waſh the Mouth the better: In order to guard againſt the too great Relaxation of the Gums, and prevent the Loſs of the Teeth, nothing is more proper than the Eſſence of the Terra Japonica, the Tinctura Laccæ Mynſichti, or the Balſam of Life, mixed with the Syrup of Pomgranats, or of Oranges; all which, when frequently applied to the Gums, are of ſingular Service.

It ſometimes happens, that Mercurials, exhibited in order to excite a Salivation, produce violent Pains of the Inteſtines, in which Caſe Preparations of the Theriaca are forthwith to be exhibited; ſuch as a few Grains of the Theriaca cœleſtis, with an Emulſion of ſweet Almonds, and half an Ounce of the Syrup of Diacodium. Theſe Emulſions, alſo, prepared with antiſpaſmodic Waters, and edulcorated with Syrup of white Poppies, are commodiouſly exhibited, when the Patient is afflicted with preternatural and continual Watching, becauſe, in ſuch a Caſe, ſtronger Hypnotics are never ſafe.

A Salivation may, ſometimes, be protracted for thirty-ſix Days, and longer; after which the Patients ought, in many Caſes, to take a proper Doſe of Mercurius dulcis every Week; and, for a conſiderable time, abſtain from acrid and pinguious Aliments. And though, after a Salivation, moſt Perſons have keen Appetites, and are ready to devour every thing that comes in their Way, yet they ought to avoid eating too liberally, becauſe they are to be treated like Children; for, as moſt of the old Blood was carried off by the Salivation, ſo benign Blood and Juices are now to be generated; which End is beſt obtained by a ſmall Quantity of laudable Aliments, duly concocted: By this means, alſo, a Relapſe is prevented. After the Salivation is finiſhed, the Patient ought, alſo, to change his Garments, becauſe, frequently, the Venereal Fomes, not entirely extinguiſh'd, lies latent, and is afterwards capable of producing new Diſorders; Inſtances of which are to be ſeen in *Hildanus*, *Cent.* 5. *Obſervat.* 115. where that Author, among other excellent Cautions neceſſary to be obſerved in a Salivation, adviſes, that, before it is attempted, the Tophs of the Bones are to be previouſly ſoftened, their Caries removed, and the Ulcers, as effectually as poſſible, are cleanſed.

The Venereal Poiſon eaſily affects the ſpongious Bones of the Noſe; and, firmly adhering to the Bones of the Palate, violently corrodes theſe tender Parts; and, by its putrefying Quality, reduces them to Fragments, or ſmall Portions. In which Caſe, a Mercurial Salivation alone is of little Service; but Injections ought rather to be made into the Noſtrils, with a Syringe of ſuch Liquors as reſiſt Putrefaction. And theſe may be compounded of the Aqua Sclopetaria, the Eſſences of Amber and Myrrh, *Peruvian* Balſam, and a few Drops of the Oil of Cloves: Which Preparation generally affords ſingular Relief to theſe corroded Parts; for, when this loathſome Putrefaction is not ſufficiently ſoon ſtopt, the Bones of the Palate are exulcerated, and rendered ſo carious, that Holes are form'd in them, through which every thing taken into the Mouth, eſpecially Liquors, regurgitate thro' the Noſtrils.

Exoſtoſes, and a Caries of the Bones, are not always infallibly cur'd by Mercury; but often more effectually by drinking ſome Quarts of a Decoction of Guaiacum every Day. That this Method may, at the ſame time, be ſeconded by external Remedies, the carious and black Parts of the Bones are firſt to be abraded, and the Parts affected ſprinkled with the Powder of Euphorbium; or, in its ſtead, Cotton, dipt in a few Drops of the Oil of Guaiacum, Cloves, or genuine Oil of Cinnamon, is to be applied. But, in a latent Caries, 'tis expedient, either by the Knife or Cauſtics, to divide the putrefying Fleſh, which covers the carious Bone, that, by this means, it may not only be expoſed to the Eye, but, alſo, have proper Medicines applied to it.

It frequently happens, that the Texture of the Bones, and eſpecially thoſe of the Legs, are, by the virulent Venereal Humour lodged within them, raiſed into Tumors, which degenerate into hard Tubercles, productive of intolerable Pain; becauſe, by their means, the highly delicate and ſenſible Perioſteum is ruptur'd. In this Caſe, the Relief of the Patient is, alſo, to be attempted by external Medicines, the moſt powerful of which are the Emplaſtrum Vigonis cum Mercurio, or the Emplaſtrum Manus Dei, call'd, alſo, Miraculoſum, heighten'd in their Virtues by the Addition of a proper Quantity of Quickſilver, and terebinthinated Balſam of Sulphur, or Balſam of Juniper. The ſame Intention is, alſo, anſwered by the emollient Plaiſter of *Agricola*, deſcribed in his *Chirurgia Parva*.

Tho' to ſome it may ſeem ſurpriſing, that the Bones, which are without Senſation, and ſo firm, that they can ſcarcely be divided by a Knife, ſhould, in this Diſorder, be ſubjected to ſo many Misfortunes, ſuch as Tumors, Inflammations, Apoſtems, and intolerable Pains: Yet, becauſe they are nouriſhed, and grow gradually larger, the fine lymphatic and nutritious Juice muſt neceſſarily enter them; ſo that it is not to be wonder'd at, if they are ſubject to Putrefaction and Apoſtems: For, whenever an acrid Ichor is accumulated in the Pores of the Bones, it, by its Acrimony, corrodes them in the ſame manner that Species of Worm, called the Teredo, perforates Wood. This ulcerous State of the Bones *Avicenna* called a Ventoſity of the Spine, and ſaid it was produced, when the groſſer Part of the putrid Ichor, accumulated in the Cavities of the Bones, became concreted into Tophs and Tubercles, whilſt the other more ſubtle Part of this Ichor, by its Acrimony, corrodes and diſtends the Bones and their Membranes; and 'tis by means of theſe Membranes, that the Bones are ſubjected to ſo violent Pains, and ſeem, as it were, to be perforated with a Piercer. The Pains accompanying this Diſorder are increaſed in the Night-time, becauſe, when the Sun is ſet, the Humours of the Body become more viſcid and tenacious. But, by the Heat of the Bed, the acrid, corroſive, and ſubtile Parts are put into a briſker Motion, ſo as to vellicate the Membranes, Tendons, and Nerves, and to diſtend them with a kind of vaporous Flatulency.

Venereal Puſtules appearing on the Forehead and Chin, and diſcharging a Sanies, or a putrid and acrid Ichor, are not, without great Difficulty, removed and conſolidated, unleſs the Venereal Poiſon is previouſly ſubdued, and the Violence of all the Symptoms abated: Nor do they always yield to Liniments, Ointments, and Plaiſters. I have, however, ſeen excellent Effects produced by the Application of a digeſtive Ointment, prepared of the Yolk of an Egg, Myrrh, and *Venice* Turpentine, mixed with an equal Quantity of the Balſam of Life.

A virulent Gonorrhœa, or a Fluor albus in Women, are not ſtopt by Mercurials. Theſe Diſorders, therefore, beſides the

Medicines recommended under the Article GONORRHOEA, are greatly relieved by Injections into the Uterus and Urethra. Injections of this Kind may be prepared of a ſecondary Quick-lime-water, made with Roſe or Elder-water, and mixed with the Aqua Sclopetaria; to which Preparation, in a Gonorrhœa, a ſmall Quantity of the Sugar of Lead may be added. Nor are Tumors of the Teſticles eaſily cured by a Salivation, unleſs the Deſign is, at the ſame time, promoted by external Medicines; the moſt common and conſiderable of which are Fomentations and Vapours of emollient Herbs and Flowers, boiled in Milk, and admitted to the Part affected; as alſo the Emplaſtrum Vigonis cum Mercurio.

But there is ſtill another internal Method of Cure, which, when neither mercurial nor ſudorific Medicines prove effectual, is of ſingular Service, not only in curing theſe Diſorders of the Genitals, but, alſo, in removing other Symptoms of this Diſeaſe, ſuch as a putrid Corruption of the ſquamous Bones, and a Polypus or Ozena, which diſcharges a malignant Sanies; for theſe Diſorders are ſo obſtinate, that they require a particular Method of Cure, which is to be perfected by Mercurials, in my manner, highly corrected and exalted ſo as to poſſeſs a diaphoretic Quality, which are to be continued for ſome Weeks, and do not excite an immoderate Salivation. In *Hoffman's Diſſertatio de Morbis rebellibus Chronicis ſine Salivatione curandis*, a Method is delivered for rendering Mercury diaphoretic, by an intimate Mixture of Gold or Tin; for theſe two Metals are, in a peculiar Manner, ſuited and adapted to correct and temperate the penetrating and volatile Nature of Mercury, and that Quality, by which it proves injurious to the nervous Parts, in ſuch a manner that the ſubtile Particles of the Mercury do not penetrate into the internal Compages of the Membranes, but only, by increaſing the ſyſtaltic Motion of the Veſſels, accelerate the Circulation of the Blood and Lymph; by which means the peccant Humours are conveyed to the Surface of the Body, and eliminated by the Pores of the Skin.

As for the Preparation of diaphoretic Mercury, one Species of it is prepared of an Amalgama of Mercury and Tin, in ſuch a manner, that, after drawing the Aqua-fortis off from it, it may be edulcorated with Water. The other is prepared of a Mixture of Mercury with Gold, and an equal Portion of the Regulus of Antimony; which, after an Abſtraction of the Aqua Regia, is to be edulcorated, in the ſame manner with the former. And with this diaphoretic Mercury, eſpecially that prepared with Gold, the Cure of a Lues Venerea is moſt ſucceſsfully carried on in this manner. Firſt, the Body is to be rendered ſoluble by the Mercurial Pills above preſcribed; then, moiſtening the Body for ſome Days with a Bath of River-water, prepared with Bran, let one Scruple of this Mercury be Morning and Evening exhibited, for ſome Days, in Conjunction with diaphoretic Antimony, either in Conſerve of Roſes, or in the Form of Pills, drinking next Morning a temperate Decoction of the Woods, and uſing, at the ſame time, a diaphoretic Regimen. But this Method is ſafer, if, after the Digeſtion of the Aliments, about Five or Six o'Clock in the Afternoon, the Patient uſes the Bath for a Month; and, at Bed-time, takes this Medicine in the Manner already directed. When theſe Meaſures are taken, the diaphoretic Mercury often produces ſo ſalutary Effects, that there is no Neceſſity for other internal Medicines, in order to carry off the Venereal Poiſon from the Body, provided only the Patient uſes a proper Regimen, and drinks a pretty large Quantity of temperate Liquors. *F. Hoffman.*

This Diſeaſe is very often contracted by mere external Contact. And the Contagion firſt affects the Part which was touch'd, whether that Part be covered with the Skin, or only with the Cuticula. Hence, when the Diſeaſe is communicated by Kiſſing, Sucking, or the like, it breaks out upon the Lips or Nipples in ſmall Ulcers; and by the Commerce of an impure Tongue, or infected Saliva, the Gums, Tongue, Palate, Uvula, Tonſillæ, and Fauces, are ſeized with horrible Abſceſſes. If the Infection has been received by the genital Parts, there too it produces Ulcers. But here, in this firſt Stage of the Infection, there is one obſervable Difference; which is, that if the Part firſt affected with the Diſeaſe be covered with the Skin, ſuppoſe the Back of the Penis, an Ulcer formed there will prove very malignant, very difficult of Cure, and, for the moſt part, there is great Reaſon to dread the Propagation of ſuch a Contagion thro' the whole Habit, ſince that Poiſon which can penetrate and corrode the ſolid Skin, ſhould ſeem to poſſeſs a very powerful Virulence; whereas, when the Diſeaſe makes its firſt Appearance in thoſe Parts, which are not defended with the Skin, ſuch as the internal Parts of the Pudenda in Women, the Glans Penis, or the internal Surface of the Prepuce, in Men, the Caſe is (*cæt. par.*) leſs formidable, becauſe here the Venereal Venom had its Way to make only through a very thin Cuticle.

As often as the Eye can judge of the State of the Part firſt infected, a red Spot appears, which nearly reſembles the firſt Eruption of the Small-pox, or Meaſles, or the Bite of a Flea. Here the Patient feels a ſlight Itching, a troubleſome Heat, but ſcarce any Pain. This Spot riſes into a Puſtule, which puſhing outwards, the ſcaly Texture of the Epidermis forms a ſmall Bliſter, which, if it is filled only with a thin tranſparent Lymph, after burſting, is generally ſoon healed, without any farther Miſchief. For what deſerves our particular Notice is, that in this Caſe the infecting Corpuſcle, mixed with the lymphatic Moiſture, as ſoon as its containing Membrane burſts, is waſhed out, and often does not leave the leaſt Taint behind it. Hence the Reaſon appears, why thoſe Bliſters, which in the common Chirurgical Language are called Cryſtallines, are ſo happily brought to a perfect Cure, without requiring Remedies of any great Moment: For, if we may draw Concluſions from the known Structure of the human Body, it ſhould appear, that, in this Caſe, the Contagion drunk up by the abſorbent Veſſels is convey'd by a mere lymphatic Vein into the Cavity of one of the ſmalleſt ſubcutaneous Follicles; where it taints the contained Lymph, and raiſes a Tubercle, which, upon burſting, entirely diſcharges a Poiſon that had no tenacious Matter to lodge in. See CELLULOSA MEMBRANA, and CHANCRE.

As often as the Marrow of the Bones is affected with the Contagion, all this oily Fluid becomes in a ſhort time corrupted, and changed into one rancid virulent Maſs of Putrefaction. And as here the acrid Poiſon has no way to diſcharge itſelf, as the Veſſels here are extremely tender, and all the Fluids merely oleous, it is plain, that, in a ſhort time, whatever is contained within the Bones muſt be reſolved into a cadaverous Putrefaction; and, becauſe of the torpid Motion of the Fluids here, muſt remain almoſt in a State of perfect Stagnation. Hence it is ſcarce in the Power of Medicine to ſtop the Progreſs of a Corruption begun here, or to expel or ſeparate the already putrid Maſs; for now thoſe Veſſels, diſtributed upon the Perioſteum, whoſe Office it was to convey the vital Fluids into the Cavities of the Bones, are deſtroy'd, and an entire Stop is put to the Introduction of freſh Liquids, and the Secretion of new Oil; while thoſe Veſſels, by which the Oil from the medullary Maſs uſed to be poured into the Interſtices of the bony Laminæ, or returned into the Bones of the Perioſteum, are, alſo, conſumed; and nothing now but a very fetid rancid Moiſture, which ſpreads a ſwift Corruption and Contagion all around, ſweats through the gaping Pores of the Veins. Hence the riſing Lamellæ depart from one another's Contact, and the Subſtance of the Bones becomes carious. Hence the Perioſteum, which in a natural State very cloſely embraces the Bone, becomes diſtended, eroded, and the Part is affected with a very acute Pain, eſpecially from Evening till Midnight, in a Gumma, Toph, or Exoſtoſis. And hence the like Deſtruction is propagated through all the Parts which ſurround the infected Bone; through which it makes its Progreſs principally by the means of the Adipoſe Membrane, whoſe whole Congeries of Cells are now inflated all the Way to the Cutis, become fungous, degenerate from their ſound State, and melt away into fiſtulous, fetid, ichorous, incurable Ulcers. No Medicine or Management in the World can ſucceed againſt this Evil, after it has once reached ſuch a Height. But whenever it happens in any Part of a particular Bone, ſo that any Quantity of infected medullary Oil lies concealed between the Lamellæ, there the Bone becomes corrupted; and always at this Place the oſſeous Layers, receding from each other, raiſe a bony Tumor, which increaſes by degrees: Whence that Part of the Perioſteum, which receives any Veſſels from this affected Part of the Bone, is inflamed, ſtretched, and racked with Pain; and from theſe Cauſes, likewiſe, the Corruption ſpreads, and Abſceſſes are ſcattered thro' the continuous Mazes of the Panniculus adipoſus. Sometimes, when theſe Tumors are opened, and the Bone is laid bare, the ſound Veſſels lying under the affected Lamellæ puſh off, and ſeparate the corrupted Part of the Bone, and afterwards, weaving a new Perioſteum, the Part is perfectly cured. A Cure is, likewiſe, performed in the ſame Manner, if the affected Part be ſeparated from the ſound, by ſcraping, by the actual or potential Cautery. This Evil is not to be cured by any other Art yet known. From what has been ſaid, we may be able clearly to judge, when, and in what Manner, this Contagion, when it has ſeized on the Bones, may be removed; when, and why, in other Caſes, it admits of no Remedy.

You will poſſibly be ſurpriſed to find a Diſeaſe, which is accounted ſo intricate and complex, reduced to ſo great a Simplicity. This is owing, ſays *Boerhaave*, to the ſevere Attention, with which I have improved ſo many Opportunities of examining its Events, both ſucceſsful and unhappy. I ſay then, that the only Hope of healing a Bone thus affected depends upon theſe Conditions, that the Marrow depoſited under the Lamellæ be laudable; and that the arterial Veſſels be ſound, and ſtrong enough to throw off the corrupted Part, in form of a Leaf or Fragment, while the Surface of the Bone is laid bare. In the mean time, all that Art can contribute to the Cure is, by laying the Bone bare, and increaſing the Force of the ſound Veſſels to aſſiſt in carrying on the Exfoliation; or to ſeparate, by manual Aid, the periſhed Laminæ from the ſound ones.

And here I muſt add another Obſervation of the laſt Importance; which is, that, as often as the Venereal Acrimony has deſtroyed the Perioſteum of a thin, lamellated Bone, void of Marrow, and whoſe Veſſels are very few and weak, neither Art nor

Nature

Nature can ſave ſuch a Bone; but the ſpreading Caries will proceed to the Sutures, by which it is joined to the neighbouring Bones; and the corrupted Bone will drop out either altogether, or in Pieces. For as theſe Bones receive all their Veſſels, and their whole Nouriſhment, immediately from the Perioſteum, and as there is ſcarce a Circulation of Liquids performed thro' their own proper Structure, when the Membrane that wrapt them up, is deſtroy'd, their ſlender Texture muſt of Neceſſity wither, the Oil in their Cells muſt become putrid, rancid, and melt down into Caries their oſſeous Subſtance. Of this kind are Bones of the Palate, Noſe, Vomer, the Ethmoide Bone, the Oſſa Spongioſa of the Noſe, the Os Unguis, Planum, and the other Bones which compoſe the Orbit; as alſo the Laminæ of the hollow Bone of the ſuperior Maxilla, the ſlender Apophyſes of the Sphenoide Bone, its Cells under the Ephippium, and the inferior Laminæ of the frontal Sinus. It ſtrikes me with inexpreſſible Grief, ſays *Boerhaave*, to remember what lamentable Misfortunes of this Kind have happened, even to ſuch as had been managed by the moſt eminent Phyſicians of ſeveral different Nations, before they put themſelves, now beyond the Poſſibility of being cured, into my Hands. I was well enough acquainted with all the boaſted Remedies againſt theſe Diſeaſes of the Bones, Salivation, Sweating, Fumigation with Mercury, or Cinnabar, and Mercurial Errhines. I knew, and have adminiſtered, every one of them with all the Pains in the World, but to no manner of Purpoſe: For, when once the inveterate Diſeaſe has taken deep Root in the Membrana Scheideri, which lines the Mouth, Noſe, and Larynx, and has deſtroy'd it where it inveſts thoſe ſlender Bones, not the leaſt Proſpect of any favourable Event remains, except by good Luck the bare Bone happens to drop out, leaving the reſt ſound; but, in the mean time, the utmoſt Endeavours muſt be uſed to keep entire the reſt of the Membrane, which is no eaſy Task, conſidering the tenacious, mucous, oily Liquor, with which this Membrane is beſmeared and filled, the innumerable Rugæ and Sinuſes, into which it is folded, together with its being conſtantly expoſed to the external Air. Let ſuch, therefore, as would not willingly boaſt, what it is not in the Power of Art to perform, be very ſparing of their Promiſes, when they ſee a plentiful Diſcharge from the Noſe of a filthy, putrid, rancid Ichor; or the back Part of the Fauces, the Uvula, the Tonſils, or the thick Membrane at the anterior Part of the Palate, waſting with Ulcers, which have the Appearance of Bacon. But he who is diligent in the Application of all proper Means, who neglects nothing that can be done, who ſtill, when one Remedy fails, has recourſe to another, who exerts his utmoſt Art to procure a favourable Iſſue, while, at the ſame time, he is very wary in his Prognoſis, acquits himſelf to his Patient, keeps himſelf ſafe, and may laugh at thoſe loud Boaſters, who run themſelves aground by their vain Promiſes.

Let us now conſider the Method of curing this Diſeaſe, when it is ſcatter'd thro' the Fat, and when, inviſcated in the oily Maſs, the prolific Poiſon propagates its Malignity thro' the Habit. We diſcover this to be the Caſe, when, after ſuſpected Embraces, often repeated Gonorrhœas, but more particularly after external Ulcers of the Pudenda, which have been neglected in the Cure, or eſpecially after a ſeeming Cure has too haſtily been performed by the Production of a ſudden Cruſt, by deſiccative or eſcharotic Applications; when after all, or ſome of theſe, Spots break out on the Skin, reſembling the Small-pox; when ſmall Ulcers break out upon the Lips, Gums, Tongue, Palate, the Uvula, Tonſils, Root of the Tongue, Larynx, Pharynx, or Cavity of the Noſe; then it plainly appears, that the Habit is affected with a Pox, and there is not now the leaſt Time to be loſt. But when the Middle of the Bones of the Cranium, or of the large round Bones of the Extremities, are ſeized with ſuch violent Pains, as if their plated Texture were rent aſunder, or were about to ſplit; if theſe Pains begin their Attack after Sunſet, proceeding by ſlow Degrees, till about Midnight they become ſo intolerable, as to oblige the tortured Patient to quit his Bed, but, towards the Morning, abate ſpontaneouſly; then we may be ſure the Diſeaſe has taken Root in the very Marrow of the Bones. Of this we have the more Certainty, if, afterwards, Tumors, whether ſoft, ſlow, obſtinate, or tophoide, or oſſeous, ariſe upon the middle Parts of the Bones; and more ſtill, if the ſoft Parts, which cover theſe Bones, are ſo affected with malignant Ulcers, as plainly to diſcover, that the Meditullium is deſtroy'd; or if the whole Body is here-and-there affected with thoſe frightful, ulcerous Breaches above deſcribed.

The Affections of the Marrow in this Diſeaſe have been already related; only it muſt be here obſerved, that the Diploe of the Bones of the Cranium performs the ſame Office, and is ſubject to the ſame Diſeaſes with the Marrow of the other Bones. Let us, therefore, now conſider wherein the genuine Cure of this Diſeaſe, when it is arrived at the Stages now deſcribed, conſiſts. If I have any Judgment in the Affair, it depends upon this alone, that all the Poiſon, which lies wrapt up in the Oils of the Body, be expelled even to the ſmalleſt Atom; for the leaſt Particle cannot be retained without endangering a Relapſe. But here we have two great Difficulties to encounter: For, firſt, it is no eaſy Matter to diſengage the virulent Particles from the Embraces of this tenacious, oily Lentor. And, in the ſecond Place, it is equally difficult to drive theſe Oils out of their Cells, to lead them back into the common Stream, and to drain them out of the Habit. And if all the Oils in the Body are not thoroughly diſſolved, and after that entirely diſcharged, together with the venomous Particles with which they have long been impregnated, it is impoſſible to root out the inveterate Diſeaſe; and, tho' you may ſeem to have cured it never ſo often, it will frequently break out again. We muſt, therefore, look out for a Method, by which all the Fat, Marrow, and every other tenacious Subſtance, wherein the Poiſon has found a Nidus, may be reſolved into mere Water, ſo thin and penetrable, as eaſily to make its Exit by the ſmalleſt Excretories. But where ſhall we find an Inſtrument ſufficient to perform this? We are provided with one in Mercury; for this mineral Fluid, as its ſpecific Gravity is to that of the Blood as 13 to 1, by whatever Ways it be carry'd into the Circulation, will, from the Motion it receives from the Heart and Arteries, act upon the Maſs of Blood with a Force proportion'd to its Weight; by which means the Texture of the Blood will be quite deſtroy'd, the red Spherules reſolved, the yellow ſerous ones comminuted, and every other Series of Globules daſhed into their ſmall conſtituent ones, till the whole Maſs is changed into a ſubtile, putrid, fugitive Lymph. Beſides, it is well known, how incredibly minute the Elements of Quickſilver are, and how much more ſubtile than the ſerous Globules of the Blood; for its being capable of entering the Pores of the Skin, without ſuffering any Alteration as to its Virtues, plainly demonſtrates, that it is a great deal more penetrating than the larger Particles of the Blood. And if we conſider with how much Eaſe it pervades the moſt denſe of all Bodies, Gold, we may reaſonably conclude, that, perhaps, the leaſt Particles of elementary Water itſelf are not ſo ſmall as thoſe of this Mineral, though, at the ſame time, from the Principle of Attraction, with which its Parts are endued, its Globules run into one another's Embraces, and adhere together with a certain Degree of Tenacity. Beſides theſe Properties of this Mineral, it is very little ſuſceptible of Change; and, perhaps, of all known Bodies, is the moſt void of Acrimony.

Now, all theſe Qualities judiciouſly conſidered, the true mechanical Power appears, by which Mercury is alone effectual, alone ſufficient againſt this Diſeaſe. Its Virtues here conſiſt in its melting down all the Fluids into a ſubtile Water, and dividing the tenacious Oils, ſo that the whole Maſs is ſo attenuated, as to run off in the Form of Saliva, or a ſerous Flux by the Inteſtines, or a violent Diſcharge by Urine or Sweat. By theſe means the old Liquids are totally expelled, and if the Loſs is not reaſonably repaired, by throwing in new Supplies, the Patient, in a ſhort time, dies of a Maraſmus. And in managing this Diſeaſe, when it is become inveterate, we muſt not truſt to the Power of Mercury, unleſs, by its means, every Drop of Oil in the Blood has been reduced to Water, diſcharged, and the Venereal Poiſon entirely waſhed out of the Habit, along with the reſolved Humours: For, if the leaſt Particle be left behind, no ſooner will the Veſſels be filled with new Juices, which in thoſe Caſes are always more oily than the old ones, then the Diſeaſe will break out again. Whence we may conclude, that the Diſeaſe is not perfectly cured, unleſs the Patient be reduced to a Death-like Paleneſs, and his Habit be quite emaciated; unleſs, during the Cure, his Food be as void of Fat as poſſible, and the Courſe protracted, till all the old Humours have been quite expelled. In ſhort, it is not every one who can manage this Remedy with Succeſs: For if you do not faithfully obſerve theſe Rules, and keep your Patient conſtantly warm, and in a conſiderable Degree of Heat too; and if, for a Month or two after the Cure, you do not take care, that he abſtain from all ſuch Food as is oily, and prone to Putrefaction, you will find, to your ſad Experience, that you have in vain fatigued him with the Hardſhips of a cruel Remedy; ſince there will almoſt infallibly remain ſome Taint to rouſe the Diſeaſe again, and give it new Vigour. A great many Things might be brought to illuſtrate what I have ſaid, but that is not my preſent Purpoſe: Only, I ſhall ſubjoin one Obſervation, the Truth of which I have too much Reaſon to know. It is this: That Mercury cures only as it is actuated by the Vis Vitæ, and expels the Venereal Poiſon no other way, than as itſelf is put into Motion, ſo that its medicinal Virtue is not able to correct this Virulence, when poſſeſs'd of a Place that lies in a manner beyond the Reach of the vital Impulſe. Hence a Caries of the Diploe of the Cranium is not to be cured by Mercury, which in ſuch Caſes runs out into the bony Cells now emptied of their Oil, and lies there an inactive Maſs. Hence too, it is, that it can ſcarcely correct the Marrow of the Bones infected with this Poiſon; nor ever cures ſuch a Gonorrhœa, as has its Seat only in the cellular Subſtance of the Penis, upon whoſe Veſſels the circulating Fluids have hardly any Momentum, tho' at the ſame time, if a Pox has got into the Habit, it will entirely remove it. Neither, as I have already ſaid, can Mercury ſave from Deſtruction thoſe tender Bones which have no other Covering, than a ſubtile Membrane. I have ſeen all thoſe miſerable Caſes, and have found how little Help Mercury affords againſt them.

them. But it proves a perfect Remedy for thoſe Venereal Diſorders that reſide in Parts where the red Blood, Serum, Lymph, and other Fluids, are hurry'd thro' their proper Veſſels, with a ſufficient Velocity, where thoſe Veſſels are at the ſame time wide enough to admit the Particles of this Mineral, and ſtrong enough to continue its Action with a due Force. Hence the Phyſician may learn when to be confident of his Art, when to diſtruſt it with Reaſon.

But when ſuch a Part is affected, as Mercury cannot operate upon, muſt we reſign the Patient to his ill Fate? By no means. And is there a Medicine from which we may hope Succeſs, when Mercury fails? There is. If the Poiſon is never ſo intimately blended with our Fluids, it may be waſhed out by the acrid Lixivium of Guaiacum. This Medicine performs that Task, by reſolving all the unctuous Particles, whether incorporated in the common Maſs of Blood, or accumulated in their proper Repoſitories, and by emaciating the Habit ſo exquiſitely, that not the leaſt Drop of Oil remains in it. Hence this has acquired the Name of the *Deſiccative Method of Cure*. In order to the right Adminiſtration of which, the Patient muſt be ſhut up in a Room ſo warm, as, by its mere Heat, to incline him to ſweating. He muſt, during the whole Courſe, abſtain from all Food, and Drink which has the leaſt Oilineſs in its Nature; taſting no other Food, than Biſcuit and Raiſins, nor Drink, except a ſomewhat weaker Decoction of Guaiacum. In the mean while, let him, four times a Day, drink as much as he is able, of a very ſtrong Decoction of this Wood. I would have him, at every Draught, ſwallow down at leaſt eight Ounces; if he takes more, ſo much the better. After he has thus continued drinking for ſome Days, and his Habit is now ſo ſaturated with this Liquor, that it is almoſt bloated into a Dropſy, you muſt now conſider the Body as quite turgid with a Liquor of ſuch a penetrating Acrimony, and acute balſamic Virtue, as diſſolves all the pituitous, dilutes all the oily, attenuates all the tenacious Fluids, and preſerves from further Corruption, whatever is grown putrid. Beſides, by this time, the depraved Humours have been gently macerated in this medicated Liquor. And now it remains, that it be put into a violent Motion, and hurry'd through the whole vaſcular Syſtem with ſo much Velocity, as to waſh, deterge, and cleanſe, the inmoſt Receſſes of the Body, that the tainted Oils may be entirely thrown out, and, conſequently, by the continued Diſcharge, the Fomes of the Diſeaſe may be expelled. For this Purpoſe, let the Patient now, every Morning faſting, ſwallow down as much of this Decoction as his Stomach can hold; then let him place himſelf in an erect Poſture in a Sweating-box, or if he lies in Bed, let a Stove be put under it. In either of theſe Places, he muſt receive upon his naked Body the Steams of kindled Spirit of Wine, and there let him ſweat as long, and as plentifully, as his Strength will allow. After he has ſuffered this Heat for half an Hour, which is almoſt the utmoſt Space to which this Proceſs ought to be protracted, let the Flame be extinguiſhed, and the Patient ſweat in his Bed for about an Hour longer. After which, let him take eight or ten Ounces of hot Veal Broth, boiled with a ſmall Quantity of Rice, but void of all Fat: His Body muſt now be carefully wiped with warm dry Flannel Cloths; which done, let him riſe, and drink of his Decoction, as formerly, throughout the Day. In this manner, to every Article, muſt this Proceſs be repeated both Morning and Evening, for fourteen Days ſucceſſively: After this, let it be repeated in the Morning only, for fourteen Days more. In the mean time, whilſt the Sweating is thus violently promoted, if there is any particular Part of a Bone touched with the Diſeaſe, it muſt be wrapt up in Cloths dipt in a very ſtrong Decoction of Guaiacum, and apply'd very warm; and, while the Sweating proceeds, the Steams of the Spirits muſt be ſo directed, as to ſtrike principally upon that Part. By this Method, the moſt intimate Receſſes of the Bones, and all the moſt inacceſſible Parts, even thoſe which the Power of Mercury could not reach, are thoroughly rinſed. I remember, I once ſaw a young Gentleman deeply affected to the very Bones with this Diſeaſe, who by this Management ſweat ſo violently, that in the Height of the Diſcharge the Sweat, tinged by the Decoction with a greeniſh Caſt, heaved up, and ſeparated the looſen'd Eſchars of the Ulcers. I reflect with Pleaſure on the Succeſs with which I uſed this Method upon that Patient, whoſe Bones were in ſome Places ſo much corrupted, that an entire Joint of one of his Fingers dropt off; and one of his Shin-bones appeared carious in ſeveral Places. By this Method exactly purſued, the ſmall Bones of the Noſe, and Pieces of the Palate-bones, were ſeparated, and left the reſt entire. In ſhort, he was perfectly cured, and lives to this Day a very ſound Perſon, and the Father of a Family.

But as Salivation, and theſe Decoctions, are the uſual Refuges in ſuch Extremities, I have conſtantly found, as often as I have had an Opportunity to make the Obſervation, that the ſweating Method may be very happily purſued after a Salivation; but that, if, after the Maſs of Fluids has, by means of this Liquor, been ſo thoroughly diſſolved, as is requiſite to a Cure, you attempt a Salivation, it is always to very little Purpoſe. In this Caſe, in whatever Manner, and to whatever Quantity, you adminiſter Mercury, you will not be able to procure a Salivation. After frequent Trials of this, I am at laſt convinced, that as Quickſilver, according to what I have already obſerved, is a Body entirely void of Acrimony, it does not at all act upon the Humours, after they are attenuated to ſo great a Degree, but ſlips off without having done any Service, and almoſt without having made the leaſt Impreſſion upon the Blood. *Boerhaave*'s Preface to the APHRODISIACA.

Some Years ago, Mr. *Chicoyneau*, a Phyſician at that time reſiding at *Montpelier*, propoſed a Method of curing the Venereal Diſeaſe by Mercurial Unctions, apply'd at Intervals, in ſuch a manner as not to excite a Salivation; and gave ſeveral Inſtances of the Succeſs with which this Method was attended. This Attempt, however laudable, attracted the ill Will of moſt of thoſe who found their Account in a tedious and expenſive Salivation, and were more ſolicitous about their own private Intereſts, than the Welfare and Convenience of their Patients. Accordingly, he was attack'd by ſome, with a Shew of Gravity; whilſt others aſſum'd the *faux Plaiſant*, and expos'd their bad Hearts, or weak Underſtandings, by a Buffoonry, always unſeaſonable, when ſubſtituted for Reaſons, and the Evidence of Facts.

Mr. *Pierre Deſault*, a Phyſician of *Bourdeaux*, afterwards made ſome Improvements on the Method recommended by Mr. *Chicoyneau*. And the late Mr. *John Douglas* adopted *Deſault*'s Practice, and purſu'd it for many Years with great Succeſs.

As I can affirm, on my own Knowledge, that it ſucceeds at leaſt as well as a Salivation, in moſt Caſes, I think myſelf obliged to take notice of what *Deſault* informs us on this Subject.

DESAULT's METHOD OF CURING A GONORRHOEA.

From the firſt Day that I am ſent for, I make the Patients rub the Yard, and principally the Canal of the Urethra, the Groin, and neighbouring Parts, or the Pudenda of Women, with an Ointment of one Part Mercury, and three of Axungia. I make them uſe two or three Drams of this Ointment, rubbing themſelves from the Anus, all along the Canal to the Glans and Prepuce. The following Day I purge the Patient vigorouſly with Jalap, from two Scruples to a Dram, according to his Conſtitution. I make him uſe for his Diet-drink, Spring-water, in which has been boiled Mercury revived from Cinnabar. This Method I continue ſeveral Days; but, if the Patient finds himſelf too much fatigued, I interpoſe a Day or two, with reſpect to the Purges; but I continue the Mercurial Friction every Night, with the aforeſaid Apozem for his conſtant Drink.

Though the Patient be afflicted with a Cordee, can make no Water without exquiſite Pain, and be cruelly tormented by nocturnal Erections; yet the firſt Friction relieves him conſiderably, the ſecond yet more, and the third commonly removes the Pain; and I have met with none, whom the fourth or fifth Friction has not entirely eaſed. By this Method, alſo, the Quantity of the Diſcharge is leſſened, the Matter changes Colour, and becomes more fluid, oily, clear, and ropy, which are all very favourable Symptoms; and thus the Running either ceaſes ſpontaneouſly, or by the Continuance of theſe Remedies, ſo that Injections and Aſtringents, which are often dangerous, become here unneceſſary.

Sometimes, indeed, the Patient is flattered, that the ſmall Running, which continues long, and appears like a Pearl in the Morning, upon ſqueezing the Canal of the Urethra, is only a Weakneſs of the ſeminal Veſſels; and that nothing is required to ſtop it, but Aſtringents. I have obſerved, after *Sydenham*, that this is a Remainder of the Diſorder not quite cured; and, after ſtopping it with Aſtringents, Tetters, and Venereal Ulcers, have appeared in ſeveral Parts of the Body.

Such ought to obſerve a ſtrict Regimen, and abſtain from Wine, Salt, Spices, and whatever is high-ſeaſoned; above all, they ought to avoid the Company of the Fair Sex, either for Venereal Intercourſe, or private Converſation; it being of the laſt Importance to leave the diſeaſed Parts at Reſt, and not to injure them by exciting Motions repugnant to the Cure.

The Running being entirely ſtopped, and all the Symptoms removed, I make them commonly take, for ſome Days, a Baſon of Milk every Morning, to reſtore that Balſam, which the Blood may have loſt by frequent purging.

The Venereal Buboes in the Groin, which are often accompany'd with a Gonorrhœa, Phymoſis, and Paraphymoſis, are cur'd the ſame way, provided there is no Pus formed in the Swellings; for, in that Caſe, it is impoſſible to avoid opening them.

I order the Patients to ſhave off the Hair, and increaſe the Quantity of the Ointment to half an Ounce; I make them rub the Groin, and the Teſticles, and, alſo, the Pudenda of either Sex. I purge every Day, making uſe of the Mercurial Water; and take great Care to repeat every Night thoſe Frictions, and to extend them to the neighbouring Parts, continuing them, and the Purges, a long time. By theſe three Remedies, I find the Buboes diſcuſs; the Phymoſis, Paraphymoſis, and Chancres, diſappear; and the Patients recover their former Health.

This Method is a thouſand times preferable to repeated Applications of Cupping-glaſſes upon Buboes, inducing painful Inciſions for laying them open, and a copious Suppuration, which has been reckoned a Criſis of the Pox.

By this Method, alſo, the Deſtruction of the inguinal Glands is prevented; for either they are deſtroy'd by Suppuration, or deprived of their Uſe by deep Scars remaining after their Opening.

When the Tumors in the Groin are much inflamed, or when the Tumor is ſituated in one or both Teſticles, attended with Pain and Pulſation, and threatening Suppuration, I bleed the Patient copiouſly, and repeat it according to the Age of the Perſon, till the Inflammation begins to recede; and I have ſpeedy recourſe to Frictions.

The Doſe of the Ointment ought to be proportioned to the Number and Greatneſs of the Complaints. I am not ſatisfy'd with applying it only to the Parts affected; I rub it in upon the neighbouring Places, and inner Parts of the Thighs, in proportion to the Degree of the Diſorder; and I preſcribe from ſix Drams to an Ounce of the Ointment.

DESAULT's Method of curing the Pox.

When the Patients have a Pox of long Continuance, and the Venereal Poiſon is diſperſed all over the Body, they ſhould be prepared by bathing, and drinking Whey. But, in a recent Pox, when the Patients are full of Juice, the Bath is not neceſſary, or, at leaſt, need not be uſed long, becauſe the Blood is ſufficiently diluted. If the Patient is reduced to great Weakneſs, and is unable to undergo theſe preliminary Preparations, we are oblig'd to have immediate recourſe to the Frictions.

After this, inſtead of raiſing a Salivation, I bring on a Flux of the Belly, changing nothing of the antient Method, but the Place of Evacuation; and, inſtead of a painful fetid Flux of the Mouth, ſubſtitute Purging, without any Fatigue, Pain, or Danger.

The whole Secret conſiſts in keeping the Patient's Body open by Clyſters of Decoction of Sena, and the Pulp of Caſſia, before the Frictions are adminiſtered. By this Precaution it happens, that the Mercury finding the inteſtinal Glands relaxed, and the Body open, its Evacuation tends that way more readily, as the Place where it finds the leaſt Reſiſtance. When I find the Looſeneſs does not anſwer the Number of the Frictions, nor the Quantity of Mercury I employ'd, I purge the Patient with Powder of Jalap, and procure copious Stools, which ſecure the Mouth. While the Looſeneſs is going on, a Friction does the Office of a Purge; and in proportion, as they are reiterated, ſo the Flux of the Belly revives; and, when it ſlackens or ſtops, I have recourſe to Clyſters, and Purges of Jalap. In this Method I proceed, till by the Ceſſation of the Symptoms, by the Quantity of Mercury I have employ'd, and the Abundance of the Evacuations, I am thoroughly perſuaded, that the Venereal Taint is entirely drain'd off, and that the Serum of the Blood is chang'd, and has made room for new Juices.

Why this Method is more safe and convenient than the old one.

1. By urging a Salivation, the Pain has often brought Patients to the laſt Extremity; the Swelling of the ſalival Glands, of the Tongue, Muſcles of the Fauces, and their Inflammation ſometimes communicated to the Larynx, have rendered the Patient incapable of Deglutition, or Breathing, ſo that by Loſs of Strength, Want of Suſtenance, and Obſtruction of Reſpiration, many have periſhed. But in carrying off the Evacuations by Stool, the Inteſtines being appropriated to receive and expel the Impurities of them, and capable of containing them in a capacious Canal, always open, they give leſs Uneaſineſs than at the Mouth, which was not deſigned for any ſuch Evacuation, or to ſerve for a common Drain.

2. Is it not, therefore, more eligible to remove by five or ſix copious Stools in an Hour, and without Pain, that which could not have been evacuated by the ſalival Glands in leſs than a Day, and with exquiſite Torment? I have often reflected, that the violent Pain ſeemed to be a convincing Proof, that the Diſcharge by Salivation was a Violence done to Nature.

3. By the Flux of the Belly, not only the Patient's Safety and Eaſe are continued, but the Teeth are preſerved; which, by Salivation, ſometimes fall out, are looſened, and almoſt always grow black, and the Gums wear away.

4. By this Method, the deep Scars, ſucceeding the Ulcers occaſioned by Salivation, are avoided; theſe Scars ſometimes form ſtrong Seams, hindering the Opening of the Mouth, and muſt ſometimes be cut after the Courſe.

5. There is no Danger of leaving a perpetual Salivation, which is occaſioned by tearing aſunder the excretory Canals of the ſalival Glands, and is ſometimes incurable.

6. The Patient needs not be confined to his Chamber above twenty-five or thirty Days, and may even go abroad in fair Weather: Beſides his Mouth being ſound, he may eat as he pleaſes, and recruit his Spirits. But, after Salivation, a long Time is required to cure the Senſibility of the Mouth and Tongue.

7. The Expences of this Method are leſs, nothing but common Food being required, and no Linen ſpoiled.

8. The Reputation of the Patient is ſaved; for he may do Buſineſs, and receive Viſits, in his own Houſe, without raiſing any Suſpicion.

Proofs that there is more Assurance of a perfect Cure in this Method than the other.

1. Almoſt all Authors agree, that Patients have been cured of the Pox, without Salivation, by a Diarrhœa only, occaſion'd by the Frictions; although all Remedies to ſtop the Diarrhœa, and raiſe the Salivation, have been in vain. If, then, we can be certain of a Cure, when the Evacuation happens by Stool, why ſhould we not invite them that Way, as we have already proved it more convenient than the other?

2. The ſalival and inteſtinal Glands are of the ſame Structure, and muſt therefore have the ſame Uſe, ſeparate the ſame ſort of Lymph, and, conſequently, it muſt be equal, in this reſpect, whether the Evacuation be made upwards or downwards. Beſides, in a Salivation, the Broth, or Ptiſan, ſwallowed by the Patient, mixes with Part of the Venom filtred through the ſalival Glands; and thus the Venom is returned into the Blood.

3. What invincibly proves, that the Lymph coming from the ſalival Glands is of the ſame Nature with that of the Inteſtines, is, that, as ſoon as the Looſeneſs ceaſes, the ſalival Glands ſwell; and, when the Looſeneſs returns, the ſalival Glands decreaſe: Since, therefore, theſe Evacuations increaſe and diminiſh at the Expence of each other, they muſt undoubtedly be ſupplied with the ſame Matter; and therefore it is not material, with regard to the Efficacy of the Cure, which Way the Evacuation be made.

4. But we may conclude, that the Evacuation by Stool is more efficacious, becauſe the inteſtinal Glands are vaſtly more numerous than the ſalival. Beſides, only two ſmall Ramifications of an Artery belong to the ſalival Glands; but the arterial Branches, which ſupply the Inteſtines, are of ſo conſiderable a Size, and convey a Quantity of Blood, which ſeems too copious for the Nouriſhment of the thin and fine Subſtance of the Inteſtines. Nature muſt, therefore, have deſigned, that this Blood ſhould receive ſome Depuration in the numerous Glands of the Inteſtines; an Intention which cannot be ſuppoſed to appertain to the ſmall Arteries of the ſalival Glands. When, therefore, a general Depuration is deſigned, the ſmall arterial Ramifications of the ſalival Glands cannot reaſonably be preferred to the conſiderable Tubes in the Inteſtines; eſpecially as Nature herſelf indicates, by the abundant Stools after the firſt Frictions, her Tendency to that ſort of Evacuation.

5. Thoſe who endeavour to ſtop the Diarrhœa after the firſt Frictions, and to force the Evacuation upwards, directly oppoſe the Advice of *Hippocrates*, who adviſes, "To act agreeably to "the Inclinations of Nature, and to chuſe thoſe Emunctories "which ſeem moſt commodious to her." Now what Paſſage can be more convenient, than a large Canal always open, placed in the Middle of the Body, like a Sewer, for the Reception of all Impurities; a Paſſage which occaſions no Uneaſineſs nor Danger, nor interrupts Maſtication, Deglutition, and Digeſtion; Functions which are overthrown by Salivation?

6. This Method of purging is much more efficacious in Poxes accompanied with habitual Gonorrhœas, than that of Salivation: For by the Diarrhœa I at once carry off both the Pox, and Gonorrhœa; but *Sydenham* obſerves, and his Obſervation is confirmed by Experience, that no Degree of Salivation can cure a Gonorrhœa, in which, as the ſame Author aſſures us, Purging does every thing.

7. When the Patient is extremely emaciated, the Diarrhœa is much ſafer, than a Salivation; becauſe, during the Purging, he can take Nouriſhment, ſleep, and recruit his Strength; the Purging, alſo, can be more eaſily moderated, than the Salivation.

8. When the Palate, Throat, Uvula, and the neighbouring Parts, are ulcerated, many bad Conſequences may be produced by forcing the Humours to the Parts affected; and the Patient may even be ſuffocated, or much diſfigured.

9. Some eminent Authors aſſure us, that the Effects of Purging are ſafe and ſalutary, in almoſt all Diſeaſes. Nor can it be ſuppoſed to fail in the Pox only, ſince the Advantages of it in the Gonorrhœa are manifeſt, which differs from the Pox only in Degree.

Objections to this Method answered.

1. It is to be feared, that the Venereal Poiſon, joined with the Mercury, and brought to the Inteſtines, will exulcerate them, as it does the Mouth; and occaſion griping and bloody Stools, which might prove mortal.

But this Objection is groundleſs: 1. Becauſe the internal Surface of the Inteſtines is lined with a Mucus, which defends them againſt the Acrimony of the Bile, and other Humours, and facilitates the Deſcent of the Excrements: This Mucus, alſo, ſecures them againſt the Impreſſions, either of the Mercury, or of the Virulence it brings along with it; and the Want of this Mucus in the Mouth ſuffers the Mercury to produce thoſe violent Exulcerations there. 2. The Canal of the Inteſtines is long, wide, and always open, and their Contents paſs quickly through them; but, in the Mouth, Diſcharges go off gently, and laſting and violent Impreſſions are made. 3. Experience proves, that this Caſe never happens in the Method by Purging.

2. *Sydenham* regards the Looſeneſs which happens after the firſt Frictions, as an Obſtacle to the Cure, and adviſes to ſtop it. *Sydenham* indeed perceived, that a Looſeneſs was an abſolute Hindrance to a Salivation, which, he imagined, was the only Remedy for the Pox. But if this celebrated Author had been convinced, that this Diſtemper could have been effectually cured by a Diarrhœa, it may be believed, from his known Integrity, that he would have altered his Opinion.

3. By throwing the Mercury off by Stool it is render'd uſeleſs, becauſe no Time is allowed it to circulate with the Maſs of Blood.

This Objection is equally ſtrong againſt Salivation, by which, alſo, the Mercury runs off. By the Method of Purging we may throw in as much Mercury as we pleaſe, and abundantly replace what is diſcharged by Stool with a freſh Supply: Thus I have uſed twenty-four Ounces of Ointment in twenty-four Frictions; a Quantity which muſt by no means be uſed in a Salivation, it being limited by *Lemery* to five.

4. Some prefer the Method of making Mercury act by Extinction, by adminiſtring Frictions at ſuch Intervals as may prevent a Salivation, and produce no kind of Evacuation.

But Experience convinces us, that Mercury, exhibited in this manner, does not always ſucceed, tho' I have ſeen good Effects produced by it.

LUFFA *Arabum.* A Name for the *Cucumis*; *Ægyptius*; *reticulatus.*

The reticular Subſtance which contains the Pulp, is uſed at the public Baths in *Egypt*, for rubbing the Skin, when affected with Morphew, or leprous Diſorders. *Proſp. Alpin. de Plant. Ægypt. Cap.* 34.

LUJULA See ACETOSELLA.

LUMBAGO. A violent Pain in the Loins, which affects the Patient in ſuch a manner, that he can ſcarcely move. It is generally ſaid to be a ſcorbutic Symptom. See SCORBUTUS. But it is frequently excited by the Gout, or Rheumatiſm. See RHEUMATISMUS.

LUMBARIS INTERNUS. A Name for the Muſcle more commonly call'd PSOAS; which ſee.

LUMBI. The Loins. See ABDOMEN.

LUMBRICALES MUSCULI.

The Name of ſome Muſcles which move the Fingers, and of others which move the Toes.

Thoſe which move the Fingers, are alſo called *Flexores primi Internodii Digitorum manus.*

They are four very ſmall ſlender Muſcles, lying in the Hollow of the Hand, in the ſame Direction with the *Perforatus*, or *Perforans.*

They are fixed by their fleſhy Bodies to the Tendons of the Perforatus, on the Side next the Thumb, near the large annular Ligament of the Carpus, Near the Heads of the metacarpal Bones, they become very thin Tendons, which accompany thoſe of the Perforans through the Furcæ of the Aponeuroſis Palmaris. Then they paſs on to the ſame Sides of the firſt Phalanges, and join the Tendons of the Extenſor communis, each of them being connected with the neareſt Portion thereof, at the Articulation of the firſt Phalanx with the ſecond.

Theſe Tendons are alſo united to ſome of the Interoſſei, and their Inſertions ſeem to vary in different Subjects; for tho' they lie generally on that Side of the Fingers, which is next the Thumb, yet, if I am not miſtaken, I have obſerved the firſt inſerted in the Index on the Side next the Thumb, the ſecond and third on each Side the middle Finger, and the fourth in that Side of the Ring Finger, which is fartheſt from the Thumb.

The Lumbricales, by the Union of their Tendons with thoſe of the Interoſſei, are Coadjutors to theſe Muſcles, not only in the lateral Motions of the four Fingers, but alſo in bending and extending them. In the lateral Motions, they co-operate according to their Situation in each Subject; and it is poſſible, that the Variety of their Inſertions anſwers to that of the Interoſſei, ſo that the reciprocal Co-operation continues ſtill to be equal.

They aſſiſt the great common Flexor to which they are fixed, only in bending the firſt Phalanges; which Motion that Muſcle principally performs, by means of the ligamentary Vaginæ, eſpecially that Portion of them which is next the Metacarpus.

They may aſſiſt the Extenſor communis, in extending the third Phalanges, together with the Interoſſei, by the Concurrence of their Tendons. But here the Variety of their Inſertions is alſo to be regarded; and, in ſome Subjects, the want of them in that Side of the Index next the Thumb, and Side of the little Finger, fartheſt from the Thumb, may be ſupply'd by the proper Extenſors of theſe Fingers.

Thoſe which move the Toes, are alſo called, Flexores primi Internodii Digitorum Pedis.

They are four ſmall Muſcles, ſituated more or leſs longitudinally under the Sole of the Foot.

They are fixed by their fleſhy Extremities to the four Tendons of the Flexor Digitorum longus, near the Inſertion of the Flexor acceſſorius. The firſt Muſcle is fixed to the Inſide of the firſt Tendon; the ſecond, to the tendinous Fork formed by the two firſt Tendons; the third, to the tendinous Fork made by the ſecond and third Tendons; and the fourth, in the ſame manner, to the third and fourth Tendons, but commonly moſt to the third.

From thence theſe four Muſcles run to the Toes, and there terminate in the ſame Number of ſmall Tendons which are inſerted in the firſt Phalanges of the Toes, much after the ſame manner as in the Hand. They are termed Lumbricales, or Vermiculares, becauſe of the Reſemblance they bear to Worms. *Winſlow's Anatomy.*

The Lumbricales have nearly the ſame Functions in the Foot, as in the Hand; and they are partly aſſiſted, and partly directed, by the Flexor acceſſorius. *Winſlow's Anatomy.*

LUMBRICUS TERRESTRIS, *Vermis terreſtris.* Offic. *Lumbricus terreſtris.* Jonſ. Inſect. 137. Ind. Med. 69. Aldrov. de Inſect. 693. Charlt. Exer. 59. Mouff. Inſect. 278. Raii Hiſt. Inſect. 1. *Lumbricus terrenus.* Schrod. 5. 343. *Vermes terreſtres majores.* Mer. Pin. 206. THE EARTH-WORM.

It is an hermaphroditic, long Animal, without Legs, of the Thickneſs of a Gooſe-quill, ſoft, carnous, and annulated, of a faint Blood-colour, with a red Neck, living under Ground, of an earthy Taſte, and no Smell.

Earth-worms are remarkably diuretic, diaphoretic, and anodyne; they diſcuſs, mollify, open Obſtructions, increaſe Milk, and conglutinate Wounds, and divided Nerves. They are principally uſed in Apoplexies, Convulſions, and other Affections of the Nerves and Muſcles, in the Jaundice, Dropſy, and Colic, and have a ſpecific Virtue againſt the ſcorbutic Gout: They mitigate Pains of the Gout, and their Aſhes are ſaid to cure the Tooth-ach. *Schroder.*

Earth-worms are often uſed in Compoſitions for cooling and cleanſing the Viſcera. They are accounted much of the ſame Nature as Snails; but they ſeem to have more of an earthy or nitrous Salt, which makes them afford Parts more penetrating and deterſive. They are good in Inflammations and Tubercles of the Lungs; and are particularly uſeful in ſuch Affections of the Reins, and urinary Paſſages, which they cool and cleanſe very much. The compound Water, which has its Name from them in the Shops, is a very good Medicine in the above-mentioned Caſes. They are ſeldom omitted in the occaſional Preſcriptions of Snail-waters, and make a very good Ingredient therein, having much more in them, that will riſe in the Still, than Snails. There is, alſo, an Oil made of them in the Shops, which retains as much of the Virtue as any ſuch Preparations are capable of; yet it does not anſwer the Pretenſions of many in arthritic Pains, and is not much in Uſe. It is prepared in the following manner:

Take of Earth-worms, half a Pound: Firſt, waſh them in ſeveral Waters, and then in White-wine, wherein let them ſtand an Hour; then, pouring off the Wine, put them into a double Veſſel; and add to them two Pounds of Oil, and half a Pint of White-wine. Boil to the Conſumption of all the Wine, and ſtrain the Oil through a Linen Cloth, for Uſe. See VERMES.

LUNA. See ARGENTUM.

LUNARIA.

The Characters are;

The Fruit is flat, of a reaſonable Bigneſs, and divided by an Interclоſure, parallel to membranaceous Valves, as it were, into two Cells, full of Seeds, which are generally kidney-ſhaped, and, as it were, marginated.

Boerhaave mentions eleven Species of this Plant; which are,

1. Lunaria; major; ſiliqua longiore. *J. B.* 882. *Tourn. Inſt.* 218. *Boerh. Ind. A.* 2. 5. *Viola Lunaria.* Offic. *Viola Lunaria longioribus ſiliquis.* Ger. 378. Emac. 464. Raii Hiſt. 1. 788. *Viola lunaris altera, ſive peregrina.* Park. Parad. 265. *Viola Lunaria major ſiliqua oblonga.* C. B. P. 203. SATTIN-FLOWER WITH LONGER PODS.

It grows on the Mountains of *Saleva* and *Jura*, near *Geneva*, and flowers in *May*. A certain *Swiſs* Surgeon, as *Camerarius* ſays, prepared a good vulnerary Ointment of the bruiſed Leaves of this Herb, and Sanicle. *Raii Hiſt. Plant.*

2. Lunaria, major; ſiliqua rotundiore. See BULBONACH.

3. Lunaria; major, perennis; ſiliqua rotundiori; flore albo. *T.* 218. *Viola Lunaria, major, altera.* C. B. P. 203.

4. Lunaria; major; ſiliqua longiore; flore purpureo. *T.* 218. *Viola lunaris.* Il. Tabern. Ic. 314.

5. Lunaria; Leucoii folio; ſiliqua oblonga, majori. *T.* 218. *Leucoium, Alyſſoides, clypeatum majus.* C. B. P. 201. *Alyſſon ſiliqua lata, aſpera, quibuſdam Lunaria, flore luteo.* J. B. 2. 934.

6. Lunaria; ſiliqua; oblonga, intorta. *T.* 219.

7. Lunaria; Orientalis; Leucoii folio incano; lutea patula. *Juſſ.*

8. Lunaria; folio Leucoii; ſiliqua oblonga, minori. *T.* 218. *Leucoium, Alyſſoides, clypeatum minus.* C. B. P. 201.

9. Lunaria; annua; minima; Hiſpanica; folio Leucoii maritimi. *Juſſieu.*

16. Lunaria;

10. Lunaria; folio Leucoii; ſiliqua oblonga, majore, ex alis foliorum erumpente. *Vaill.*

11. Lunaria; perennis; lutea; folio Leucoii; ramis expanſis. *Vaill. Boerh. Ind. alt. Plant. Vol.* 2. *p.* 5.

LUNARIA BISCUTATA. A Name for the *Thlaſpidium*; *Monſpelienſe*; *hieracii folio hirſuto.*

LUNARIA BOTRYITIS. A Name for the *Oſmunda*; *foliis lunatis.*

LUNARIA PELTATA. A Name for the *Ionthlaſpi*; *minimum*; *ſpicatum*; *lunatum.*

LUNARIA RADIATA. A Name for the *Medicago*; *annua*; *trifolii facie.* And for the *Pelecinus vulgaris.*

LUNARIA, in Chymiſtry, is explained Mercurial Water, Vinegar of the Philoſophers, Corroſive Water, and Sputum Lunæ. It imports the ſame as BORIZA.

LUNÆTRIA, in the chymical Jargon, is a Species of hectic Fever, which is curable in one Period of the Moon. *Caſtellus* from *Dolæus.*

LUNATICUS. A Lunatic is, properly, a Perſon labouring under any Diſtemper, which increaſes and diminiſhes, or ſeizes and goes off again, at different times of the Moon. It generally ſignifies a mad Perſon, whoſe Diſorder is, in this manner, govern'd by the Moon.

LUNIFICUS. An Epithet for Mercury.

LUPARIA. A Name for the ACONITUM PONTICUM.

LUPHA. The *Aſſyrian* Name for the ARUM. *Oribaſ. Coll. Med. Lib.* 11.

LUPIA. A kind of hard glandiform Tumor, like a Ganglion, in many Parts of the Body. When Authors deſcribe a Tumor, by this Name, ſeated within the Eyelid, they ſeem to mean a CHALAZA. A round, ſmall, ſoft Tumor about the Joints, is, alſo, called *Lupia.*

LUPINUS.

The Characters are;

The Pod is full of Seeds, either flat or ſpherical; and the Leaves are ſhaped like a Fan, or digitated.

Boerhaave mentions ſeven Species of this Plant; which are,

1. Lupinus peregrinus major; vel villoſus cœruleus major. *C. B. P.* 348. *M. H.* 2. 85.

2. Lupinus; ſylveſtris flore cœruleo. *C. B. P.* 348. *Boerh. Ind. A.* 2. 48. *Lupinus ſylveſtris.* Offic. *Lupinus flore cœruleo.* Ger. 1043. Emac. 1217. *Lupinus cœruleus minor.* Park. Parad. 335. Raii Hiſt. 1. 907. *Lupinus ſylveſtris purpureo flore, ſemine rotundo vario.* J. B. 2. 291. *Lupinus ſylveſtris purpureo flore; ſemine rotundo, vario, majore.* Tourn. Inſt. 392. WILD LUPINES.

This is cultivated with us in Gardens, and flowers in *July.* The Parts in Uſe are the compreſſed, variegated, round, and flat Seeds, which agree in Virtues with thoſe of the common Garden-lupines.

3. Lupinus; peregrinus major; flore incarnato.

4. Lupinus; ſativus, flore albo. *C. B. P.* 347. *Tourn. Inſt.* 392. *Boerh. Ind. A.* 2. 49. *Lupinus.* Offic. *Lupinus ſativus.* Ger. 1043. Emac. 1217. Raii Hiſt. 1. 906. *Lupinus ſativus albus.* Park. Theat. 1073. *Lupinus vulgaris, ſemine & flore albo, ſativus.* J. B. 2. 288. LUPINES.

The white Lupine has a round hairy Stalk, on which grow many digitated Leaves, ſet in a round Compaſs upon long Foot-ſtalks, conſiſting uſually of nine Parts, narrow next the Stalk, and ending in an obtuſe Point, ſoft and hairy, eſpecially underneath. The Flowers grow in verticillated Spikes, on the Top of the Branches, in the Shape of Pea-bloſſoms, of a white Colour; and are ſucceeded by upright, flat, hairy, large Pods, including three or four flat white Seeds. They are ſown every Year in Gardens, and flower in *June*, and the Seed is ripe in *July*, which is the only Part in Uſe.

Lupines are of a ſomewhat bitter Taſte, opening and cleanſing, good to deſtroy Worms, to bring down the Menſes, and expel the Birth and Secundines. Outwardly, they are uſed againſt Deformities of the Skin, ſcabby Ulcers, ſcald Heads, and other cutaneous Diſtempers. *Miller's Bot. Off.*

They ſow Lupines in *Tuſcany*, as *Matthiolus*, and I myſelf, ſays *Ray*, have obſerved, not only for Aliment, but to fatten the Soil. And *Pliny* tells us, that the Fields and Vineyards are enriched by the ſowing of Lupines, as much as by the beſt Kind of Dung.

The Seed, macerated in freſh warm Water, loſes its Bitterneſs, ſo that it is rendered grateful to the Palate, and may be eaten without any other Dreſſing. *Galen* writes, that the Seeds are eaten, boiled with Garum and Oxygarum; or only ſeaſon'd with a little Salt: But that they generate an Aliment of a thick Juice, and ſlow of Paſſage. While their native Bitterneſs remains, they have a detergent and digeſtive Virtue, and deſtroy Worms, whether applied outwardly as a Cataplaſm, or taken inwardly, as an Eclegma with Honey, or drank in Poſca; the Decoction, alſo, is effectual for the ſame Purpoſe. Externally uſed, they are eſteemed an Emplaſtic; whence their Decoction in Fomentations, and their Meal in Cataplaſms, are effectual againſt the Vitiligo, Achores, Puſtules, Pſora, Gangrene, and malignant Ulcers, partly as a Deterſive, and partly as a Digeſtive without Corroſiveneſs. Some apply the Meal, with Vinegar, to the Sciatica: And the ſame, made into a Peſſary with Myrrh and Honey, provokes the Menſes, and expels the dead Fœtus. What *Theophraſtus* ſays, that no Animals will eat of green Lupines becauſe of their Bitterneſs, muſt be underſtood of the Fruit; for they are now commonly ſown among Turneps, for the feeding of Cattle, as we are told by *J. Bauhine. Raii Hiſt. Plant.*

The Name *Lupinus* is of great Antiquity; and the Seeds are ſaid to have been uſed by the Antients, in Plays and Comedies, inſtead of Pieces of Money: Hence the Proverb *Nummus Lupinus*, that is, a Piece of Money of no Value; and hence that of *Horace:*

Nec tamen ignorat, quid diſtent Æra Lupinis.

The Seeds, ground to a Meal, afford a nutritive ſort of Food, This Meal is emollient, nutritive, and anodyne; but, internally taken, it binds the Belly too much; for which Reaſon it is exhibited in the worſt Dyſenteries, being mixed with a little Muſcadine. The Seeds agree in Virtues with the Orobus; and, by their Bitterneſs, expel Worms: Boiled, they are of Service in the Scabies and Ulcers; and are a principal Coſmetic. *Hiſtoria Plantarum*, aſcribed to *Boerhaave.*

5. Lupinus; Indicus; folio anguſtiſſimo.

6. Lupinus; ſylveſtris, flore luteo. *C. B. P.* 348.

7. Lupinus; exoticus; flore albo. *H. Eyſt. Æſt.* 0. 13. *F.* 4. *Fig.* 1. *Boerh. Ind. alt. Plant. Vol.* 2. *p* 48.

LUPULUS.

The Characters are;

The Root is very creeping. The Leaves are rough, angulous, and conjugated; and the Stalks voluble. The Flowers are apetalous, furniſhed with Stamina, are ſeated in a quinquepartite Calyx expanded like a Star, are collected into Tufts, and grow on a ſeparate Plant. The Ovaries are horned, and collected into ſquamous Tufts, compoſed of a Multitude of ſmall Leaves growing to an Axis, each Leaf incloſing a Seed, which is generally round, and hid by a membranaceous Cover.

Boerhaave mentions two Species of this Plant, the Male and the Female; which *Dale* includes under one Article, that is,

Lupulus mas & fœmina. *C. B. P.* 298. *J. B.* 2. 151. *Raii Hiſt.* 1. 156. *Synop.* 52. *Tourn. Inſt.* 535. *Boerh. Ind. A.* 2. 104. *Lupulus.* Offic. *Lupulus ſativus & ſylveſtris.* Park. 176. *Lupus ſalictarius.* Ger. 737. Emac. 884. HOPS.

The Hop is a Plant which runs to a great Height, climbing up and twiſting round the Poles, which are placed for its Support. The Branches are rough and hairy, bearing large, rough, Vine-like Leaves, divided into three Parts, ſerrated about the Edges. On the Tops of the Stalks grow Cluſters of large, looſe, ſcaly Heads, of a pale-greeniſh-yellow Colour when ripe, and of a pretty ſtrong Smell. The manured Hops are cultivated in particular Gardens; the wild are found frequently in the Hedges, being ripe in *September.* The Hops, and the young Shoots, or Aſparagi, are uſed.

The young Shoots, or the Hop-tops, are eaten by many in the Spring, and are accounted good to cleanſe the Blood, looſen the Belly, and provoke Urine. The Hops, beſides their great Uſe in making Beer, are good to open Obſtructions of the Liver and Spleen, to cure the Jaundice, and bring down the Menſes, and are ſerviceable in hypochondriac Affections. Some Authors commend them as a Remedy againſt the Stone, which others make a Doubt of. A Pillow ſtuffed with Hops, and laid under the Head, is ſaid to procure Sleep in Fevers, attended with a Delirium. *Miller's Bot. Off.*

The Hop is bitter, deterſive, and gives no Tincture of Red to blue Paper. By the chymical Analyſis, a little Acid, a great deal of volatile concrete Salt, and Oil, are obtained from it; which ſhews it to contain ſome Sal Ammoniac, mixed with ſome Sulphur and Earth. The Tendrils and Tops of Hops are uſed to purify the Blood, in the Scurvy, Tetters, and all cutaneous Diſeaſes: Infuſe, a whole Night, two Pugils of Hop-tops, in Whey, or White-wine. In hypochondriac and melancholic Caſes, give an Apozem and Julap of Hops, with two Drams of Tincture of Steel to each Doſe, which, alſo, provokes the Terms; the Syrup of its Juice has the ſame Virtues; you may, alſo, mix Fumitory-juice with it for the Syrup. *Cluſius* ſays, that at *Salamanca*, in *Spain*, they prepare the following Sudorific, for a Falling off of the Hair, in the Venereal Diſeaſe:

> Take eight Pounds of Water; one Pound of Hop-roots: Let them macerate together all Night; next Day boil them to the Conſumption of a third Part, or to half, if the Diſorder be very conſiderable: Give eight Ounces of this Decoction in the Morning faſting, and cover the Patient: Some add Parſley-roots, or Dogs-graſs; and ſome Raiſins. *Martyn's Tournefort.*

The principal Uſe of Hops is well known to conſiſt in preſerving Beer from ſpeedily growing ſour, or corrupting, and that it may keep for a long time: For this Purpoſe Hops are effectual by their Bitterneſs, which, however, vaniſhes by degrees with Age, the Beer, in the mean time, contracting a vinous Taſte. Hops boiled in the Liquor, or Wort, are, alſo, thought to render the Beer the wholſomer, and more grateful to the Taſte; to communicate to it a diuretic and emmenagogue Virtue; to purge

the Blood, and to be good for the Jaundice, and hypochondriac Affections. But whether it be of any Efficacy for diſſolving and expelling the Stone in the Kidneys and Bladder, or, on the contrary, contributes to its Generation and Concretion, remains a Doubt with ſome.

They who recommend Hops for the Stone, urge as a Proof thereof, their heating and diuretic Quality. The Exploders of Hops, on the contrary, ſupport their Opinion by a ſtrong Argument indeed, no leſs than Experience, which aſſures us, that by hopt Beer the Paroxyſms of the Stone are exaſperated, but, on the contrary, by drinking of Ale, or unhopt Beer, are mitigated: Beſides, it is pretended, that ſince the Introduction of the Uſe of Hops in Beer into *England*, the Stone is become epidemical, and much greater Numbers are afflicted with the ſame, than were ever known to be in former Times. As for our Part, ſays *Ray*, we are inclined to agree with thoſe who approve and recommend the Uſe of Hops in Beer; for it ſeems to us to be thereby rendered more ſalutary, more agreeable to the Stomach, and the more efficacious in concocting the Food. Nor am I induced to think the contrary, becauſe Phyſicians forbid the Uſe of Beer to thoſe who are afflicted with the Stone, but recommend drinking of Ale under the ſame Diſorder; for this is done with an Intention of mitigating the Paroxyſms: For which Purpoſe Ale, by its Mildneſs, and Lubricity, or Smoothneſs, is well qualified, but by no means for eradicating the Diſeaſe, or removing its Cauſe; for, by its ſlimy and viſcous Properties, and by the Quantity of Tartar, and Feculences, which it depoſites, it ſeems rather proper for the Generation and Concretion of the Stone, than for its Diſſolution and Comminution. And it is not true, as to Matter of Fact, that the Stone is become more epidemical ſince the Introduction of Hops: For, though the Uſe of Hops in *London* be more frequent than ever, yet fewer Perſons now labour under the Stone, than did heretofore; as appears from the accurate Obſervations of Mr. *Grant*, on the Bills of Mortality. As to the Generation of the Stone in the human Body, we believe it to be promoted by thoſe Liquors which contain and precipitate a copious Tartar: Hence we ſuppoſe, that Water-drinkers will preſerve themſelves from this Diſtemper; whereas thoſe who indulge themſelves in Wine, or drink every Day pure Wine, are very ſubject to the Stone, or the Gout; the Cauſe of which Diſeaſes ſeems to be one and the ſame Matter; for which Reaſon there is often a Tranſmutation of theſe two Diſorders, one into another. It is, alſo, an Obſervation, that far greater Numbers are afflicted with the Stone in *France*, where Wine is the ordinary Drink, than in *England*, where we uſually drink Beer: Now it is well known, that *French* Wines precipitate a copious Tartar. As to this laſt Particular, however, the ingenious Dr. *Searl* has, by convincing Experiments, refuted that received Opinion, which makes the Matter of the Stone to be Tartar; though it be true, that great Wine-drinkers are ſubject to the Stone, and that Wine abounds with Tartar: But it generates the Stone, not becauſe it depoſites a copious Tartar, but for ſome other Reaſon, not yet diſcovered.

Take of Bay-ſalt, and new Hops, each two Handfuls; blue Currants, a quarter of a Pound: Bruiſe and mix them well together, and, reducing them to a Maſs, apply the ſame, as an Epithem, to the Wriſts, for a quotidian Fever. Mr. *Boyle. Raii Hiſt. Plant.*

Hop-tops are deterſive, but the exceſſive Uſe of them creates a great Pain in making Water. The Herb ſerves for an Epithem in intermittent Fevers, being applied to thoſe Places of the Body where the Veſſels are moſt expoſed: It is, alſo, proper to deterge acrimonious Humours; but it is prejudicial to dry Conſtitutions, on account of its drying Quality. The Decoction of the Herb is opening, and ſomewhat heating; whence it is recommended in hypochondriac Diſorders, the Scurvy, chronical Fevers, the Itch, and other cutaneous Diſeaſes. The bruiſed Leaves are good in Luxations, Contuſions, and Tumors. And the Roots, boiled, are ſudorific. *Hiſt. Plant. adſcript. Boerhaav.*

LUPUS. Offic. Schrod. 5. 304. Schw. Quad. 106. Geſn. de Quad. Digit. 634. Charlt. Exer. 15. Raii Synop. A. 173. Aldrov. de Quad. 144. Jonſ. de Quad. 89. THE WOLF.

The Parts of this Animal in Uſe are the Teeth, Heart, Liver, Inteſtines, Fat, Bones, Dung, and Skin. The Teeth, ſet in Silver, are given to Infants, to rub their Gums, in order to make way for the Eruption of their Teeth. The Heart is ſaid to be good for the Epilepſy. The Liver corrects hepatic Diſorders, and is, therefore, good for thoſe who are hydropical, or emaciated, and for ſuch as are moleſted with Coughs. The Inteſtines are exhibited as an extraordinary Remedy in the Pain of the Colic; which they are, alſo, ſaid to cure, if only tied about the Patient: The ſame Effect is aſcribed to the Skin. The Fat is of equal Virtue with that of the Dog; it heats, digeſts, cures Diſeaſes of the Joints, and is good for ſore Eyes. The Bones are effectual in the Pleuriſy, and for Blows and Punctures. And the Dung is good for the Colic. *Dale* from *Schroder*.

LUPUS MARINUS. Schonf. Ichth. 45. Charlt. Piſc. 31. *Lupus marinus.* Schonfeldii, Jonſ. Tab. 47. *Lupus marinus noſtras & Schonfeldii.* Rali Ichth. 130. Ejuſd. Synop. Piſc. 40. *Anarrhicas.* Geſn. Paralip. 4. THE SEA-WOLF, or WOOLF.

The Parts in Uſe are the Teeth, called the *Molares*, or Grinders, which are ſold in the Shops under the Name of the *Lapis Bufonites*. THE TOAD-STONE. *Bufonitis Lapis.* Ind. Med. 23. *Bufonites majuſculus ætro-rubens inſtar Capſulæ Glandis quercinæ.* N. 200. Suid. Lithop. Brit. 70. Mort. North. 244. *Bufonius.* Mer. Pin. 210. *Lapidis Bufonitis Varietas prima.* Boet. de Lap. 301. *Batrachitæ, vel Craportinæ.* Geſn. de Lap. 161. They are like a Bubble, hollow in one Part, and convex on the other, of a whitiſh-brown, and ſometimes of a dark-brown, and ſometimes black, white, green and particoloured. It is recommended as a moſt effectual Remedy againſt Poiſons, and the Peſtilence.

Merret, in his *Pinax Rerum naturalium Britannicarum*, aſſures us, that the Stones called *Toad-ſtones*, which are eſteem'd as Gems, are nothing but the *Dentes molares* of this Fiſh. "I demonſtrated, ſays he, before the King, who was pleaſed to honour "with his Preſence the Lectures of my learned Collegue Dr. "*George Ent*, whom he knighted, that theſe Stones were the "Grinders of the Sea-wolf; and our Goldſmiths, with the greateſt "Admiration, confeſſed, that theſe Teeth were the ſame as they "ſold for true Toad-ſtones."

I am of Opinion, ſays *Dale*, that the *Lapides Alectorii* [See ALECTORIA] have much the ſame Original; but whether from this, or ſome other kind of Fiſh, is not certain. They are ſaid by Miſtake to be found in the Stomach of a Cock, or Capon. That Stones are found in Birds of the Gallinaceous Kind, we know by every Day's Experience; but theſe Stones are not generated there, but ſwallowed by thoſe Fowls for the Comminution and Digeſtion of their Food, and afterwards diſcharged with the Excrements. What has been ſaid of the *Lapis Chelidonius*, [ſee CHELIDONIUS] or *Swallow-ſtone*, with reſpect to its Original, ought to be compared with what is here ſaid of the *Lapis Alectorius*.

A Cancer is, alſo, ſometimes called *Lupus*, becauſe it eats away the Fleſh.

LUS. See LUZ.

The Fleſh and the Gall are in Uſe, the former of which is effectual in a Cachexy, and comforts the Brain; and the Gall, made into a Litus with Honey, mightily ſharpens the Sight. *Xiranid.*

LUSCIOSUS. A Perſon who can only diſcern Objects which are very near the Eye. The ſame as MYOPS.

LUSTUM. The Cream of Milk. *Rulandus.*

LUTATIO. Luting of chymical Veſſels. See LUTUM. But *Lutatio* is, likewiſe, a beſmearing the Parts of the Body with Mud, in order to dry up ſuperfluous Humidity; a Practice very common in *Egypt*, as we learn from *Galen*.

LUTEA, or CIRLUS, is the Name of a ſmall Bird, deſcribed by *Aldrovandus*. I take it to be the Yellow-hammer.

LUTEOLA.

The Characters are;

The Leaves are oblong and intire; the Flower is anomalous, polypetalous, the Petals diſſimilar; the Fruit is globular, concave, and tricuſpidated.

Boerhaave mentions but one Sort of this Plant; which is,

Luteola herba; ſalicis folio. *C. B. P.* 100. *Tourn. Inſt.* 423. *Boerh. Ind. A.* 251. *Struthium.* Offic. *Luteola.* Ger. 398. Emac. 494. Raii Hiſt. 2. 1054. Synop. 3. 366. *Lutea Plinii quibuſdam.* J. B. 3. 465. DYERS-WEED.

Dyers-weed grows to be a Yard or more high, having hollow, chanel'd Stalks, covered with long narrow green Leaves, ſet on without Foot-ſtalks; the Flowers grow at the End of the Branch in a long Spike, or Thyrſus, being ſmall and green, and are ſucceeded by little, round, gaping, flatiſh Seed-veſſels, opening into three Parts, and ſhewing a very ſmall brown Seed. It grows upon Banks, and upon Walls and Ruins, and ſometimes in fallow Fields; but is ſown in ſeveral Places for the Uſe of the Dyers, who dye a Yellow with it.

This is eſteemed to be the Struthium of *Dioſcorides*; and, tho' very rarely uſed, is, by ſome, accounted a good Wound-herb, and of Uſe againſt the Jaundice. It is frequently ſold by the Herb-women for Glaſtum or Woad. *Miller's Bot. Off.*

Tho' *Struthium* was ſo well known to the antient *Greeks*, that *Dioſcorides* thought a Deſcription of it unneceſſary, the Learned of the latter Ages have greatly differ'd in their Sentiments about it. *Cordus* took it for the *Impratoria*, or Maſterwort Some, as *C. Bauhine* obſerves, will have it to be the red Valerian; *Fuchſius, Lonicerus*, and *Thalius*, the *Saponaria*, or Sopewort: All theſe Opinions are rejected by *C. Bauhine*, who takes it for a Species of *Lychnis*, which was ſent to him. *Lacuna* and *Geſner* ſuppoſe the common *Luteola* to be the *Struthium*, in which they are contradicted by *Matthiolus*, who calls that Herb *Pſeudo-ſtruthium*.

ſtruthium. *Honorius Bellus*, in his ſecond Epiſtle to *Cluſius*, determines the *Luteola* to be the *Struthium*; with whoſe Opinion, ſays *Dale*, I agree, and conſequently have joined them under one Article.

It is called *Luteola*, *à Colore luteo*, from a yellow Colour, becauſe the Root, boiled with Salt, dyes Wool of a very fine yellow or gold Colour. It is of an opening Quality, and the bruiſed Root is applied to the Hands in feveriſh Diſorders: It agrees in all Things with the *Rubia*. *Hiſt. Plant. aſcript. Boerhaav.*

LUTRA. Offic. Bellon. Aquat. 31. Aldrov. de Quad. Digit. 294. Jonſ. de Quad. 104. Charlt. Exer. 18. Schw. Quad. 107. Geſn. de Quad. Digit. 683. Mer. Pin. 167. Raii Synop. A. 186. Schonef. Icht. 46. THE OTTER.

It is found in large Rivers, and the Fat is uſed; which, being mixed and boiled up with digeſtive Medicines, is very ſerviceable in removing Diſeaſes of the Joints. *Holler*. The Liver, dried, powdered, and taken in the Quantity of a Scruple, or a Dram, is recommended for a Dyſentery. The Teſticles, likewiſe, dried, powder'd, and taken in the like Doſe, are ſaid to cure an Epilepſy.

LUTRON, λυτρὸν. A Bath. It is, likewiſe, the Name of an Ophthalmic Medicine in *Galen*, *de Comp. M. S. L.* 4. *C.* 7.

LUTUM. A Lute. By the Name of Lute, or Luting, Chymiſts underſtand a mixed, tenacious, ductile Subſtance, which grows ſolid with drying; and, being applied to the Junctures of Veſſels, ſtops them up, ſo as to prevent the Air from getting either in or out: But theſe Lurings are of principal Uſe in confining the Particles raiſed by the Fire in Diſtillation, ſo as to prevent their eſcaping out of the Veſſel; whence it appears, that different Lutings are required, according to the Difference of the Subjects to be diſtilled.

When the Subject is merely aqueous, Linſeed-meal, ground to fine Powder, and well mixed, or worked up into a ſtiff Paſte, with the White of Egg, makes a proper Luting; for, being applied to the Junctures of diſtilling Veſſels, it grows hard with Heat; and, if it happens to crack, it is eaſily repaired by a freſh Application, which ſoon grows ſolid. But a Paſte made of the ſame Meal, well worked up with cold Water, very well anſwers the End in the Diſtillation of all fermented inflammable Spirits, and all volatile alcaline Salts. This Paſte will not anſwer in the Diſtillation of mild Acids, or acetous Liquors, which ſoften and diſſolve it, ſo as to let the Fumes eſcape: In theſe Caſes, therefore, a Bladder, ſteep'd in Water, till it grow ſlimy, makes an excellent Luting, by being applied and preſſed wet upon the Junctures of the diſtilling Veſſels.

A Luting that acquires a ſtony Hardneſs, is neceſſary in the Diſtillation of the foſſil Acids, as thoſe of Vitriol, Sea-ſalt, and the like; which is called the Philoſophical Luting, and may be prepared from the Calx of Copperas and Quick-lime, by boiling the Caput Mortuum in Vitriol, in ſeveral Parcels of Water, till it be thus thoroughly waſhed from its ſaline Parts, then drying the Powder, and preſerving it in a cloſe Veſſel. This Powder is to be rubbed with an equal Quantity of ſtrong Quick-lime, and wrought into a Paſte with the White of Eggs, firſt beat thin; and this Luting is immediately to be applied to the Junctures of the Veſſels; the Veſſels being firſt a little heated. If it be not applied quick, it preſently dries to a ſtony Hardneſs, ſo as to be untractable; but, when properly uſed, it confines all the ſaline Spirits, like Glaſs itſelf. I prepare a Luting for the ſame Purpoſe, without much Trouble, in this Manner: I beat pure Sand and Potter's Clay together, in ſuch Proportion, with Water, till the Matter no longer ſticks to the Fingers; then add one fourth Part of common Lime, ſo as to make the Paſte ſufficiently ſtrong; and the drier this is applied, the better for the Purpoſe, provided it be left ductile; for thus it hardens into an excellent Cement, and the Cracks, if any ſhould happen, are eaſily ſtopped up by the ſame. This Cement is the more parable or commodious, as the beſt Quick-lime is not often to be had.

It is a great Inconvenience in the ſtronger Diſtillations with a naked Fire, that, when the Veſſels are violently heated, they are ſubject to crack, and fly to Pieces, upon opening the Door of the Furnace, and letting in the cold Air, or throwing in freſh Fuel; whence it is highly proper here to defend the Veſſels by a Coating, from this ſudden Impulſe of Cold; and this is frequently neceſſary, alſo, when the Operation is performed in Glaſs Veſſels, and a Sand-heat, if the Fire be ſo ſtrong as to endanger the Melting of the Glaſs. The beſt Luting that I know of for this Purpoſe, is made by beating fat Potters Earth, and powdered Sand, with Water, into a well-wrought Paſte, which will not ſtick to the Fingers; adding thereto a little common Lime at the laſt, and beating them well together. Then the Veſſel to be coated, being warmed and expoſed to the Vapour of hot Water, that its whole Surface may become dewy, let this Cement be ſpread all over it equably with the Hand; afterwards ſprinkle the Surface of the Coating with hot and dry Sand, and ſet the Veſſel in a cool Place, that the Coating may dry ſlowly; with Care to fill up the Cracks in the ſame Manner, if any ſhould happen in the Drying. If thus the Coating be thoroughly dried, the Veſſel will ſuſtain the Action of a violent Fire unhurt.

There is another Kind of Cement made uſe of by ſome Chymiſts of *London*, to anſwer the ſame End; conſiſting of ſifted Wood-aſhes, beat up to a due Conſiſtence with the White of Eggs, and a little Gum-water. The ſame Service may be had in a more excellent Manner, as well for cracked Glaſſes as broken China, or the like, from what the Painters call drying Oil; or a Mixture of Linſeed-oil and Ceruſe, made by Inſolation, or Decoction, into a perfectly white Balſam, and afterwards ground upon a Marble with freſh Ceruſs, till the Whole is perfectly fine, and become of the Conſiſtence of an Unguent. This dries ſlowly indeed, but is very effectual.

LUXATIO. A Luxation.

A Luxation is a Receſs or Removal of the moveable Extremity of a Bone from the Hollow or Socket in which it naturally moved, accompanied with an Impediment or Hindrance of Motion.

A Luxation, which is, alſo, called a Diſlocation, and, by *Cœlius Aurelianus*, *in Cap.* 1. *Lib.* 2. *Morb. Chronic. Delocatio*, denotes a Removal of the Bone from that Part which it naturally poſſeſſed; and in this Senſe it imports every Change of the natural Situation of the Bones. Cuſtom, however, the Standard of Words, has reſtrain'd, it to a Receſs or Removal of the articulated Bones from the Place they naturally poſſeſſed.

Since, therefore, a Luxation, properly ſo called, can only happen in the articulated Bones, the Definition here given will be found highly accurate; for in every Articulation two Things are to be conſidered, the receiving Bone, and Bone received. *Gorræus*, in his *Definit.* informs us, that the *Greeks* called the Hollow of the receiving Bone, which received the Head of the other Bone, κοτύλην· and the Part of the received Bone lodged in this Cavity, ἄρθρον· or, ſimply, a Joint. We have an excellent Definition of a Luxation in the third Chapter of the ſixth Book of *Paulus Ægineta*, who tells us, that "It is a Remo-"val of the Bone received, from its proper Cavity to another; "by means of which, voluntary Motion is hindered." For, unleſs there be an Impediment or Hindrance of Motion, it cannot be properly called a Luxation, though the Extremity of the moveable Bone ſhould recede from the Cavity in which it naturally moves; for in the ſurpriſing Articulation of the inferior Jaw-bone, the Head of which is lodged in a pretty deep Sinus in the inferior Part of the Os ſquamoſum, near the Proceſſus zygomaticus, yet, by means of an interpoſed cartilaginous and elaſtic Lamina, the Head of the inferior Jaw-bone may be removed from its Cavity, and again return into it, without any Impediment of Motion. Beſides, for the Performance of various Motions of the inferior Jaw-bone, it is requiſite, that its Head ſhould be thus capable of being removed from its Cavity.

This Removal of the articulated Bone from its Cavity is either total, or partial; the former is a Luxation, and the latter a Diſtortion.

It is eaſy to conceive, that the Head of an articulated Bone may either totally ſlip from the Cavity in which it is naturally contained, or be ſo removed from its natural Situation, as to remain partly within, and partly without, its Cavity. *Hippocrates*, however, in his Treatiſe *de Articulis*, denies that this can happen in all Articulations: For as the Heads of the Os Humeri and Os Femoris are entirely round, and received into ſimilar Cavities, he concluded, that there could not be a partial Removal of them from their Cavities; but that it was neceſſary either they ſhould be totally removed, or that, being partially removed, they would again ſlip into their Cavities. But it is ſufficiently obvious, that this may happen in other Articulations. Hence *Paulus Ægineta*, in the third Chapter of his ſixth Book, tells us, that, in the Definition of Luxations, "There is no other "Diſtinction to be made, but that of Greater or Leſs; for, "when the Head of the Bone is entirely removed from its Ca-"vity, it is called by the common Name of ἐκβεβλημα· whereas "when it is only ſlightly removed, or brought to the Lips of "its Cavity, it is called ὑποβεβλημα." For the Prepoſition ὑπὸ, prefixed to any Name of a Diſorder, denotes its Slightneſs: Thus the antient Phyſicians uſed *Parapoplexia* for a ſlight Apoplexy, and *Paraſynanche* for a gentle Quinſey. Hence *Veſalius*, *in Chirurg. Magn.* ſeems to have uſed theſe Words improperly, when he affirmed, that Luxations ariſing from an Influx of Humours upon the Joint were called ὑποβεβλημαλα· and thoſe ariſing from an Impulſe of the Humours into the Articulation, ἐκβεβλημαλα. But it will be ſufficiently obvious, from what follows, that true and genuine Luxations may be produced by Humours falling into the Cavity of the Articulation. But a Luxation, in which the Head of the Bone is only partially removed from its Cavity, is called a Subluxation, or a Diſtortion; which laſt Word, however, alſo, denotes a Change of the Situation of Muſcles, or Tendons, by ſome external Force; as, alſo, a Diſtraction of the Ligaments produced by the ſame Cauſe, or, as

it were, by a kind of Intorſion: Hence ſuch an imperfect Luxation is leſs ambiguouſly called a Subluxation, than a Diſtortion.

The worſt Luxation of all is that produced by a Solution or Separation of the Epiphyſis from the Body of the Bone.

In the larger Bones, join'd to each other by a moveable Articulation, ſuch as the Oſſa Femoris, it is obſervable, that both Extremities are diſtinct from the reſt of the Bone; which may be moſt palpably ſeen in the Bones of new-born Children and Abortives; for theſe Bones were once totally cartilaginous, and, in their middle Point from both Extremities, there firſt begins to appear a ſmall bony Portion, which diffuſing itſelf both Ways, or to each Extremity, gradually converts the Cartilage into a Bone. See *Albini Icones Oſſium Fœtus humani.* But both Extremities long remain cartilaginous, and in theſe, alſo, the Cartilage begins internally to be form'd into a Bone, which gradually diffuſes itſelf almoſt thro' their whole Subſtance. But there long remains between the Os Femoris, and both its Extremities, ſomething of a cartilaginous Nature; by which, as by a kind of Glue, the Extremities of the Bone ſeem fixed, and, as it were, agglutinated to its Body, till at laſt this cartilaginous Subſtance becoming bony, the Extremities, according to the laſt quoted Author, are concreted into one continued Body with the reſt of the Bone; but in ſuch a manner, however, that externally there remains for ſome time a certain Mark of Diviſion, which is at laſt aboliſh'd, as *Albinus*, in the Work above quoted, intimates. Theſe Extremities of the Os Femoris, diſtinguiſh'd from the reſt of its Body by this intermediate Cartilage, or Mark of Diviſion, are called Epiphyſes. In young Animals theſe Epiphyſes are, by a very gentle Force, ſeparated from the reſt of the Bone, as we daily obſerve at Tables. But in thoſe Parts where the Epiphyſes are join'd to the reſt of the Bone, ariſe Ligaments which every-where ſurround and ſecure the Articulations. And *Columbus*, in his Treatiſe *de re Anatomica*, *Lib.* 1. *Cap.* 2. thinks, that the principal Uſe of the Epiphyſes was, that, from their Conjunction with the Bone, Ligaments might ariſe, which are obſerved to be continued to no other Part, but here emerge from the Bone itſelf. *Clopton Havers*, alſo, in his *Oſteologia Nova*, has obſerved, that, in thoſe Parts where the Ligaments ariſe, the Perioſteum, ſurrounding all the reſt of the Bones, is there ſeparated from them, and, creeping over the external Surface of the Ligaments, is conveyed to another Bone.

If, therefore, the Epiphyſis is ſeparated from the reſt of the Bone, 'tis ſufficiently obvious, that the Motion of ſuch a Joint muſt be diſturb'd. But this cannot be properly and ſtrictly called a Luxation, becauſe the Extremity of the moveable Bone remains in the Cavity in which it naturally moves. But, in the Definition already given, ſuch a Removal of the Extremity of the moving Bone from its Cavity conſtitutes a Luxation; for which Reaſon this Diſorder may, perhaps, be more properly referred to Fractures. *Galen*, in his *Method. Medend. Lib.* 6. *Cap.* 5. ſeems to claſs it among the Species of Fractures, ſince he calls it ἄταγμα, whereas he calls other Fractures by the general Name of κάταγμα, and tells us, that the Word ἄταγμα was uſed only by Phyſicians, but not generally by other Perſons. It ſignifies that Species of Fracture, in which the Extremity of the Bone, eſpecially where it is articulated with the other Bone, is broken; and, becauſe ſuch a Species of Fracture is often taken for a Luxation, the former is generally referred to the latter. But this is principally obſerved to happen in Luxations of the Os Femoris, the Epiphyſes of which are often ſeparated from the reſt of the Bone; or the Neck of the Bone itſelf, which is highly tender, is fractur'd; for *Ruyſch*, in *Theſaur. Anatom.* 8. N° 103. informs us, that a celebrated Surgeon eight times opened the Carcaſes of lame old Women, and always found the Neck of the Os Femoris broken, but never obſerv'd any Luxation. But, ſince in young Patients the Epiphyſes are moſt eaſily ſeparated from the reſt of the Bones, this Diſorder is therefore moſt incident to them; and eſpecially when Infants, carried in a Perſon's Arms, ſuddenly throw their Bodies backwards, there is great Danger, leſt the Epiphyſis of the Os Femoris ſhould be ſeparated, or the Neck of that Bone be broken; in conſequence of which they remain lame during their whole Lives, becauſe the Body of the Bone, now ſeparated from its articulated Head, is drawn upwards by the Force and Action of the Muſcles: But, in Caſes of this kind, ſurpriſing Efforts of Nature, to ſupply this Defect, are ſometimes obſerved; for *Ruyſch*, in his *Theſaur. Anatom.* 9. N° 74. informs us, that in the Body of an old Woman, who, during her Life, had labour'd under ſuch a Misfortune, he found the Neck of the Os Femoris totally wanting, in the room of which Nature had ſubſtituted various hard, thick, and round Ligaments, by means of which the Head of the Bone was united, and joined to the other Parts of it. 'Tis ſufficiently obvious, that the Cure of this Misfortune is more difficult, than that of a Luxation properly ſo called; for luxated Bones, reduced to their natural Situation, are eaſily retain'd, provided the Part is kept in a State of Reſt; but, when the Epiphyſis is ſeparated from the reſt of the Bone, the Muſcles inſerted in the Bone will, by their natural Contraction, remove it from its proper Situation; by which means the Limb is almoſt always ſhortened, and the Motion of the Part deſtroy'd.

The Cauſe of a Luxation may be an external Force, extending, intorting, or expelling the Head of a Bone from its Cavity.

There can be no Luxation without an external Force, if the Articulations, and the Ligaments ſecuring them, are in their natural Condition; and, in Adults eſpecially, thoſe of a ſtrong and robuſt Make, a very conſiderable Force is requir'd to diſlocate an Articulation, as is ſufficiently obvious from the Strength of the Ligaments which ſecure the Joints. But an external Force may act in the three manners here ſpecified, that is, by Extenſion, Intorſion, or Expulſion.

A Luxation may, alſo, proceed from an internal Cauſe, form'd in the Cavity of the Articulation, and forcing the Head of the Bone received, out of its Socket.

The Ligaments connecting the articulated Bones, and ariſing from thoſe Parts where the Epiphyſes are join'd to the reſt of the Bone, ſurround the whole Articulation, like a kind of hollow Capſula; and form a kind of Incloſure, from which nothing can be diſcharged, and to which nothing has Acceſs. In the internal Cavity of every Articulation are contained the two Extremities of the receiving and received Bone, every way ſurrounded by a Cartilage; and, in the large Articulations, there are very conſiderable Glands, which receive their Name from *Havers*, their firſt Inventor. There is one ſuch large Gland in the Articulation of the ſuperior Part of the Os Femoris, and four or five ſmaller Glands in the Articulation of the Knee, as we are inform'd in *Clopton Havers's Oſteologia Nova:* Beſides, many ſmall Follicules are found on the internal Surface of the Ligament which ſurrounds the Articulation. The ſame Author, in the Part already quoted, informs us, that from theſe Glands, which by anatomical Injections are known to conſiſt of numberleſs Veſſels, there is a certain Mucus, like the White of an Egg, and of a ſaline Taſte, ſecreted. The cartilaginous Extremities of the Bones contained in the Cavity of the Articulation, and which, ſo far as we know, are covered with no Perichondrium, ſeem to diſcharge a thin medullary Oil; a large Quantity of which is lodged in the cavernous Parts of the Bones, near the Articulations. *Clopton Havers*, in his *Oſteologia Nova*, informs us, that in large Horſes Bones he, with his naked Eye, could perceive thoſe Pores, thro' which the medullary Oil was diſcharged into the Cavities of the Articulation. This Doctrine is confirm'd by various Experiments; for, as that Author informs us, if the Articulations of a Carcaſe are preſerved entire, till the mucilaginous Subſtance gradually diſappears, or is perhaps reſorb'd, there is found in their Cavities a pure pinguious Oil, which he ſays he has ſometimes obſerved in the Articulations of the Fingers. Animals, kill'd ſoon after violent and long-protracted Labour, have but a ſmall Quantity of Marrow in the Cavities of the larger Bones, whereas in the Bones of Animals duly fed, and kept in a State of Reſt, there is a far larger Quantity of Marrow. From all which Conſiderations it ſeems to be ſufficiently obvious, that the Marrow of the Bones diſcharged thro' the Extremities of the articulated Bones is mixed with the Mucilage ſecreted from the Glands; and that, by an Union and Mixture of theſe, that Liniment is form'd, which anoints the Extremities of the articulated Bones, and ſo lubricates them, that they can move without any Attrition upon each other. For this Reaſon, when the pinguious Oil of the Body is conſumed by hard Labour, old Age, or Diſorders of any kind, a Crackling of the Joints ariſes, becauſe there is an Attrition of the too dry Extremities of the Bones upon each other. Beſides, from the ſmalleſt exhaling Arteries, that ſubtile Dew which we know to be lodg'd in all the Cavities of the Body, large as well as ſmall, tranſudes into the Cavities of the Articulations.

There are, therefore, three different Humours in the Cavities of the Joints; that is, the univerſal perſpiring Fluid, the medullary Oil, and the Mucilage ſecreted from the Glands lodg'd there; from a Mixture of which is form'd that lubricating Matter, which, being attenuated by the Heat and mutual Attrition of the Bones, will be again abſorb'd in the ſame Quantity it was accumulated. But if, by any Cauſe, the Abſorption of the Matter thus diſcharged ſhould be defective, or diminiſh'd, and the ſecreting and expelling Cauſes ſhould, at the ſame time, continue to diſcharge it, it will be accumulated, and, by that means, diſtend and weaken the Capſula form'd by the Ligaments. Hence a Receſs or Removal of the articulated Bone from its Cavity may eaſily ariſe from this Cauſe. 'Tis ſufficiently certain, from various practical Obſervations, that large Tumors are often produced about the Joints by this Cauſe: And *Havers*, in his *Oſteologia Nova*, informs us, that the medullary Oil, diſcharg'd from the cellular Subſtance of the Bone, thro' the Pores of their cartilaginous Extremities, into the Cavities of the Articulations, has a ſtrong Tendency to Concretion, if it is not attenuated by the Motion, and mutual Attrition, of the articulated Bones; for he ſays, that in

fed

fed Animals, which generally have but little Exercise, he has often found concreted Fat lodg'd in the Pores, thro' which it used to be discharged, and which he at first took for some small Gland, tho' he afterwards found, that it was nothing but concreted Oil.

We are, farther, to consider, that an Inflammation may arise here, since it is certain from anatomical Observatitons, that numberless small Arteries are distributed through the Ligaments and Glands of the Joints; and that a Suppuration may ensue, as, also, an Accumulation of Pus in the Cavity of the Articulation; and, consequently, that, by this means, the like Misfortunes may be produced with those arising from the natural Humours of the Joints, collected here, and not absorbed again. Mr. *Petit*, in *Mem. de l'Acad. des Sciences*, informs us, that Luxations are frequently produced by this Cause; and ingenuously confesses, that he discover'd this by the Errors he himself committed; for when, by a Fall, for Instance, a violent Force acts upon the great Trochanter of the Os Femoris, it is sufficiently obvious, that the Head of this Bone must be strongly applied to the Cavity in which it is contained: Hence the Glands seated there, and the round Ligament, may be so violently contused, as often to produce an Inflammation, a Suppuration, and an Accumulation of Pus, or of the Mucilage. The Ligaments, thus distracted and weaken'd, will no longer retain the Head of the Os Femoris in its Situation; but it will be gradually expelled from its Cavity, and the Muscles affixed to the Os Femoris will, by their Contractility, draw it upwards, and produce an incurable Lameness. This Disorder is with Difficulty discovered in the Beginning, since the Luxation is not produced till a great while after. If it is known, that such a Cause has preceded, and if there is a violent Pain in the Articulation, Venesection, a slender Diet, and antiphlogistic Remedies, are necessary to prevent the Inflammation, or remove it, if present. Keeping the Part affected in a State of Rest, and applying proper Fomentations to it, will, also, be of singular Service. Thus a Luxation arising from this Cause may be prevented; but, if it is already made, it seems incurable.

These Causes last-mentioned are assisted, in producing their Effects, by an Extension, Relaxation, or Rupture of the Ligaments, whether by an external or an internal Cause.

The Cohesion of the Ligaments is the only Cause why the articulated Bones remain in their due Situation. In the Ligaments, therefore, a certain Flexibility is requisite, that they may yield to all the various Motions of the Joint; but they must, at the same time, be so tenacious, as not easily to be stretched or lengthen'd too far. Under the Article FIBRA it is shewn, that too great a Distraction is justly reckon'd among those Causes, which weaken the solid Parts of the Body: Hence too great an Extension of the Ligaments, though it does not immediately produce a Luxation, yet it may so dispose the Joints, as afterwards to render them easily capable of a Luxation. The same will, also, hold true, if, in consequence of too great a Relaxation of all the Solids of the Body, or a particular Weakness of the Ligaments, they should not be able sufficiently to resist the distracting Causes. *Celsus*, in the eleventh Chapter of his eighth Book, describing the general Causes of all Luxations, speaks in the following manner: "Since all the Articulations are se-"cured by strong Ligaments, they are luxated, either by Force, "or when the Ligaments are ruptured, or weaken'd by any "Cause; they are, also, luxated more easily in Children and "young Persons, than in robust and full-grown People." It is well known, that in young Persons all the solid Parts are soft, and easily distracted: But in some Persons, tho' full-grown, and sufficiently robust, a surprising Relaxation of the Ligaments is observable in almost all the Articulations; for sometimes Impostors have exposed themselves to public Shew; who, by the sole Force of the Muscles, could luxate, and again reduce, almost all the Articulations of the Body, so as to bend it like a Piece of Wax into various Postures: Hence *Hippocrates*, in his Treatise *de Fracturis*, justly informs us, "That, in the Reduction "of Luxations, one Constitution is widely different from another, "and one Cavity from another; since, in some, the Task is easy; "and, in others, highly difficult. The Ligaments are, also, widely "different; since, in some, they are lax; in others, tense. But there "are many of so moist and succulent a Habit of Body, that they can, "when they have a mind, without any Pain, luxate and reduce "their Articulations." He afterwards adds, that "Luxations "do not easily happen in corpulent Patients; but that, when "they do happen, they are with Difficulty reduced; where-"as the contrary holds true in lean Persons." Then he confirms this Doctrine by the Example of Oxen, which, in the latter End of Winter becoming greatly emaciated, have the Os Femoris more easily luxated, than at other times.

But if, by external Force, the Ligaments are ruptured, or their Cohesion destroyed by a Suppuration, or Corrosion, it is sufficiently obvious, that, in such a Case, a Luxation must be easily produced.

Luxations produce a Change of Figure in the Part, Tumor, Hollowness, a Shortening, and sometimes an Elongation, of the Member, Immobility, Distraction of the Muscles, Torpor of the subjacent Parts, a Palsey, a Compression of the adjacent Vessels, Pain, Watchings, an Inflammation, an Oedema, an Anchylosis, Convulsions, Extenuation, the Mortification of the Part, or the Death of the Patient.

In this Paragraph are enumerated the Phenomena, which generally accompany or succeed a Luxation.

As for Change of Figure, Tumor, and Hollowness; these are common Signs, which, accompany every Luxation. *Celsus*, in the eleventh Chapter of his eighth Book, says, "There is "always a Tumor in that Part in which the Bone becomes "prominent, and a Cavity in that Part from which it is re-"moved." But such an unusual and preternatural Tumor and Cavity principally appear, if the luxated Joints are covered with a small Quantity of Integuments; as in the Shoulder and Elbow, for Instance; for, in the Articulation of the superior Extremity of the Os Femoris, this Tumor and Cavity are more difficultly discover'd, on account of the large Quantity of Fat, and the Number of surrounding Muscles. But, that we may be certain, whether the Articulation is luxated, or not, *Hippocrates*, in his Treatise *de Articulis*, justly advises us to compare the injured with the corresponding sound Part: "For, "*says he*, we must judge of the affected Member by the cor-"responding sound one, and not by looking at the Articulations "of another Person; since the Joints of some are more pro-"minent than those of others." In the same Treatise he, also, informs us, that the Change of Figure alone is not sufficient to determine, whether a Joint is luxated, or not: "For, *says he*, "in many Patients, the Joints, whether through intense Pain, or "any other Cause, have a different Figure from those of sound "Persons, though they are not really luxated." And even tho' a preternatural Cavity appear about the Articulation, yet, unless there is an unusual Tumor in the opposite Part, formed by the Head of the luxated Bone, a shameful Error may be committed, especially about the Articulation of the Humerus. *Hippocrates*, in the same Treatise, informs us, that he knew some Physicians of Note, who imagined that the Articulation of the Humerus was luxated, when, in consequence of a Separation of the Acromion, the superior Commissure of the Humerus appeared depressed and hollow. And *Galen*, in his Comment on the same Passage, informs us, that this Accident happen'd to himself; for, when, in a certain Place of Exercise, his Acromion was separated, the Master, seeing the preternatural Cavity, imagined that the Head of the Humerus had slipt down into the Arm-pit; for which Reason he extended the Arm strongly, and endeavour'd to reduce the luxated Articulation, but in vain: And, when, by the Assistance of others, a very strong Extension was made, *Galen* himself, by putting his Fingers into the Arm-pit of the affected Side, endeavour'd to reduce the luxated Joint; but, when he found nothing preternatural in the Cavity of the Arm-pit, he advised them to abstain from any farther Extension: However, imagining that the intense Pain had induced *Galen* to give this Advice, they continued the Extension, and would have certainly torn the Muscles, if a Person of Skill had not seasonably come to the Relief of *Galen*, who, by this prepostrous Treatment, perceived himself ready to fall into Convulsions, which could only be prevented by continually anointing the Part with warm Oil. Hence it is obvious, what great Caution is necessary in determining whether an Articulation is luxated, or not; since the most skilful have sometimes err'd in this Affair. *Vanswieten* informs us, that he saw a poor Countryman, whose whole Arm, as far as the Humerus was become gangrenous, because, the Cubit being only tumid with a true Phlegmon, an impudent Quack imagined it to be luxated; and, for that Reason, rack'd the Patient with several violent Extensions thereof.

As for an Elongation or Shortening of the Member; when the Head of the articulated Bone slips out of the Cavity in which it is naturally contain'd, the Muscles affixed to the Bone, by their proper Contraction, draw it upwards. For this Reason a luxated Member generally becomes shorter, in the same manner as fractured Bones. See FRACTURA. In some Cases, however, though rarely, the luxated Member becomes longer; if, for Instance, the Head of the luxated Bone is so situated, that it cannot be drawn by the Muscles: Thus, as *Celsus*, in *Lib.* 8. *Cap.* 12. informs us, "If both Heads of the inferior Jaw are luxated, "the whole Chin hangs down, and protuberates forwards; the "inferior Teeth stick farther out than the superior, and the Tem-"poral Muscles appear tense and stretch'd;" for the prolapsed Heads of the inferior Jaw-bone cannot by the affixed Muscles be retracted beyond the Tubercles placed before the Cavities of the Articulation: For which Reason, in such a Case, the inferior Jaw-bone always protuberates beyond the superior. And *Hippocrates*, in his Treatise *de Articulis*, when treating of Luxations, among the Signs which inform us, that the Os Femoris is slipt to the internal Parts, reckons this one, that the Thigh affected is longer than the other, when compared with it: "For, *says he*, "the Head of the Os Femoris is lodged on that Bone, which "rises upwards from the Coxa to the Pecten, and its Neck is

"sustain'd

" ſuſtain'd in the Cavity of the Articulation." For theſe two Reaſons, *Hippocrates* would have a luxated Thigh to be longer than its correſponding Member. But a Shortening of luxated Members happens more frequently, though they are, alſo, ſome times render'd longer: But it ſtill more rarely happens, that a luxated Part retains the ſame Length with its ſound correſponding Member. *Hippocrates*, however, informs us, that this happens, when the Head of the luxated Os Femoris ſlips to the anterior Parts; but adds, at the ſame time, that ſuch a Luxation rarely happens.

As for Immobility; all thoſe Motions which require a due and natural Diſpoſition of the luxated Joint, either cannot be performed at all, or, at leaſt, not without the greateſt Difficulty; and certainly, in a true Luxation, all thoſe Motions can never be exerciſed, which were perform'd when the Joint was ſound: Thus, for Inſtance, when the Articulation of the Humerus is in its natural State, a Perſon can with his extended Arm deſcribe numberleſs Cones, whoſe Vertexes may be conceived in the Cavity of the Articulation, and whoſe Baſes are deſcribed by the Extremities of the Fingers. But, if the Head of the Os Humeri is ſlipt out of the Cavity of the Scapula, this can never be done. The ſame holds true in the other Articulations. However, all the Motions of the Joints are not always deſtroyed by Luxations; for ſome of them often remain, as *Hippocrates*, in his Treatiſe *de Articulis*, juſtly obſerves; for, after having ſpoken concerning thoſe Perſons, who, from their Birth, have ſhort Shoulders, whether from a Luxation in the Uterus, or any other Cauſe, he tells us, " That in full-grown Perſons, when the Humerus is " luxated, and not reduced, the Top of the Shoulder becomes " extenuated, and more ſtript of its former Fleſh; but, when " the Patients are freed from Pain, they cannot equally well per- " form all thoſe Motions, which require that the Cubit, being " removed from the Breaſt, ſhould be raiſed high: But they can " perform all thoſe Motions, which require that the Humerus " ſhould be moved forwards or backwards; for they are capable " of uſing an Augre, a Saw, or an Ax, provided it is not ne- " ceſſary to raiſe the Cubit very high." In various other Parts of the ſame Book, *Hippocrates*, when treating of the Luxations of the ſame Articulation, tells us, what Motions are deſtroyed, and what remain: Hence, under this Limitation, Immobility is claſſed among the Effects of a Luxation.

As for a Diſtraction of the Muſcles; the Head of the luxated Articulation, ſituated in an improper Place, will neceſſarily preſs the adjacent Muſcles, and diſtract them. Beſides, the Muſcles affix'd to the luxated Bone will neceſſarily change their Situation. Hence, ſome of theſe Muſcles muſt be lengthened and ſtretch'd, whilſt others are relaxed. When Mr. *Petit*, in *Mem. de l'Acad. des Sciences*, *An.* 1722 enumerates the Signs, by which 'tis known, that the Head of the Os Femoris is ſlipt out of its Cavity to the poſterior Parts, he informs us, that the Glutæi Muſcles are relaxed, whereas the Muſculus Triceps appears highly tenſe, like a Cord from the Region of the Pubes, to the Middle of the Os Femoris. When the Head of the inferior Jaw-bone is luxated, it is ſufficiently obvious, from an anatomical Knowledge of the Parts, how much the Temporal Muſcles muſt be diſtracted. Hence Convulſions are often produced, and ſometimes the Death of the Patient.

As for a Torpor of the ſubjacent Parts, and a Palſey; theſe, for Inſtance, will be produced, if the luxated Articulation compreſſes any large Nerves; or if, as it happens in a Luxation of the Vertebræ, the ſpinal Marrow is compreſs'd. When *Hippocrates*, in his Book *de Articulis*, treats of a Luxation of the Spine, he informs us, that, when the ſuperior Part of the Spine is luxated inwards, the whole Bodies of the Patients become paralytic and torpid [νεναρκωμένοι]. Now, if the Head of the Os Humeri, falling into the Cavity of the Axilla, compreſſes the large Trunks of Nerves diſtributed there, it is ſufficiently obvious, that the ſame Misfortunes may happen in the ſubjacent Parts. When the Head of the Os Femoris is luxated to the anterior Parts, among the other Signs of this Diſorder, *Hippocrates*, in his Treatiſe *de Articulis*, reckons a Suppreſſion of Urine, becauſe, in this Caſe, the Head of the Bone is adjacent to very conſiderable Nerves. But it ſhould ſeem, that a Compreſſion of the Nerves ſhould rather excite an involuntary Excretion, than a Suppreſſion of Urine. But *Hippocrates*, in his Treatiſe *de Locis affectis*, *Lib.* 2. *Cap.* 4. informs us, that, if the Medulla Spinalis is injured by any Cauſe whatever, neither the Fæces, nor the Urine, are at firſt evacuated; but, as the Diſorder becomes older, that they are involuntarily diſcharged. Hence it is obvious, that a Compreſſion of the Nerves may ſometimes produce a Suppreſſion of Urine. If, therefore, the Nerves ſubſervient to Senſation and Motion are entirely compreſs'd, a Palſey, accompany'd with perfect Inſenſibility, will be produced; and, if the Compreſſion be but ſlight, it will, indeed, diminiſh, tho' not abſolutely deſtroy, the Function of the Nerves. In this Caſe, the ſubjacent Parts will be ſeiz'd with a Torpor; which, as *Galen*, in his Treatiſe *de Locis affectis*, beautifully expreſſes it, is a kind of intermediate Diſorder between a Palſey and perfect Health.

As for the Compreſſion of the adjacent Veſſels; as the Head of the Os Humeri, ſlipt from its Cavity towards the Axilla, often preſſes upon the large adjacent Trunks of Nerves, ſo it may alſo compreſs the large Blood-veſſels ſituated there; and conſequently, ſo long as it remains in that Poſition, hinder the free Influx and Efflux of the Blood in the ſubjacent Parts. Hence a Gangrene, or Atrophy, will enſue.

As for Pain; ſuch a Diſpoſition of the nervous Fibres ariſing from the Brain, as threatens a Solution of Continuity, excites the Idea of Pain in the Mind. But an Articulation cannot ſlip from its Cavity without a ſtrong Diſtention of the Ligaments which ſurround it; and, ſo long as the luxated Bone remains in this preternatural Poſition, the Ligaments are more diſtracted, than in a natural State. Hence a pretty acute Pain accompanies a very recent Luxation, which, however, generally ceaſes, or, at leaſt, is greatly diminiſhed, when the luxated Bones are reduced to their due and natural Situation. For this Reaſon Luxations are juſtly claſs'd among the Cauſes of Pain. Now, if we conſider, that the Perioſteum, in that Part where the Ligaments of the Joints ariſe, is ſeparated from the Bone, and runs along the Ligaments, as is obſerved under the Article FRACTURA, it will be ſufficiently obvious, that the Ligaments cannot be diſtracted, without, at the ſame time, affecting the incumbent Perioſteum, which is poſſeſs'd of an intenſe and quick Senſation. Hence another Cauſe of Pain ariſes. Beſides, the Head of the luxated Bone, by preſſing the adjacent Parts, may diſtract the nervous Fibres diſpers'd thro' theſe Parts, and, compreſſing their Veſſels, produce Obſtructions and Inflammations, which is ſtill a freſh Source of Pain. But when the luxated Bone is not reduced, the Fibres of the Ligaments are, by their long Diſtraction, as is obſerved under the Article FIBRA, ſo weakened, as to become capable of a more eaſy Yielding and Elongation, without Danger of Rupture. Hence the Pain is gradually diminiſhed, till at laſt it ceaſes. But the adjacent Parts, being preſſed and acted upon by the Head of the luxated Bone, become callous, and loſe their Power of Senſation. We have already obſerved, when treating of the Immobility ſubſequent to Luxations, that thoſe Patients are, in Proceſs of Time, freed from Pain, whoſe luxated Articulations are not reduced; and that they can ſtill commodiouſly perform a conſiderable Number of Motions. When *Hippocrates*, in his Treatiſe *de Articulis*, ſpeaks of a Luxation of the Os Femoris towards the exterior Parts, he ſays, " That when the Fleſh, into " which the Head of the articulated Bone is ſlipt, becomes cal- " lous and tough, the Pain ceaſes for a time; and, when ſuch " Patients are free from Pain, they can, if they have a mind, " walk without a Staff, and ſupport their Bodies on the affected " Leg." For *Gorræus*, in *Definit. Med.* obſerves, that the Word γλίσχρον, in Fluids, denotes a greater Viſcidity, and, in Solids, an increaſed Tenacity or Toughneſs.

As for Watchings; theſe are juſtly claſſed among the Effects of Pain: Since, therefore, it has been juſt now prov'd, that Pain accompanies Luxations, it follows of courſe, that the Patient muſt be afflicted with Watchings ſo long as intenſe Pain continues.

As for Inflammation; an Inflammation is preſent, when the Fluid ſtagnating in the Veſſels is preſſed and acted upon by the ſucceeding Liquid, which is thrown into a briſk Motion by the Fever. In Inflammations, therefore, an Obſtruction and a briſk Circulation of the Humours are ſuppoſed. But every Force which compreſſes, or lengthens, the flexile Veſſels, leſſens their Cavities, and may, conſequently, prove the Cauſe of an Obſtruction. Now, by a Luxation, the Ligaments, Muſcles, and Tendons, affixed to the Bones, are lengthened, and the Bones removed from their natural Situations compreſs the adjacent Parts. Hence an Obſtruction proceeds from a Luxation, as the Effect does from its Cauſe, and a Fever is claſs'd among the Effects of Pain. Hence it is obvious, that in Luxations the two Circumſtances ſufficient to produce an Inflammation concur; that is, an Obſtruction, and a briſk Circulation, of the Blood, produced by the Fever ariſing from the Pain accompanying every Luxation. But what violent Fevers, accompanied with Inflammation, are often ſubſequent to Luxations, *Hippocrates* informs us, in his Treatiſe *de Fracturis*: " For, " ſays he, unleſs the Os Humeri, luxated at the Cubit to the " anterior Parts, is forthwith reduced, violent Inflammations " enſue; but, if it is luxated to the poſterior Parts, it excites an " intenſe Pain, and violent continual Fevers, accompany'd with " an Evacuation of unmix'd Bile, and which in a few Days prove " mortal." This he, alſo, confirms in his Treatiſe *de Articulis*, when ſpeaking of the Luxation of the Cubit; and, when treating of the Luxation of the Jaw-bone, he adviſes it to be reduced with all Expedition, becauſe, otherwiſe, the Patient's Life will be endangered, on account of the continual Fevers ariſing from that Neglect: And he afterwards adds, that, in ſuch a Caſe, the Patient generally diſcharges by Stool a ſmall Quantity of unmix'd Bile; and, if he vomits, the Matter thrown up is of the ſame kind.

As for an Oedema; 'tis obſerved under the Article INFLAMMATIO, that at firſt all preternatural Tumors were comprehended under this Name, but that it was afterwards confined to ſoft Tumors, which were free from Pain, and yielded to the Preſſure of the Finger. Such a Tumor is, for the moſt part, only form'd in the Membrana Celluloſa, by the Lymph accumulated and becoming

coming ſtagnant in the Cellulæ of that Membrane. But ſuch a Tumor principally accompanies Luxations, when the luxated Bone compreſſes large Veins; for by that means the Motion of the Fluids in the Veins is hindered. Hence the ſubtile Dew, diſcharged from the Arteries into the Cavities of the Membrana Cellulóſa, cannot be commodiouſly abſorb'd by the Veins; in conſequence of which, being accumulated, it becomes ſtagnant, and is convérted into Water, or what *Hippocrates* calls *Ichor*.

As for an Anchyloſis; *Celſus*, in *Lib.* 5. *Cap.* 18. informs us, that Articulations, contracted by a recent Cicatrix, are by the *Greeks* called ἀγκύλη. But *Ægineta*, in *Lib.* 4. *Cap.* 55. informs us, that an Immobility of the Humours, or any Contraction of Joints [τῶν ἄρθρων κατοχὴ] produced by an Infarction of the Humours, or any Contraction of the Nerves, is called ἀγκύλη, and ἀγκύλωσις. An Anchyloſis, therefore, ſignifies a deſtroy'd or loſt Flexibility of the Joints, which is often accompany'd by a preternatural Tumor. But, that the Joints may remain moveable, a due Figure and Adaptation of the Extremities of the articulated Bones, the greateſt Lubricity in conſequence of the cartilaginous, and highly ſmooth Surfaces of the Extremities of the Bones, and the mucilaginous Liquor, and, laſtly, a due Flexibility of the Ligaments ſurrounding the Joints, are requiſite. But, by a Luxation, all theſe Circumſtances are ſometimes deſtroy'd, or at leaſt conſiderably changed; for the Ligaments, when an Articulation ſlips from its Cavity, being either ruptur'd, or violently diſtracted, become inflam'd. The ſame Effect may be, alſo, produced by the Force uſed in order to reduce the Luxation. This Inflammation may be ſucceeded by a Suppuration, or a Gangrene. Hence the Ligaments will afterwards remain contracted and rigid. Beſides, when the Ligaments are thus affected, there will not be ſuch a Secretion of the Mucilage deſtin'd for lubricating the Joints, as there generally is in a natural State. By this means the Motion of the Joint will be hindered. And ſince, when the Ligaments are inflam'd, an intenſe Pain is excited by the ſmalleſt Motion of the Joint, the Part remaining at Reſt, the Mucilage of the Joints is not ſufficiently attenuated and reſorb'd; which, therefore, being accumulated, and its finer Parts diſſipated, will become concreted into an irreſolvable Maſs, and totally deſtroy the Motion of the Joint. If, whilſt the Head of a Bone ſlips out of its Cavity, or whilſt it is reducing, the cartilaginous Surface, on the Margin of the Cavity, is injured, or in any manner deprav'd, this will prove another Source of an Anchyloſis.

As for Convulſions; an intenſe Pain, which diſorders the whole Common Senſory, is frequently ſucceeded by Convulſions; for which Reaſon Convulſions may ſucceed a Luxation. Beſides, a Luxation is frequently accompanied with ſuch a violent Diſtortion of the Muſcles, and Diſtraction of the Tendons, as are ſufficient to produce Convulſions; for we know from daily Experience, when the Tendons of the Muſcles ſubſervient to the Motion of the Hands and Feet ſtart from their natural Situation, what intolerable Pain and Convulſions, generally called the *Cramp*, ſuch Muſcles are ſeized with. *Hippocrates*, in his Treatiſe *de Articulis*, tells us, that when the Bones of the Legs are luxated, and the Diſorder accompanied with a Wound, the Bones at the Ancles, whether luxated internally, or externally, are not to be reduced, becauſe, if they are reduced, the Patients live but a few Days, and die of Convulſions. In the ſame Work he tells us, that the like Misfortune is to be expected, if the Bones of the Cubit are ſo luxated about the Carpus, as to ſtick out of the Wound. And he afterwards affirms, that, if Convulſions ſhould ſucceed the Reduction of the Luxation, the reduced Part ought forthwith to be forced out of its Cavity, and bathed with ſome proper warm Liquor.

As for Extenuation; when by any Cauſe the larger Arteries, or the Nerves diſtributed to any Part, are hindered from conveying the vital Humours neceſſary for the Life and Nouriſhment of that Part, a true Maraſmus is produced, becauſe the former Fluids being gradually diſſipated, and freſh ones not ſupplied, all the Veſſels become contracted. Under the Article VULNUS there is a memorable Inſtance of this, in which the axillary Artery being entirely cut, the whole Arm afterwards wither'd away like a Mummy. When, therefore, the Head of the Os Humeri, for Inſtance, being luxated, has for a long time compreſſed the large axillary Veſſels, it is ſufficiently obvious, that the like Misfortune is juſtly to be dreaded.

But *Hippocrates*, in his Treatiſe *de Articulis*, mentions another Cauſe of Extenuation; that is, when the luxated Bones are not reduced: For, when treating of a Luxation of the Thigh, he ſays, that if it happens to thoſe who have not arrived at their full Growth, and is not reduced, the Thigh, Leg, and Foot, are by that means rendered ſhorter. "Nor, ſays he, in like manner, "are the Bones lengthened, but rather rendered ſhorter, eſpe- "cially the Os Femoris. The whole Leg, alſo, loſing its Fleſh "and Muſcles, becomes extenuated and ſmall, partly becauſe "the Bone is moved from its natural Situation, and partly be- "cauſe it cannot perform the Offices it could in a natural "State; for Exerciſe ſtrengthens that which is weak, and reſolves "ſome Part of that which hinders the Increaſe of the Member "in Length. But thoſe Patients are moſt injured who have "this Articulation luxated in the Uterus: Thoſe who ſuſtain "the next greateſt Injury, are ſuch as have it luxated in their "Infancy and Youth: But adult and robuſt Perſons ſuſtain "the leaſt Damage by ſuch a Misfortune." But *Hippocrates*, in the ſame Work, obſerves, that this Extenuation is principally obſervable in the Parts moſt contiguous to the luxated Articulation; which he proves by the Example of thoſe whoſe Shoulders have been luxated before their Birth, or, at leaſt, before they have arrived at their full Growth; for in ſuch Perſons the Os Humeri is ſhorter, and the Cubit and Hand ſomewhat leſs, than in ſound Perſons: He adds, that they can do moſt things with the affected as well as with the ſound Arm: And he ſays, that the Fleſh of the Thigh and Leg is diminiſh'd, when the Head of the Os Femoris, articulated with the Coxa, ſlips towards the internal Parts, becauſe the Patients cannot uſe that Leg. Hence the Extenuation ſucceeding an unreduced Luxation is not always to be aſcribed to a Compreſſion of the large Veſſels, but often depends on a Defect of muſcular Motion in the Part affected. For this Reaſon *Hippocrates*, in his Treatiſe *de Articulis*, obſerves, that in Adults, when the Os Femoris ſlips from its Cavity, to the external Parts, and is not reduced, the Bulk of the Member is not much diminiſhed, becauſe the Uſe of the Member is not deſtroyed; for the Fleſh, in which the Head of the Bone is lodged, being rendered firm by the Attrition, they can walk without a Staff. But afterwards, from various Obſervations concerning this Extenuation, he deduces a general Axiom: "If, ſays he, the Parts of the Body "deſtined for any particular Purpoſe are moderately uſed and "exerciſed in that for which they were deſigned, they continue "ſound, and are increaſed; but, if they are not uſed, they become "morbid, are not increaſed, and ſoon become, as it were, old. "This happens principally to the Nerves and Joints, unleſs they "are duly uſed." How efficacious muſcular Motion is in reſtoring, by means of the Aliments, what, by the neceſſary Effect of Life and Health, is daily loſt, not only from the whole Body, but, alſo, from each of its Parts, is ſhewn under the Article FIBRA. Now, if we conſider, that the Muſcles, Tendons, and Ligaments, when left to themſelves, are, by their ſpontaneous Contraction, ſhortened, and become rigid; and that, when the diſtending Cauſes are removed, the Veſſels of the human Body are, by their proper Contractility, rendered narrower; the Reaſon will be obvious, why, after a Luxation, by which the Motion of the Member is hindered, an Extenuation enſues. Beſides, this Doctrine is ſufficiently confirmed by the Obſervations of the beſt and moſt skilful Surgeons.

As for the Mortification of the Part, or the Death of the Patient; among the Effects of Pain, we may juſtly reckon a Gangrene, which is ſuch a Diſorder of a ſoft Part, as, after the Abolition of the vital Influx of the Fluids into the Arteries, and its Efflux by the Veins, tends to a Mortification. The ſame Misfortune, alſo, often ſucceeds the violent Inflammation, which ſo frequently accompanies Luxations. *Hippocrates*, in his Treatiſe *de Articulis*, when the Bones of the Leg are luxated about the Ancle, tells us, that, if a Reduction of them is attempted, the Foot and Leg are ſeized with a Gangrene. If, therefore, the large Veſſels are ſo compreſſed, or injured by a Luxation, that the Influx and Efflux of the vital Humours is hindered, the Mortification of the Part is immediately approaching. The ſame will, alſo, happen, if, when a violent Inflammation is already preſent, a Reduction of the luxated Bone is attempted: For, in order to ſuch a Reduction, a ſtrong Extenſion, and rough Handling, are often neceſſary; by which means the Inflammation quickly degenerates into a Gangrene. That the Death of the Patient may, alſo, ſometimes be produced by Luxations, is ſufficiently obvious from what has been already ſaid; for we have obſerved, that a Luxation of the Jaw-bone produces violent Convulſions, and Death. And *Hippocrates* informs us, that ſevere continual Fevers, which in a few Days prove mortal, follow Luxations of the Cubit. When the larger Articulations are luxated with a Wound, ſo that the Bones ſtick out of the Wound, Convulſions and Death immediately ſucceed, if they are reduced; and, when they are left in their luxated Condition, the Patient's Life is ſtill dubious.

From what has been ſaid the evident Signs of a Luxation may be drawn.

That we may be certain of the Luxation of any Joint, we muſt firſt inquire, whether there has been any previous Cauſe, whether external or internal, whoſe Force was capable of removing the Head of the Bone from its Cavity. We ought, alſo, carefully to attend whether the Ligaments ſecuring the Articulation are, by any previous external Force, too much diſtracted, or ruptured, or by whatever Cauſe ſo relaxed, that they cannot ſufficiently ſecure the Joint, as is already obſerved. After, from theſe Circumſtances, a Luxation is juſtly ſuſpected, we are carefully to inquire, whether thoſe Signs are preſent, which inform us, that a Luxation is already made. The moſt conſiderable of theſe are, a preternatural Tumor made by the Head of the Bone lodg'd in a wrong Place, and an unuſual Cavity in that Part which the Head of the Bone naturally poſſeſs'd. But,

that

that the Diagnoſtic may be the more certain and infallible, both theſe Circumſtances muſt be preſent, ſince any one of them often proves fallacious. This Diagnoſtic is ſtill ſurer, if the natural Motion of the Member is either totally deſtroy'd, or at leaſt, much diſordered and impaired. If, at the ſame time, upon comparing the affected with the ſound Part, a conſiderable Difference appears in their Figure and Length, there ſeems to be no longer any Doubt, but a Luxation is preſent.

It may, however, ſometimes happen, that the Diagnoſtic of a Luxation is very difficult; for if, by a violent Contuſion or Diſtortion, an Inflammation has rendered the Joint tumid, it is neither eaſy to diſcover the preternatural Cavity in the Articulation, nor the unuſual adjacent Tumor, whilſt, at the ſame time, the Motion of the Joint is totally hindered by the Intenſeneſs of the Pain. Hence, in ſuch a Caſe, we are carefully to attend, whether the preceding Cauſes are ſuch as we may reaſonably expect ſhould produce a Luxation. Nor, in a dubious Caſe, will it be improper to ſuſpend our Judgments, becauſe, when a violent Inflammation ariſes, it would be by no means ſafe to reduce the luxated Members. For this Reaſon, after the Inflammation is removed by proper Remedies, the affected Part may be examined. The great Caution neceſſary in diſtinguiſhing Luxations is ſufficiently evinced by a memorable Caſe related by *Galen*, in *Comment. prim. in Libr. Hippocrat. de Officina Medici.*

After we are convinced of the Preſence of a Luxation, it is ſtill requiſite we ſhould determine whether the Head of the luxated Bone has ſlipt to the exterior, or interior, the ſuperior, or inferior Parts; for many things neceſſary to the Prognoſtic and Cure depend upon the Knowledge of this Circumſtance. Anatomy, which teaches the various Union of Bones in different Articulations, and a Conſideration of theſe Motions, which depend upon the natural Condition of the Joint, are of ſingular Service in the Prognoſtic and Cure of Diſlocations. But this may be principally known from the Part in which the Head of the luxated Bone is lodged. For this Reaſon *Hippocrates*, and after him ſome other Phyſicians and Surgeons, have collected all the Signs, by which the various Luxations of the ſame Joint may be diſtinguiſh'd. Thus, in his Treatiſe *de Articulis*, he tells us, that the Patient, whoſe Cubit is luxated towards the poſterior Parts, cannot extend his Arm: And, on the contrary, that, when the ſame Articulation is luxated to the anterior Parts, the Elbow cannot be bended. And, when treating of the various Luxations of the Os Femoris, he accurately deſcribes the Signs accompanying each.

After a mature Conſideration of the Bulk, Figure, Situation, the Parts compreſſed and intercepted, the Time of the Duration, the Concretion of the luxated Parts, the Pain, the Inflammation, and other Symptoms, the Thinneſs, or Thickneſs, of the ſurrounding Parts, the Ligaments deſtroy'd or lengthen'd, the affixed Muſcles, and the like, we are to form a Prognoſtic, which teaches us whether the Cure will be entire or imperfect, quick or ſlow, eaſy or difficult.

After by the diagnoſtic Signs 'tis certain, that there is a Luxation, we ought to conſider all the Circumſtances enumerated in this Paragraph, that we may form a ſure Prognoſtic of what is either to be dreaded from the Luxation itſelf, or from the Force neceſſary to be uſed for its Reduction. All theſe things are to be ſuggeſted, if not to the Patient himſelf, yet, at leaſt, to his Friends, leſt any future Misfortunes, unavoidable by the moſt skilful, ſhould rather be aſcribed to the Negligence of the Surgeon, than the Violence of the Diſorder. But in forming a Prognoſtic we are principally to conſider, whether 'tis to be expected, that all the Motions, uſually performed by the Joint when ſound, can be reſtor'd; or whether only ſome Uſes of the luxated Member are to remain, though it is not entirely ſuch as it was before the Luxation; for thus an entire and imperfect Cure are diſtinguiſhed. Beſides, it ought to be determined whether the Cure can be ſoon perform'd, or whether it requires a long Time before a due Firmneſs can be reſtor'd to the Joint. Thus, for Inſtance, if a Luxation happens in conſequence of a violent Diſtraction, or a previous Relaxation, the Ligaments are ſo weakened, that a ſpeedy Cure cannot be expected. But a Cure is ſaid to be eaſy, when only a ſlight Extenſion is neceſſary to the Reduction, and no violent Symptoms are preſent. But where the contrary happens, a difficult Cure may be expected, which requires a ſtrong Extenſion, and many Efforts for its Reduction. Though, to uſe the Language of *Celſus*, in the 26th Chapter of *Lib.* 5. "'Tis the Part of a Quack to heighten every ſmall Cir-"cumſtance, that he may ſeem to have performed the more "ſurpriſing a Cure;" yet there is no Harm in making a pretty difficult Prognoſtic; for, by this means, if any Misfortune ſhould happen, it will appear, that the Surgeon foreſaw it; if, on the contrary, every thing ſhould ſucceed well, he will reap the Praiſe of ſo lucky an Event. What Misfortunes are to be dreaded, will be ſufficiently obvious from the following Circumſtances.

The Largeneſs. The Largeneſs of a Luxation is eſtimated by the Diſtance between that Place, which the Head of the luxated Bone poſſeſſes, and the Cavity of the Articulation. But 'tis ſufficiently obvious, that the more the luxated Bone has receded from its Cavity, ſo much the more the Ligaments ſurrounding the Joint muſt be diſtracted, and ſometimes broken; by which means the adjacent Muſcles and Tendons will ſuffer the greater Violence. Hence an intolerable Pain and Inflammation will be produced. 'Tis, at the ſame time, evident, that the nearer the luxated Bone is lodged to the Cavity of the Articulation, the more eaſily the Luxation is reduced. Hence *Celſus*, in *Lib.* 8. *Cap.* 15. informs us, that the Os Humeri is far more eaſily reduced when it ſlips forwards, than when it falls down into the Arm-pit.

As for the Figure; we have already obſerved, that there is a Change of Figure in a luxated Member. Upon comparing it, therefore, with the correſponding ſound Part, the greater the Diverſity of Figure is, the greater is the Change of Situation in all the adjacent Parts, and conſequently their Diſtortion or Diſtraction the ſtronger; all which Circumſtances, as is ſufficiently obvious, render the Cure proportionably more difficult. The Figure, alſo, of the luxated Bone creates a very conſiderable Difference in this Affair. Thus, for Inſtance, when the Os Humeri is luxated, and a due Extenſion made, if its Head is ſituated before the hollow Sinus of the Scapula upon a Remiſſion of the extended Parts, it eaſily returns into its Situation. But in the Os Femoris it is quite otherwiſe; for its Head and Neck form an obtuſe Angle, with the reſt of the Bone ſituated below. Hence other Meaſures are neceſſary for its Reduction; for though, by means of a ſtrong Extenſion, the luxated Bone ſhould be brought oppoſite to its Cavity, it may very eaſily ſlip upwards; and, at the ſame time, miſs its Cavity, which lies to one Side: Hence *Hippocrates*, in his *Treatiſe de Articulis*, when ſpeaking of the Reduction of the Os Femoris luxated to the interior Parts, ſo orders the whole Apparatus, that, when the Extenſion is made, an Aſſiſtant is to move the Bone from Side to Side, till it returns to its natural Situation.

As for the Situation; if we conſider the beautiful Obſervations made by *Hippocrates*, in his *Treatiſe de Articulis*, concerning the various Situations of the Os Femoris, when luxated, it will be ſufficiently obvious what different Effects of Luxations muſt ariſe from this Cauſe alone; for if the Os Femoris ſlips to the internal Parts, and cannot be reduced, which frequently happens, the Fleſh ſurrounding the luxated Bone decays, and the Uſe of the Part will remain very much depraved: But a far leſs terrible Misfortune will enſue, when the ſame Bone is luxated towards the external Parts. For which Reaſon *Hippocrates*, in the ſame Work, laid down this general Concluſion: "About the Coxæ "there is a great Difference whether the Head of the Os Fe-"moris is luxated towards the internal or the external Parts; there "is, alſo, a Difference, though a leſs conſiderable one, when "it is luxated at the Knee." There is a peculiar kind of Lameneſs proper to each of theſe Caſes: For they, in whom it is luxated to the external Parts, have their Leg crooked, and ſtand leſs ſtreight than thoſe in whom it is luxated to the internal Parts. The like happens when the Bone at the Ancle is luxated; for, if it is luxated to the external Part, the Leg is bow'd towards the internal Part, but can ſtand; but, if it is luxated to the internal Part, the Leg is bow'd outwards, but the Patient cannot ſtand ſo well.

As for the Parts preſſed and intercepted; what Misfortunes may happen when luxated Bones preſs the adjacent Parts, never appears more palpably than in Luxations of the Vertebræ; for, in this Caſe, the ſpinal Marrow included in their Cavities is preſs'd, contuſed, and ſometimes lacerated; and the higher ſuch a Luxation is, the more terrible Conſequences it produces. Hence *Celſus*, in *Lib.* 8. *Cap.* 13. juſtly pronounces Luxations of the Head, in which the Proceſſes uniting the ſuperior Vertebræ are luxated backwards, to be abſolutely mortal: "For, ſays he, the "Tendons lying under the Occiput are diſtended; the Chin "hangs down upon the Breaſt; the Patient can neither drink, "nor ſpeak, and, ſometimes, diſcharges his Semen involunta-"rily. This Situation is ſoon ſucceeded by Death." He afterwards informs us, that the ſame Fate attends thoſe who have the Vertebræ of the Spine luxated, and that they die within three Days, though not ſo ſoon as thoſe whoſe Heads are luxated. He, alſo, there enumerates the Diſorders ſubſequent to Luxations of the Vertebræ; for, if they are totally removed from their Place, he affirms, that the ſpinal Marrow, Membranes, and Nerves, muſt neceſſarily be broken. But, if they were only luxated to the external Parts, he propoſed a Method of Cure from *Hippocrates*. But we have already conſidered this, when treating of the Torpor and Palſey of the Parts below the luxated Articulation. But if, whilſt the luxated Bone is reducing, the Nerves, the Veſſels, or any Parts of the Muſcles, or Tendons, are intercepted, and lodged between them, it is ſufficiently obvious what intolerable Pains and Convulſions muſt be produced by that means. But ſuch an Interception will not readily happen, if a due Extenſion is made before the Reduction.

As for the Time of the Duration; *Hippocrates*, in his Treatiſe *de Articulis*, laid down a general Rule in reducing Luxations, which was, to do it with all Expedition: For, ſays he, the Reduction is moſt eaſily made, and the Patient ſubjected to leaſt Pain, if the Luxation is reduced before the Joint becomes tumid. The moſt celebrated Surgeons, in Luxations complicated with a Fracture, firſt take proper Meaſures for retaining the fractur'd Bones

Bones in a proper Situation; and then proceed to the Reduction of the Luxation. But in Caſes of this kind they always reduce the Luxation, before they attempt the Cure of the Fracture, partly on account of what has been ſaid, and partly becauſe the Extremities of the fractured Bone, reduced to their natural Situation, will eaſily recede from each other, by the Force requiſite to the Reduction of the Luxation. But, if the luxated Bone has remained for ſome time in that Situation, the Part affected will ſoon become tumid, inflamed, and immenſely painful. Hence a Gangrene is to be dreaded, if it is roughly handled. Beſides, the Ligaments, when long diſtracted, loſe their Strength. Hence the reduced Bone will afterwards eaſily ſlip out. But the conſiderable Glands, ſituated in the larger Articulations, when freed from the Preſſure of the Head of the Bone, or when they are inflamed, may become ſo tumid as to diminiſh the Cavity of the Articulation. Hence the Reduction will be difficult, and the Retention of the reduced Bone ſtill more ſo. Beſides, the Mucilage of the Joints before attenuated and diſſipated by the Motion of the Joint will be now accumulated, and inſpiſſated into a Maſs afterwards not to be reſolved by all the Efforts of Art, and which frequently ſo fills the Cavity of the Articulation, that there no longer remains any Place for the Head of the luxated Bone. Now, if we conſider, that a Luxation, unleſs ſoon reduced, is always ſucceeded by an Inflammation, by which a long-protracted and deep-ſeated Suppuration may be produced, as *Hippocrates*, in his *Treatiſe de Articulis*, obſerves, when ſpeaking of a Luxation of the Femur, the Reaſon will be ſufficiently obvious, why, in forming a due Prognoſtic, many Misfortunes muſt be foreſeen, if the Luxation has continued for a conſiderable time without Reduction.

As for the Concretion of the luxated Parts; 'tis well known, that all the Parts of the Body, adjoining and contiguous to each other, are hinder'd from Concretion, by an intermediate Liquor, as ſubtile as Dew, and which is lodged in all the Cavities of the Body, whether large or ſmall. But, as ſoon as this ſubtile Liquor proves defective, the Parts, before ſeparate, ſoon become concreted; but, when an Inflammation ſeizes any Part, the larger Veſſels infarcted and diſtended compreſs the ſmall exhaling Ducts. Hence a Drineſs ariſes in inflamed Parts, and, for this Reaſon, an eaſy Concretion with their contiguous Parts. Thus, after violent Pleuriſies and Peripneumonies, the Lungs are almoſt always found adherent to the Pleura. The Head of the luxated Bone, deprived of its natural Mucilage, adjoining to Parts inflamed by a violent Diſtraction or Compreſſion, is eaſily concreted with them, if it remains long in that Situation. Hence 'tis obvious, that a Reduction is then impoſſible; but we immediately ſee the Cavity of the Articulation filled with luxuriant Glands, or the inſpiſſated Mucilage. Perhaps, alſo, the Cavity, when the Bone remains long out of it, becomes gradually leſs. When the Teeth are pulled out, the Laminæ of the Jaw-bone, which, when ſeparate, conſtituted the Socket, gradually approach nearer to each other, till, at laſt, they are ſo united as to leave no Mark of a Socket.

As for the Pain; a recent Luxation is always accompanied with Pain, as we have already obſerved: But, if this Pain is highly intenſe, the worſt Conſequences are juſtly to be dreaded; becauſe it indicates, that the pained Parts are in ſuch a Condition, as tends to a total Solution of Continuity. Beſides, the worſt Effects of intenſe Pain are to be expected, becauſe, in order to the Reduction, a ſtrong Extenſion of the Parts already ſo pained is requiſite. Hence Convulſions, Deliriums, and Gangrenes, are to be dreaded.

As for an Inflammation; why an Inflammation ſucceeds a Luxation, we have already obſerv'd: But it generally accompanies it, unleſs the luxated Part is quickly reduced; and, where a violent Inflammation ſeizes a luxated Part, there is the greateſt Danger; for, unleſs the luxated Member is forthwith reduced, it cannot be ſo afterwards without the greateſt Difficulty; and, if inflamed Parts are rudely handled, a Gangrene will ſoon enſue. But in ſuch a Caſe, as well as in all others, of two Evils the leaſt is to be choſen; and 'tis better to leave the Parts in their luxated Condition, till the Inflammation is, by proper Medicines, aſſwaged. This was, alſo, the Opinion of *Hippocrates*; for, in his Treatiſe *de Articulis*, when ſpeaking of the moſt dangerous Luxations, he ſays, "That they are to be reduced on the ſame or next "Day, but not at all on the third or fourth. When, therefore, "they are not forthwith reduced, we are to paſs over theſe Days; "for, when they are reduced within ten Days, they are generally "retained." And elſewhere, when treating of a Luxation, he lays this down as a general Rule, "That it is improper to reduce any "luxated Bone, when a Fever is preſent, and eſpecially that of the "Cubit." But a Fever is the Sign and Concomitant of a violent Inflammation accompanying a Luxation. Thus, alſo, *Celſus*, in the eleventh Chapter of his eighth Book, informs us, "That every "luxated Member is to be reduced, before an Inflammation comes "on." But, if an Inflammation is preſent, we are to wait till it is aſſwag'd; and, when the Inflammation is over, the Reduction may be attempted. In ſuch Caſes, therefore, the Reduction is to be defer'd, and the Patient and his Friends to be told, that the worſt Diſorders are to be dreaded, if the Reduction is attempted; that the Cure will afterwards be difficult, and perhaps not entire; leſt the ſubſequent Misfortunes of the Patient ſhould be raſhly imputed to the Surgeon or Phyſician: For tho' Luxations are to be reduced with all poſſible Expedition, if no Circumſtance contraindicate it, yet practical Obſervations ſufficiently evince, that we are not to deſpair, tho' the Bone has, for a conſiderable time, remained luxated; for *La Motte*, in his *Traité complet de Chirurg. Tom.* 4. gives us an Inſtance of a luxated Humerus with a violent Inflammation, which could not be reduced till two Months after; and yet the Diſorder was at laſt totally cured. *Hildanus*, in *Centur.* 2. *Obſ.* 90. has ſufficiently, by various Inſtances, demonſtrated the terrible Misfortunes, which often ſucceed the Extenſion of inflam'd Parts.

As for Convulſions, and the other Symptoms; we have already obſerved, that Convulſions ſometimes ſucceed Luxations, eſpecially on account of the Violence of the Pain, and the ſtrong Diſtortion or Diſtraction of the Muſcles or Tendons; and what terrible Misfortunes ſucceed Convulſions, is ſufficiently obvious from Experience. Now 'tis certain, the Reduction of a luxated Member cannot be attempted when Convulſions are preſent, becauſe the Pain and Diſtraction of all the Parts being increaſed, the Cauſes of the Convulſions would of courſe be augmented. The antient Phyſicians, and eſpecially *Hippocrates*, were greatly afraid of Convulſions in this Caſe; and *Celſus*, in *Lib.* 8. *Cap.* 25. tells us, "That if, after the Reduction, the Nerves are diſtended, "the Member is forthwith to be luxated again." *Hippocrates*, alſo, in his *Coacæ Prænot.* N° 361. ſeems for this Reaſon to have affirm'd, that, in a Tetanus and Opiſthotonus, a Luxation of the Jaw-bone is mortal; for ſuch a Luxation cannot be reduced, by reaſon of the Tetanus; and, unleſs it is ſpeedily reduced, the Life of the Patient is in the moſt imminent Danger, as we have already obſerved.

If, beſides the Symptoms already enumerated, there are a violent Fever, Deliquiums, and a Hiccup, 'tis ſufficiently obvious, that the Reduction of a Luxation cannot be ſafely attempted, and conſequently that the Prognoſtic muſt be highly difficult.

As for the Slenderneſs or Thickneſs of the ſurrounding Parts; we have already obſerved from *Hippocrates*, that the Joints ſurrounded with a large Quantity of Fleſh are luxated with Difficulty, and require proportionable Pains for their Reduction. Hence the moſt dangerous Luxations are thoſe of the larger Joints, ſurrounded by ſtrong Muſcles and Ligaments; for ſuch Articulations cannot, without violent Cauſes, be expel'd from their natural Situations: Hence the moſt dangerous Symptoms frequently enſue. For this Reaſon *Celſus*, in *Lib.* 8. *Cap.* 25. when treating of Luxations accompanied with a Wound, ſays, "That in "this Caſe there is great Danger, which is ſtill increaſed in pro-"portion to the Largeneſs of the Member, and the Strength of "the ſurrounding Ligaments and Muſcles. For this Reaſon, "when the Os Humeri, or the Os Femoris, are luxated, the "Death of the Patient is to be dreaded; for, when theſe Bones "are reduced, there is no Hope; and, if they are not, there is ſtill "ſome Danger." And, when treating of Luxations of the Femur, he ſays, "They are attended with great Danger, ſince they are "either reduced with Difficulty, or ſlip out again; becauſe, "when the Muſcles and Ligaments are very ſtrong, they hardly "admit of Reduction; or, when they are weak, do not re-"tain the reduced Bone." Hence 'tis obvious, that, in making a Prognoſtic, we ought to advert to theſe Circumſtances.

As for the Deſtruction or Elongation of the Ligaments; if, in conſequence of a Luxation, the Ligaments ſurrounding a Joint are ſo diſtracted, tho' without a Rupture, as to ſuffer the Bone to ſlip out of its Seat; when the Bone is reduced, they may be ſo contracted, as again to acquire their former Strength. But, if they are ruptur'd, there is great Danger, leſt their crude Lips ſhould adhere to the Bone, or other adjacent Parts; or, leſt the Cicatrix of the Wound, when cur'd, ſhould render the Ligaments leſs flexible: Hence the eaſy Motion of the Joint will afterwards be hindered. Thus, for Inſtance, a ſudden Luxation of the Os Femoris can hardly be conceiv'd, but, at the ſame time, the round Ligament ariſing in the Cavity of the Coxa, and inſerted in the Head of the Os Femoris, muſt be ruptur'd; for 'tis certain, that a Luxation may be produced by Cauſes lodged in the Cavity of the Joints, and gradually weakening or ſtretching the Ligaments. Hence the Difficulty of the Cure is, in ſuch a Caſe, ſufficiently obvious; for the retracted Extremities of this Ligament are rarely ever join'd again; in conſequence of which the reduced Bone will afterwards more eaſily ſlip out of its Cavity. But, when the Ligaments are totally deſtroy'd, and the luxated Bones ſtick thro' the Wound of the Integuments, the Cure is ſo highly difficult, that *Hippocrates*, in his Treatiſe *de Articulis*, abſolutely deſpairs of the Reduction of ſuch a Luxation: "For, ſays he, in "Caſes where the Bones about the Ancles are totally luxated, "whether to the internal or external Parts, with a Wound, ſuch "Luxations are not to be reduced; for, if they are reduced, ſo "violent Convulſions are brought on, as in a few Days deſtroy "the Patient; and, in this Caſe, few ſurvive the ſeventh Day." He affirms, that the only Hope of the Patient's Safety conſiſts in not

not reducing Bones thus luxated, tho', at the ſame time, an unſeemly Lameneſs continues during the whole Remainder of the Patient's Life. He informs us, that there is the ſame Danger, when the Bones of the Arm are luxated with a Wound; and aſſerts, that Luxations of this kind are, of all others, the moſt dangerous, when they happen to the large Bones. Hence, if the Os Femoris, luxated at the Knee, produces a Wound, the Reduction of it will ſooner prove mortal, than in other Caſes; and, tho' it is not reduced, yet it is far more dangerous, than other Luxations. When the Bones of the Toes and Fingers were luxated, ſo as to produce a Wound, he indeed order'd an Attempt to reduce them, tho' with the utmoſt Caution; for he tells us, that even in theſe Caſes the reduced Bones are generally eaſily luxated again; for which Reaſon he ſeems to think, that even in theſe Caſes the Reduction ought not to be attempted, except with a View to hinder the Surgeon from being branded with want of Skill by the ignorant Multitude. But *La Motte*, in his *Traité complet de Chirurgie*, *Tom.* 4. gives us a memorable Inſtance, which proves that we ought not always to deſpair, when ſuch a Luxation, with a Diſtraction of the Ligaments, happens, eſpecially about the lower Joints. Luxations of this Kind muſt however, in the very Nature of the Thing, be highly dangerous, and difficult to be cured.

As for the Muſcles affixed to the Bone; if there are ſtrong Muſcles about the luxated Articulation, the Luxation muſt have been produced by violent Cauſes; in conſequence of which the Muſcles may be ſo diſtracted, as afterwards not at all, or at leaſt not entirely, to recover their former Strength; for which Reaſon there will always after remain a Defect of Motion in the luxated Part. Thus, for Inſtance, it is certain from Anatomy, that one of the Heads of the Biceps Muſcle of the Arm, ariſing from the ſuperior and exterior Part of the Sinus of the Scapula, in which the Head of the Os Humeri is lodg'd, is ſituated in the Capſula of the Articulation, and proceeds over the Head of the Os Humeri to the Sinus ſituated there; after which it emerges from the Capſula of the Articulation, ſwells into a fleſhy Belly, and is at laſt united to the other Head of the ſame Muſcle. Now, if the Head of the Os Humeri is luxated to the anterior Parts, 'tis ſufficiently obvious, that a conſiderable Violence muſt be done to the Tendon of the Biceps Muſcle. Hence, perhaps, a Defect of Motion will remain in the Member.

Having thus conſider'd the principal Circumſtances from which the Prognoſtic of Luxations is to be deduced, we now come to treat of their Cure.

To the Cure, then, of a Luxation two Things are neceſſary: Firſt, A Reduction of the luxated Parts; and, ſecondly, A Retention of them in their natural Situation, in order to a Cure.

If, after a mature Conſideration of Circumſtances, there are no Symproms found, which render the Reduction either uſeleſs or impoſſible, it is to be attempted: We have already obſerved, that Luxations of long ſtanding cannot be reduced, becauſe the Cavity of the Articulation is generally filled with concreted Humours, or other Parts, which become luxuriant, when freed from the Preſſure of the Bone. We have, alſo, obſerved, that the Reduction cannot be attempted, when there is a violent Inflammation, a conſiderable Tumor, or Convulſions: Nor is the Reduction to be undertaken, when we foreſee, that theſe will ſoon happen; for in theſe Caſes a proper Delay is more prudent. But to a perfect Cure the two following Things are requiſite: Firſt, A Reduction of the luxated Parts: This is of itſelf ſufficiently obvious. And, ſecondly, A Retention of the Parts in their natural Situation; for the Ligaments, which unite the articulated Bones, are the principal Strength of the Articulation. But a Luxation cannot happen, unleſs thoſe Ligaments are either ruptured, or ſo lengthen'd, as to ſuffer the Head of the articulated Bone to ſlip out of its natural Seat. We have, alſo, obſerved, that by a violent Diſtraction the ſolid Parts of the Body may be ſo weaken'd, as to loſe a great deal of their Strength: Hence, though the luxated Members are reduced, yet the Ligaments have not their former Strength; for which Reaſon the Head of the Bone would again eaſily ſlip out, unleſs that Misfortune was prevented by proper Meaſures. How eaſily a Luxation happens after a Reduction, we learn from *La Motte*, in his *Traité complet de Chirurgie*, *Tom.* 4. where he ingenuouſly confeſſes, that, when he had reduced a luxated Humerus, and did not take ſufficient Care to keep the Patient from elevating his Arm, the Bone was forthwith luxated again, though he took care to reduce it afreſh ſo quickly, that neither the Patient, nor the Aſſiſtants, were ſenſible of the Error. It is, therefore, requiſite to the Cure of a Luxation, that the reduced Bones be retained in their Situation, till a due Strength is reſtored to the Ligaments; ſo that the Motions uſual in a ſound State may be performed without any Danger of a ſecond Luxation; for this is the principal Intention to be purſued. But the Time requiſite for reſtoring the due Strength of the Ligaments is not exactly limited by Authors: It is, however, certain, that it varies according to the Largeneſs of the Luxation, and the Joint; as, alſo, according to the Variety of Conſtitutions, and the more or leſs terrible Symptoms, with which the Luxation is accompanied. The Largeneſs of the Luxation, as we have already obſerved, is eſtimated by the Diſtance of the luxated Bone from the Cavity in which it ought naturally to be contained: And it is ſufficiently obvious, that the greater Violence is done to the Ligaments, and other adjacent Parts, the more the luxated Bone is diſtant from its natural Situation; and, conſequently, that the longer Time muſt be requiſite for a perfect Cure. The greater Weight an Articulation ſuſtains in a ſound State, the Cure of a Luxation in it will be protracted proportionably the longer. Thus *Celſus*, in *Lib.* 8. *Cap.* 10. informs us, that Luxations of the Os Femoris and Talus require a long State of Reſt, before the Cure is completed. But *Hippocrates*, in his Treatiſe *de Articulis*, affirms, that a luxated Finger may be cured in fourteen Days time. How great a Difference is produced in Caſes of this Nature, by the Diverſity of Conſtitutions, *Celſus*, in *Lib.* 8. *Cap.* 11. informs us, in the following manner. "If the Body is ſlender and moiſt, and the Nerves weak, the "Bone is more eaſily reduced; but is more eaſily luxated again, "and leſs faithfully retained. In Patients of an oppoſite Con"dition, the Bones are more firmly retained; but, when luxated, "more difficultly reduced." *Hippocrates*, in his Treatiſe *de Articulis*, has the ſame Sentiments. But it is ſufficiently obvious, that the Number and Vehemence of the Symptoms protract the Cure. *Hippocrates*, however, informs us, that a gentle Inflammation, after the Reduction of a Luxation, is rather beneficial than hurtful, ſince, in this Caſe, the Pain prevents the Motion of the Member; and the Ligaments, render'd tenſe by the Inflammation, retain the Head of the Bone more firmly in its Cavity: For, in his Treatiſe *de Articulis*, he ſays, "Thoſe who have "the Humerus reduced without any Inflammation of the ſur"rounding Parts, can forthwith uſe their Arm without any Pain, "and think that no future Caution is neceſſary to be obſerved "by them. But it is the Duty of the Phyſician to put them "on their Guard, ſince, in this Caſe, the Member is again "more eaſily luxated, than where there is an Inflammation." It is always expedient to be careful for a conſiderable time, not to ſubject the Member luxated to violent Motions; but we muſt, at the ſame time, take care, that by too long-protracted a State of Reſt, the Articulation may not become rigid.

We are, alſo, during the Courſe of the Cure, by proper Remedies, and a due Regimen, to mitigate thoſe Symptoms, which, in ſuch Caſes, are generally moſt troubleſome, and to prevent future Symptoms: The principal of theſe are Pain and Inflammation, together with all their Conſequences. But it is ſufficiently obvious, that the more numerous and violent Symptoms are to be expected, the larger the luxated Bone is; becauſe ſuch Articulations are not without violent Cauſes luxated, and, alſo, require a ſtrong Extenſion, in order to their Reduction. Hence, *Hippocrates*, in his Treatiſe *de Articulis*, informs us, that in the Reduction of all large Articulations, and ſuch as are with Difficulty reduced, the greateſt Abſtinence is to be injoined; but a ſmaller Degree, where the Articulation is ſmall, and eaſily reduced.

The Reduction is made, firſt, By ſecuring the Body of the Patient. Secondly, By moving the luxated Member, ſo as to make its Head correſpond to its Cavity. And, thirdly, By introducing its Head into its Cavity, by Intorſion, Thruſting, or Pulſation.

Firſt, Since a greater or leſs Extenſion is requiſite to the Reduction of a Luxation, and ſince an Extenſion cannot be made without Pain, it is ſufficiently obvious, that the Body of the Patient muſt be ſecured, leſt he ſhould diſturb the Operator in performing his Office. Beſides, it is neceſſary, leſt his whole Body ſhould follow, whilſt the Part affected is drawn.

Secondly, *Galen*, in *Comment. in Hippocrat. de Articulis*, when treating of the general Cure of all Luxations, tells us, that a luxated Bone muſt be reduced by the ſame Road through which it paſſed. After conſidering, therefore, in every Luxation, whence the Head of the Bone began to be expelled, which Way it went, and where it ſtopped, we muſt make the End of the Luxation the Beginning of the Reduction, and proceed to the Beginning of the Luxation. Then he illuſtrates this by an Inſtance of the Os Humeri luxated to the anterior Parts. How uſeful this Caution is for the ſucceſsful Reduction of luxated Bones, is ſufficiently obvious; for the luxated Bone made a Way for itſelf, by removing the adjacent Parts: It can, therefore, return moſt eaſily through a Way already made, but not through any other; eſpecially, if the Luxation is accompanied with a Rupture of the Ligaments; for in this Caſe, unleſs the Head of the luxated Bone is directed in the ſame Courſe through which it paſſed, it cannot at all be reduced. Now, that this may be done, a more or leſs ſtrong Extenſion is requiſite, according as the luxated Member is larger or ſmaller. It is, alſo, neceſſary, the Extenſion ſhould be ſo ſtrong, as to prevent the Interception of the adjacent Parts, whilſt the luxated Head of the Bone is returning into its Cavity. In Luxations of the ſmaller Joints, a ſufficient Extenſion may be generally made with the Hands; as, alſo, in

the larger Articulations in young Perſons, and thoſe of lax Conſtitutions. But, if a more conſiderable Force is requiſite, Cords and Machines often become neceſſary. Many beautiful Things concerning the Uſe and Structure of theſe are found in *Hippocrates de Articulis*.

Thirdly, When the luxated Member is by a due Extenſion, and a proper Motion, ſo diſpoſed as to correſpond to its Cavity, the remaining Part of the Operation is eaſily performed: Hence *Hippocrates*, in his Treatiſe *de Articulis*, when ſpeaking of a Luxation of the Os Femoris to the internal Parts, tells us, "That, if the Extenſion "is duly made, the Head of the Femur is ſo raiſed, as to correſpond "to its natural Cavity; and, when it is thus raiſed, any Impulſe "or Direction is ſufficient to convey it into that Cavity: But, "if the Extenſion is defective, the Reduction will be proportionably more difficult." For the Elaſticity of the Ligaments, and the Strength of the Muſcles, are, in ſuch a Caſe, often ſufficient for the Reduction. But a Knowledge of the Structure of the luxated Articulation eaſily teaches the skilful Surgeon what is to be done, when, after a due Extenſion, the luxated Member, placed directly oppoſite to its Cavity, does not return to its natural Seat; for, in this Caſe, the Reduction muſt be made by a gentle Intorſion, Intruſion, or Application of the one to the other. And, in the Reduction of many Luxations, the Extenſion and Reduction, are, by skilful Surgeons, made almoſt at one and the ſame time. Thus *Celſus*, in *Lib.* 8. *Cap.* 12. treating of the Luxation of the Jaw-bone, after he has given Directions with reſpect to diſpoſing and ſecuring the Body of the Patient, tells us, that, "If, when the Jaw-bone is ſecurely laid hold of, "provided one Side only is luxated, the Chin is to be ſhaked, and "brought towards the Throat; whilſt, at the ſame time, the Head "being ſecured, the Chin is to be raiſed, and the Head of the "Jaw-bone forced into its Cavity, in ſuch a manner as that all "theſe may be performed almoſt in one Moment." When Surgeons attempt to reduce a luxated Humerus, by hanging the Patient by the affected Arm, over the Top of a Door, or a Ladder, the Luxation is often forthwith reduced, by ſtrongly pulling the affected Member; but, in difficult Caſes, it is of the laſt Importance for the Surgeon to have skilful Aſſiſtants.

That the luxated Bone is reduced to its natural Seat, may be known by a certain Sound, or Noiſe, made at the very Moment the Reduction happens. But *Celſus*, in *Lib.* 8. *Cap.* 15. informs us, that a Reduction of the Humerus happens ſometimes with, and ſometimes without, a Noiſe: But almoſt all Surgeons obſerve ſuch an obſcure Noiſe. But *Hieronymus Fabricius ab Aquapendente, in Chirurg. Univerſ. Lib.* 5. *Cap.* 1. ſeems to dread a conſiderable Misfortune from ſuch a Noiſe, which he thought was produced when the Head of the Bone ſtruck upon the Lips of the Cavity: Hence he imagined theſe might be broken, and lodged in the Cavity of the Articulation, before the Head of the Bone entered it; in conſequence of which, an entire Reduction could not be obtained: Or he imagined, that this Noiſe was produced by the Head of the Bone ſtriking upon the Cavity; a Circumſtance from which he afterwards dreaded terrible Misfortunes. But daily Experience, and the Obſervations of the moſt skilful Surgeons, ſufficiently evince, that this Fear is entirely groundleſs; ſince, for the moſt part, ſuch a Noiſe is heard, whilſt, at the ſame time, none of the Misfortunes aſcrib'd to theſe Cauſes enſue. We have already obſerved, that the principal diagnoſtic Signs of a Luxation are, the depraved Figure of the Part, a Cavity about the Articulation, and a Tumor in the oppoſite Part: It is therefore obvious, that, when luxated Bones are duly reduced, all theſe Signs ought to diſappear. Pain, alſo, always accompanies a recent Luxation, on account of the violent Diſtraction of the Ligaments, and other ſurrounding Parts: But, immediately upon the Reduction, this Pain either totally ceaſes, or, at leaſt, is conſiderably diminiſhed. There ſometimes, alſo, remains ſome Degree of Pain, though the Reduction is duly made, on account of the Violence the ſurrounding Parts have ſuffered by the luxated Bone, and the Extenſion, which muſt ſometimes be pretty ſtrong, before the Reduction can be made.

The reduced Members are retained in their Situation by Reſt, proper Bandages, and by keeping the Parts in their natural Situation.

After luxated Bones are reduced into their Cavities, the other Part of the Cure conſiſts in retaining them there; and this is obtained

By Reſt. In every Luxation, the Ligaments ſecuring the Joints are either ruptur'd, or at leaſt violently ſtretch'd. Unleſs, therefore, Reſt is injoin'd, the reduced Bone is eaſily luxated again. Beſides, 'tis ſhewn under the Article FIBRA, that the ſolid Parts of the Body are weakened by too ſtrong a Diſtraction. And under the ſame Article 'tis ſhewn, that the Strength of the Coheſion of the ſolid Parts is increaſed, if they remain long in the ſame Contact; and that, in conſequence of this, they often acquire too great a Degree of Strength. Reſt, therefore, is neceſſary, that a due Strength may be reſtored to the diſtracted Ligaments, or that they may be united, if they are ruptured. But we are to take care, leſt, by too-long-continued Reſt, the Ligaments ſhould become rigid, or an Anchyloſis be produced by an Accumulation and Inſpiſſation of the Mucilage of the Joints. Hence, a few Days after the Reduction, when there is no Fear of an Inflammation, and the Pain is totally ceas'd, it is expedient, gently to move the Joint, and rub it ſoftly, as *Hippocrates*, in his Treatiſe *de Articulis*, when ſpeaking of a Luxation of the Humerus, warmly recommends. And *Celſus*, in *Lib.* 8. *Cap.* 16. orders this Caution to be principally obſerv'd in Luxations of the Cubit: "For, ſays he, it is to be quickly and frequently mov'd, "fomented with warm Water, and long rub'd with Oil, Nitre, "and Salt; for, in the Cubit, whether it has remain'd luxated, "or is reduced, a Callus is ſooner form'd, than in any other "Articulation: If, therefore, by means of Reſt, this Callus is "produced, it will afterwards prevent the Bending of that Arti-"culation."

Beſides, the Pain, or Inflammation, which, in conſequence of the Violence done to the adjacent Parts, often remain after the Reduction of a Luxation, require Reſt.

As for Bandage; unleſs the Ligaments are entirely ruptur'd, or violently diſtracted, the reduced Bone is eaſily retained, provided the Part affected is kept in a State of Reſt. Hence Bandages are not always neceſſary. Thus *La Motte*, in his *Traité complet de Chirurgie, Tom.* 4. tells us, that, when he reduced a luxated Jaw-bone, he apply'd no Bandages; notwithſtanding which, the Cure ſucceeded happily. But if there is any Dread, leſt the reduced Bone ſhould again ſlip out, it is expedient to ſecure it by proper Bandage, eſpecially if by means of Compreſſes the Preſſure of the Bandage is principally determined to that Part towards which the Bone was luxated. This is beautifully adverted to by *Hippocrates*, in his Treatiſe *de Articulis*, when treating of the Cure of Luxations of the Os Humeri. "Theſe, ſays he, muſt "be cured by a Cerecloth, Compreſſes, and the Application of "various Bandages. Soft Wool, wrapt up, muſt, alſo, be put "under the Axilla, in order to fill up its Cavity, and ſupport "the Joint." For, by this means, the Head of the Os Humeri will be hindered from ſlipping from its own Cavity, into that of the Axilla; for *Hippocrates* ſays, he knew of no other Species of Luxations of the Os Humeri; for which Reaſon he did not treat of them.

But 'tis ſufficiently obvious, that in any Luxation, when the Way thro' which the Bone has ſlipt out, is known, it may, by a proper Bandage, be hindered from ſlipping out again. But, when the Part is thus ſecured, the Bandage ought rarely to be loos'd, unleſs an Inflammation comes on; in which Caſe, *Hippocrates* ordered the Apparatus to be frequently renewed in all Luxations.

As for the natural Situation of the Part; the Part affected muſt remain long in a State of Reſt: But that this may be obtained, ſuch a Poſition of the Part is requiſite, as we obſerve in a ſleeping Perſon, when no Muſcles act by the Direction of the Will, but the Flexor Muſcles of the Joints, by their proper Contractility, overcome the Extenſor Muſcles. Hence all the Joints, almoſt, appear gently bended; ſee the Article FRACTURA. For this Reaſon *Hippocrates* laid it down as a general Rule in all Luxations, that the affected Part ſhould always be kept at Reſt, and in a proper Poſture. Then he deſcribes the Poſtures moſt expedient in different Luxations. Thus, for Inſtance, when treating of the Cure of Luxations of the Cubitus, he ſays, the Part ought to be ſo diſpos'd, as that the Hand may be ſomewhat higher than the Elbow, and the Arm placed by the Side; for, when it is thus ſuſpended, it is borne with the greateſt Eaſe.

If theſe Meaſures are duly taken, a ſucceſsful Cure may be expected, if the Luxation is produced by an external Force; but, when the Luxation proceeds from too great a Laxity of the Ligaments, the Cure is far more difficult. *Celſus*, in *Lib.* 8. *Cap.* 11. informs us, that Luxations proceeding from a Weakneſs of the Ligaments, tho' reduced, yet happen again. The Reduction of ſuch Luxations is, indeed, eaſy; but the Retention of them in their proper Situation, highly difficult, and ſometimes abſolutely impoſſible. The only Hope of reſtoring due Strength to the relaxed Ligaments, conſiſts in keeping the Part affected long in a State of Reſt, and applying corroborating Fomentations. In Caſes of this Kind, Mr. *Petit* tells us, that he knew excellent Effects produced by thick Compreſſes wet in aromatic Spirit of Wine, mix'd with Alum-powder, and the Whites of Eggs, apply'd to a reduced Femur, and ſecured by proper Bandage: And, without removing the Dreſſings, he frequently each Day moiſten'd the Compreſſes and Bandage with the ſame Liquor. *Galen*, in *Comment.* 4. in *Hippocrat. de Artic.* tells us, that he twice cured a Luxation of the Femur produced by this Cauſe; but ſays, that the Joint muſt be long covered with drying Medicines, in order to remove the exceſſive Humidity of the Ligaments. *Hippocrates* thought the Cure of ſuch Luxations ſo difficult, that he had recourſe to the actual Cautery for that Purpoſe: As he ſaw many diſabled by Luxations of the Humerus, and knew none who had a proper Method of curing them, he at large deſcribes one, which, tho' by him confined to Luxations of the Humerus, into the Cavity of the Arm-pit, yet may be attempted in other Luxations of that Articulation.

The whole Method of Cure ſeems to conſiſt in cauterizing the Skin, and Membrana adipoſa, in that Part to which the Head of the Bone ſlipt, that, by means of the Cicatrices of the healed Ulcers, the Integuments may be ſo corrugated and hardened, as not to be eaſily extended afterwards; by which the Head of the Bone will be kept from ſlipping that way. Elevating the Arm a little, (for, unleſs it was rais'd, Acceſs could not be had to the Arm-pit; and, if it was too much elevated, the tenſe Skin could not be laid hold on) he orders the lax Skin, and Membrana adipoſa, to be ſo raiſed with the Fingers, that the Integuments may be ſeparated as much as poſſible from the Glands, Nerves, and large Blood-veſſels.

Then he orders an Iron, not too thick or large, but oblong, to be paſſed thro' the Skin, thus rais'd, as quickly as poſſible; for which Purpoſe he adviſes the Iron to be ignited ſo, as to become pellucid [χρῆ δὲ διαφάνει καίειν]. Then, whilſt the Skin is yet elevated, he orders a ſmall Spatula [ὑπάλειπτρον] to be paſſed thro' the Perforation, and the Skin to be let go. Then, in the Middle, between the two Perforations, a ſmall red-hot Iron is to be paſs'd through the Integuments, till it reaches the ſubjacent Spatula: By this means three different Parts may be cauteriz'd, without any Danger of injuring the Parts lying under the Integuments: But, in the Cure, the Eſchars will be ſeparated, and the Integuments again united. But, in conſequence of the Loſs of Subſtance produced by the Cautery, 'tis obvious, that the Cicatrices will be corrugated and hard. For this Reaſon he ordered, that through the whole Courſe of the Cure the Arm ſhould be litted no higher, than the Cure of the Ulcers rendered neceſſary; for, ſince by this means the Integuments are not diſtended, the Margins of the Ulcers will grow more firmly to each other. And, after the Ulcers were cured, he ordered the Arm, for a long time, to be ty'd to the Side, with a View to render the Cicatrices more firm, and to contract that Space into which the Head of the Humerus uſed to fall down. He alſo ſpecify'd two other Parts, in which the Uſe of the actual Cautery might be beneficial in this Caſe; that is, upon both Sides of the Head of the Os Humeri, between this and the Tendons of the pectoral Muſcle, and the Latiſſimus Dorſi, which are the Cords, on each Side, that form the Cavity of the Axilla.

Doctor *Vanſweiten* informs us, that he knew this Method of cauterizing try'd by a Quack, for the Cure of Hernias, after the Reduction of the Viſcera, becauſe he imagin'd, that the Integuments contracted by a profound Cicatrix would not be afterwards eaſily extended. *Van Swieten in Boerh. Aph.*

When a Bone is removed, in ſuch a manner, out of its natural Articulation, as to have its Function and Uſe deſtroy'd, that Bone is ſaid to be luxated or diſlocated. Thus, when the Head of the Humerus ſlips, or is by any external Violence forced, out of the Glenoide Cavity of the Scapula, or the Os Femoris out of the Acetabulum, it is term'd a Luxation, or Diſlocation. This Accident, therefore, can properly happen only to Bones which have moveable Joints or Articulations; though, in a leſs accurate Manner of ſpeaking, it is called a Luxation, when the Bones of the Noſe, or the Epiphyſes in Children, ſeparate, and thence loſe their natural Uſes.

Thoſe who would be well verſed in the Knowledge and Cure of Diſlocations, ſhould have a very diſtinct Idea of the Figure of all the Articulations, with their Ligaments and Muſcles: And this may be acquired by an Intimacy with Books of Anatomy, but much better by a frequent and diligent Inſpection into Skeletons, and recent Bodies; for the latter will furniſh us with the Ligaments and Cartilages in their natural Situations, which are not to be found in Skeletons.

Luxations are divided into Perfect and Imperfect. In the Imperfect, the Bones are removed in Part only, yet diſqualified for performing their proper Office: Some call this a Subluxation, or Diſtortion. But, in the perfect Luxation, the moveable Bones are entirely diſplaced from their Juncture with each other, as when the Humerus, or Femur, are removed quite out of their reſpective Sinuſes. In either of theſe the Bone may ſlip out, either internally or externally, behind or before, upwards or downwards. Another Diviſion of Luxations is, into ſimple and compound: The latter is attended with a Wound, Fracture, Weakneſs, and Reſolution of the Ligaments, Contuſion, or violent Inflammation; the former is free from any of theſe Symptoms. Laſtly, they are Recent, or of long Standing. It is to be obſerved, that the more free and moveable the Articulation, the more eaſy it is to be diſlocated.

So much for the Diſorder in general. We ſhall now deſcribe each particular Kind, beginning with the Head, which is ſuppoſed to be luxated, 1. When the Bones of the Noſe are ſeparated. 2. When the lower Jaw is protruded forwards; for the Prominence of the Os Petroſum prevents it from being forced backward. 3. When the Head, with the ſuperior Vertebræ of the Neck, is diſtorted. Laſtly, and which has frequently occurred to Phyſicians, when the Bones of the Cranium are divided from each other by Pain, a Fever, or an Hydrocephalus.

The Vertebræ which compoſe the Spine, are ſeldom perfectly luxated. But the Vertebræ of the Neck, being ſmall, and very moveable, are more ſubject to Luxation, than thoſe of the Breaſt or Back, which are larger, and more ſtrongly connected together; whilſt thoſe of the Loins are, again, more ſubject to be luxated than thoſe of the Back, becauſe they are more moveable and ſmooth, are deſtitute of thoſe Sinuſes with which the Vertebræ of the Back are furniſh'd, and have a thicker Cartilage interpoſed betwixt each. Laſtly, the Os Coccygis is ſometimes protruded outwards by a difficult Birth, and ſometimes repreſſed inwards by a Fall: By which means it compreſſes the Rectum, and excites many troubleſome Complaints.

As the Bones of the Breaſt are various, they may be variouſly luxated. Thus the Ribs may, by a violent Fall or Blow, be diſplaced, and forced into the Thorax, to the great Prejudice of the Motion of the Breaſt and Lungs. Sometimes the Xyphoide Cartilage may be depreſſed by Violence, and injure the Stomach. The Clavicles, alſo, may be removed out of the Sinus of the Scapula; or, what is more common, out of the Sternum: By which Accident the Arm is looſened, and its Motion obſtructed.

The Os Humeri is the moſt ſubject to Diſlocation, of any Bone, partly from the Shallowneſs of the Glenoide Cavity, and partly from the Freedom of its Motion. It may ſlip out either before, behind, or downwards, but never upwards, unleſs the Acromion is fractured; for that keeps down its Head very firmly.

Though the Cubit is ſubject to different Luxations, it ſeldom undergoes any without extraordinary Violence; and then it is generally imperfect, becauſe it is defended, both externally and internally, by a large Articulation, and ſhort Ligaments, while the Proceſs of the Olecranium prevents it from being diſlocated forwards. However, it eaſily and frequently ſlips out backwards.

The Wriſt is very ſeldom removed from the Bones of the Cubit, and, when it is, the Diſlocation is generally imperfect, from the Shortneſs and Strength of its Ligaments. But, if this Accident happens, it is rather anteriorly or poſteriorly, than internally or externally; for there is a bony Protuberance on each Side of the Carpus, where it is articulated to the Radius and Ulna, which defends it from a lateral Diſlocation. The Bones of the Wriſt are ſometimes ſubluxated, or diſtorted from each other, which uſually produces a Diſtortion and Stiffneſs of the Hand: So may the Bones of the Fingers be diſplaced, but they are more readily reduced and cured.

In the lower Extremities, we will firſt conſider the Luxation of the Thigh. This may be upwards, downwards, forwards, or backwards; and each of theſe Ways may be diſtinguiſhed from the reſt, by the different Figure about the Articulation, and the Length of the Limb. We muſt obſerve once more, that the Head of this Bone is not ſo often forced out of the Acetabulum by external Violence, as the Generality of Surgeons have imagined. For the Moderns, contrary to the Opinion of their Predeceſſors, generally find the Neck of the Thigh-bone fractured; which is not to be wondered at, ſince the Head is received into ſo deep a Cavity, and ſecured by ſuch ſtrong Ligaments, that it cannot be diſplaced in a dead Subject, by the moſt robuſt Man; and the Neck of this Bone is, at the ſame time, very ſlender and brittle, ſo that a much leſs Force is required to break it, than to diſplace the Head. Probably the Thickneſs of the Muſcles about this Articulation, as it prevented a Fracture of the Neck from being diſtinguiſhed from a Luxation of the Head of the Thigh-bone, gave Riſe to the Miſtake of former Surgeons, relative to this Subject.

From hence we may plainly find the Reaſon of the ill Succeſs attending the Antients, in their Reduction of this imaginary Luxation; nor can we be at a Loſs to know, why they invented ſo many Machines for the Extenſion of this Limb, by the Uſe of which, as it was no Diſlocation, but a Fracture, they excited violent Pains, Convulſions, Inflammations, Abſceſſes, and other dangerous Symptoms; whilſt nothing is more certain, than that this Bone is very rarely luxated by any external Force; for it is ſcarce poſſible the Head ſhould ſlip out of the Acetabulum, unleſs the Ligaments are previouſly relaxed by a Collection of noxious Humours near the Joint, which Children are more ſubject to than Adults.

Ignorant Surgeons very frequently miſtake a Diſlocation of the Patella for that of the Joint at the Knee, and, conſequently, torment the Patient with ſuperfluous Extenſions; whereas, to one skilled in Anatomy, both the Sight and Touch will be ſufficient Guides: For the Patella is always luxated, either internally or externally; but the Knee itſelf, tho' it may be forced either Way, ſeldom ſuffers a perfect Luxation, becauſe the Articulation is deep, and the Ligaments ſtrong.

The Foot may be thruſt out of the Sinus of the Tibia, either before or behind; but it is defended laterally by the Ancles, and cannot be diſplaced there, unleſs they are fractured at the ſame time. We read in ſome Authors, that the Fibula may be ſeparated from the Tibia by ſome extraordinary Violence, and the Foot at the ſame time turned outwards. The Bones of the Tarſus are connected by very firm Ligaments, and cannot be eaſily diſlocated; but, when they are, it is followed with exquiſite Pains, Convulſions, Inflammations, and Sphacelus, unleſs timely relieved. Laſtly, The Toes are ſeldom luxated; but when they are, they muſt be treated like the Fingers.

The Cauſes of Luxations are either external, as Falls, Blows, Leaps, Strugglings, and Diſtentions; or internal, as preternatural

Collections

Collections of morbid Humours in the Joints, which relax the Ligaments to that Degree, that the Heads of the Bones ſlip out ſpontaneouſly; or from a very inconſiderable Violence, as riſing up, walking, or leaping. The weakeſt Men are moſt ſubject to this; for which Reaſon the Bones of Infants are very eaſily diſtorted, and divided from their Epiphyſes by a Fall, or rough Handling. It is remarkable, that *Zwinger* knew a lame Woman, who bore three lame Sons. *Theat. Pract.* P. 2. *pag.* 109.

The Signs of Luxations are many and various: 1. A Deprivation of Motion in the Joint. 2. A Change of the Figure, and natural Poſition. 3. Unuſual Cavities and Tumors; for there will always be a Tumor on that Side where the Bone is forced; and an Hollowneſs on that from whence it was forced. 4. A different Length of the Limb, which is ſhorter, when the Bone is protruded upwards; and longer, when it is puſhed downwards. Laſtly, The Pains ariſing from a violent Diſtenſion of the Ligaments; for, unleſs the Luxation is immediately reduced, there muſt neceſſarily follow Convulſions, Inflammations, Sphacelus, and Death itſelf; though, when it proceeds from internal Cauſes, ſcarce any Uneaſineſs attends it. In the mean time, to make a more ready Diſcovery of Diſlocations, it will be proper to obſerve this Rule, that, when the Head of any Bone is removed out of its Place, the other End will be diſtorted in an oppoſite Direction; for, when the ſuperior Extremity of a Bone is forced outwards, the inferior will incline inwards; and, when the ſuperior Part is forced inwards, the inferior will be diſtorted outwards.

Tho' theſe general Signs of Luxations may be ſufficient for an able Surgeon, yet we ought not to be ignorant of thoſe peculiar to ſome only: Thus, in a Diſlocation of the lower Jaw, the Mouth cannot be ſhut. When a Vertebra is diſplaced, the Parts below it are deprived of Motion and Senſe; for, by every ſuch Luxation, the Spinal Marrow, which is tranſmitted through their Middle, is compreſſed or wounded, and the Courſe of the Spirits through that, and its Nerves, to the lower Parts, diſturbed, or abſolutely intercepted. In a Luxation of a Rib, the Breath is drawn with Difficulty, and other bad Symptoms appear. But each particular Diſorder may be deduced from the Action of each particular Part.

In an imperfect Luxation from external Violence, the Patient feels moſt acute Pains, and the Limb becomes immoveable, without any great Change in its Figure or Poſition; though, upon a more accurate Examination, there may be generally found ſome little Inequality of the Articulation or Limb.

Luxations from internal Cauſes may be known by theſe Signs: 1. The Limb is ſo relaxed, that it may be eaſily turned about in any Direction. 2. There is a Cavity about the Joint, and an Hollowneſs between the Bones, which may be felt with the Fingers. 3. The diſlocated Bone may be eaſily replaced, but ſoon ſlips out again ſpontaneouſly, becauſe of the Weakneſs of the Ligaments and Muſcles. 4. It is longer than the ſound Limb. 5. No Pain, Inflammation, or Convulſion, attends a Luxation of this Kind. Laſtly, This generally happens to the upper Part of the Femur or Humerus, and ſometimes in the Articulation of the Foot with the Tibia.

The Surgeon, who would be well verſed in the Prognoſtics relative to Luxations, ſhould make himſelf perfectly acquainted with the Structure of the Part affected, and the Cauſes and other Circumſtances of the Diſorder: For Luxations which are imperfect and ſimple, are cured with much more Eaſe than thoſe which are perfect, or complicated with Wounds, Inflammations, Fractures, and Convulſions; and the more the Bones are removed from each other, and the worſe the Accidents attending, ſo much the more difficult is the Cure; ſo that they cannot ſometimes be reduced, by reaſon of a violent Inflammation and Fracture; nor, after Reduction, be retained in their proper Place, by reaſon of a Weakneſs in the Ligaments: The laſt is moſt uſual in Luxations from internal Cauſes; and, when it happens in young Subjects, the lower Part of the Limb generally waſtes, and becomes flaccid and weak. Recent Luxations are more eaſily cured than thoſe of long Standing; for, in the latter, Tumors, Inflammations, and a copious Collection of Humours, weaken the Ligaments, and fill up the Cavity of the Articulation, ſo that the Head cannot be replaced in its Socket, but ſometimes lodges in a new external Part of its Sinus; as when the Head of the Thigh-bone adheres and grows to the external Part of the Os Coxæ, or of the Acetabulum, the Cavity itſelf being filled up with ſome preternatural tenacious Juice.

If a Bone is diſlocated in Infants, or an Epiphyſis is ſeparated from it, the Caſe is very dangerous: For, 1. The tender, cartilaginous Head of the Bone is ſo diſtorted, that its natural Figure can ſeldom, if ever, be reſtored. 2. The Accident is too often concealed by Servants and Nurſes; and, conſequently, the Cure is not attempted, till it is too late. 3. The Surgeon, not appriſed of the true Cauſe, may treat it as a Defluxion of Humours on the Joint, whilſt the tender and cartilaginous Parts grow diſtorted, and in a very unnatural Poſition. Laſtly, The Ignorance of the Surgeon himſelf may miſlead him in the Reduction; for a violent Diſtention of thoſe ſoft Bones, and their Epiphyſes, will add Misfortune to Misfortune.

The Cure of Luxations.

The Method of treating Luxations is very near the ſame with that of Fractures; for in both the whole Deſign is, 1. To replace the Bone by Extenſion and Reduction. 2. To retain it in its natural Poſition. 3. To prevent the conſequent Symptoms. The Reduction ſhould be performed, when the Patient is placed on a Stool, Table, Bed, or the Ground, as the Surgeon ſhall judge moſt convenient; tho' Luxations of the Jaw, Clavicle, Cubit, or Hand, ſhould be reduced on a Chair; thoſe of the Vertebræ or Thigh, on a Table; thoſe of the Legs or Feet, on a Bed; and, laſtly, thoſe of the Humeri, or Vertebræ of the Neck, on a Floor.

The Extenſion is perform'd much after the ſame manner, as in Fractures: An Aſſiſtant muſt diſtend the inferior Part of the Bone, till its Head correſponds with its Sinus. If this cannot be accompliſhed by the Hands, a Napkin will generally be ſufficient to make a due Extenſion: The Machines, therefore, repreſented by *Oribaſius*, *Paré*, *Scultetus*, and others, are very ſeldom neceſſary, but only terrify and diſcourage the Patient.

When the Limb is ſufficiently diſtended, the Surgeon muſt compreſs the Articulation gently with his Fingers or Hands, till he finds the luxated Bone replaced.

It is an Indication of an accurate Reduction, if any Noiſe or Cracking is heard; if the affected Limb is of an equal Length with the ſound; if the Pains abate; or, laſtly, if it is reſtored to its former Motion.

Luxations cannot always be immediately reduced; for, when they are attended with Inflammations, Hæmorrhages, or Tumors, theſe Impediments muſt be removed by proper Remedies; and if the Limb be at the ſame time fractured, before the Extenſion is attempted, the Fracture ought to be united with a ſtrong Callus; that is, if the Fracture happens to be ſo near the Joint, that the Reduction cannot be made without diſturbing of it; but, if you have room to fix a Laque between the Fracture and the Joint, when the Inflammation or Tumor ſubſides, it would be proper to attempt the Reduction.

When the diſlocated Bones are properly reduced, the Surgeon's next Care is to retain them in their proper Situation; and this may be compaſſed with leſs Difficulty than in fractured Bones; for Luxations ſeldom require any ſtrict Bandage, or long Reſt: Thus Luxations of the upper Extremities are generally held firm enough, after Reduction, by their own proper Ligaments and Muſcles; and Inactivity is ſo far from being requiſite, that the Limb ought ſometimes to be gently moved and inflected, to prevent a Stiffneſs: But, when this happens in the lower Extremities, the Patient ſhould reſt ſome Days in his Bed, and not move the Limb, or attempt to riſe and walk, till the Joint has recovered its uſual Strength; and then it may be gently moved at firſt, and afterwards the Patient may riſe and walk.

In a Luxation of long Standing, likewiſe, a Bandage and Reſt are altogether neceſſary, till the former Vigour of the Ligaments is reſtored; though here, without a gentle Motion and Flexion, there will be Danger of a Stiffneſs and Concretion of the Joint. In the mean time, it will be proper to bathe the Bandages plentifully with Spirits of Wine, Hungary-water, or Spiritus Matricalis, or ſome other warm ſtrengthening Spirit, which will render the Ligaments very firm and ſtrong. The Bandages ſhould be neither too tight, nor too lax. The Application of Plaiſters, mean time, is rather pernicious than ſerviceable.

The Treatment of the Symptoms attending Diſlocations, as Inflammations, Tumors, Pains, Convulſions, and Hæmorrhages, is the ſame as that directed under the ſame Circumſtances, in Fractures and Wounds; but, after Reduction, they generally diſappear inſenſibly. When the Ligaments are very much debilitated, it is extremely ſerviceable, after having rubbed the Part well with warm Linen, to foment it with burnt rectified Spirit of Wine, and, after that, a Quantity of ſome ſtrengthening Spirit, as directed in Fractures, applying a proper Bandage. A Continuance of Pain, after replacing the Luxation, gives ſome Reaſon to dread a concomitant Fracture; and if, upon Examination, this proves to be the Caſe, the Surgeon muſt reduce it. A ſlight Fever may be cured by Bleeding, cooling Medicines, and a thin Diet. A Gangrene muſt be treated not only with the Medicines already recommended, but, alſo, with Fomentations, and reſolvent Cataplaſms, ſecuring them with the Eighteen-headed Bandage. For the Cure of other Symptoms, proceed as directed for theſe under the Article FRACTURA. If a Luxation is attended with a Wound, the Eighteen-headed Bandage is proper. An Abſceſs ſhould be opened, as ſoon as it is ripe; for otherwiſe the Matter will corrode the Articulation or Bone, and produce a dangerous Fiſtula, which can be remedied only by Amputation. When the Bones are ſeparated with ſuch Violence, that the adjacent Ligaments, Tendons, and Skin, are broken and deſtroyed, the Caſe is then, according to *Hippocrates*, abſolutely incurable; and they will be ſo far from uniting firmly, that an Attempt to reduce them will excite Convulſions, and a Gangrene: For the Preſervation of Life, therefore, the Limb ſhould be immediately amputated. When a Luxation is attended with

a Fracture

a Fracture, the Luxation ſhould be reduced firſt, if this is poſſible, and afterwards the Fracture; but, if this cannot be done, proceed as directed under the Article FRACTURA. Laſtly, When any Limb becomes rigid, it muſt be treated in the manner mentioned under the laſt quoted Article.

Of Luxations in particular.

Luxations in the Head.

A Separation of the Bones of the Cranium, either from an Hydrocephalus in Infants, or the Head-ach and Fevers in Adults, is by ſome termed a Luxation of the Head. For the Treatment of the firſt, ſee the Article HYDROCEPHALUS; and, as the other very ſeldom happens, it ſeems only curable by Compreſſion and Bandage.

Luxations of the Noſe.

A Luxation of the Noſe is diſcoverable, 1. By the Eye, when we ſee the Figure of the Noſe deformed: 2. By the Touch: Or, 3. By the Ear, when we hear the Patient draw his Breath with Difficulty. But this is an uncommon Accident; for the Bones of the Noſe are ſo firmly connected to the Os Frontis, and other Bones, that they will ſooner break, than ſeparate.

With reſpect to the Cure, the Patient muſt be ſeated immediately on an high Stool, and an Aſſiſtant behind him muſt hold his Head firm, whilſt the Surgeon with one Hand introduces a Probe, Gooſe-quill, or proper Piece of Stick, to raiſe up the ſeparated Parts; and with the other directs them to their proper Places. After this, a ſticking Plaiſter will complete the Cure. If it is attended with a Wound, it muſt be managed according to our Directions for a Fracture of the Noſe, under the Article FRACTURA.

Of a Luxation of the lower Jaw.

The lower Jaw is very ſeldom luxated, becauſe of the Strength of its Ligaments and Muſcles, which retain it in the Sinus of the inferior Part of the Cranium; but, when it does happen, it may be on one Side, or both. The moſt uſual Cauſe is too great Oſcitation, tho' it ſometimes proceeds from a violent Fall or Blow. If the Diſlocation is on both Sides, the Chin inclines downward, and the Jaw is forced forward; if on one, the Chin inclines to the oppoſite Side; but the Proceſſes of the Bones of the Cranium will not ſuffer it to be luxated backwards.

A Diſtortion of the Chin towards one Side ſhews, that the lower Jaw is luxated on the oppoſite Side; for the Part to which the Chin inclines, is found; but that from whence it recedes, is diſlocated: The latter, too, gapes wider, and diſables the Patient from ſhutting his Mouth, and chewing with his Teeth, as the lower Range of them projects beyond the upper. When the Luxation is on both Sides, the Mouth not only gapes wide, but the Chin is preſſed forwards; and, of conſequence, the Patient can neither ſhut his Mouth, ſpeak diſtinctly, nor ſwallow eaſily.

A Luxation on one Side may be remedied without any great Difficulty; but, when both are diſlocated, and not immediately replaced, dangerous Symptoms, as Pains, Inflammations, Convulſions, Fevers, Vomitings, and, at laſt, according to *Hippocrates*, Death itſelf, enſue; and this Danger is in proportion to the Violence of the Extenſion of the Nerves, Tendons, and Ligaments; tho' the timely Aſſiſtance of an expert Surgeon will overcome all theſe Difficulties.

The Patient muſt be ſeated on a low Chair, and an Aſſiſtant hold back his Head firm againſt his own Breaſt; then the Surgeon muſt put both his Thumbs, wrapped in Linen, that they may not ſlip, or be hurt, as far as he can, into his Mouth, and apply the reſt of his Fingers externally. When he has faſt Hold of the Jaw, he ſhould preſs it, firſt, downwards; then, backwards; and laſtly, upwards: All this, performed in an Inſtant, will complete the Reduction. Let him always withdraw his Fingers out with the utmoſt Expedition, leſt they ſhould be compreſſed, bit, or bruiſed.

If the Jaw is diſlocated on one Side, he muſt proceed in the ſame manner; only the affected Part muſt be preſſed more ſtrongly downwards, and backwards, than the other. Some are for performing this Cure by a ſevere Blow on the oppoſite Cheek. Bandages ſeem abſolutely unneceſſary, except the Luxation is of long Standing; and then the Four-headed Bandage, with ſome ſtrengthening Spirit, may be applied for ſeveral Days, and laid aſide, whilſt the Patient eats.

Luxations of the Vertebræ.

Luxations of the Spina Dorſi, or Vertebræ, from their Structure and Articulation, muſt be imperfect, unleſs attended with a Fracture, and an Hurt or Laceration of the Spinal Marrow, which threatens inſtant Death. And indeed the imperfect Luxations themſelves are extremely dangerous, and happen either between the two ſuperior Vertebræ of the Neck and the Head, or between the other Vertebræ.

A Luxation between the Head and ſuperior Vertebra is immediate Death: For the tender Medulla, which is in the Spine, and connected to the Brain, the Brain itſelf, and Nerves under the Occiput, are too much diſtended, compreſſed, or lacerated. The Proceſſes of the Head generally ſlip out of their two Sinuſes, when a Perſon falls headlong from an high Place, a Ladder, or an Horſe, or when he receives a violent Blow upon his Neck; and he is vulgarly ſaid to have broke his Neck, though it is ſeldom any more than a Luxation: Yet there may be a real Fracture of the Vertebræ of the Neck. If a Man has any Life remaining after ſuch a Luxation, which ſeldom happens, his Head is diſtorted, and his Chin fixed to his Breaſt, which prevents his ſwallowing, ſpeaking, or moving the Parts below his Neck. The Compreſſure or Hurt of the Medulla, therefore, without ſpeedy Help, cauſes preſent Death.

The Patient muſt be immediately laid on the Ground or Floor, in ſuch a manner as the Surgeon may put his Knees on the Patient's Shoulders, and then make a proper Extenſion, gently turning the Head from Side to Side, till a Noiſe, or the natural Poſition of the Neck, or a Remiſſion of the Symptoms, convince him that the Luxation is reduced. Here the Knees hold the Patient firm, while the Hands perform the Extenſion and Reduction. Theſe are *Heiſter*'s Directions; but I ſhould think the beſt Way is to lay the Patient flat, and the Surgeon to ſit down, and place his Feet on the Patient's Shoulders, and ſo extend.

The Patient may be ſeated on the Ground, and an Aſſiſtant keep down his Shoulders firmly, while the Surgeon takes Hold under his Ears, pulls up his Head ſtrongly, but cautiouſly, inclining it to each Side, till the above-mentioned Symptoms ſhew it to be replaced. The other Vertebræ of the Neck may be treated in the ſame manner.

Petit has contrived another Method, though he does not ſay he ever practiſed it: He forms two Strings, with a large Aperture about their Middle, (ſee *Tab.* XXXI. *Fig.* 1, 2.), one of which (*Fig.* 1.) he throws over the Patient, as he lies on his Back, in ſuch a manner that his Head is tranſmitted through the Opening A B, the Part A comes under his Chin, B under his Occiput, the two Extremities C C are extended over his Ears, and the Extenſion is perform'd by D E. The other (*Fig.* 2.) he recommends to keep the Patient firm; through the Aperture F he tranſmits the Head, G comes down the Back, H over the Breaſt, and the two Ends I I are joined between the Thighs, which prevents the Body from yielding to the Extenſion of the former. When the Head and Neck are ſufficiently extended by the oppoſite Direction of theſe Slings, the Surgeon endeavours to reſtore the Luxation. But, to confeſs the Truth, I muſt prefer the foregoing Methods; partly, becauſe they are more ſimple; and partly, becauſe they are more expeditious; for while this Machinery is fetching, and adapting, the Patient may be dead. *Petit* propoſes no other Method through his whole Book, nor does he ſubſtitute any thing in the room of theſe, when they may be wanting, though, I think, Napkins or Pieces of Linen, two or three Hands broad, perforated in the ſame manner, will anſwer the ſame Purpoſe.

After Reduction, the diſtended Ligaments may be reſtored to their former Strength, and a Tumor prevented, by bathing with Hungary-water and Camphire, Opodeldoc, Aqua Anhaltina, or ſome other ſtrengthening Spirit, applied warm, by means of Compreſſes impregnated therewith. Reſt is proper, till the Neck becomes ſufficiently ſtrong. The only Uſe of Bandages is to retain the Compreſſes.

The Vertebræ of the Back are ſeldom removed quite out of their Places, without a Fracture, but generally adhere to thoſe next them. Theſe Luxations, therefore, are, for the moſt part imperfect; for only their upper and lower Apophyſes, and ſometimes only one of them, are diſplaced; ſometimes only one Vertebra, ſometimes more, are luxated; though the intermediate Vertebræ, betwixt two that are luxated, are reckon'd in the Number of thoſe luxated, tho' they are really in their proper Situations. Thus, when the uppermoſt Vertebra of the Loins is divided from the loweſt of the Back, and the loweſt Vertebræ of the Loins from the Os Sacrum, we commonly ſay, that five Vertebræ are diſlocated, when, ſtrictly ſpeaking, the two exterior only are out of their Places.

The Vertebræ of the Spine cannot be luxated without a very extraordinary Violence; for they are not only united cloſely by their Apophyſes, but very firmly connected by exceeding ſtrong Ligaments and Cartilages: For this Reaſon, neither a violent Flexure of the Back, nor a Fall or Blow on it, will remove them, unleſs the Cartilages or Ligaments are broken; but rather join them more ſtrongly; though, when this happens, it lacerates the Vertebræ, and ſpinal Marrow, and quickly kills the Patient. When a Vertebra, therefore, is luxated without a Fracture, the Body muſt incline much forwards, or to one Side; for, upon theſe Occaſions, the ſuperior Proceſſes recede from the inferior, and, conſequently, they may be removed with more Eaſe from each other: When the Left Side is affected, the Patient bends towards the Right, and *vice verſâ*.

The common Signs of Luxations in the Spina of the Back are the following: The Back is crooked and unequal; the Patient can neither ſtand nor walk; and his whole Body ſeems paralytic. All the Parts below the Luxation are inſenſible and immoveable; the Excrements and Urine cannot be diſcharged, or ſometimes they are emitted involuntarily; the lower Parts die gradually, and, at length, Death itſelf enſues. But theſe Symptoms are proportionable to the Violence of the Diſorder.

The Number of the luxated Vertebræ is diſcoverable by the preternatural Incurvation; for, when one only is diſplaced, the Incurvation forms a kind of Angle. If the Apophyſes of the Vertebræ are moved forward, the Spina Dorſi will incline the ſame Way, and the Patient ſuffer exquiſite Pain, by bending his Body, which will be leſs, when he lies on his Back: If the Vertebra is forced to the Right Side, the Body will incline towards the Left, and be eaſier bent towards the Right, than the Left Side; and the contrary, if the Vertebræ are forced towards the Left Side.

As to the Prognoſtic in theſe Luxations, they are all extremely dangerous, both on the Account of the Injury the ſpinal Marrow may have received, and, alſo, becauſe of the Difficulty of reducing the Vertebræ; and the more the latter are ſeparated, the more will the former be injured, the conſequent Symptoms worſe, and the Patient's Death more certain. The Danger, likewiſe, is greater, the nearer the diſlocated Vertebræ are to the Head; for a Wound of the ſpinal Marrow in thoſe Parts is both ſooneſt inflicted, and attended with the worſt Conſequences. Luxations, therefore, in the Neck, are more pernicious than thoſe in the Back; and thoſe in the Back more dangerous than thoſe in the Loins. And, what may ſeem wonderful, the Symptoms are milder, where ſeveral Vertebræ are luxated, than where one alone is out of its Place; and the Caſe is leſs dangerous, when both the Apophyſes are diſplaced; for, when this happens only to one, the ſpinal Marrow is more injured; but, in ſlight Luxations, the Vertebræ may be more eaſily reduced, and the Danger is not ſo great.

Since the Inſtruments uſed by the Antients appear to have been rather injurious than ſerviceable, the following ſeems the moſt ſuitable Method for reducing theſe Luxations. When both the Apophyſes of the Vertebræ are diſlocated, the Patient muſt be laid on his Belly croſs a Tub, Drum, or ſome other gibbous Body; then two Aſſiſtants are to depreſs both Ends of the luxated Spine, on each Side, which elevates, and gradually extends, the Vertebræ, the Spina Dorſi being thus bent in form of an Arch: After this the Surgeon preſſes down the inferior diſlocated and prominent Vertebra, and, at the ſame Inſtant, expeditiouſly puſhes the ſuperior Part of the Body upwards. If the firſt Attempt fails, it ſhould be repeated two or three times. *Petit* lays a thick Cloth rolled cylindrically acroſs the Bed, and, placing the Patient over it, treats him in the preceding Manner. When the Left *Apophyſis* only is diſplaced, after the Patient is laid in the ſame Poſture, one Aſſiſtant may depreſs the Left Coxa, and the other the Right Humerus, provided the *Apophyſis* on the Left Side is luxated; but the Reverſe, if the Injury is on the other Side. This certainly is the propereſt Method, if there is really any, for reducing the Luxations of the ſpinal Vertebræ. For the reſt, Compreſſes, moiſtened with Spirit of Wine, or Spirit of Wine camphorated and warm, ſhould be applied, with the Napkin and Scapulary: The Patient muſt be laid in a ſoft, even Bed: Bleeding, and bathing the weak Parts with warm ſtrengthening Spirits, will be of Service; the Bandage muſt be ſeldom removed, and the uſual Symptoms muſt be palliated, till the Cure is completed.

Luxations of the Os Coccygis.

The Os Coccygis may be forced internally by a violent Fall or Blow, and externally by a difficult Birth: This Accident is accompanied with acute Pains in the lower Part of the Spine, Inflammations, and Suppurations of the Rectum, and a Suppreſſion of the Fæces. Theſe Symptoms, with the Sight and Touch, will diſcover this Luxation, which may be eaſily reduced by an expert Surgeon; for the Thumb alone, by Preſſure, will replace an external Diſlocation. After this may be applied Compreſſes, dipt in warm Wine, or its Spirit, narrow below, and broad above, to fill up the Sinus of the Podex: Theſe are to be ſecured by the T Bandage (*Tab.* XXIII. *Fig. b*): But the Part between the Thighs ſhould be ſlit, and ſo faſtened, that the Patient may go to Stool, without looſening it; and thus a Relapſe may be prevented.

For an internal Luxation of the Os Coccygis, the fore Finger, being dipt in Oil, after paring the Nail, ſhould be introduced, as high as poſſible, into the Anus, to thruſt outwards the depreſſed Bone; whilſt the other Fingers, applied externally, guide it to its proper Place. The Patient ſhould reſt for ſome time on his Bed, and, when he riſes, ſit in a Chair, with a Hole in the Bottom, that the affected Part may not be compreſſed or diſturbed.

Luxations of the Ribs.

The Ribs are ſeldom diſlocated; but an external Violence will ſometimes remove them downwards, upwards, or inwards; for the Proceſſes of the Vertebræ, with the thick, ſtrong, adjacent Muſcles, prevent a Luxation outwards. If the Ribs are forced inwards, both the Pleura, and the internal Parts of the Breaſt, are injured; from whence proceed excruciating Pains, Inflammations, Difficulty of Breathing, Coughs, Ulcers, Immobility of the Body, and other ſuch dangerous Symptoms. Theſe, with the external Form and Poſition of the Side, evidently diſcover this Misfortune.

The Reduction ſhould be undertaken immediately; and, when the Diſlocation is upwards or downwards, the Patient muſt be laid prone on a Table, and the Rib replaced by the Hands; or the Arm of the affected Side may be ſuſpended over a Door or Ladder; and, while the Ribs are thus diſtended, the luxated Heads may be reduced.

Internal Luxations of the Ribs are not eaſily reducible, becauſe neither the Hands, nor any other Inſtrument, can be applied to elevate them; though I do not think them abſolutely incurable: For, by laying the Patient on his Belly, either upon a Table, or over ſome gibbous or cylindric Body, moving the anterior Part of the Rib towards the Back, and ſhaking it ſometimes, the Head may probably recover its former Situation. If this fails, and ſpeedy Aſſiſtance is neceſſary, recourſe muſt be had to the ſevere Method propoſed for fractured Ribs under the Article Fractura. In the mean time, where the Symptoms are not very bad, nor the Heads of the Ribs much removed from their proper Situations, we may forbear the Inciſion of the Fleſh, and a violent Compulſion of the Ribs, as luxated Ribs have often remained ſo without any Danger. The Part muſt be dreſſed with Compreſſes dipt in warm Spirit of Wine, or Spirit of Wine camphorated; and theſe muſt be ſecured by the Napkin and Scapulary.

For Luxations of the Clavicles, ſee Clavicula.

Luxations of the Humerus.

The Humerus is the moſt ſubject of any Bone to a Diſlocation; becauſe its Ligaments are lax, its Motion large, and the Glenoide Cavity of the Scapula but ſhallow. This Bone ſometimes ſlips out under the Axilla, forwards and backwards, even under the very Scapulæ; but very ſeldom directly downwards, and never upwards, unleſs the Acromion and Coracoide Proceſſes are fractured at the ſame time; for whilſt theſe, with the ſtrong Deltoide and Biceps Muſcles, remain entire, they keep down the Humerus, and ſtrongly reſiſt a Luxation upwards.

When the Humerus is luxated downwards, 1. There is a Cavity in the ſuperior Part, perceptible to the Finger, and a Tumor under the Arm-pit, becauſe the Head of the Bone is lodged there. 2. The Acromion, on account of the adjacent Sinus, is more prominent than ordinary. 3. That Arm is longer than the other; and, when it can be moved or extended, gives exquiſite Pain in lifting it up to the Mouth. When it is luxated forwards as well as downwards, there is the ſame Cavity under the Acromion; but the Head projects towards the Breaſt under the Axilla, and the Arm cannot be moved without acute Pains. Laſtly, when it is luxated backwards, the Cubit approaches the Præcordia, and the Head of the Bone is prominent on the Outſide of the Shoulder. The Arm cannot be extended, or even moved from the Breaſt, without great Agony. A Diſlocation forwards or inwards is the moſt dangerous, becauſe the luxated Head of the Humerus injures the great Arteries and Nerves of the Arm.

Recent Luxations of this Kind may be eaſily reduced, eſpecially if they are perpendicularly downward or backward, or the Arm retains its natural Length; but, if they happen inward, under the pectoral Muſcle, or the Arm is ſhorter, or the Diſorder of long Standing, or attended with Tumors, Inflammations, or a Fracture of the Acromion, the Limb cannot be reſtored to its former Vigour without great Difficulty. But, when the Head of the Humerus grows to the adjacent Parts, particularly under the Arm, it is reducible by no means whatever. The Reduction, likewiſe, is more difficult in ſtrong and fat Subjects, than in thoſe who are lean and weak.

As ſoon as the Luxation is diſcovered, the Patient ſhould be ſeated on the Floor, or a low Stool (ſee *Tab.* XXXI. *Fig.* 3.); one ſtrong Aſſiſtant B is to hold his Body firm, that he may not yield to the Extenſion; and another C to fix both his Hands a little above the Cubit, extending it ſtrongly and gradually: But, before the Extenſion, the Surgeon D ſhould ſuſpend a large Napkin, of a ſufficient Length, and tied in a Knot about his own Neck, in ſuch a manner, that the Knot may hang behind, and the Part E over his Breaſt; through this he ſhould tranſmit the Arm up to the Axilla, and, taking the Humerus in his Hands, order the Aſſiſtant to extend the Limb, while he elevates the Head of it with the Napkin, and directs it with his Hands into the Sinus of the Scapula. I would adviſe him to move the Humerus diſcretionally, in different Directions, according to the manner of the Luxation; for, by this means alone, I reduced three Diſlocations in one Month.

Though the preceding Method ſeems the moſt ready and commodious, it is not always ſufficient, eſpecially when the Patient is robuſt, or the Diſorder of long Standing: In theſe Caſes, therefore, it will be proper to ſubſtitute more Hands, applying a long Napkin, or the Belt of *Hildanus*, (ſee *Tab.* XXIX. *Fig.* 17.) to the Os Humeri, a little above the Cubit; and ordering

as many Perſons as are neceſſary, to extend the Limb. The Reſiſtance ought to be proportionably greater than the Extenſion. The Patient, therefore, ſhould be retained by two Aſſiſtants; and, when they are inſufficient, the Humerus ſhould be put through a perforated Piece of Linen up to the Scapula, one half coming over the Patient's Breaſt, the other behind the Back, and the Ends tied in a Knot. This is to be held by ſome Aſſiſtants, or faſtened to a Beam, or any other fixed Point, to ſecure the Patient from giving way. While this is doing, the Surgeon muſt very accurately elevate, agitate, and reſtore, the luxated Limb. When this will not make a ſufficient Extenſion, the Pulley (*Tab.* XXIX. *Fig.* 15.) will be proper to extend the Arm, as in a Fracture. See FRACTURA.

For the Method of reducing this Luxation by the Ambe, ſee AMBE.

There are many other Contrivances, both antient and modern, for this Purpoſe: The former are deſcribed and delineated by *Oribaſius*, *Paré*, *Gerſdorfius*, *Brunſwigius*, *Scultetus*, and others: The latter are publiſhed in the *Act. Erudit. Junken*, *Purman*, and *Petit*. And, though each Inventor prefers his own, there are *French* Surgeons, who pronounce them all unneceſſary, or more improper than the Ambe of *Hippocrates*. Others, with *Gouey*, eſteem all Machines, except the Hands, Napkins, or Slings, abſolutely unneceſſary.

However, ſince *Petit* has acquired ſo great a Character in his Profeſſion, it will not be amiſs to give a brief Deſcription of his Machine (ſee *Tab.* XXXI. *Fig.* 6.). *Petit* contrived a Machine to make an Extenſion, and a Reſiſtance, at the ſame time: With this View he made a Supporter of ſtrong Linen, or Fuſtian, a Foot long, and lined with Leather (ſee *Tab.* XXXI. *Fig.* 7.). He puts the Arm through the Aperture A, ſo that one End B comes over the Breaſt, the other C over the Back. He lets the Horns of the other Machine (*Fig.* 6. *a a*) into the Holes D D; and the other Extreme of *Fig.* 6. B is lodged upon the Ground. In this Machine there are ſeveral little Pullies C C, as in the Polyſpaſton, with the Rope *d d*; there is, beſides, a moveable Handle, by which the Pullies and Cords are ſtretched, and the Arm extended. To promote this Extenſion, he faſtens a peculiar Sling, (A A *Fig.* 8.) made of double and ſoft Leather, a little above the Cubit, having firſt pulled the Skin upwards: This he ſecures by a Silk Cord, three quarters of an Ell long, *b b*, ſew'd in a peculiar manner to the Leather, and faſtened with a Knot. To this Silk Cord he faſtens another *c d e*, by two moveable Loops *f f*, to which is joined the Cord *d d*, *Fig.* 6. which paſſes round the Pullies (*Fig.* 6.). After this Apparatus, he orders the Aſſiſtant to wind up the Rope by the Handle E, (*Fig.* 6.) which extends the Arm; and, at the ſame Inſtant, the Surgeon directs the Head of the Bone to its former Place, if it does not ſpontaneouſly recover it.

But, to ſpeak impartially, I think the Hands and Napkin, with ſtrong and prudent Aſſiſtants, are generally ſufficient, tho', if any one will uſe other Methods, let him chuſe that which extends the Limb ſufficiently, and ſtretches the Muſcles equally. Upon this Principle we may the better judge, whether the Ambe of *Hippocrates* be proper; or the more precarious Way of pulling and extending the Arm over a Door, Ladder, or Beam laid croſs the Shoulders of two ſtrong tall Aſſiſtants; or whether we ſhould order a Perſon to ſit down, and raiſe himſelf up expeditiouſly, taking the Patient's Arm over his own Shoulder; or, placing the Patient on the Ground, put a Foot, or Ancle, under his Humerus, and pull it up with Violence. But here the utmoſt Care is required to prevent a Contuſion or Rupture of the Muſcles, Nerves, Veins, and Arteries, by a too violent Extenſion and Reduction; for that ſuch Accidents are frequent, *Paré* and others teſtify. The Surgeon's Buſineſs, therefore, is, to order a ſtrong, but equable, Extenſion.

LUXATIONS OF THE CUBIT.

The Cubit conſiſts of two Bones, the Radius and Ulna, which are articulated by a Ginglymus. Theſe Bones are ſo connected, that the Ulna, or Cubit, being the largeſt Bone, and ſeated in the lower Part of the Arm, performs the whole Action of Flexion and Extenſion, but not without the Radius; ſo that the Radius always follows the Motion of the extended and inflected Ulna. On the contrary, the Radius will move internally or externally, with the Hand, without any Motion or Flexion of the Ulna. Both theſe Bones are ſo connected to the Os Humeri, that large Proceſſes are received into deep Cavities, and ſecured with very ſtrong Ligaments. Though the Cubit, therefore, may be luxated outward, inward, forward, or backward, it is ſeldom perfectly diſlocated, unleſs the Olecranon is fractured, or the Ligaments weakened by ſome extraordinary Violence.

If the Cubit is luxated backwards, which is moſt frequent, the Arm becomes crooked, and ſhorter, and cannot be extended; in the internal Part of the Flexure, the Humerus will be prominent; in the external, the Olecranon, with a large Cavity between both Bones. On the contrary, the Size of the Olecranon will ſcarcely admit of a Luxation of the Cubit forwards, unleſs that be fractured at the ſame time; but, when this is the Caſe, the Os Humeri will ſtick out behind, and the Ulna before, with a Sinus proportionable to the Degree of the Luxation. When the Luxation is external, the Tumor is ſo too, and *vice verſâ*. In a Word, unleſs the Ligaments and Muſcles of the Cubit are entirely broken, that Bone is incapable of ſuffering a perfect Diſlocation. But either of thoſe Accidents are diſcoverable to the Sight and Touch.

Since in violent Luxations of the Cubit the Ligaments and Tendons muſt be greatly ſtrained, the neceſſary Conſequence, without timely Relief, will be acute Pains, Tumors, Inflammations, Convulſions, Vomiting, Fevers, Gangrene, and Death itſelf, as *Paré* obſerves. And, to confeſs the Truth, in a violent Diſorder of this Kind, or one of long Standing, the Bone cannot be replaced without great Difficulty, by reaſon of the ſtrong Ligaments, and various Proceſſes. The ſlighter, however, the Luxation is, and the more recent, the leſs Difficulty there is in reducing it.

The Patient muſt be ſeated in a Chair, and two ſtrong Aſſiſtants muſt extend the Humerus and Cubit, till the Muſcles are ſufficiently diſtended, and there appears a free Space between the Bones: Then the Surgeon muſt reduce the Bone with his Hands alone, or with them aſſiſted by Bandages; and immediately bend the Elbow, that the Proceſſes may return to their Cavities. But, if the Tendons and Ligaments cannot be ſufficiently extended, he ſhould apply emollient Oils, Ointments, or the Fat of Animals, or relaxing Fomentations and Cataplaſms. When the bare Hands are inſufficient for the Extenſion, he may uſe the Machines and Methods propoſed in caſe of Fractures.

After Reduction, the Bone ſhould be ſecured with a Bandage, and the Arm ſuſpended in a Sling about the Neck. But *Hippocrates* adviſes neither to retain the Bandage too long, nor keep the Arm entirely without Motion; for, by an Inſpiſſation of its Mucilage, the Joint would become rigid and immoveable: The Bandage, therefore, ought to be looſened every Day, or every other Day, and the Cubit gently inflected different Ways; after which, hot Compreſſes, dipt in burnt Wine, may be applied, and ſecured with Bandages, till the Ligaments and Articulation recover their former Vigour.

LUXATIONS OF THE HAND.

Though the Hand is very accurately connected to the Bones of the Cubit, particularly to the Radius, by the Carpus, and ſtrong Ligaments; yet it is liable to a Luxation in all the four Directions. But this uſually happens forward or backward, becauſe the great Proceſſes of the Ulna and Radius defend it on each Side. The Hand is ſaid to be luxated forwards, when it inclines towards the Flexor Muſcles of the Fingers; backwards, when it tends towards the Extenſor Muſcles; outwards, when there is a Tumor near the Thumb, and a Cavity near the little Finger; and inwards, when the Reverſe happens. From theſe Obſervations we may eaſily diſcover a Luxation of the Hand.

This Diſorder, from the violent Diſtortion of the ſtrong Ligaments, muſt be attended with exquiſite Pains, and a Rigidity of the Fingers, which can neither be bent nor extended, by reaſon of the Compreſſion of their Tendons. From hence will follow an Inflammation, Tumor, Abſceſs, Gangrene, Sphacelus, and Caries of the ſpongy Bones of the Carpus, which are ſeldom curable but by Amputation. In a recent inconſiderable Luxation, a milder Practice will complete the Cure.

This Diſlocation, therefore, ſhould be ſpeedily reduced, 1. By ordering one Aſſiſtant to hold the Hand, and another the Arm, and ſo pull in different Directions. 2. By placing the Sinus of the extended Hand on a Table, or ſome other flat Body, that the Tumor may be depreſſed. This will be effectual, in whatever Part the Hand is luxated.

LUXATION OF THE CARPAL BONES.

One or two of the carpal Bones are ſometimes removed from their proper Place, which is diſcovered by a Tumor in one Part, and a Cavity in another, perceptible to the Touch: It is likewiſe accompanied with violent Pains. This Luxation, if recent, is to be treated as a Luxation of the Hand.

LUXATION OF THE METACARPUS.

The four Bones of the Metacarpus may, by external Violence, be ſeparated from the Carpus, to which their ſuperior Parts are connected. But this cannot happen in all the Directions; for the two middle Bones cannot be forced to either Side, nor the two external ones thruſt inward, though each of them may be luxated forward or backward. This may be diſcovered by the Sight and Touch, and muſt be cured in the ſame manner as Luxations of the carpal Bones.

LUXATIONS OF THE FINGERS.

Laſtly, the Fingers and Thumbs may be diſlocated in every Joint, and every Direction. But this may be ſoon diſcovered and remedied: For, as the Ligaments are not very ſtrong, the Fat and Muſcles thin, and the Sinuſes of the Articulation ſhallow, the Surgeon

Surgeon need only extend the Finger with one Hand, and reduce it with the other. As for the proper Bandage, ſee the Article FASCIÆ.

LUXATIONS OF THE FEMUR.

We have already obſerved, under the Article FRACTURA, how very uncommon a Luxation of the Thigh is, and that the Antients often miſtook a Fracture for it. The Reaſons are very plain: For, 1. the Articulation is in a very deep Sinus, formerly called *Sinus Coxæ*, now *Acetabulum*. 2. The whole Head is almoſt covered with a broad, concave Cartilage. 3. The Ligaments are very ſtrong. 4. It is guarded by very ſtout, thick Muſcles. 5. The Neck of this Bone is the moſt brittle Part of it; conſequently that is more ſubject to a Fracture, than the Head to a Luxation; though, whenever this happens, as it ſometimes may, it proceeds rather from an internal, than external Cauſe. For the Head will ſpontaneouſly ſlip out of its *Acetabulum*, when the Ligaments are relaxed by a Collection of Humours, ſo that the Femur is ſometimes luxated without the leaſt external Violence, when the Patient lies quiet in his Bed, and, upon his riſing, one Leg appears longer or ſhorter than the other, and ſeems, as it were, unhinged.

Robuſt Adults are not ſo ſubject to this, as tender Infants.

This Luxation is generally perfect, becauſe the exact Roundneſs of the Head, the Narrowneſs of the *Acetabulum*, and the Strength of the adjacent Muſcles, will not admit of a ſmall Separation: For the very Inſtant the Head is forced to the Edge of the *Acetabulum*, it muſt either ſlip quite out, or return to its natural Place; though ſome will affirm, that there may be an imperfect Luxation.

The Thigh may be diſlocated four Ways, inwards, outwards, upwards, and downwards, but it generally happens, inwards and downwards, towards the large Foramen of the Os Pubis: For the cartilaginous Defence in that Part of the *Acetabulum* is leſs, and more depreſſed; and the Ligamentum Rotundum gives way more eaſily than in any other Part; and the adjacent Muſcles are there of leſs Force to prevent the Head from ſliping out. Beſides there are certain Eminences of the Os Pubis, and *Acetabulum*, which retain the Head, when once ſlipt out downwards. When the Thigh is luxated outwards, it generally ſlips upwards at the ſame time; for the ſtrong Muſcles of the Thigh, meeting with no Reſiſtance, will draw it in that Direction.

If the Thigh is luxated inwards, and, as it commonly happens, downwards, the Leg is longer and more bowed than the other, and the Knee and Foot turn outwards: The Head of the Bone is thruſt near the lower Part of the Inguen, and the Foramen of the Os Pubis. Sometimes the Compreſſure of a Nerve, which communicates with the Bladder, cauſes a Suppreſſion of Urine. This Diſlocation produces a Sinus in the Buttock, becauſe of the Abſence of the great Trochanter, and the reſt of the Bone; and, without timely Aſſiſtance, the whole Limb withers. For this Reaſon the Patient cannot ſtand upon that Leg, but is obliged to lay the whole Streſs of his Body upon the other, and in walking to move it ſemicircularly, whilſt the Body itſelf muſt be ſupported either by other Men, or Crutches under his Arms, or, at leaſt, by Sticks; though I have ſeen Inſtances, where the Head has grown ſo firmly to the adjacent Parts, without the Acetabulum, that it has ſupported the Body without Crutches or Sticks, but the Patient always halted.

When the Thigh is luxated backward, it is uſually drawn upward. Hence appears a Cavity below the Inguen, and a Tumor in that Part of the Buttock where the Bone, and Head of the Trochanter, are lodged. The Fold in the Buttock being forced upwards, the reſt of the Limb will become ſhorter than the other, the Foot bend inwards, the Heel not touch the Ground, but the Patient will ſeem to ſtand on his Toes. Laſtly, the diſlocated Limb may be more eaſily inflected than extended. And the Body is more firmly ſupported by this Limb, when luxated outwards, than inwards, becauſe, in the laſt Caſe, the Feet are ſeparated farther from each other.

Many, therefore, without Reduction, ſtand and walk ſtrongly, by the Help only of a higher Heel to their Shoe. But there is generally ſome ſlight Decay of the Limb, from a Compreſſion of the Nerves. If there ſhould ever happen an internal or external Luxation, without a Protuberance above or below, it may be diſcovered from what we have ſaid, and a due Conſideration of the Structure of the Part.

Since it is univerſally agreed, that there is a great Difficulty in diſtinguiſhing between a Luxation and a Fracture of the Femur, I will venture to recommend the following Signs. We may judge it to the former, 1. When the Os Femoris is luxated by a Flux of Humours, without any external Violence, but only by walking or riſing up. 2. When it is unattended with Pain, Tumor, or Inflammation. And, 3. When the whole Limb may be bent and turned about at the Acetabulum without any Noiſe, which is uſually heard in Fractures. The contrary Signs indicate a Fracture.

The Cure of a luxated Thigh is very difficult. For, 1. The Strength and Thickneſs of the adjacent Muſcles, particularly in robuſt Men, prevent a ſufficient Extenſion. 2. On the ſame Account the Head of the Femur is, with Difficulty, returned into the Acetabulum; and it is not eaſy to be certain when it is replaced.

3. When the Bone is duly replaced, it may ſlip out again, from the Lubricity and Weakneſs of the Ligaments. To this may be added, 4. That thoſe very Ligaments are ſometimes broken or lacerated by the external Violence. And, 5. The Inſpiſſation of the Mucilage in the Acetabulum often prevents the Reduction, or forces the Bone out again, when it is replaced. So that no Reduction at all, or a late one, muſt produce Lameneſs.

When the Thigh is luxated forwards and downwards, the Patient muſt be laid upon his Back, on a Table; then a ſtrong Napkin, or Linen Sling, is to be paſſed over the Groin, near the Part affected, one End of which is to come over the Belly, and the other over the Buttocks and Back; and both are to be tied with a Knot, on the Creſt of the Ileum, and then held firm by Aſſiſtants, or rather faſtened to a Hook or Ring, fixed to ſome Place, eſpecially if we uſe the Polyſpaſton, to keep the Body from yielding to the Extenſion. Immediately above the Knee muſt another Napkin, Sling, or the Belt of *Hildanus*, (ſee *Tab.* XXIX. *Fig.* 17.) be faſtened with a Compreſs under it; both Slings being drawn tight, the Thigh muſt be extended enough to draw it out of its Sinus, and replace it in its Acetabulum, without great Violence, by the Surgeon's Hands, one of which is to preſs the Head outward, and the other to guide the Knee inward. Or it may be done by a Napkin, in the Form of a Sling, faſtened round the Extremities of the Thigh, as in a luxated Humerus, eſpecially if the Knee is forced inwards by the Hand. When theſe Methods are inſufficient for the Extenſion, the Polyſpaſton (ſee *Tab.* XXIX. *Fig.* 15.) muſt be uſed. When the Limb is properly extended, the Surgeon muſt place himſelf near the Table, on the injured Side, and with his Hands reſtore the Bone, from the Os Pubis, to its former Situation.

When the Thigh is diſlocated backward, the Patient muſt be laid with his Face downwards on a Table, the Thigh extended in the ſame manner, but with more Violence than we juſt now propoſed, and the Surgeon muſt perform the Reduction with his Hands or Knee, an Aſſiſtant in the mean time extending and turning the whole Limb inwards. For the proper Bandages, ſee the Article FASCIÆ. The Patient ſhould be confined to his Bed for three Weeks, or a Month.

In whatever Direction this Bone is luxated, *Petit* recommends his Machine, becauſe the ſtrong Muſcles generally render the Hands, and all other Inſtruments ineffectual. But the Stay (*Tab.* XXXI. *Fig.* 7.) may be leſs, and without the Aperture A; for the Thigh is not to be put through it, but the Middle of this Stay is applied to the Tubercle of the Iſchium, and one End is brought before, the other behind. The Patient is placed on his ſound Side, that the diſlocated Thigh may lie upwards; but the Machine is put between the Thighs, the Knee of the diſtorted Side being a little bent. The Sling, (*Fig.* 8. *Tab.* XXXI.) after the Skin is drawn up, is faſtened ſtrongly a little above the Knee, and then to the Rope, which paſſes round the Pullies. (*Fig.* 6. *d d*). The Horns of the Machine, *a a*, are put through the Stay, (*Fig.* 7. *d d*;) and, by winding up the Rope by the Handle E, (*Fig.* 6.) the Limb is cautiouſly and gradually extended, till the Surgeon judges it ſufficient. After this, he proceeds as directed above.

When the Reduction is rendered more difficult by the Luxation being forward and downward, and the Adheſion of the Bone to the Foramen of the Os Pubis, *Petit*, inſtead of the Horns *a a*, (*Fig.* 6.) has ſubſtituted the others (at *Fig.* 9.), which, at the Ends, have tranſverſe and lunar Prominencies: One of theſe A he puts upon the Os Ilei, the other B on the Middle of the Thigh; he afterwards ties the Napkin about the Inguen, which he faſtens to the Rope about the Pullies; and then makes an Extenſion by turning the Handle, ſo that the Machine exerts its Force in three different Places. The Part A keeps the Patient firm, and reſiſts the Os Ilei, as an immoveable Fulcrum; B, when the Rope is drawn tight, forces the lower Part of the Thigh inwards; and the Napkin, by the Aſſiſtance of the Rope and Pullies, draws the upper Part outwards, all which Motions are neceſſary in this Operation. But too ſtrong an Extenſion will be very prejudicial, as the Limb is already too long, ſo that it ſhould be continued only till the Surgeon can replace the Bone; otherwiſe it would prove uſeleſs, and muſt be repeated.

If the Luxation ſhould be imperfect, and the Head of the Bone ſtick upon the internal Edge of the Acetabulum, the ſuperior Part of the Thigh muſt be puſhed outwards, and the inferior inwards: But, if it is lodged upon the external Edge of the Acetabulum, the ſuperior Part of the Femur is to be preſſed with one Hand inwards, whilſt, with the other Hand, the inferior Part is directed outwards.

LUXATIONS OF THE PATELLA AND KNEE.

OF A LUXATED PATELLA.

The Patella is generally luxated externally or internally, tho' ſome aſſert, that it may be diſplaced upwards or downwards: This Accident is a neceſſary Attendant upon a perfect Luxation of

of the Knee, as it is ſo ſtrongly connected to the Femur and Tibia. Many ignorant Surgeons treat it as a Diſlocation of the Knee itſelf, and do the Patient much Injury by extending the Limb, and preſſing the Part: But any one of Judgment, by comparing the affected and ſound Limb, may readily determine whether the Patella is luxated, and towards what Part, and, of conſequence, what Method is proper for the Cure.

The Patella is to be reduced by laying the Patient flat on his Back upon a Table, Bed, or the Floor, ſo that an Aſſiſtant may pull his Leg ſtrait; or he may ſtand erect: Then the Surgeon muſt take firm Hold of the Patella with his Fingers, and force it into its proper Place. After this, nothing more is required, but a Bandage and Reſt, with a gentle Motion of the Limb at Intervals, till it has recovered its former Vigour.

A proper Luxation of the Knee is when the Tibia recedes from the Femur, which happens outward, inward, and backward; ſeldom or never forward, without very extraordinary Violence, becauſe the Patella, being connected to the Articulation by thoſe exceedingly ſtrong Tendons which extend the Leg, oppoſes a Diſlocation that Way. Nor do the Bones of the Leg eaſily ſuffer a perfect Luxation, becauſe the Sockets are very deep, and the Ligaments exceedingly ſtrong, unleſs thoſe very Ligaments are broken at the ſame time; from whence it muſt neceſſarily follow, that the Patient will be tortured with ſuch exquiſite Pain and Convulſions, that, if he eſcapes with Life, there will remain a Rigidity and Lameneſs in the Joint. On the contrary, a ſlight Luxation, or rather a Subluxation, is very eaſily remedied. Luxations of this Joint are eaſily diſcovered, becauſe the conſequent Cavities and Tumors are evident, the Part being but very little covered with Fleſh: But they are very ſeldom cur'd without leaving an Anchyloſis; for by this Accident the Ligaments and Glandules of the Articulation muſt be broken, or violently bruiſed and lacerated; from whence will proceed an Inſpiſſation of their nutritious Juices, which prevents the natural Motion of the Limb.

In a ſlight Luxation the Patient muſt be ſeated on a Bed, Bench, or Table, one Aſſiſtant taking hold of his Thigh above the Knee, and another extending his Leg, while the Surgeon reduces the Bone with his Hands or Knee. When the Hands and Slings are inſufficient, recourſe ſhould be had to the Inſtruments deſcribed under the Article FRACTURA; as the Belt of *Hildanus*, and the Polyſpaſton (*Tab.* XXIX. *Fig.* 15. 17.). The Extenſion muſt not be ſo violent as to ſeparate the Epiphyſes from the Bones, in Children and young Perſons; for that will induce a worſe Diſorder, and perpetual Lameneſs. As for the reſt, it muſt be properly bound up, put in a Straw-caſe, and treated as a luxated Patella.

The Fibula may, by external Violence, be diſunited from the Tibia, either at the ſuperior or inferior Part. When it happens in the inferior Part, it generally proceeds from a Luxation of the Foot externally. This Bone, therefore, muſt be reduced, bound up, and the reſt of the Treatment muſt be agreeable to our Directions given above for Luxations of the Patella and Knee. Laſtly, the Patient muſt be forbid to lay any great Streſs upon the diſordered Limb too ſoon, as that will be attended with an incurable Lameneſs.

LUXATIONS OF THE FOOT AND ANCLE.

The Ancle may, by leaping, running, or walking, be luxated in all four Directions; and the Direction may be diſcovered by the particular Poſture of the Joint: For, when the Luxation is internal, the Bottom of the Foot bends outward; and the Reverſe when external; but the latter is the more common Accident. When it is luxated forward, the Heel becomes ſhorter, and the Foot longer, than uſual; the contrary Direction is attended with contrary Symptoms. Laſtly, the Ancle can ſcarce ever be diſlocated outward, unleſs the Fibula is removed from the Tibia, or entirely broken where it forms the external Malleolus.

A Luxation of the Ancle, from any extraordinary Violence, is generally attended with dangerous Symptoms; for the Diſtortion of the Foot muſt ſtrain the Ligaments, Tendons, and Nerves, which will produce extreme Pains; or the Veins and Arteries may be burſt, and a Gangrene excited by a large Extravaſation of Blood.

But every Diſorder of the Foot from leaping or turning on one Side is not a Luxation of the Ancle; for it may be only a Contuſion or Laceration of the Parts, and yet the Patient be afflicted with moſt acute Pains, livid Tumors, and Stiffneſs; ſo that he can neither ſtand nor walk, but is confined to his Bed for ſome time. Extenſion and Reduction, therefore, are improper.

The Difficulty of reducing the Ancle is proportionable to the Violence of the Cauſe. But the beſt Method is, to place the Patient on a Bed, Table, or Seat, and order two Aſſiſtants to extend the Leg and Foot in oppoſite Directions, whilſt the Surgeon replaces the Bone with his Hands and Fingers. After Reduction, the Part ſhould be bathed with Salt and Oxycrate, and then bound up. The Patient muſt keep his Bed till the Symptoms leave him, and his Ancle is capable of ſupporting his Body without Danger.

In a Contuſion of the Ancle, the Part ſhould be immediately dipt in cold Water; and this ſhould be repeated for ſeveral Days. But, if this ſeems diſagreeable, I would recommend Compreſſes impregnated with Salt and Oxycrate; theſe are to be bound on, and renewed often. *Dionis*, in his Surgery, follows almoſt the very ſame Method of Cure; for he prepares what the Surgeons call a Defenſative Ointment, of the Whites of Eggs, Oil of Roſes, and Alum duly triturated, which he ſpreads on Lint, and firmly ſecures on the Ancle: On the third Day after this Application he boils Wine with aromatic and aſtringent Ingredients, ſuch as Roſes, Wormwood, Roſemary, Pomgranate-bark, Alum, and Salt; with that Decoction he carefully foments the Ancle. Then he applies a Compreſs wet in this Wine, and ſecures it by a tighter Bandage than before. When he has continued this for twelve Days, he applies a ſtrengthening Plaiſter till the Pains entirely ceaſe.

Some Contuſions are only curable by Time; and we have Inſtances, where Patients have been unable to walk on rough Ground, or go up and down Stairs, for a whole Year, without great Trouble. For the Prevention of this, the ſame Methods are to be purſued, as we have directed for Luxations of the Ancle after Reduction. For Bandages, ſee the Article FASCIA.

LUXATIONS OF THE CALCANEUS.

Sometimes the Calcaneus is luxated inwards or outwards. This is diſcoverable by a Cavity on one Side, and a Tumor on the other: It is attended with ſevere Pains, and is to be cured by the Method already directed, keeping the Limb quiet for ſome time.

LUXATIONS OF THE OTHER BONES OF THE FOOT.

Laſtly, If any other Bone of the Foot be diſlocated, the adjacent Ligaments, with the Nerves and Tendons, are generally ſo much injured, that acute Pains, violent Inflammations, Convulſions, and, according to ſome, Death, enſue, without ſpeedy Aſſiſtance. They ſhould be reduced, therefore, as we directed for the Bones of the Hand; and the Toes muſt be treated in the ſame manner as the Fingers. The Patient muſt keep his Bed for ſome time.

LUXUS, in *Scribonius Largus*, is, luxated.

LUX. See ALBADARA.

LYCANCHE. A Species of Quinſey.

LYCANTHROPIA, from λύκος, a Wolf, and ἄνθρωπος, a Man. Lycanthropy, a Species of Madneſs; of which *Oribaſius* gives the following Deſcription: The Patients leave their Houſes in the Night-time, and, in every thing imitating Wolves, wander about the Tombs till Break of Day [*Actuarius* adds, that they return home then, and come to their Senſes]. You may know them by the following Symptoms: Their Looks are pale, their Eyes dull, hollow, fixed, and dry, without the Moiſture of a Tear. Their Tongue is quite dry, there being no Spittle in their Mouths, and they are ready to periſh with Thirſt; their Legs, from the Bruiſes they receive in the Night, [among Stones and Thorns, *Actuar.* and from the Bites of Dogs, *Aetius*] are full of incurable Sores and Ulcers. Theſe are the Characters of the Lycanthropy, which is a Species of Melancholy; and in the Time of the Fit ought to be treated with Phlebotomy, the Blood being ſuffered to run till the Patient faints. Meats of good Juice, with Baths of ſweet Water, are to be preſcribed. Whey is to be drank for three Days together, and a Purge of *Hiera of Colocynthis* is to be twice or thrice adminiſter'd. After purging, *Theriaca* muſt be exhibited, together with other things, proper for the Cure of Melancholy. At the Approach of the Fit uſe Irrigation of the Head, with ſuch things as are proper to procure Sleep; and, when he falls aſleep, his Ears and Noſtrils muſt be rubbed with Opium. *Oribaſ. Synopſ. Lib.* 9. *Cap.* 10.

Aetius, *Tetrabib.* 2. *Serm.* 2. *C.* 11. gives the ſame Deſcription and Cure; only calls the Diſeaſe κυνανθρωπία, Cynanthropy, as well as λυκανθρωπία, Lycanthropy; and obſerves it prevails moſt in *February*.

P. Ægineta, *L.* 3. *C.* 16. intitles his Chapter upon this Subject, περὶ λυκάνθρωπου ἢ λυκανθρώπου. Upon this Dr. *Freind*, in his Hiſtory of Phyſic, remarks, that "*Lambecius* ſeems to give us a very right "Explanation, how this Blunder of λυκάνθρωπου aroſe from miſtak-"ing the Abbreviation uſed in the Manuſcripts." But if we reflect, that, according to the antient Fable, *Lycaon* was turned into a Wolf by *Jupiter*, we may, perhaps, have Reaſon to believe this Blunder only imaginary; for *Lycaon* is no improper Name for a Perſon affected with this Madneſs. The Title of his Chapter, then, may run thus, in *Engliſh*, of a *Lycaon*, or a Perſon affected with a Lycanthopy, λυκανθρώπου.

Aetius informs us, that his Chapter, upon this Subject, was taken from *Marcellus*. Now *Marcellus Sidites* lived in the Time of *Marcus Antoninus*, and wrote forty-two Books about Phyſic, in heroic Verſe, one of which treated of the *Lycanthropia*, as we learn from *Suidas*. *Suidas* ſays, περὶ λυκάνου, which ſeems to be a Fault.

It is remarkable, that the Demoniac in Scripture, who was poſſeſſed of this Sort of Madneſs, is ſaid to have had his Dwell-

ing among the Tombs. If we may believe the Reports of Travellers, this Diſtemper has not been uncommon in ſome Countries, as *Livonia* and *Ireland*. *Donatus ab Altomari* ſays he has ſeen two Inſtances of it himſelf; and *Foreſtus* relates an Hiſtory which agrees exactly with the Deſcription given by *Oribaſius*.

LYCAON, λυκάων. See LYCANTHROPIA.

LYCHNION, λυχνιον. The Name of a Medicine for anointing the Eyes, deſcribed by *Galen, de Comp. M. S. L. Lib.* 4. *Cap.* 7.

LYCHNIS.

The Characters are;

The Leaves are entire and conjugated; the Calyx is entire, ſwelling, tubulated, generally ſtriated, not caducous, ſometimes diſtended like a Bottle, with a narrow Margin. The Flower is like a Clove-gilly-flower, pentapetalous, (the Petals being placed circularly, and generally Heart-ſhaped) often adorned with two or three ſmall Leaves repreſenting a Crown, and furniſhed with Stamina, to the Number of five, or upwards, as far as ten. The Fruit is conical, involv'd in the Calyx, opening at the Apex, and furniſhed with three or more Tubes. The Seeds are numerous, roundiſh, and angulated, or Kidney-ſhap'd.

Boerhaave mentions eighty-one Species of this Plant, none of which have any particular Medicinal Virtues aſcribed to them, that I know of, except the 1ſt, 6th, 14th, 20th, 27th, 35th, 39th, 46th, and 73d.

The 1ſt is the

Lychnis; coronaria; Dioſcoridis; ſativa; flore dilute rubente. *C. B. P.* 203. *Tourn. Inſt.* 334. *Boerh. Ind. A.* 210. *Lychnis Coronaria.* Offic. *Lychnis coronaria vulgo.* J. B. 3. 340. Raii Hiſt. 2. 993. *Lychnis Coronaria vulgaris.* Park. Theat. 629. *Lychnis coronaria rubra ſimplex.* Parad. 252. *Lychnis Coronaria rubra.* Ger. 381. Emac. 467. ROSE CAMPION.

It is cultivated in Gardens, and flowers in *June*; the Seed is uſed, which, according to *Dioſcorides*, purges Bile by Stool, and heals the Sting of the Scorpion.

The ſixth is the

Lychnis; ſegetum; major. *C. B. P.* 204. *Raii Hiſt.* 2. 998. *Synop.* 3. 338. *Tourn. Inſt.* 3. 335. *Boerh. Ind. A.* 210. *Nigellaſtrum.* Offic. *Lychnoides ſegetum ſive Nigellaſtrum.* Park. Theat. 632. *Pſeudomelanthium.* Ger. 226. Emac. 1087. J. B. 3. 341. COCKLE.

A Dram of the Powder of the Seed of this Plant, given to drink in Broth, or Water, for three Mornings, is excellent for the Vapours. *Simon Pauli* affirms, that *Sennertus*, and himſelf, uſed the Root of this Plant ſucceſsfully, to ſtop Hæmorrhages, even thoſe which happen in continued Fevers. They put it under the Tongue of the Patient, and left it there for ſome time. *Martyn's Tournefort.*

It grows among Corn, and flowers in *June* and *July*. The Seed is uſed, which is of a hot and dry Quality, and, being applied in a Peſſary, with Honey, provokes the Menſes. *Hippocrat.* It is extol'd, by ſome, as vulnerary. DALE.

The Fourteenth is the

Lychnis; ſylveſtris; alba; ſimplex. *C. B. P.* 204. *Tourn. Inſt.* 334. *Boerh. Ind. A.* 211. *Ocymoides.* Offic. *Ocymoides album multis.* J. B. 3. 342. *Lychnis ſylveſtris flore albo.* Ger. Emac. 468. Park. Theat. 630. Raii Hiſt. 2. 994. Synop. 3. 339. WILD WHITE CAMPION.

This wild Campion has a long whitiſh creeping Root, and round hairy Stalks, a Foot high, or more, having two oval ſharp-pointed hairy Leaves at every Joint; the Flowers grow on the Tops of the Branches, three or four together, on long Foot-ſtalks, conſiſting of five white, round, pointed Leaves, ſtanding in looſe hairy Calyces; the Seed-veſſel is large, and open at the Top, having a dentated Crown, including a ſmall, greyiſh, round Seed. It grows in Hedges and Borders of Fields, and flowers in *May*.

Parkinſon ſays, that the white Flowers of this Plant have been uſed, with Succeſs, againſt the Fluor Albus, and are good to ſtop inward and outward Bleeding. *Dioſcorides* recommends the Seed againſt the Bites of all venomous Creatures. *Miller's Bot. Off.*

This Plant has an herby Taſte, very inſipid, a little glutinous, and gives no Tincture of Red to blue Paper. *Martyn's Tournefort.*

The Seed is uſed, which is drying, and of fine Parts; *Dioſcorides* commends it for the Sciatica. The Herb boiled in Poſſet is an excellent Remedy for Convulſions in Children. *Raii Hiſt. Plant.*

The twentieth is the

Lychnis; ſylveſtris; ſive aquatica, purpurea ſimplex. *C. B. P.* 204. *Tourn. Inſt.* 335. *Boerh. Ind. A.* 2. 111. *Lychnis ſylveſtris.* Offic. *Lychnis ſylveſtris rubello flore.* Ger. Emac. 469. Raii Hiſt. 2. 994. Synop. 3. 339. *Lychnis ſylveſtris flore rubro.* Park. Theat. 631. *Ocymoides purpureum multis.* J. B. 3. 343. RED WILD CAMPION.

It grows by Hedges, and flowers in Summer: The Seed, which is the Part uſed, agrees in Virtues with that of the *Roſe Campion.*

The twenty-ſeventh is the

Lychnis; ſylveſtris; quæ Been album vulgo. See BEHEN ALBUM.

The thirty-fifth is the

Lychnis; ſylveſtris; quæ Saponaria vulgo. *Tourn. Inſt.* 336. *Boerh. Ind. A.* 212. *Saponaria.* Offic. Ger. 360. Emac. 444. Raii Hiſt. 2. 999. *Saponaria major lævis.* C. B. P. 206. *Saponaria vulgaris.* Park. Theat. 641. J. B. 3. 346. *Lychnis ſaponaria dicta.* Raii Synop. 3. 339. SOPEWORT.

Sopewort has many creeping Roots, ariſing from a thick woody Head; it ſends forth rediſh Stalks, about a Foot high, full of Knots, which are encompaſſed by the broad Foot-ſtalks of the Leaves: Theſe are ſmooth, of a pale-green Colour, broad and ſharp-pointed, about two Inches long, having three pretty high Veins on their back Part. The Flowers grow on the Tops of the Stalks, being large, of a pale-purple Colour, each made of five large, round-pointed Leaves, ſet in a ſmooth, long Calyx: The Seed is ſmall and round, growing in long roundiſh Seed-veſſels. It grows in watery Places, and near Rivers, and flowers in *June*. The Leaves are uſed.

It is called Saponaria, or Sopewort, becauſe its Juice will get greaſy Spots out of Cloaths. It is accounted opening and attenuating, and ſomewhat ſudorific, and is by ſome commended againſt the Lues Venerea. Outwardly applied, it helps hard Tumors and Whitloes, and provokes Sneezing; but it is ſeldom uſed. *Miller's Bot. Off.*

The Decoction of this Plant cures the Itch, and Tetters; and *J. Bauhine* affirms, that it takes Spots out of Cloaths. *Schroder* ſays, that its Roots are aperitive and reſolvent; that it is good for the Venereal Diſeaſe, to prevent the Aſthma, and provoke the Terms: It is uſed in the Oil of Euphorbium, according to the Deſcription of the *London* Diſpenſatory. The Sopewort is very bitter, and gives hardly any Tincture of Red to blue Paper, which ſhews, that the bitter natural Salt of the Earth is mixed with it, without any conſiderable Alteration, unleſs it be accompanied with a great deal of Sulphur. *Martyn's Tournefort.*

The thirty-ninth is the

Lychnis; ſegetum; rubra; foliis perfoliatæ. *C. B. P.* 204. *Raii Hiſt.* 2. 999. *Tourn. Inſt.* 335. *Boerh. Ind. A.* 212. *Vaccaria.* Offic. Ger. 395. Emac. 492. J. B. 3. 357. *Lychnis ſegetum, Vaccaria rubra dicta.* Park. Theat. 633. COW-BASIL.

It grows among Corn, and flowers in *June* and *July*. The Seed, which is uſed, is hot and dry, and provokes Urine.

The forty-ſixth is the

Lychnis; pratenſis; flore laciniato, ſimplici. See ARMERIA.

The ſeventy-third is the

Lychnis; arvenſis; glabra; flore majore. See GRAMEN LEUCANTHEMON, under the Article ALSINE.

Amongſt the Species of *Lychnis*, *Ray* mentions one which grows in *Braſil*, called *Camera Flore albo Braſilienſis. Marggr.* But I don't know that any particular Medicinal Virtues are aſcribed to it.

LYCHNIS INCANA. A Name for the *Myoſotis; incana; repens.*

LYCHNIS INDICA. A Name for the *Plumbago; Ceylanenſis; folio ſplendente Ocymaſtri; flore lacteo.*

LYCHNIS, SEGETUM, MINOR. A Name for the *Myoſotis; Hiſpanica, ſegetum.*

Beſides the foregoing Species of *Lychnis*, *Dale* mentions the following; which is,

MUSCIPULA. Offic. *Muſcipula viſcaria ſive Lychnidis Species.* J. B. 3. 349. *Viſcaria.* Ger. 481. *Viſcaria ſive Muſcipula.* Ger. Emac. 601. *Lychnis viſcoſa, rubra altera ſylveſtris.* C. B. P. 205. Raii Hiſt. 2. 1001. Tourn. Inſt. 337. *Lychnis ſylveſtris rubra minor.* Park. Theat. 632. CATCH-FLY.

It grows ſpontaneouſly among Corn, and flowers in *June* and *July*; the Seed is in Uſe, and has the ſame Virtues attributed to it, as the other Species of *Lychnis*.

LYCHNI-SCABIOSA.

The Characters are;

The Calyx is oblong, tubulous, cylindrical, multifid, deeply jagged, and ſimple. The five outer Flowers are monopetalous, tubulous beneath, and quadrifid above, the upper Segment being the largeſt, the two lateral ones leſs, and the loweſt the leaſt and ſhorteſt. The middle Flowers are tubulous and quadrifid, and produce each four Stamina, which ariſe from their Inſide. The Disk of the Calyx is not globular, but contains oblong *Ova*, whoſe Apices are adorned with the Crown of the Scabious; within this Crown it contains a little Flower, and produces a long Tube.

Boerhaave mentions but one Sort of this Plant; which is,

Lychni-ſcabioſa; flore rubro; annua. *Scabioſa Orientalis, flore Caryophylli quorumdam. Boerh. Ind. alt. Plant. Vol.* 1. *p.* 131.

There are no Medicinal Virtues aſcribed to this Plant at preſent that I know of.

LYCHNITES. A precious ſhining Stone, which is ſaid to grow in the Rocks in *Thrace*, and in the neighbouring Countries.

LYCIUM. Offic. Schrod. 4. 198. *Lycium Buxi foliis.* C. B. P. 478. *Lycium ſive Pyracantha.* Ger. 1151. Emac. 1322. *Lycium vulgatius.* Park. Theat. 1009. *Lycium Italicum.* J. B. 1. 59. Raii Hiſt.

Hiſt. 2. 1627. *Lycium Buxi foliis rotundioribus Syriacum vel Perſicum.* Breyn. Prod. 2. 64. BOX-THORN.

It grows in hot Countries. What is uſed of it in Medicine is the Rob, or concreted Juice of the Leaves and Branches, the Preparation of which is thus deſcribed by *Dioſcorides*: The Branches with the ſmall Roots are bruiſed, and, being firſt macerated for many Days, are boiled; then the Wood being thrown away, the Liquor is again boiled to the Conſiſtence of Honey. *Lycium* is adulterated by putting *Amurca*, or the Juice of Wormwood, or Ox-gall, into the boiling Liquor. In the ſame manner is *Lycium* prepared of the expreſſed and inſolated Seed. The beſt *Lycium* is what will burn, and, when quenched, ſhews a red Spume; is black on the Outſide, but, when broken, red within, which has nothing of a rank Smell, but a bitteriſh aſtringent Taſte, and is of the Colour of Saffron.

It is of an aſtringent Quality, and deterges whatever darkens the Pupil of the Eye; and cures the Ulcerations, Itchings, and inveterate Rheums, affecting the Eyelids. It is effectual, alſo, in Purulencies of the Ears, in Exulcerations of the Gums and Tonſils, Fiſſures of the Lips, or Rhagades of the Anus, and Abraſions, the affected Parts being anointed therewith. Exhibited either in Potion, or by way of Clyſter, it is very proper for the Cœliac Paſſion, and the Dyſentery. For an *Hæmoptoe*, or Cough, it is given in Water; and to thoſe who are bit by a mad Dog, it is preſcribed to be ſwallowed in Pills, or drank in Water. It renders the Hair yellow, cures a Paronychia, Herpes, and putrid Ulcers; applied in a Peſſary, it ſtops the menſtrual Flux; and drank in Milk, or taken in Pills, it relieves thoſe who are bitten by mad Animals. *Dioſcorides.*

There are two Species of *Lycium* mentioned by *Dioſcorides*; one is produced from a Plant growing in *Greece*, which is our preſent Subject, and is called ſimply *Lycium*; the other is prepared of an *Indian* Plant, of which we have ſpoken under the Article ACACIA, where it paſſes under the Name *Cate*. But, ſince the *Lycium* is unknown to the Moderns, there are different Opinions about it. The Shops, as *Schroder* writes, commonly make their *Lycium* of the Berries of the *Periclymenum*, or Honeyſuckles; others of the Fruit of the *Liguſtrum*, or Privet; and others of wild Plums. But they might have provided a better Succedaneum, as *C. B.* on *Matthiolus* obſerves, from the Oxyacantha, or the *Rhamnus*.

LYCIUM is, alſo, a Name for ſeveral Sorts of *Rhamnus*; which ſee.

LYCIUM INDICUM. See ACACIA.

LYCOCTONUM. See ACONITUM PONTICUM.

LYCOIDES, λυκοειδὴς, from λύκος, a Wolf, and εἶδος, Form. This is, by Authors, explain'd a ſort of Madneſs, or a Quinſey, cauſed by a Retention of the Seed; but I believe it imports the ſame as LYCANTHROPIA.

LYCOPERDON.

The Characters are;

It is ſimple, and ſhaped like a Sponge; within, it is replete with very fine Seeds, which, at the ſlighteſt Motion, when ripe, are diſploded like Smoke.

Boerhaave mentions eleven Species of this Plant; which are,

1. Lycoperdon; vulgare. *Tourn. Inſt.* 563. *Boerh. Ind. a.* 15. *Crepitus Lupi.* Offic. *Lupi Crepitus, ſive Fungus ovatus.* Park. 1323. *Fungus rotundus Orbicularis.* C. B. P. 374. *Fungus orbicularis, ſeu Lupi Crepitus.* Ger. 1385. Emac. 1582. *Fungus pulverulentus dictus Crepitus Lupi.* J. B. 3. 848. Raii Hiſt. 1. 104. Synop. 16. *Boviſta Officinarum.* Dill. Cat. 196. PUFF-BALLS, BULL-FISTS, MOLLI-PUFFS.

You meet with them in Paſture-grounds almoſt every-where in Autumn. The whole Plant is in Uſe, and is of a drying and aſtringent Quality; whence the Powder of it, ſprinkled on Wounds, ſtops their Bleeding: It, alſo, dries up inveterate Ulcers, and reſtrains the Flux of the Hæmorrhoids; but it is reckon'd hurtful to the Eyes. *Raii H. P. p.* 105. The Powder is a ſovereign Remedy againſt an Hæmorrhage. *Boerh.*

2. Lycoperdon; minus; & multiplex; ſphæricum. *T.* 563.

3. Lycoperdon; minus; & multiplex; ovatum. *T.* 563.

Each of theſe two laſt Species is white within, fleſhy, aſh-coloured without; it afterwards inclines to a Lemon-colour, and at laſt grows ſoft, dries up, burſts, and emits a tawny-coloured Duſt; and this Duſt is mixed with Whites of Eggs, to ſtop the Blood in all ſorts of Hæmorrhages. *Martyn's Tournefort.*

4. Lycoperdon; Alpinum; maximum; cortice lacero. *Tourn. Inſt.* 563. *Boerh. Ind. a.* 15. *Lycoperdon maximum.* Offic. *Fungus maximus rotundus, pulverulentus dictus, Germanis.* PFO-FIST. J. B. 3. 848. Raii Hiſt. 1. 105. Synop. 16. *Fungi rotundi orbiculares ſecundum genus.* C. B. P. 375. *Boviſta maxima alba.* Dill. Cat. 196. GREAT DUSTY MUSHROOM.

It is found in fat Paſtures, and by Dunghils. The whole Plant, which is ſometimes as big as a Man's Head, is in Uſe, and is recommended for ſtopping the moſt dangerous Hæmorrhages; for which Purpoſe *Cluſius* ſays, that the Barbers, in many Places of *Germany*, keep it by them.

5. Lycoperdon; ſemi-orbiculare. *T.* 563.

6. Lycoperdon; Pariſienſe; minimum; pediculo donatum. *T.* 563. 331. *Fig. E. E.*

7. Lycoperdon; oblongum; utrinque introrſum emarginatum. *T.* 563.

8. Lycoperdon; qui fungus globoſus, lævis, pallidus Ducis Poli & Rom. *Bocc. Muſ.* 1. 303.

9. Lycoperdon; parvum; mortarii bellici forma.

10. Lycoperdon; ingens; conoides; pileatum; plerumque gemellum.

11. Lycoperdon; Sphæricum; cortice tenaci caſtaneo. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 15.

All theſe Plants conſiſt of innumerable Veſicles, which contain a lacteous Humour, which becomes a Powder flying away like Smoke; this Powder, view'd in a Microſcope, appears to be Seed; the Plant inverted reſembles a Cap.

Lycoperdon, λυκόπερδον, from λύκος, a Wolf, and πέρδω, Crepitus, is the ſame as *Crepitus Lupi* in *Latin*, and was the Name given by the Antients to this Plant, becauſe they imagin'd the Dung of the Wolf became ſuch a kind of Fungus. All the Species are poiſonous, and very pernicious, if received into the Lungs or Stomach; but the great *Lycoperdon*, divided in the Middle, affords a Powder which is of excellent Uſe for ſtopping an Hæmorrhage. *Hiſt. Plant. aſcript. Boerhaav.*

LYCOPERSICON.

The Characters are;

The Flower reſembles that of the Nightſhade; the Fruit is carnous, ſoft, of a roundiſh Figure, and divided into ſeveral Cells containing Seeds.

Boerhaave mentions ſix Species of this Plant; which are,

1. Lycoperſicon; fructu albo. *T.* 150. *Solanum pomiferum, fructu rotundo, ſtriato, molli, albo.* C. B. P. 167.

2. Lycoperſicon; fructu Ceraſi rubro. *T.* 150. *Solanum, racemoſum, Ceraſorum forma.* C. B. P. 167.

3. Lycoperſicon; fructu; Ceraſi luteo. *T.* 150.

4. Lycoperſicon; Galeni. See AMORIS POMA.

5. Lycoperſicon; Galeni; fructu rubro. *Poma amoris, fructu rubro.* H. Eyſt. Aut. o. 1. F. 2. Fig. 1.

6. Lycoperſicon; fructu ſtriato; duro. *T.* 150. *Solanum, pomiferum fructu rotundo, ſtriato, duro.* C. B. P. 167. J. B. 3. 620. *Mala Æthiopica.* Dod. p. 459. *Boerh. Ind. alt. Plant. V.* 2.

It is called *Lycoperſicon*, λυκοπερσικὸν, from λύκος, a Wolf, and περσικὸν, a Peach, that is to ſay, in *Engliſh*, Wolf's Peach.

As to its Virtues, there has been a Diſpute, and Authors are not yet agreed about them; but to me it ſeems more proper to be rank'd among poiſonous than medicinal Plants; for the Seeds, taken inwardly, ſubvert the Stomach, and induce a Faintneſs, with a kind of apoplectic Diſorder. *Hiſt. Plant. aſcript. Boerhaav.*

LYCOPODIOIDES. See the Explication of Terms under the Article BOTANY.

LYCOPODIUM. Offic. *Muſcus clavatus ſive Lycopodium.* Ger. 1374. Emac. 1562. Park. 1307. Raii Hiſt. 1. 120. Synop. 25. *Muſcus ſquamoſus vulgaris repens, clavatus.* T. Inſt. 553. *Muſcus terreſtris repens ſive Clavatus.* C. B. P. 360. *Muſcus terreſtris a Trago pictus.* J. B. 3. 766. *Plicaria & Cingularia.* Polonis. CLUB-MOSS. See the Explication of Terms under the Article BOTANY.

It grows on Heaths, and hilly Places; and flowers in *July* and *Auguſt*. The whole Plant is in Uſe, and the Flower or yellow Powder of the Clubs.

Lycopodium refrigerates and dries; its principal Uſe is in expeling the Stone, and in Fluxes of the Belly. Outwardly it is of Service in faſtening looſe Teeth, and in drying and conſolidating Wounds, *Schrod.* in extirpating the *Plica*, *Ephem. Ger. Anno* 2. The Flower is very ſerviceable in the Epilepſy of Children, and in the Heartburn, and flatulent Gripes, with which they may be affected, *R. Synop.* It is recommended in pulmonary Diſorders, *Buxb.*

Bruiſed, or boiled in Wine, it has the Virtue of mitigating any Pain or Inflammation, and is therefore good to be applied warm to the Gout. A Dram of the Powder, taken in red Wine, cures Fluxes, and the Dyſentery.

The *Polanders*, but eſpecially the *Ruſſians* and *Lithuanians*, on account of its frequent Uſe in curing the *Plica*, a Diſtemper familiar and epidemic among them, call it *Plicaria* and *Cingularia*. They take this Plant, or Moſs, after dividing it with a Knife from the Bottom upwards, and infuſe it in a Decoction of Brank-urſine, firſt very well heated; and, after one or two very gentle Ebullitions, add ſome Ferment of white Bread, and ſet it aſide near the Furnace for Fermentation. Of this Decoction, either by itſelf, or with new-laid Eggs, in form of a Broth, they eat and drink every Day, waſhing the Head with the Decoction firſt well warmed, and ſometimes, for the greater Virtue, boiled over again with new Moſs, to a Lixivium of a dark-red Colour; after waſhing they uſe no Comb.

An Ointment for the PLICA.

Take of Plicaria, and the Roots of Bryony, equal Parts; of the Fat of the Hedghog, a ſufficient Quantity: Mix them well

well together, and ſet them in a Glaſs Veſſel well ſtopped *in Balneo Mariæ*, for an Hour; make them into an Ointment, with which anoint the Roots of the complicated Head of Hair, twice in a Day.

The Country-women in the *Ukraine*, when labouring under an exceſſive Flux of the Menſes, with Pains and Strangulations of the Uterus, prepare a Girdle of it, which they wear next their Skin; and bind it about their Heads as a Diadem, to repreſs an Hæmorrhage from the Noſtrils. *Ephem. Germ. An.* 2. The Seed of the Plant, given from twelve Grains to a Scruple, has had immediate Succeſs in an Epilepſy complicated with an Iſchury. *Ex Obſ. Wedelii, Ephem. Germ. An.* 3.

Gathered in the Months of *Auguſt* and *September*, it yields a very ſubtle yellow Powder, of great Virtue in the Epilepſy, Cardialgia, and Gripes: As much of it as will lie on the Point of a Knife, being taken, is an excellent Remedy to facilitate the Paſſage of the Urine. *Ephem. Germ. An.* 1 *Raii Hiſt. Plant.*

LYCOPSIS. A Name for the *Echium*; *Ægyptiacum*; *ferox*; *flore albo.*

LYCOPUS.

The Characters are;

The Calyx is ſhort, and divided into ſix acute Segments; the Flower is generally bell-ſhaped, and divided into four or five roundiſh Segments; the Whorles of the Flowers are pretty cloſely compacted, and are diſpoſed at a good Diſtance one from the other.

Boerhaave mentions two Species of this Plant; which are,

1. Lycopus; paluſtris; glaber. *Tourn. Inſt.* 191. *Boerh. Ind. A.* 186. *Raii Synop.* 3. 236. *Lycopus.* Offic. *Marrubium aquaticum.* Ger. 765. Emac. 700. Raii Hiſt. 1. 535. *Marrubium aquaticum vulgare.* Park. Theat. 1230. *Marrubium aquaticum quorundam.* J. B. 3. 318. *Marrubium paluſtre glabrum.* C. B. P. 230. WATER-HOREHOUND.

It grows by the Side of Brooks, and in watry Places; and flowers in *July*. The Herb is the Part uſed. The Plant is ranked, by *Monti*, in the Claſs of Aſtringents.

Lycopus, λυκόπους, is compounded of λύκος, a Wolf, and πούς, a Foot, that is to ſay, Wolf's-foot; becauſe the Antients imagined its Leaves to reſemble the Foot of a Wolf. Many things are related by the Antients concerning the Lycopus; but whether it be the ſame with what now goes by that Name, is not certain. The Antients called all vulnerary Herbs by this Name; but, as to any Virtue of this Plant in particular, we have nothing certain. *Hiſt. Plant. aſcript. Boerhaav.*

2. Lycopus; foliis in profundas lacinias diſſectis. *J.* 191. *Marrubium paluſtre, foliis profundiſſime diſſectis.* Flor. 1. 80.

LYGISMOS, λυγισμὸς, from λυγίζω, to bend, or diſtort. This Word occurs in *Dioſcorides, Lib.* 4. *Cap.* 107. and imports Contorſions, that is, of the Limbs.

LYGMOS, or LYNX, λυσμὸς, λύγξ. An Hiccough. See SINGULTUS.

LYMA, λῦμα, from λύω, to waſh. The Sordes, or Filth, of the Body, which comes off by waſhing; or the Excrements of the Belly.

LYME, λύμη, in *Hippocrates*, implies an Injury or Damage.

LYMPHA. The Lymph. A fine Fluid ſeparated in the Body from the Maſs of Blood, and contained in peculiar Veſſels.

Dr. *Keil* ſays, that, if you examine the Lymph chymically, you will find, that it contains a great deal of volatile, but no fixed Salt, ſome Phlegm, ſome Sulphur, and a little Earth.

The Uſe of this Lymph may be gathered from the Conſideration of the Parts into which it diſcharges itſelf. That which comes from the Head, Neck, and Arms, is thrown into the Jugular and Subclavian Veins. All the Lympheducts which the Parts in the Cavity of the Thorax ſend out, empty themſelves into the Thoracic Duct; and the Lymph from all the reſt of the Body flows to the Receptacle of the Chyle: So that there can be no Doubt, but that its chief Uſe is to dilute and perfect the Chyle, before it mixes with the Blood. Now the whole Lymph, which is ſeparated from the Blood, being requiſite for this Uſe, it is plain, that there could be no Glands in the Abdomen appropriated for the Separation of the whole Lymph, but what muſt have had a very great Share of the Blood which paſſes through the Aorta, in order to ſeparate ſo great a Quantity of Lymph. But the Liver and Kidneys requiring, likewiſe, a great Quantity of Blood, and which could not be avoided, Nature choſe to ſeparate the Lymph from the Blood which goes to all the Parts of the Body, rather than appoint particular Glands for it in the Abdomen, which would have been more at hand, but which would have robbed the other Parts of a large Quantity of Blood, and occaſioned a very unequal Diſtribution of it. *Keil.* See PAROTIS.

Below the Parotides, toward the Maſtoide Apophyſis, is fixed a ſmall Gland. It is round, and of an even Surface, without Tubercles, and it is the uppermoſt of a great Number of Glands of the ſame kind, which lie partly below the Interſtice between the parotid and maxillary Glands, and, at different Diſtances along the internal Jugular Vein, all the Way to the lower Part of the Neck. We obſerve among theſe Glands, and upon this Vein, a great Number of tranſparent Veſſels, with an Appearance of numerous Valves. The Fluid which they contain is tranſparent, a little mucilaginous, and is called *Lymph.*

The Veſſels are, likewiſe, termed *lymphatic Veſſels*, and the Glands, *lymphatic Glands.* Theſe Glands are not all equally large, nor equally round, ſome being oblong, thick, flat, and ſmall. The lymphatic Veſſels go out alternately by one Extremity from one Gland, and enter by the other Extremity ſome other Gland, near the former; and both as they go out, and as they enter, theſe Extremities are very much ramified. The Trunk is commonly ſingle, and the Valves are ſo diſpoſed as that the Fluid contained in the Veſſel can only run toward the Thorax, but cannot return to the Head.

Theſe Glands and Veſſels are to be found in many other Parts of the Body; we meet with them not only in ſeveral Parts of the Head, but, alſo, in many outward and inward Parts of the Thorax, Abdomen, and both Extremities. They accompany the maxillary ſalival Glands, as well as the Parotides; and there are ſeveral ſpread on the lateral and back Sides of the Neck, in the Membrana adipoſa, near the Muſcles.

In the Cavity of the Thorax the lymphatic Glands are ſituated at different Diſtances on one Side, and behind the Oeſophagus, eſpecially at the Place which is even with the fifth Vertebra of the Back. I have found ſome on the anterior Portion of the Diaphragm on one Side of the Mediaſtinum; and there are others round the Baſis of the Heart, in the Fat which lies there. They are to be met with, likewiſe, in the Subſtance of the Membrana adipoſa, which covers the Thorax, near the inner Surface, eſpecially about the Clavicles; and in the cellular Interſtices of the Muſcles which lie on the Thorax.

In the Cavity of the Abdomen theſe Glands are very numerous, and particularly round the ſuperior Orifice, and on the two Curvatures of the Stomach; on the Capſula of the Sinus of the Vena Portæ, on the cellular Ligament of the Gall-bladder, near the Beginning of the Ductus cyſticus; at the Adheſions of the Omentum to the Spleen, and to the Colon; through the whole Extent of the Meſentery; at the Adheſions of the Meſocolon; behind the Adheſions of theſe two Membranes to the Vertebræ of the Loins; near the Bifurcation of the Aorta; and along the Iliac Veſſels. There are, likewiſe, other ſuch Glands on the Outſide of the Abdomen, in the Subſtance, and toward the Inſide, of the Membrana adipoſa.

In the ſuperior Extremities of the Body, theſe Glands lie principally under the Articulation of the Os Humeri, with the Scapula, and in the Hollow of the Axilla. The moſt conſiderable lymphatic Glands in the lower Extremity are toward the lower Part of the Inguina, commonly called the Inguinal Glands, to which the Faſcia lata, or crural Aponeuroſis, gives a kind of double Capſula, which makes ſome of them lie very near the Skin, and the reſt at a greater Diſtance from it.

As all theſe lymphatic Glands differ more in Situation than in Size and Figure, they are commonly enumerated and denominated from the Places already mentioned, where they lie in the following Order:

Glandulæ Parotides Lymphaticæ, Glandulæ Maxillares Lymphaticæ, Glandulæ Jugulares, Glandulæ Cervicales, Glandulæ Occipitales, Glandulæ Claviculares, Glandulæ Axillares, Glandulæ Thoracicæ, Glandulæ Oeſophagææ, Glandulæ Mediaſtinæ, Glandulæ Cardiacæ, Glandulæ Ventrales externæ, & internæ, Glandulæ Stomachicæ, Glandulæ Hepaticæ, Glandulæ Cyſticæ, Glandulæ Epiploicæ, Glandulæ Meſentericæ, Glandulæ Lumbares, Glandulæ Iliacæ, Glandulæ Inguinales, Glandulæ Crurales, &c.

There are three Sorts of Veſſels, which now go by the Name of Lymphatics; whereas, formerly, that Word was uſed only to ſignify the tranſparent Veſſels already mentioned, which accompany the lymphatic Glands. The original Sources of theſe Veſſels are very difficult to be found out; and even their Diſtribution thro' the Body has not been ſufficiently traced to enable us to deſcribe them particularly. As to their Termination, we are ſure, that, for the moſt part, they end in the Thoracic Duct.

Beſides theſe Veſſels, which accompany the Glands, there are others of the ſame Structure, found on the ſeveral Viſcera, where no lymphatic Glands have hitherto been diſcovered. We meet with them in very great Numbers in the external Membrane of the Liver, and in the Duplicature of the ſuperior membranous Ligament of this Organ. Several Diſcoveries have been made about theſe Veſſels in Brutes.

The third Sort of Veſſels, termed Lymphatics, are the ſmall Arteries and Veins, which, in their natural State, tranſmit only the ſerous Part of the Blood. Theſe Veſſels differ from thoſe of the firſt, in the Smallneſs of their Diameter, and in their Structure and Situation. All theſe little Arteries and Veins are uniform, extremely narrow; and, tho' their Sides are not thinner than thoſe of the valvular Lymphatics, yet their Diameters are generally leſs. The other Lymphatics are full of Valves, and very thin, but they are not narrow in proportion. The arterial and venous Lymphatics are found on the Parts which are naturally white, as on the Skin, and the White of the Eye; and their Origins are eaſily diſcoverable; but the valvular Lymphatics are confined to the internal Parts of the Body, and are found

found on Parts of all Colours that are in the Body, and we cannot eaſily trace them to their original Sources. *Winſlow's Anatomy.* See CHYLUS.

LYMPHÆDUCTUS, or LYMPHATICA VASA. The lymphatic Veſſels. See LYMPHA.

LYNCEUS, λυγκεύς. The Name of a Collyrium mentioned by *Galen, de C. M. S. L. Lib.* 4. *Cap.* 7. and by *Paulus Ægineta, Lib.* 7. *Cap.* 16. It is recommended for wearing off callous Excreſcences, and ſharpening the Sight.

LYNCIS LAPIS. See BELEMNITES.

LYNCOURION, from λύγξ, a Lynx, and οὖρον, Urine, becauſe fabled to be produced by the concreted Urine of that Animal. *Dioſcorides, Lib.* 2. *Cap.* 100. makes it a Species of Amber, to which he adds the Epithet πλειυσαρόεσσα and ſays it is good for the Stomach, and in a Diarrhœa. Some will have it the ſame as the Lapis Lyncis, and I belive it is only another Name for that Stone.

LYNX. Offic. Schrod. 5. 301. Raii Synop. A. 166. Aldrov. de Quad. Digit. 90. Jonſ. de Quad. 82. Charlt. Exer. 14. *Lupus cervarius.* Geſn. de Quad. Digit. 677. *Unica.* Caius de Animal. 42. THE OUNCE.

The Parts in Uſe are the Fat, and the Claws; the Fat is proper for Reſolutions, Strains and Luxations of the Joints; the Claw is ſet in Gold and Silver, and worn as an Amulet againſt the Epilepſy and Convulſions. *Dale* from *Schroder.*

LYRA. A large Sea Fiſh, which is not uſed by way of Aliment; but, dried, and taken in Powder, in the Quantity of a Dram, it is ſaid to be aperitive. *Lemery des Drogues.*

LYSIMACHIA.

The Characters are;

The Leaves are oblong, entire, and grow two, three, or four together at each Joint of the Stalk. The Flower is monopetalous, expanded circularly, multifid, and ſcattered on the Tops of the Branches. The Fruit is a Shell, almoſt globular, and gaping at the Top.

Boerhaave mentions ſix Species of this Plant; which are,

1. Lyſimachia; lutea; major; quæ Dioſcoridis. *C. B. P.* 245. *Tourn. Inſt.* 141. *Boerh. Ind. A.* 202. *Lyſimachia.* Offic. *Lyſimachia lutea.* Ger. 386. Emac. 474. J. B. 2. 901. Raii Hiſt. 2. 1021. Synop. 3. 282. *Lyſimachia lutea major vulgaris.* Park. Theat. 544. *Nummularia erecta Rivini.* Rupp. Flor. Jen. 14. YELLOW WILLOW-HERB.

This Looſe-ſtrife has ſeveral brown hairy Stalks, two Foot high or more, having ſometimes three or four, but oftener only two Leaves at a Joint, which are of a yelloviſh-green Colour, and hairy underneath, and darker, about three Inches long, and an Inch broad in the Middle, growing narrower at both Ends. The Flowers ſtand ſeveral together on the Tops of the Branches, conſiſting of a ſingle Leaf divided into five Parts, with ſeveral Stamina in the Middle, of a yellow Colour, ſomewhat like St. John's-wort. The Seed-veſſels are round, and parted in two, containing very ſmall Seed. The Root is long and ſlender, and creeps upon the Surface of the Earth. It grows in watry Places, and by River-ſides.

The Antients commend this Plant for a great Aſtringent, and good for all kinds of Fluxes from any Part of the Body, as, alſo, to conſolidate the Lips of freſh Wounds, prevent their Bleeding, and heal them in a ſhort time. It is not often uſed. *Miller's Bot. Offic.*

This Plant is called *Lyſimachia* from *Lyſimachus* the Son of a King of *Sicily*, who is ſaid to be the firſt who diſcovered it. It delights in moiſt Places, but has no Virtues; for thoſe which *Dioſcorides* aſcribes to the Lyſimachia, ſeem not to agree to this, but to belong to ſome other Plant. *Hiſt. Plant. adſcript. Boerhaav.*

2. Lyſimachia; bifolia; flore luteo, globoſo. *C. B. P.* 245.

3. Lyſimachia; ſempervirens; ſpicata; Ephemerum dicta; flore Blattariæ. *H. L.*

4. Lyſimachia; Orientalis; anguſtifolia; flore purpureo. *T. Cor.* 7.

5. Lyſimachia; annua; minima; polygoni folio. *T.* 142. *Linum, minimum, ſtellatum.* C. B. P. 214. Prodr. 107. This is ſaid to be poiſonous.

6. Lyſimachia; Canadenſis; lutea; folio Jalappæ. *Sarazen. Boerhaave, Index alt. Vol.* 1. *p.* 101.

LYSIMACHIA is, alſo, a Name for ſeveral Sorts of SALICARIA.

LYSIMACHIA *cæruleo flore.* A Name for the *Veronica; ſpicata; longifolia.*

LYSIMACHIA *galericulata.* A Name for the *Galeopſis; paluſtris; folio Betonicæ; flore variegato:* And for the *Caſſida; paluſtris; vulgatior; flore cæruleo.*

LYSIMACHIA *humifuſa.* A Name for the *Nummularia; lutea; major;* and, alſo, for the *Nummularia rubra.*

LYSIPONION, λυσιπόνιον. The Name of an Acopon deſcribed by *Paulus Ægineta, Lib.* 7. *Cap.* 19. In *Myrepſus, S.* 1. there is an Antidote, intituled *Luſiponos,* quoted from *Galen.*

LYSIS, λύσις. Solution. It is uſed relative to Luxations; to the Termination of Diſeaſes; to an Evacuation by Stool; to the menſtrual Flux; to Bandages; and to all kinds of Weakneſs.

LYSSA, λύσσα, λύττα. That Species of Madneſs, which is ſaid to be peculiar to Dogs and Wolves. But it is, alſo, uſed to expreſs the Madneſs in Man, excited by the Bite of a mad Animal. See HYDROPHOBIA.

LYSSODECTOS, λυσσόδηκτος, from the preceding Word, and δήκω, to bite. A Perſon bitten by a mad Animal; or one labouring under the Diſtemper thereby excited.

LYTERIOS, λυτήριος. An Epithet for thoſe Signs which precede the Solution of Diſeaſes.

LYTHRON, λύθρον. Duſt mixed with Sweat and Blood. *Heſychius.* In *Hippocrates's* Epiſtle to *Damagetus,* it ſignifies the excrementitious menſtruous Blood.

M.

M. For the Signification of this Letter in the chymical Alphabet, ſee ALPHABETUM CHYMICUM.

In Preſcriptions it imports *Miſce,* Mix; or *Manipulus,* an Handful.

MABOUJA. A very hard Root of a Tree, of which the ſavage *Americans* make themſelves Clubs. We are told by *Lemery,* that *Mabouja,* in the Language of theſe Savages, ſignifies the Devil; and that they give the Name to this Root, becauſe, when armed therewith, they look upon themſelves to be very terrible.

MACALEB *Geſneri.* See *Mahaleb,* under the Article CERASUS.

MACALEB *Serapionis.* A Name for the *Phillyrea; latifolia; lævis.*

MACANDON. The Name of a coniferous Tree, mentioned by *Bontius,* which grows in *Malabar,* called, alſo, *Cada Palava.* H. M.

Bontius writes, that the Fruit is exactly like the Pine-nut; only it ends not in ſo acute a Cone, nor is of ſo ſtony an Hardneſs, but quite ſoft, and of a faint, or rather inſipid Taſte. The Flowers he compares to thoſe of the Honeyſuckle.

The *Malayans* roaſt the Fruit under the Aſhes, and eat it for the Dyſentery, and to mitigate the Violence of the Cholera Morbus. They ſay, alſo, that it is good in pectoral Diſorders, the Aſthma, Phthiſis, and Pleuriſy, on account of the emplaſtic Virtue of its mucous Parts.

Bontius thinks it ought to be called the *Indian Tree Comfrey,* or *Tree Conſolida,* becauſe he more than once experienced the conſolidating Virtue of the Fruit, in an Hoſpital, for a Spitting of Blood. The Leaves, alſo, he ſays, are incarning; and are excellently qualified for generating Fleſh in Wounds and Ulcers, and inducing a Cicatrix. For the ſame Purpoſe a Salt may be extracted from the Leaves by Chymiſtry; which Salt, beſides its conſolidating Quality, has, alſo, a mundificant Virtue in cleanſing inveterate and malignant Ulcers. The expreſſed Juice, boiled with the Oil of the Leaves of the Fig-tree, is good to anoint Parts affected with the Gout. *Raii Hiſt. Plant.*

MACEDONICUS. An Epithet for a Plaiſter deſcribed by *Aetius,* and by *Paulus Ægineta, Lib.* 7. *Cap.* 17.

MACEDONISIUM SEMEN. This Seed is directed by *Nicolaus Myrepſus, Sect.* 1. *Cap.* 1. as an Ingredient in the *Antidotus aurea Alexandri. Fuchſius* informs us it is the Seed of the *Hippoſelinum,* Alexanders.

MACER. Offic. Theoph. *Macer veterum.* C. B. P. 408. *Macer Græcorum.* Park. Theat. *Macer Dioſcoridis & Græcorum.* J. B. 1. 262. *Ulmo affinis, vaſculis membranaceis & ſemine intus incluſo compoſito.* Raii Hiſt. 2. 1779. THE GRECIAN MACER.

It is brought from *Barbary*, and the Part in Uſe is the thick yellow Bark, which has a very aſtringent Taſte, and is ſaid by *Dioſcorides* to be good for Spitting of Blood, the Dyſentery, and Fluxes.

The recent Bark of the Root, mixed with Oxygala, or ſour Milk, is uſed by all the Phyſicians of *Malabar*, and other Parts of the *Eaſt-Indies*, with very good Succeſs, in curing all ſorts of Dyſenteries, and Fluxes of the Belly. Some macerate half an Ounce of the Powder of the dried Root in four Ounces of Whey, and give it twice in a Day, Morning and Evening; after which they exhibit boiled Rice, without Salt or Butter; and immediately after that, Chickens bruiſed, macerated, and boiled in a Decoction of Rice: Sometimes, if Neceſſity requires, they mix Opium with it. The *Arabians*, alſo, uſe the ſame, mixed with Nutmeg, in the Cure of all kinds of Fluxes of the Belly. The Root uſed with Water of Mint, and Powder of Maſtich, is believed to be ſalutary and effectual in reſtraining Vomitings, and corroborating the Stomach. The *Indian Jogues* aſſure us, that a little Bit of this Tree is of more Effect in ſtopping Vomitings and Looſeneſſes, than a great Quantity of the Bark of Myrobalans or Areza; and that it excels the *Malabarian Coru:* Moreover, that the Fruit *Macre* deſtroys all ſorts of Worms in the human Body, and breaks the Stone in the Kidneys, and ſecures thoſe who eat it every Day in the Morning from the Stone and the Colic, and from Inebriation. The Similitude of the Name, *Macer* and *Macre*, and their Agreement in Virtues, prove this Bark to be the *Macer* of *Dioſcorides*. *Raii Hiſt. Plant.*

Mr. *Juſſieu*, in the Memoirs of the Royal Academy of Sciences, for 1729. ſeems to think the Macer of the Antients the ſame as the SIMAROUBA; which ſee.

MACERATIO. Maceration. This is an Infuſion, or ſoaking Ingredients in Water, or any other Fluid, in order either to ſoften them, or get out their Virtues. *Lemery* defines Maceration to be a ſort of Digeſtion, confined to thick Subſtances. Thus, ſays he, when Roſe-leaves are put into Fat, in order to make Oil of Roſes; this Mixture is expoſed for ſome Days to the Sun, in order to macerate, that the Quality of the Roſes may be the better convey'd to the Fat. *Pharm. Univerſ.*

MACHA, in *Paracelſus*, ſignifies a Beetle.

MACHÆRIA. Peach-kernels. *Galen, Lib.* 5. *de Comp. M.S. Loc. Cap.* 9.

MACHÆRION, μαχαίριον. MACHÆRIS, μαχαιρὶς. A Chirurgical Inciſion, or Amputation-knife. A Part of the Liver of Animals was thus called by the *Aruſpices*, according to *Ruffus Epheſius*; but, he ſays, in Man it is ſcarcely diſcoverable. *Lib.* 1. *Cap.* 28. *de Appellat. Partium Corporis.*

MACHAL, imports fixed. *Rulandus.*

MACHA-MONA. A kind of *African* Calebaſh. It is the Fruit of a very large Tree, which grows in *Africa*, and the *American* Iſlands. When this Fruit is ripe, the Pulp has a ſouriſh Taſte, with a little Aſtringency; it is delicious in hot Countries, and they prepare a Liquor of it, which they uſe inſtead of Lemonade to cool and refreſh themſelves; and give it to ſick Perſons under a Looſeneſs. The Pulp, dried, taſtes as well as the ſpiced Bread of *Rheims*. The Slaves make a kind of thick Gruel with this Pulp and Water; it is of an abſorbent Quality. The *African* Women uſe the Pulp inſtead of Rennet, for curdling their Milk.

The Seeds of this Fruit are as big as ſmall Pine-apple Kernels, kidney-ſhaped, of a Cheſnut-colour, and incloſing an Almond far more delicious than our ſweet Almonds. *Lemery des Drogues.*

MACHAON, the Son of *Æſculapius*, and Brother of *Podalirius:* He was the elder Brother, as may be inferred from what *Podalirius*, in *Q. Calaber*, ſpeaks concerning his Death. "This "dear Brother of mine, *he ſays*, educated me as if I was his "own Son, after our Father was received into Heaven, and "taught me to cure Diſeaſes." Tho' *Homer* always mentions *Podalirius* firſt, it appears to be only for adjuſting his Verſe; and what he ſays of *Machaon* in other reſpects, plainly ſhews that he was the moſt eſteem'd of the two; and that he was ſent for, preferably to his Brother, to attend the greateſt Officers in the Army. It was *Machaon*, who had the Treatment of *Menelaus*, when he was wounded by *Pandarus*; he it was who cured *Philoctetes*, when lame of a Wound in one of his Feet, by the careleſs letting fall of an Arrow, dipt in the Blood of the Hydra. This Cure proves *Machaon* to be more skilful in his Art, than *Chiron* the Centaur, who could not cure himſelf of a Wound of this Nature.

As to other reſpects, the two Brothers were both Soldiers, as well as Phyſicians; and *Machaon* ſeems to have been the braveſt of the two: He was of the Number of thoſe who enter'd into the Wooden Horſe, and once was wounded in the Shoulder, in a Sally made by the *Trojans*; at laſt he was killed in a Duel by *Nireus*, or, as others ſay, by *Eurypylus*, the Son of *Telephus*, leaving, by his Wife *Anticlea*, two Sons, *Nicomachus* and *Gorgaſus*, who lived at *Pheræ*, and poſſeſſed their Grandfather's Kingdom, till they were expelled by the *Heraclidæ*, on their Return from the *Trojan* War. *Pauſanias* mentions three other Sons of *Machaon*, *Sphyrus*, *Alexanor*, and *Polemocrates:* Some of the Sons ſeem to have been Phyſicians; and, perhaps, they all followed their Father's Profeſſion, which was preſerved in the Family with great Care. It is not certain whether *Machaon* was a King in his own Right, or acquired it by his Wife; but *Homer*, in two or three Places, calls him *Paſtor of the People*; a Title which he gives to *Agamemnon*, and the other Kings. *Pauſanias* relates further, that *Machaon* was buried at *Meſſene*, whither his Bones were carried from the Camp before *Troy*, by the Care of *Neſtor*.

Podalirius, in his Return from the *Trojan* War, was caſt by a Tempeſt on the Coaſts of *Caria*, where a Shepherd, who had entertained him, having diſcover'd that he was a Phyſician, conducted him to the King *Damæthus*, whoſe Daughter had fallen from the Top of an Houſe. *Podalirius* cured her, by Bleeding in both Arms; which ſo pleaſed the King, that he gave her to him in Marriage, with the *Cherſoneſus*, where *Podalirius* built two Cities; one called *Syrnum*, from *Syrna*, the Name of his Wife; and the other *Bybuſſus*, which was the Name of the Shepherd, who had relieved and entertained him after his Shipwreck. *Podalirius*, beſides other Children, had one called *Hippolochus*, from whom *Hippocrates* was ſaid to be deſcended.

This is the firſt Inſtance we have upon Record of Phlebotomy, and is related by *Stephanus Byzantinus*.

MACHINA, μηχανὴ, μηχάνημα, a Machine, in Medicine, ſignifies in a general Senſe, the larger kinds of Chirurgical Inſtruments; particularly ſuch as are contrived for the Reduction of Luxations: Of theſe *Oribaſius* has left a particular Tract. Sometimes it is to be underſtood particularly of the *Scamnum Hippocratis*; as in *Galen, Lib.* 4. *de Artic.*

MACHIS, a Term beſtow'd by *Paracelſus* on all Beetles, and other Inſects, which are not generated of Dung. *Paragraphor. Lib.* 2. *Sat.* 5.

MACIS. Mace. See NUX MOSCHATA.

MACOCKI *Virginiani ſive Pepo Virginianus.* Ger. Emac. *Pepo Virginianus.* C. B. The *Virginian* Macock, or Pumpion. *Raii Hiſt. Plant.*

MACOCQUER, *Fructus orbicularis, Granis Cordis Effigie.* C. B. An orbicular Fruit, four Inches in Diameter, with an Heart-ſhaped Kernel. It is taken by *Ray* for a Species of the preceding. *Raii Hiſt. Plant.*

MACOUNA. A Species of Phaſeolus, or Kidney-bean, growing in *Braſil. Raii Hiſt. Plant.*

MACAXOCOTLIFERA *Arbor Nieremberg.* A Tree in the *Weſt-Indies*, about the Size of an ordinary Plum-tree: The Fruit is called *Macaxocotl*, and is red, and of a long Figure, of the Size of a moderate Walnut, with large Stones, and a ſcanty, ſoft, and juicy Pulp, yellow on the Inſide like the Stone. This Fruit is eaten, and well-eſteem'd, by *Europeans*, who are accuſtom'd to them; for they looſen the Belly, and by their ſweet Taſte, mixed with a kind of Sharpneſs, are pleaſing to the Palate. The ſecond Species is the *Atoyaxacotl*, which is much leſs than the former, of a yellow Colour, orbicular Shape, of a finer Smell; has a ſmaller round Stone, and a more pleaſant Taſte. The third is the *Coztieczocotl*, as the *Mexicans* call it, which is eſteem'd by many a Species of Myrobalans. This Sort is pale, large, ſpotted, and of a more grateful Pulp than the reſt. The fourth is the *Atoyaxocotl Chichiltic*, which is the leaſt of all, of a ſcarlet Colour, and of a ſweeter Smell than the reſt. The laſt is the *Chichiaxocotl*, which ſignifies *running down with Sweat*; this Species is of the Size of a Walnut, of the Colour of a Raiſin, of a more plentiful Pulp, and ſmaller Stone, than the others. Theſe Trees grow in hot open Countries, which are well cultivated and water'd. The Decoction of the Bark of the Trees cures the Itch, and Swellings in the Legs, and the Powder thereof heals Ulcers. It is common to all theſe Trees to produce their Fruit, which adheres to the Trunk and Branches, before their Leaves; which is a Property belonging to very few Trees. Of the Leaves are prepared acid Brines and Pickles, which are opening and looſening to the Belly. The Fruit affords no very grateful or wholſome Aliment. The Aſhes of the Wood are uſed by the young Women to colour their Hair yellow. *Raii Hiſt. Plant.*

MACRAUCHEN, μακραυχὴν, from μακρὸς, long, and αὐχὴν, a Neck, long-necked. *Galen, Com.* 1. *in* 6. *Epid. T.* 3.

MACROCEPHALUS, μακροκέφαλος, from μακρὸς, long, and κεφαλὴ, a Head. Long-headed. A Property or Affection endemic to ſome People of *Aſia*, called therefore, by *Hippocrates, de Aëre, Aq. & Loc. Macrocephali*, Longheads.

MACROCOSMUS, the great, external, and extended World, with reſpect to Man, the *Microcoſmos*, or little World. In adorning, diſplaying, and comparing theſe two Worlds, the Followers of *Paracelſus* and *Helmont* have exerted their Wits upon all Occaſions. *Caſtellus.*

MACROPHYSOCEPHALUS, μακροφυσοκέφαλος, from μακρὸς, long, φῦσα, a Flatus, and κεφαλὴ, a Head, is one who has

has his Head diſtended beyond its juſt Dimenſions, by ſome flatulent Affection. *Caſtellus.*

MACROPIPER. See PIPER LONGUM.

MACROPNUS, *μακρόπνους*, from *μακρὸς*, long, and *πνέω*, to breathe, is one who fetches his Breath at long Intervals. *Hippocrates, Lib.* 2. *&* 6 *Epid.* Macropnus is oppoſed to Brachypnus. See BRACHYPNOEA.

MACULA, *ἐξάνθημα, σπίλος, κηλὶς*, in Medicine, is a cutaneous Efflorescence, which changes the Colour of the Cuticle. There are *Maculæ Peſtilentes*, peſtilential Spots, or Efflorescences. *Maculæ Hepaticæ*, hepatic Spots, or Effloreſcences, proceeding from a Ichoreſcence of the Blood, attended with a ſort of Coagulation. *Maculæ Volaticæ*, volatic, or ſoon vaniſhing Spots, familiar to Children, from a Fermentation of the ſanguineous Ichor. *Maculæ* is, alſo, a Name for the *Nævi materni*, or native Spots and Blemiſhes, or for any morboſe Mark or Character impreſſed on the Fœtus. *Macula Oculi*, in *Rulandus* and *Johnſon*, is a Cataract or Suffuſion. *Caſtellus. Maculæ albæ*, white Spots, are thoſe Affections of the Cornea Tunica of the Eye, which are comprehended under the Names of *Albugo*, *Leucoma*, *Nebula*, and *Nubecula*. *Heiſter.*

MADAROS, *μαδαρὸς*, from *μαδάω*, to diſſolve and melt away through an Exceſs of Moiſture; ſmooth, bald; *μαδάρωσις*, *μάδησις*, (*Madrotes*, *Madiſis*) a Deflux, or Falling off of the Hair, Baldneſs.

MADAROSIS, *μαδάρωσις*, in a ſpecial Senſe, is the ſame as *Milphoſis*, *μίλφωσις*, or a Falling off of the Hairs of the Eyelids. See DEPLUMATIO. This kind of Affection belongs, and is aſcribed, alſo, to very humid and foul Ulcers. *Hippocr. de Humor.* and 6 *Aph.* 4. where we read, *τὰ περιμάδαρα ἕλκεα κακοήθεα*, "Ulcers, with a bald Circumference, are malignant."

MADEFACTIO, *ὑγεγονὸς*. The ſame as HUMECTATIO; which ſee. *Madefactibilia*, Madefactibles, are ſuch Things as admit adventitious Moiſture into their innermoſt Subſtance, as Wool, and a Sponge. *Caſtellus.*

MADELCON, *μάδελκον*. A Name in *Dioſcorides* for *Bdellium.*

MADIC. Butter-milk. *Rulandus.*

MADICUM. A Collyrium in *Oribaſius*, *Synopſ. Lib.* 3. ſo called, becauſe the Ingredients are levigated and moiſtened with Water.

MADISTERION, *μαδιςήριον*, an Inſtrument for rendering the Skin ſmooth, by taking away the Hairs.

MADOR, *ἱδρὼς*, ſuperfluous or adventitious Moiſture: *Cocta* (Things boiled) were called by the Antients *madida*, (moiſt); for *madere* with them meant the ſame as *coqui*, as is obſerved by *Rhodius ad Scribon.* N° 41. for, by Boiling, Things are moiſten'd and ſoften'd. In the ſame Senſe it is uſed by *Helmont*, *Tr. Aſthma & Tuſſis*, N° 75. where he denies, that *madida* (that is, *decocta*) dry up the Humours. In a preternatural State, the Sweat which ariſes under a Syncope, or Fainting, whether it be cold or hot, is not really *Sudor* (Sweat); but may, more properly, be called *Mador.*

MADREPORA, a petrifying Plant, growing in the Sea, and diſtinguiſhed from Coral only by ſeveral Perforations in its Branches, which are pretty frequently diſpoſed in the Form of a Star. It is commonly white, ſometimes grey, ſometimes red marked with white: There are many Species of it mentioned by *Imperatus*, *C. Bauhine*, and *Tournefort*. *Boerhaave* enumerates twenty-four.

Though the Madrepora has really its Origin and Growth in the Sea, it is ſometimes found on the Land, and even in Places which are elevated, and at a good Diſtance from any Water. M. *Juſſieu* preſented one to the Royal Academy of Sciences, in *November* 1709. which was found on the Mountain of *Chaumont* in *Normandy*. This Madrepora was porous, light, of a white Colour, and in all reſpects like the common Madrepora, reſembling white Coral.

It is ſurpriſing, that a Subſtance, which, probably, had its Origine no-where but in the Sea, ſhould be found in Places ſo far diſtant, and even on Mountains, as in its proper Matrice. But the Madrepora is not the only Production of the Sea, which we meet with on the Land, where we ſee Mountains, and other Places, abounding with a great Variety of petrefied Shells, which ſeem calcin'd by their long Continuance in that Situation. We find alſo Teeth of Fiſhes, and ſeveral other Parts of Sea-animals, which could never be carried thither, but by extraordinary Tempeſts and Inundations; and we might even go as far back as the Deluge to account for them.

All theſe petrefied Plants are alcaline and aſtringent: Levigated, and taken inwardly, they produce the Effects of Coral. The Doſe is from half a Scruple to two Scruples, for a Diarrhœa and Hæmorrhages. *Lemery des Drogues.*

MÆMACYLON, (*Oribaſ.*) MEMACYLON, (*Dioſcorides*). the Fruit of the ARBUTUS; which ſee.

MÆNA. Offic. Rondel. de Piſc. 1. 138. Bellon. de Aquat. 125. Geſn. de Piſc. 519. Aldrov. de Aquat. 223. Raii Ichth. 318. Ejuſd. Synop. Piſc. 135. Charlt. Piſc. 25. Jonſ. de Piſc. 54. THE CACKEREL.

It is taken in the *Mediterranean* Sea. The Head, burnt to Aſhes, and ſprinkled on the Part, cures callous Fiſſures of the Anus. The Garum, prepared of the Fiſh is good to waſh putrid Ulcers in the Mouth. *Dioſcorides, Lib.* 2. *Cap.* 32.

MAGALAIZE, *Maganaize*, *Magneſe*, *Magne*, is a ſhining Mineral, much like Antimony, but more tender and brittle: There are two Sorts, the grey and the black; the firſt is very ſcarce; they are both found in the Quarries of *Piedmont*. It ſerves to purify and whiten, and is uſed by the Potters, Enamellers, and Glaſs-makers. *Lemery de Drogues.* See MAGNESIA.

MAGDALEONES. Maſſes of Plaiſters, or other Compoſitions reduced to a cylindrical Form; they are, alſo, called *Cylindri*, *κύλινδροι.*

MAGDALIÆ. The ſame with the preceding.

MAGDALIDES, in *Scribonius Largus*, N° 201. are the ſame as MAGDALEONES.

MAGIS, *μαγὶς*, in general, ſignifies a Maſs or Quantity of any thing, ſufficient to fill the Hand; much the ſame as MAGMA. *Galen, Exeg.* In *Hippocrates, Lib.* 1. *de Morb. Mul. & de Steril.* it ſignifies, in a ſpecial Senſe, a Compoſition of Heads of Garlick, ſtrong Cheeſe, and Polenta, beaten up together, and made into a ſort of Pudding. *Magis*, in *Pollux*, ſignifies a Kneading-trough.

MAGISTERIUM, Magiſtery, is a Term differently uſe; for, firſt, it is aſcribed to Powders prepared by Solution and Precipitation, as Magiſtery of Hartſhorn, and of Corals: Secondly, it is beſtowed on Reſins, or reſinous Extracts, as Magiſtery of Scammony, of Jalap, and the like; though, accurately ſpeaking, the true Magiſtery, they ſay, exiſts only when ſomewhat of a Menſtruum remains united with the extracted Eſſence. *Schroder.*

Magiſtery is a Name which the antient Chymiſts gave to certain white and very light Precipitates: By this Term they would have us underſtand a very ſubtile and exquiſite Preparation. *Lemery, Cours de Chymie.*

The Word Magiſtery is commonly uſed for a Powder, generally white, prepared of ſome certain Subſtances by Precipitation. Theſe Subſtances are either of the mineral kind, as Earth and Stones; or Vegetables, as Herbs, and the like; or Animals, as Bones, Horns, and cruſtaceous Parts. The Method of preparing it is after the following manner: Take the Subſtance from which you deſign to prepare the Magiſtery, and bruiſe or break it groſly; then pour thereon a proper Liquor, an Acid or the like, in order to its Solution or Extraction. The Solution is precipitated by an Affuſion of the Liquor, or by the Matter by whoſe Force that of the Solvent is blunted: The precipitated Powder may be waſhed, if neceſſary, with common Water, and afterwards gently dried. *Schroder, Lib.* 2. *Cap.* 67.

MAGISTRALIS. An Epithet beſtowed on ſuch Medicines, eſpecially compound ones, as are prepared for preſent Uſe, and not to be found in the Shops, being the ſame with what are otherwiſe called *Medicamenta extemporanea*, extemporaneous Medicines. *Caſtellus.*

MAGISTRANTIA. The *Imperatoria*, Maſterwort, is ſometimes ſo called.

MAGMA, *μάγμα*, in a large Senſe, ſignifies any thick Ointment, which is made up with but a ſmall Quantity of Liquids, in order to prevent its running abroad. In a ſtricter Senſe it means the Recrement of an Ointment, or the Fæces which are left after the Expreſſion of the more liquid Parts. *Galen* reſtrains the Word *Magma* to the Fæces of Myrobalans, *Lib.* 7. *de C. M. P. G.*

MAGNA ARTERIA. The ſame as AORTA.

MAGNALE, *μεγαλεῖον*. The Work of God. *Rulandus. Linden.* In *Paracelſus*, and his Followers, it ſignifies ſome occult and divine Virtue. *Helmont* deſcribes the *Magnale magnum* to be a kind of Spirit, who adminiſters to Sympathy and Antipathy, is the Prompter and Promoter of Actions, and by virtue of which Magnetiſm is conveyed, as by a Vehicle, to a diſtant Object, *Tr. de Magnet. vuln.* Again, Magnale, he ſays, in mixt things, is the Æther, which is thinner than Air, and of an ambiguous Subſtance between Body and No Body, receiving only the external Conſtellations of its native Soil. *Paradox* 2. N° 12. and elſewhere. Magnale, as it has nothing like itſelf among created Beings, ſo it will admit of no Manifeſtation by Reſemblance. The Magnale is not Light, but a ſort of conjugal Form aſſiſting the Air. *Tr. Vacuum Naturæ.*

MAGNES. Offic. Mer. Pin. 212. Schw. 384. Calceol. 257. Boerh. 438. Aldrov. Muſ. Metall. 553. Worm. 62. Charlt. Foſſ. 62. *Lapis Magnes.* Matth. 1384. THE LOAD-STONE.

The Load-ſtone of the Shops, *Ἡρακλεωτικὸς λίθος* and *Ἡρακλειτὶς* of the *Greeks*, *Lapis Heraclius*, from *Heraclea* a Town in *Lydia*; *Μαγνήτης*, from *Magneſia*, another Town in *Lydia*; *Σιδηρίτης*, from its attracting Iron; *Magnates* of *Avicenna*, and *Calamita* of *Rhaſes*; is a ferruginous, denſe, foſſile Subſtance, of a blackiſh, bluiſh, or rediſh Colour, attracting Iron, or another Magnet, or repelling them; and directing its Poles always to thoſe of the World, when it is at Liberty to move. This Subſtance

is

is not to be confounded with the Magnes of *Theophraſtus*, which, he ſays, was white, and ſhining like Silver; not hard, but eaſily made into Veſſels by the Turners Art; neither did it attract Iron. It was, however, named from the ſame *Magneſia* in *Lydia*. Another Name of the Load-ſtone is *Lapis Lydius*, which is, alſo, applied to what we call the Touch-ſtone, by which the Truth of Gold and Silver are tried. Theſe two Significations of *Lapis Lydius* are, therefore, carefully to be diſtinguiſhed, becauſe they are very different.

Some of the antient *Greeks*, having obſerved the Virtue of the Magnet in repelling Iron, believed there were two Kinds of it, different from each other, one which attracted Iron, the other which repelled it.

The Load-ſtone is found in many Parts of *Europe*, and for the moſt part in Iron Mines; but the beſt are thoſe which come from the *Eaſt Indies*, and *Ethiopia*. It is, undoubtedly, a kind of Iron Ore: and, in ſome Places in *Germany*, they actually extract the Iron it contains: When expoſed in the Focus of a great Burning-glaſs, it, likewiſe, manifeſtly diſcovers Iron. The Virtues of the Magnet in attracting and repelling Iron, and in turning its own Poles to thoſe of the World, are very wonderful; and eſpecially its being able to communicate theſe Virtues to the Iron which it touches.

The Load-ſtone is not uſed inwardly in Phyſic; though *Galen* ſays it has the ſame Virtues as the Blood-ſtone; and, alſo, mentions its purgative Virtue, and recommends it, on that account, in Dropſies. *Dioſcorides* propoſes, that it be given in the Quantity of three Oboli, to evacuate groſs melancholy Humours. Some think it poſſeſſed of a deleterious Quality, which is denied by others; but I imagine the poiſonous Quality is to be underſtood of that kind of Magnes mentioned by *Theophraſtus*, which I take to be a kind of native Litharge.

The true Load-ſtone, externally uſed, is drying, aſtringent, and conſolidating. It is an Ingredient in the *Emplaſtrum Manus Dei*, *Emplaſtrum divinum*, *Emplaſtrum nigrum*, and *Emplaſtrum ſtypticum* of *Charas*. *Geoffroy*.

It is of an aſtringent Quality, and ſtops Bleeding; being burnt, it expels groſs and atrabilious Humours, but it is ſeldom uſed. *Schroder*. It is preſcribed in Hernias. *Hoffman*. *Paracelſus* makes it an Ingredient in a Plaiſter prepared, not only for extracting the Head of an Arrow from the human Body, but all manner of Dirt and Filth whatever. *Dale*.

MAGNES ALBUS. Mont. Exot. 13. *Magnes candidus*. Kentm. 14. THE WHITE LOAD-STONE. *Dale*.

This Load-ſtone is called, by the *Italians*, *Calamita alba*, and *Magnes carneus*; becauſe, as the true Load-ſtone draws Iron, this is ſuppoſed to draw Fleſh. It is a white Stone, marked with black Spots, which, if laid on the Tongue, ſticks very cloſely to it; and is no other than a kind of rocky Marl, found ſometimes in the ſame Mines with the Load-ſtone. It is fooliſhly and fictitiouſly ſaid to be of wonderful Efficacy in Love Affairs. *Geoffroy*.

According to *Monti*, it abſterges with an Aſtringency, and is to be reckoned among Antarthritics, Antiſcorbutics, and Aperitives. *Dale*.

MAGNESIA is commonly the ſame as *Marcaſita*, a Marcaſite; but, as a Term of Art, ſignifies melted Tin, into which Mercury being caſt, is thoroughly mixed and incorporated with it into a brittle Subſtance, and white Maſs. It is, alſo, *Argenti cum Mercurio Mixtura*, a Mixture of Silver and Mercury, and a very fuſile Metal, diſſoluble as Wax, and of a moſt ſurpriſing Whiteneſs, called the *Magneſia Philoſophorum*, the Philoſophers Magneſia. Again, it is taken for the Matter of the Philoſophers Stone, and for Sulphur. *Rulandus*, *Johnſon*. Synonymous Terms for this Arcanum or grand Secret of the Philoſophers in the Magiſtery of the Stone (*in Magiſterio Lapidis*) are *Lac Maris*, *Coagalum*, *Aphroſelinum Orientis*, *Magneſia Lydiæ*, *Italicum Stibium*, *Pyrites Achaiæ*. *Theat. Chym. Vol.* 1. *p.* 778. Antimony is, alſo, called *Magneſia Saturni*. *Schroder*, *Lib.* 3. *Cap.* 17. *Caſtellus*.

MAGNESIA. Offic. Geoff. Laet. Ed. Angl. 178. *Manganeſe*. Mer. Pin. 212. Schwench. Not. in Boerh. Chym. 140. *Sapo vitri*. Mer. Ars Vit. SOAP OF GLASS.

Magneſia, or Maganeſia, is a foſſil, metallic, ferruginous Subſtance, reſembling Antimony in its ſhining Colour, and very brittle. *Pomet* mentions two Kinds of it, one Aſh-coloured, which is not eaſy to be got, and, therefore, little uſed; the other black, which is very common. It is uſed in making and purifying of Glaſs; for, by mixing a ſmall Quantity of it with the Glaſs, whilſt in Fuſion, it clears it from any green or bluiſh Colours, and makes it more tranſparent and bright: On that account *Merret* termed it *Sapo Vitri*. If too great a Quantity be put in, it gives the Glaſs a purple Colour. It is uſed by Potters in colouring their Veſſels black, as the Zaffara is for blue. *Merret*, alſo, ſays, the beſt Manganeſe is that which is hard, heavy, ſparkling, and blackiſh, and which, being reduced to Powder, turns Lead black. It is dug in *Germany*, *Italy*, *Piedmont*, and in *England* near the *Mendip* Hills in *Somerſetſhire*, famous for Lead Mines: And accordingly *Merret* tells us, that where-ever the Miners find Maganeſe, they conclude, that there is Lead Ore under it; but whether it contains any Lead, or not, has not hitherto been diſcovered. It is not uſed in Phyſic. *Geoffroy*.

MAGNESIA ALBA.

How prejudicial and virulent a Quality draſtic Purgatives are poſſeſſed of, is ſufficiently known to the Skilful in the Healing Art. For this Reaſon a Medicine capable of ſafely and efficaciouſly eliminating the Contents of the Inteſtines has been long ſought after. And, ſince moſt Purgatives, in conſequence of their acrid ſalino-ſulphureous Principle, are neither grateful to the Smell nor Taſte, but create a certain Nauſea, Phyſicians have long eagerly wiſhed for a Purgative, which was both grateful to the Palate, and fragrant to the Smell. For this Reaſon *Helmont*, obſerving that ungrateful and draſtic Purgatives were only to be obtained from the Vegetable Kingdom, earneſtly wiſhed, that an efficacious one of oppoſite Qualities might be found in the Mineral Kingdom.

But ſuch a Medicine was long and in vain ſought for, till, at laſt, there appeared at *Rome* a highly white Powder, without either Taſte or Smell, of an highly light and tender Subſtance; one Dram of which not only procured ſeveral Stools, without any Diſadvantage or Loſs of Strength, but, alſo, purged hypochondriac Patients, and thoſe whoſe Primæ Viæ were loaded with acid Juices, incapable of being eaſily carried off by other Purgatives, whilſt it at once deſtroyed and eliminated the offending Acid. This Powder appeared under the Name of *Magneſia alba*; but its firſt and genuine Inventor is not certainly known. At *Rome* it bore the Name of the Count of *Palma*, though many are of Opinion, that the Preparation was carried from *Germany* to *Italy*.

What I myſelf know of this Powder, I ſhall, without any Reſerve, communicate to the Public. Upwards of fourteen Years ago, *Johannes Siboldus*, an able Chymiſt, and an Acquaintance of *Helwigius*, Author of the *Phyſica inſtaurata inaudita*, was at *Magdeburg*: Theſe two Gentlemen, according to *Katſchius*, a Phyſician at *Halle*, and formerly Amanuenſis to *Siboldus*, were in Queſt of a Spirit, or univerſal Menſtruum, extracted from nitrous Earth. With this View they not only diſtilled by an open Fire, from a Retort, thoſe Earths from which Nitre is extracted, after having long expoſed them to the Sun, by which means they obtained a volatile urinous Spirit; but they, alſo, waſhed theſe Earths with Water, boiled the Lixivium prepared from it, and diſtilled the remaining Maſs from a Retort. By this means a rediſh Spirit was obtained; and, by a ſtronger Degree of Fire, a Caput mortuum was left, of an highly white Colour, inſipid, light, and to which they gave the Name of the *Magneſia of Nitre*. But of its Virtues, or purgative Quality, nothing was at this time known.

From what has been ſaid, it is ſufficiently obvious, that the Origins and Natures of this Magneſia, and of the Powder prepared from the Lixivium of Nitre, are pretty much the ſame: For this general Account ſufficiently ſhews, that both the Preparation and Name of this Powder were known in *Germany* much ſooner than in any other Country. And it is probable, that *Helwigius*, who afterwards travelled through the Provinces of the *Indies*, and *Italy*, together with other Medicines, communicated this, alſo, to the *Italians*.

But, that we may form a right Judgment of the Nature and Efficacy of this Medicine, we muſt obſerve, that this Powder is entirely inſipid, of a white Colour, and of an highly alcaline Quality, ſince it not only produces a violent Effervеſcence with every Acid, but becauſe an Acid, alſo, diſſolves that Earth. The Solution made by this means, which is of an highly bitter, ſaline, and acrid Taſte, ſufficiently ſhews, that the Powder is of an alcaline, earthy, diſſolvable, and, at the ſame time, a ſulphureous Nature, becauſe the Solution is highly bitter. On the contrary, other alcaline Subſtances, ſuch as Crabs-eyes, Egg-ſhells, and prepared Shells, by an Affuſion of Spirit of Vitriol, produce a ſtrong Ebullition; but their Solution is ſo far from being bitter, or exceſſively ſalt, that it is only gently ſo, or rather entirely inſipid. The Powder of Quick-lime, though generally accounted an alcaline Earth, neither produces an Effervеſcence upon an Affuſion of the Spirit of Vitriol, which theſe Subſtances do, nor is a palpably ſaline Taſte produced; but, though there is a large Quantity of the Powder of Quick-lime added, the Spirit of Vitriol ſtill continues acid, its corroſive Quality being only a little mitigated.

It is certain, that, in ſome Patients, one or two Drams of the Magneſia purge pretty briskly, by procuring five or ſix Stools; whereas, in others, the ſame Doſe produces no more than Efforts to an Evacuation of the Fæces. The Reaſon of this Diverſity of Effects is ſufficiently obvious from what has been ſaid; for it is certain, that this earthy Powder by no means contains a cathartic Principle, which can only conſiſt in the ſaline, penetrating, and acrid Quality of any Subſtance; but that its purgative Virtue reſults from the particular Diſpoſition of the Humours lodged in the Body; becauſe, if it meets with acid Humours in the Cavities of the Stomach and Inteſtines, it is converted into a neutral Salt, of an acrid ſaline Taſte, and of a ſtimulating Quality, ſince we obſerve, that an highly acrid

Salt

Salt is produced, when this Medicine is mixed with Spirit of Vitriol. Now we know from Experience, that large Doſes of bitteriſh neutral Salts procure ſeveral Stools, as *Hoffman* has ſhewn, in his *Differt. de Salium mediorum excellente & purgante Natura*. It is not, therefore, ſurpriſing, that this Powder ſhould be ſometimes deſtitute of a purgative Virtue; when, for Inſtance, the Primæ Viæ do not abound with Acids, but with a viſcid Phlegm, which hinders it from being diſſolved, and converted into a ſtimulating Salt.

But I am not ignorant, that ſome Objection may be made to this Opinion; ſince other earthy Subſtances, which quickly reſolve and abſorb the Acid lodged in the Primæ Viæ, by no means prove laxative. But to this it may be anſwer'd, that ſometimes the Body is render'd ſoluble by the abſorbent or bezoardic Powders, if there is a large Quantity of Acid lodged in the Primæ Viæ. But the purgative Virtue of theſe is not ſo great as that of the Magneſia; becauſe their Solutions with acid Liquors are not ſo conſiderably ſaline and acrid, as the Solutions of the Magneſia with the ſame acid Liquors; ſince the former are only poſſeſſed of a moderately ſaline Taſte. Hence it appears, that, beſides the earthy, there is, alſo, another Principle in the Magneſia, which, upon the Admixture of an Acid, is converted into a ſtimulating and purgative Subſtance.

But that we may more effectually inveſtigate the Cauſes and Reaſons of this purgative Quality in the Magneſia, it is neceſſary we ſhould make an accurate Inquiry into the Matter of which it is made. This, therefore, is nothing but a Lixivium, remaining after the Cryſtallization of Nitre, called by the Nitre-makers, *Mother-water of Nitre*; becauſe, without the Addition of it, there can be no Coagulation of the Nitre into Cryſtals, though, from this alone, no Nitre in a cryſtalline Form can be procured.

This Lixivium, upon inveſtigating its Nature, is,

1. Highly heavy and ponderous; for one medicinal Pint of it is more than five Ounces heavier than an equal Quantity of Water; and the Proportion of its Weight, to that of Oil of Vitriol is as ten to eighteen: For one medicinal Pint of Oil of Vitriol, is eighteen half Ounces heavier than the ſame Quantity of Water; one medicinal Pint, therefore, of this Lixivium contains five Ounces of ſolid Matter.

2. This Lixivium is of an highly bitter and ſaline Taſte, and, upon Evaporation, cannot be dried; but is immediately diſſolved by the Air.

3. This Lixivium does not produce an Efferveſcence with any gentle Acid, ſuch as Spirit of Vitriol; but with Oil of Vitriol it produces a ſtrong Ebullition; and, with both, a Powder of a white Colour is precipitated to the Bottom: And what is to be carefully obſerved, is, that the Oil of Vitriol, when poured upon it, not only produces a Noiſe, but, alſo, ſends forth a rediſh Smoke; which is a ſufficient Proof, that ſome Portion of the Spirit of Nitre is as yet lodged in it. The Smell, alſo, diſcovers that ſome Portion of the Spirit of Salt is lodged in it; nor is it to be doubted, but that, from this Lixivium, an excellent Aqua Regia might be prepared; ſuch as that commonly obtained from the Acid of Salt and Nitre: It is, alſo, ſufficiently obvious, that the Particles of Nitre, and common Salt, are in this Lixivium contained under the Form of pingueous and ſulphureous Particles.

4. Tho' Oil of Vitriol, or any ſtrong Acid, mixed with this Lixivium, produces a violent Efferveſcence; it is yet ſurpriſing, that the fuming Spirit of Nitre, which is a ſtrong Acid, does not give the ſmalleſt Sign of an Efferveſcence, when mixed with it: A Phenomenon which, among others, ſurpriſingly proves the different Natures and Virtues of Acids.

5. This Lixivium, when mixed with an alcaline Liquor, whether of a volatile or fixed Nature, ſuch as urinous Spirit of Sal Ammoniac, prepared with Water, or Oil of Tartar per Deliquium, produces no Ebullition; but there enſues a very conſiderable Precipitation of an earthy whitiſh Powder.

6. This Lixivium, when mixed with an equal Quantity of highly rectified Spirit of Wine, is intimately incorporated with it; only a certain earthy Matter remains in the Bottom of the Veſſel.

7. This Lixivium, when coagulated by means of the Fire, and put into an ignited Crucible, produces a ſtrong Ebullition and Froth: Then, upon increaſing the Fire, a Spirit like Aqua Fortis, of a fetid Smell, and which ſome preſerve, is yielded under the Form of a red Smoke. Afterwards, upon raiſing the Fire ſtill higher, the Powder called the Magneſia remains; and this is the moſt common Method of preparing this Medicine.

8. A more compendious Method of preparing this Powder is by a Precipitation of the Lixivium, either with the Acid of Vitriol, a Lixivium of Pot-aſh, or Oil of Tartar per Deliquium: Then this Earth is to be waſhed with River-water, and dried.

But, that the genuine Nature of the ſeveral Ingredients contained in this Lixivium may be the more accurately diſcover'd, it is neceſſary, carefully to inveſtigate how, and of what Matter, the inflammable Nitre is prepar'd. Now, in order to the Elaboration of Nitre, putrefied Earths, obtained from the Excrements of Animals; old Earths, obtained from Walls, and burnt Buildings, which have been long expoſed to the Influence of the Sun and Winds, and by that means render'd very fine; as, alſo, the Athes of Wood, together with Quick-lime, are abſolutely neceſſary: And from all theſe, in Conjunction with Water, is prepared the Lixivium of Nitre, which is formed into a cryſtalline Salt; and the remaining Part is the Lixivium called *the Mother-water*.

From what has been ſaid, it is ſufficiently obvious, that, ſince neither a ſulphureous, nor an earthy Principle, contribute to Cryſtallization, theſe Principles are principally contained in the Lixivium of Nitre, prepared of the above-mentioned Ingredients; and that the other Principles remain in the Mother Lixivium. This Lixivium conſiſts of a certain Salt, approaching to the Nature of an acid and common Salt, and which, when mixed with ſubtile, earthy, alcaline, ſulphureous, and pinguious Parts, conſtitutes a Lixivium of a ſaline and bitteriſh Taſte, from which the above-mentioned Effects and Phenomena proceed: And to me this Lixivium appears highly ſimilar to that generally prepar'd of Quick-lime and Sal Ammoniac; for when the Caput Mortuum of the Spirit of Sal Ammoniac, prepared with Quicklime, is diſſolved in Water, by this means, a bitteriſh acrid Lixivium is obtained, which when inſpiſſated with Spirit of Sal Ammoniac, or Oil of Tartar per Deliquium, without any Efferveſcence a Precipitate falls to the Bottom, in the Form of an earthy Powder. This, alſo, happens with Oil of Vitriol; but with no other Acid, whether mild or ſtrong, ſuch as Spiritus Nitri fumans, does it produce any Noiſe or Ebullition, though, at the ſame time, it is precipitated by the Affuſion of every Acid.

Having thus traced the Origin of the Magneſia, we need not heſitate to affirm, that it conſiſts of the more ſubtile Earth of Quick-lime, and the other Ingredients of Nitre, variouſly obtain'd from the Lixivium by a Separation of the ſaline Parts: This ſubtle Earth, however, differs from crude and unprepared Quick-lime.

For, tho' Quick-lime is an earthy Alcali of an highly acrid Taſte, yet it neither produces an Efferveſcence with an acrid Liquor, nor is coagulated into a Sal ſalſum, which is produced by an Admixture of the Magneſia with any acid Spirit, ſuch as that of Vitriol. This Alcali is, therefore, far more tender and ſubtile than burnt Quick-lime: Nor is it a Remedy deſtitute of uncommon Efficacy, provided it is exhibited according to the different States and Circumſtances of Patients; for it is not only abſorbent and cathartic, when acid Sordes are lodged in the Primæ Viæ; but, alſo, when exhibited in a ſmall Doſe, fifteen or twenty Grains, for Inſtance, I have often found it prove both diaphoretic and diuretic.

Nor muſt we forget to mention a Diſadvantage, with which I have ſeen the too frequent Uſe of the Magneſia attended; which is, that it leaves Flatulences, and gnawing Pains, in the lower Part of the Abdomen, and has a Tendency to generate corroſive Juices in the Primæ Viæ, as generally happens in hypochondriac Patients. The moſt commodious Vehicle in which it can be exhibited, is Almond-milk, which has a Tendency to correct the Acrimony of the Humours ſtagnating in the Stomach. *Hoffman, Obſerv. Phyſ. Chym. Lib.* 4. *Obſ.* 2.

MAGNESIA OPALINA.

In making the Liver of Antimony, ſome add, to the Antimony and Nitre, decrepitated Sal Ammoniac; and thus make what is called the Opalin, or Ruby-colour'd *Magneſia* of Antimony, from its red Colour, which is a much weaker Emetic than the Liver of Antimony; and does not cauſe Vomiting in Horſes, and other Quadrupeds, but only makes them ſweat, or increaſes Perſpiration. It is given to ſuch Brutes, from one to three Ounces every Day, for ſeveral Weeks together, to fatten them, and cure their cutaneous Diſeaſes, or other Indiſpoſitions. *Geoffroy.*

Lemery directs the Magneſia Opalina to be made of equal Parts of Antimony, Nitre, and decrepitated Sea-ſalt.

MAGNETICUS. An Epithet of ſome Medicines, particularly Plaiſters, not only in a proper Senſe, on account of their containing Particles of the Loadſtone in their Compoſition, but in a tropical Signification; becauſe they are ſuppoſed to act by an occult attractive Force, in manner of the Loadſtone. Such is the Emplaſtrum magneticum, in *Schroder, Lib.* 2. *Cap.* 53. and that of *Cnœfelius*, prepared of Amber and a dried Toad. *Caſtellus.*

MAGNETINUS, an Epithet of Tartar. *Magnetinus Tartarus*, in *Paracelſus, Lib.* 1. *de Tartar.* is a very hard and ſpongy Stone.

MAGNOLIA. The Laurel-leaved Tulip-tree.

The Characters are;

It hath a roſaceous Flower, conſiſting of ſeveral Leaves, which are placed in a circular Order, from out of whoſe Cup ariſes the Pointal, which afterwards becomes an hard conical Fruit, with many Tubes or Riſings, in each of which is contained one hard Nut, which, when emitted, hangs by a long String. *Miller* mentions three Species of this Plant; which are,

1. Magnolia Lauri folio ſubtus albicante. *Catesb. The leſſer Laurel-leaved Tulip-tree, or ſweet-flowering Bay.*

2. Magnolia altiſſima, Lauroceraſi folio ampliſſimo, flore ingenti candido. *Catesb. Commonly called the Laurel-leaved Tulip-tree, or Carolina Laurel.*

3. Magnolia ampliſſimo flore albo; fructu cœruleo. *Plum Nov. Gen.* American *Laurel, with very large Leaves, a white Flower, and blue Fruit.*

MAGNUS, μέγας, great, is applied to various Subjects in Medicine, both natural and preternatural: Thus we read of the great Artery, a great Pulſe, a great Fever; the Epilepſy, in particular, is called by *Hippocrates*, 6 *Epid.* the great Diſeaſe.

MAJOR, μείζων, greater, the Comparative, is aſcribed to the ultimate Perfection of the Philoſophers Stone, which is called the *Majus perfectum*, conſiſting of four Colours, and endued with a Power of multiplying its Species. *Theat. Chym. Vol.* 1.

MAXIMUS, μέγιστος, the greateſt, is applied by *Paracelſus*, *de Morbis Amentium*, *Tr.* 2. *Cap.* 4. to a peculiar Remedy of his againſt Madneſs, and the Suffocation, as he calls it, of the Underſtanding. *Caſtellus.*

MAGORINA. A Word coin'd by *Paracelſus*, out of Spite to the Univerſities, to ſignify the *Idolum Academicum*, as he calls it, which diſturbs and confounds all Speculations. *Fragment. de Morb. Gallic. & de Apoſtem. C.* 2.

MAGORREUM, the characteriſtic Cure of Wounds, ſo called by *Paracelſus*, *Lib.* 2. *de Vit. long. Cap.* 24.

MAGOS, μάγος, the Name of a Plaiſter deſcribed by *Aetius*, *Tetrab.* 3. *Serm.* 2. *Cap.* 25. recommended for drying and conglutinating ſinuous and fiſtulous Ulcers, and for the Dropſy, and watery Hernias. It is, alſo, called *Hephæſtias.*

MAGRA, Red Earth; alſo the Cornelian. *Rulandus.*

MAGUDARIS. A Name in *Dioſcorides*, for the *Silphium.*

MAGUEI. A Name which the *Americans* give to ſome Species of the Aloe. *Ray.*

MAGUS. See MAGOS.

MAHALEB. *Raii.* See CERASUS.

——— *Serapionis.* A Name for the *Phyllyrea*; *latifolia*; *lævis.*

MAIA, *Maea*, μαῖα, the largeſt Species of Sea-crabs.

MAIL ANSCHI. A Species of Rhamnus, growing in *Malabar.*

A Decoction of the Root is effectual in the Gout; a Decoction of the Leaves, with Sugar, is good for the Jaundice; and ſo are the Leaves ſimply taken in Milk. The expreſſed Juice of the Leaves taken in Cows-milk, with Sugar, is good for thoſe who evacuate a white and purulent Urine. *Raii Hiſt. Plant.*

MAIL ELOU. *Arbor baccifera trifolia Malabarica ſimplici Oſſiculo cum pluribus Nucleis.* H. M. *Luſitanis* Carilla. This is a tall Tree, fifty Feet in Height, growing in many Parts of *Malabar*; is an Evergreen, and flowers and bears Fruit once, and ſometimes twice in a Year.

Of the Leaves and Bark, bruiſed, and boiled in an Infuſion of Rice, is prepared an Apozem, which is an effectual Remedy in Pains after Child-birth, expelling the Secundines, and promoting the Diſcharge of the Lochia. The ſame is preſcribed as ordinary Drink for Men or Women, of an exceſſively groſs and fat Habit of Body, in order to their gradual Extenuation. The Juice of the green Bark, taken with the Milk of the ripe Cocoa-nut, cures the Diarrhœa, and removes the Pain of the Colic. Of the tender Branches of this Tree, and of the *Paal-valli*, bruiſed and boiled together in Water, they prepare a Bath againſt inveterate Fevers, the Gout, and all manner of Pains in the Joints. *Raii Hiſt. Plant. p.* 1557.

MAIL ELOU KATOU. *Arbor baccifera Malabarica, folio pinnato, floribus umbellatis ſimplici Oſſiculo cum pluribus Nucleis.* H. M. It is a vaſt Tree, taller than the *Mail Elou*, and growing in the hilly and rocky Parts of *Malabar*; is an Evergreen, flowers and bears Fruit once every Year, and lives above two hundred Years.

The Wood, beſides its Uſefulneſs to the Joiner and Carpenter, is extolled for its Efficacy in the Diarrhœa, Dyſentery, and Teneſmus. The Leaves, boiled with Pepper, and the Seed of *Coddapala*, in an Infuſion of Rice, are an Antidote againſt the Bites and Stings of Serpents, Scorpions, and other venomous Creatures. Of the Bark, bruiſed and boiled, is prepared a Medicine to diſſolve Blood coagulated in the Body by means of a Fall. *Raii Hiſt. Plant. p.* 1558.

MAIL OMBI *Malabarenſibus. Baccifera Indica racemoſa Fructu umbilicato rotundo monopyreno.* H. M. Is a Tree of the Bigneſs of an ordinary Apple-tree, growing in many Places of *Malabar*, always green, and bearing Fruit twice in a Year, that is, in *April* and *September*. As to its Virtues, we have no certain Account. *Raii Hiſt. Plant. p.* 1500.

MAJORANA.

The Characters are;

The Galea is erect, roundiſh and bifid; the Beard is tripartite, and appears almoſt like a quinquefid Flower. The Flowers are collected into round, cloſe, ſhort Heads, compoſed of four Orders of ſmall Leaves lying one upon another in the nature of Scales.

Boerhaave mentions three Species of this Plant; which are,

1. Majorana; vulgaris. See AMARACUS.

2. Majorana; rotundifolia; ſcutellata; exotica. *H. R. Par.* 114. *Origano cognata, Zatarendi.* C. B. P. 223. *Zatarhendi Herba.* J. B. 3. 2. 256.

3. Majorana; Cretica; Origani foliis; villoſa; Satureiæ odore; corymbis majoribus, albis. *T. Cor.* 13. *Origanum Smyrnium.* Wheler. Itin. 243. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 178.

MAJORANA SYRIACA. A Name for the *Marum*; *Syriacum*; *vel Creticum.*

Beſides the foregoing Species of *Marjoram*, *Dale* mentions the two following; which are,

1. *Majorana tenuifolia.* C. B. P. 224. Raii Hiſt. 1. 538. Ger. 539. Emac. 664. Park. Theat. 11. Tourn. Inſt. 200. *Majorana tenuior & lignoſior.* J. B. 3. 241. MARJORAM GENTLE, or PERENNIAL.

It is cultivated in Gardens, and the Herb is in Uſe, which agrees in Virtues with the *Amaracus. Dale.*

2. *Majorana Oleracea.* Offic. *Majorana major, Anglica.* Ger. 538. Emac. 664. Raii Hiſt. 1. 539. *Majorana latifolia ſive major, Anglica.* Park. Theat. 12. *Origanum Onites.* C. B. P. 223. Raii Synop. 3. 296. Tourn. Inſt. 199. POT MARJORAM.

It is cultivated in Gardens among other culinary Herbs, and agrees in Virtues with the *Origanum ſylveſtre, Cunila bubula Plinii. Dale.*

MALA	ÆTHIOPICA,	See LYCOPERSICON; FRUCTU STRIATO; DURO.
	ARMENIACA,	ARMENIACA MALUS.
	AURANTIA,	AURANTIA.
	CITRIA,	CITRUM.
	CYDONIA,	CYDONIA.
	GRANATA,	PUNICA.
	INSANA,	MELONGENA; FRUCTU OBLONGO; VIOLACEO.
	LIMONIA,	LIMON.

MALABATHRINUM, μαλαβάθρινον [μύρον] Ointment of *Malabathrum*, is inſpiſſated with the ſame Ingredients, as the *Unguentum nardinum*, or Ointment of Spikenard [ſee NARDUS]; only more Myrrh is added to it, which renders it of a heating Quality; in Virtues it agrees with the *Crocinum* and *Amaracinum.* See AMARACUS and CROCINUM. *Dioſcorides*, *Lib.* 1. *Cap.* 76.

MALABATHRINUM *Vinum*, μαλαβάθρου οἶνος, Wine of *Malabathrum*, is prepared, by putting half a Pound of *Malabathrum* into two Congii of Muſt, and ſtraining it off after two Months; the Doſe is one *Cyathus*, mix'd with three *Cyathi* of Water. This Wine is effectual in Diſeaſes of the Kidneys and Liver, for the Jaundice and Dyſury, for thoſe who have loſt their Colour, or are diſorder'd in their Stomach. Some add an Ounce or two of Acorns, or three Ounces of celtic Nard to a Ceramium [about nine Gallons] of Muſt. *Dioſcorides*, *Lib.* 5. *Cap.* 67.

MALABATHRUM.

Folium Indum ſeu Malabathrum. Park. Theat. 1584. *Folium Indum Malabatrum.* Mont. Exot. 8. *Malabatrum ſive Folium Indum.* Chab. 33. *Malabathrum & Folium Indum Officinarum.* J. B. 1. 430. *Tamalapatra.* Ger. 1315. Emac. 1534. *Tamalapatrum ſive Folium.* C. B. P. 409. *Canella ſylveſtris Malabarica.* Raii Hiſt. 2. 1502. Comm. Flor. Mal. 68. *Canella arbor ſylveſtris.* Munting. 120. *Canella ſive Cinnamomum vulgare craſſiore cortice.* J. B. 451. Chab. 34. *Katou Karva.* Hort. Mal. 5. 105. Tab. 53. *Pſeudo-caſſia Dioſcoridis.* Jonſ. Dendr. 162. *Pſeudo-caſſia ſive Cinnamomum vulgare craſſiore cortice.* J. B. 1. 451. *Canella ſeu Cinnamomum vulgare craſſiore cortice.* Chab. 34. Raii Hiſt. 2. 1562. *Cinnamomum ſeu Caſſia craſſior, Pſeudo-caſſia.* C. B. P. 409. *Cinnamomum craſſiore cortice.* Ejuſd. INDIAN LEAVES. *Dale.*

Theſe are pretty large Leaves, of a thick, firm Texture, of a yelloviſh Colour, in Shape of a large Bay-leaf, but ſharper-pointed, and ſmoother, having three remarkable Nerves or Ribs, running through all the whole Length of the Leaf, of a pleaſant, hot, ſpicy Smell and Taſte. They are generally believed to be the Leaves of the Caſſia-lignea, or Cinnamon-tree, or both; for, upon comparing them with the Leaves of the true Cinnamon, I can find very little Difference either in Shape or Colour, Smell or Taſte. How far the Leaves of the Canella Malabarica, which are eſteemed to be the true Folia Inda, differ from theſe, is uncertain, ſince they are never brought to us, theſe ſupplying their Place; and I queſtion not, but to as good Purpoſe. They are ſeldom uſed now, Mace being appointed in our Diſpenſatories in their ſtead. *Miller's Bot. Off.*

This is the Leaf of a kind of wild Cinnamon-tree, brought us from *Malabar*, and other Places of the *Eaſt Indies*. Theſe Leaves are diſtinguiſh'd from the true Cinnamon-leaves, by their being leſs aromatic. Their Virtues are cordial and alexipharmic. *Geoffroy.*

The *Folium Indum*, or *Tamalapatra*, according to the Obſervation of the very curious *Fab. Columna*, agrees in all reſpects with the Leaf of the *Canella*, excepting the Taſte. *Dioſcorides* writes, that this Leaf ſwims on the Waters, after the manner of the *Lens paluſtris*, ſupported by no Root. The Antients, ſays *Scaliger*, dreamed; for we, who have carry'd our Diſcoveries to the uttermoſt Parts of the *Arabias* and *Indias*, could never meet with this wonderful Leaf. *Garcias* alſo aſſures us, that the *Greeks* were miſtaken in this Matter; for the *Indian* Leaf, he ſays, does not ſwim on the Waters, but grows on an high Tree, remote from the Waters, in *Cambaya*, and many other Places. The Natives call it *Tamalapatra*; which Word the *Greeks* corrupted into *Malabathrum.*

The

The *Malabathrum* is ſaid to agree in Virtues with Spikenard, particularly in powerfully provoking Urine, correcting a Fœtor of the Mouth, and preſerving Garments from Eroſions by Worms. *Raii Hiſt. Plant.*

MALACHE, μαλαχὴ, from μαλάσσω, to mollify, is either a looſening Medicine for the Belly, or one to ripen hard Tumors. *Blancard.*

MALACHITES. Offic. Charlt. Foſſ. 33. Calc. Muſ. 218. Aldrov. Muſ. Metall. 900. Worm. 95. *Malachites. vel Molochites.* 263. De Lact. 87. THE MALACHITE.

It may be taken for a Species of the Jaſper, or Praſius. It is opaque, and of a Mallow-green, whence it has its Name, μαλάχη, *Malache*, in *Greek*, ſignifying a Mallow. It is found in *Cyprus*, *Meiſſen*, and the Country *Tirol*, and is exhibited as a Febrifuge.

MALACIA, μαλακία, *ἀπία.* See PICA.

MALACION, μαλάκιον, from μαλακὸς, ſoft, is a Term for a Fiſh which has no Scales, ſuch as the Sepia, or Cattle-fiſh. Sea-hare, and Urtica or Sea-blubber. Thoſe kind of Fiſh were ſuppoſed by the Antients to be void of Blood and Bowels: They are now ranged under the Head of *Exanguia Mollia, ſive Molluſca. Caſtellus. Dale.*

MALACODERMOS, μαλακόδερμος, from μαλακὸς, ſoft, and δέρμα, the Skin, is an Epithet of ſuch Animals as have a ſoft Skin; by way of Diſtinction from the *Oſtracodermi*, ὀστρακόδερμοι, teſtaceous Animals.

MALACOIDES.

The Characters are;

It has the Flower and Appearance of the Mallow, and a dry Fruit like that of the Rubus, conſiſting of a Multitude of Capſules collected into an Head, like a Cluſter of Grapes, and full of Kidney-ſhaped Seeds.

Boerhaave mentions but one Sort of this Plant; which is,

Malacoides; Betonicæ folio. *T.* 98. *Malva; Betonicæ folio.* Boc. Ic. 15. & Deſer. Zanon. H. 130. M. H. 2. 522. *Boerh. Ind. alt. Plant. V.* 1. *p.* 271.

The Name is derived from μαλαχὴ, the Mallow, and εἶδος, the Form or Reſemblance, that is to ſay, having the Form or Appearance of the Mallow; which it, alſo, reſembles in Virtues. *Hiſt. Plant. aſcript. Boerhaav.*

MALACOS, μαλακὸς, μαλθάκος, Soft, is oppoſed to Hard. A thing is ſaid to be ſoft when it yields to the Touch without changing Place; others deſcribe it as a Medium between Hard and Liquid, which eaſily gives way if preſſed, without ſurrounding the preſſing Organ; of which Nature are Wax, Clay, and the like. The Epithet is applied to various Subſtances, as to the Skin, the Pulſe, and to Wines, which are ſaid to be ſoft when they are ſweet, mild, and delicate, in Oppoſition to auſtere, generous, hard. Soft is ſometimes uſed for Humid, as in *Hippocrates, Lib. de Salub. Diæt.* Sometimes it is applied to Diſeaſes in a moderate or remiſs State, as 1 *Aph.* 7. and by *Scribonius Largus*, N. 201. to recent Ulcers.

MALACTICOS, μαλακτικὸς, from μαλάσσω, to ſoften. The ſame as EMOLLIENS. See EMOLLIENTIA.

MALA-ELENGI, *baccifera Indica, flore compoſito.* H. M. Is a Tree of a moderate Bigneſs, and about twenty Foot high, growing in *Malabar*, ever green, and bearing Fruit once a Year.

Of the Leaves boiled with Pepper, and Calamus Aromaticus in Oil of Seſamum, is prepared a Liniment for the Head, which is very much commended for the Vertigo, Epilepſy, and the like cephalic Affections. Of the Bark, with Frankincenſe and Orpiment, is prepared an Ointment, which is ſaid to be a potent Remedy for Affections of the Liver, the Region of that Part being anointed therewith. The Kernels of the Fruit are tied up in a Bag with Pepper, and worn about the Neck as an Amulet and Preſervative againſt the Epilepſy. *Raii Hiſt. Plant.*

MALAGMA, μάλαγμα, from μαλάσσω, to mollify, is the ſame as CATAPLASMA, though it bears, alſo, a ſtricter Senſe, as it ſignifies particularly ſuch Cataplaſms as are of an emollient Quality. *Galen, Lib. 7. de C. M. P. G.*

A Malagma was the Form of a Topic, not very different from a Plaiſter. At firſt it ſeems to be applied principally to Emollients, by its Name; but afterwards was applied to Aſtringents, or any other Topics of the ſame Form. It conſiſted principally of Gums, Aromatics, and other ſtimulating Ingredients, as Salts and the like. Sometimes a very little Quantity of Oils or Axungias, entered into three Compoſitions, and a little Wax. Sometimes there was little beſides Gums, diſſolved in Wine or Vinegar, and Reſins, which hardened to a Conſiſtence of themſelves. Theſe were reduced to Powder, and moiſtened with ſome Liquor, when applied to any Part.

MALAKKA-PELA. A Name for the *Guajava*; *rubra*; *acida*; *fructu rotundiori.*

MALAGRETA. A *Spaniſh* Word for the greater Cardamoms, or Grains of Paradiſe, as *Fuchſius* obſerves in his Notes on *Myrepſus, Antid. Cap.* 22. at the Word *Menegetæ*, a barbarous Term of the ſame Import.

MALANDRIA. A Diſeaſe in Horſes, called the *Malanders*, being an ulcerous kind of Fiſſure under the Ham. It is, alſo, a Species of Elephantiaſis, or Lepra: Whence the Patients labouring under it are called by *Marcellus Empiricus, Malandriоſi.*

MALAVISCUS. The Althæa, or Marſhmallow, is ſometimes called by this Neme.

MALAZISSATUS. One who has his Teſticles concealed in the inward Parts; he is otherwiſe called *Emaſculatus*, and *Mulieratus.*

MALE, μάλη, for μασχάλη, the Armpit, is no *Greek* Word, as *Rufus Epheſius* ſays, *Cap.* 10. Or, according to *Pollux*, is a Term ἰδιωτικὸν, in Uſe among the Vulgar; though it be common to ſay ὑπὸ μάλης ἔχειν, to have, or conceal, ſomething under the Armpit.

MALER. Salt. *Rulandus.*

MALICORIUM. The Peel of the Pomgranate. See PUNICA MALUS.

MALIGNITAS. Malignity. *Sydenham* is of Opinion, that the Symptoms excited by a prepoſterous Method of Treatment, are frequently aſcrib'd to Malignity, of which he thus delivers his Opinion.

I conceive that all the Malignity, which appears in Epidemics, whatever its ſpecific Nature be, conſiſts and centers in very hot and ſpirituous Particles, that are more or leſs oppoſite to the Nature of the Juices contained in the Body; becauſe only ſuch Particles are capable of producing ſo ſudden an Alteration of the Juices, as is frequently obſerved in malignant Diſeaſes. And I judge that theſe hot and ſpirituous Particles, chiefly act by way of Aſſimilation; for, by the Law of Nature, every Principle endeavours to produce its Like, and to reduce and mould whatever oppoſes it to its own Nature. Thus Fire generates Fire, and a Perſon ſeized with a malignant Diſeaſe, infects another by an Emiſſion of Spirits, which ſoon aſſimilate the Juices to themſelves, and change them into their own Nature.

From theſe Conſiderations, it ſeems to follow, that it is beſt to expel theſe Particles by Sweat, ſince by this Procedure the Diſeaſe would be immediately eradicated. But Experience contradicts this, and ſhews that every Species of Malignity will not admit of this Remedy. For tho' in the Plague, the peſtilential Particles, as well on account of their exceeding Subtility, as likewiſe, becauſe they reſide in the moſt ſpirituous Parts of the Blood, are diſſipable, and may be expelled by an uninterrupted Sweat; yet in other Fevers, where the aſſimilating Particles are leſs ſubtile, and mixed with groſſer Humours, the malignant Humour can, not only not be expelled by Sweat; but is frequently increaſed by the Diaphoretics given to promote it. For the more active thoſe hot and ſpirituous Particles are rendered by the uſe of heating Medicines, the more is their power of aſſimilating increaſed; and the more likewiſe thoſe Juices are heated, whereon they act, ſo much the more readily are they aſſimilated, and yield to the Impreſſions thereof. Whereas, contrariwiſe, it is reaſonable to think, that Medicines of an oppoſite Nature, do not only reſtrain the Action of the hot and acrid Particles; but likewiſe thicken and ſtrengthen the Juices, ſo as to enable them to undergo, or even to conquer, the Force of the Morbific Spirits. And here I may appeal to Experience, which has taught me, that the Purple Spots in Fevers, and the black Eruptions of the Small-Pox, increaſe more readily in Proportion as the Patient is heated; and that, according to the Coolneſs of the Regimen employ'd, which is very ſuitable in theſe Diſeaſes, they are uſed to decreaſe and be diminiſhed.

Now, were it to be inquired, whence it happens, ſince Malignity conſiſts in ſuch hot and ſpirituous Particles, that ſo few Signs of a Fever, are frequently found in the moſt malignant Diſeaſe; it might be anſwered, that in the Plague, the moſt remarkable Inſtance of Malignity, the morbific Particles are ſo very ſubtle, eſpecially in the Beginning, that they paſs through the Blood like Lightening, and (the Spirits being as it were fixed and congealed) raiſe no Ebullition therein: Whence the Patient dies without a Fever.

But in other Epidemics, accompanied with a leſs Degree of Malignity, the febrile Symptoms are ſometimes ſo ſlight, from the Diſturbance raiſed in the Blood by the morbific Particles contained in the Maſs, that Nature, being in a manner oppreſſed, is rendered unable to produce the more regular Symptoms, that are ſuitable to the Diſeaſe; and almoſt all the Phenomena that happen, are irregular, by reaſon of the entire Subverſion of the animal Oeconomy; in which Caſe the Fever is often depreſs'd, which of its own Nature, would be very high. Sometimes, alſo, fewer Signs of a Fever appear, than the Nature of the Diſeaſe requires, from the Tranſlation of the malignant Cauſe, either to the nervous Syſtem, to ſome of the ſolid Parts, or to ſome of the Juices lying out of the Road of the Circulation, while the morbific Matter is yet turgid.

But which way ſoever it may be, I am not able even to conjecture, what other Method of Cure ought to be uſed to conquer the Malignity, beſides, that which is ſuitable to the Epidemic, wherewith it is joined: So that whether the Epidemic be of the ſame Nature with thoſe, wherein the febrile Matter is firſt concocted, and then properly expelled by Sweat;

of the Nature of thoſe that are terminated by ſome Eruption; or of thoſe that require the Aſſiſtance of Art, to make way for them; in all theſe Kinds, the Malignity, which is the Concomitant of the Diſeaſe, will riſe and ſink, remain and go off, with the original Diſeaſe; and conſequently, whatever Evacuation agrees in general with the Fever, agrees likewiſe with the Malignity, how much ſoever theſe Evacuations may be of a contrary Nature to each other. Hence the Malignity, that accompanies autumnal Intermittents, and alſo the continued Fever, which is of the ſame Nature, will yield to a Sweat, which follows Concoction as its Effect. And the ſeaſonable Suppuration of the Puſtules in the Small-Pox, will take off the Malignity attending that Diſeaſe, and ſo of the reſt: In all which the peculiar Species of Malignity is beſt overcome by thoſe Methods, which prove moſt ſucceſsful in the Cure of thoſe Diſeaſes whereto it belongs, whether by this, or any other Procedure. This appears evident to me, from Reaſon, and it is likewiſe univerſally confirmed by Experience.

MALINATHALIA, a Name in *Blancard* for the *Cyperus*.

MALLAM TODDALI. H. M. *Baccifera Indica racemoſa, Florum Staminulis binis, Acinis monopyrenis.* A Tree of a moderate Bigneſs, growing in *Malabar*, whoſe Root, Bark, Leaves, and Fruit, are eſteemed a ſpecific Remedy againſt the Epilepſy, Phrenſy, and the like Diſtempers of the Brain. *Raii H. P.*

MALLEABILITAS is defin'd by the Spagiriſts, to be that natural or artificial Diſpoſition of Metals, which renders them tractable or ductile under the Hammer, in Oppoſition to Brittleneſs, or Friability.

MALLEAMOTHE, *ſeu Pavetta*, H. M. *Pavate*. Park. Acoſtæ. *Pavate Arbor Foliis Mali Aureæ*. J. B. *Arbor Malabarenſium Fructu Lentiſci*. C. B. It is a low Tree, or rather Shrub, three Feet high, but, according to *Acoſta*, eight or nine Feet, growing in *Malabar*.

Of the Roots are made Haſts for Knives, the Leaves ſerve to dreſs the Ground, and, being fry'd in Oil of Palm, furniſh a Liniment for removing the *Impetigo*, and drying the Puſtules of the Small-Pox: A Decoction of the ſame, in common Water, is uſed as a Fomentation, to mitigate the Pains of the Hemorrhoids. The Root pulverized with Ginger and Saffron, and exhibited in an Infuſion of Rice, cures the Dropſy, by powerfully promoting a Diſcharge of ſuperfluous Seroſities, by the urinary Paſſages. *Acoſta* commends the Shrub principally for two Effects; firſt, againſt Fluxes of the Belly, for which Purpoſe, however, it is of leſs Efficacy, than many other Medicines; ſecondly, for curing all kinds of Eryſipelas, eſpecially ſuch as proceed from mere Bile. They macerate the whole Root or Trunk, bruiſed in a Decoction of Rice; and ſuffer them to remain there for ſome Hours, that the Water may contract an Acidity; after which they anoint the Eryſipelas therewith, and order the Patient to drink a ſufficient Quantity of the ſame twice a Day, the Stomach being firſt purged. They give the ſame Water to thoſe who labour under an Inflammation of the Liver, and the burning Heat of a Fever; and uſe it mix'd with a ſmall Quantity of the Juice of the Leaves of Tamarind, to anoint the Lips of the Wounds, in order to prevent an Inflammation. *Raii H. P.*

MALLEOLUS, πέρας, by ſome is inaccurately taken for the ſame as *Talus*, σφυρὸν, the Anclebone, where it means the interior Extremities of the Tibia and Fibula. *Galen de Oſſibus, Cap.* 22. See CRUS.

MALLEUS, σφύρα, a Surgeon's Inſtrument called the *Mallet*; alſo a Bone in the Ear, for which ſee AURIS.

MALPIGHIA.

The Characters are;

The Calyx is ſmall, monophyllous, quinquefid, with bifid Segments. The Flower is roſaceous, pentapetalous, with the Stamina growing together, in form of a Tube. The Ovary, which is ſeated in the Bottom of the Calyx, becomes a carnous, globular, ſoft, unicapſular Fruit, containin three winged Stones, each fill'd with Kernels.

Boerhaave mentions but one Sort of this Plant; which is,

Malpighia; Mali Punici facie. *Plan. N. G. A.* 46. *Ceraſus Americana, Myrti foliis conjugatis, fructu acerbo, tetrapyreno.* Pluk. Ph. 158. 4. *Ceraſus Jamaicenſis, fructu tetrapyreno.* H. A. 1. 145. H. Prægn. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 244.

There are no medicinal Virtues aſcribed to it.

MALTA, βύνη. Malt. See BYNE.

MALTHA, μάλθη, ſignifies Wax, eſpecially the ſofter kind thereof, *Galen.*

MALTHACODES, μαλθακώδης, ſoftening, is an Epithet of mollient topical Remedies prepared with Oil, and mention'd by *Hippocrates, Lib. de Ulcer.* They are forbidden to be uſed in Ulcers by *Galen, Lib.* 4. *de C. M. D. G. Cap.* 1. *ad Fin.*

MALTHACOS, μαλθακὸς, the ſame as MALACOS; which ſee.

Cœlius Aurelianus, among the Number of Diſeaſes reckons that infamous and deteſtable Diſpoſition of thoſe, whom the *Greeks* called μαλθακοὶ, (*Malthaci*) and the *Latins Molles* and *Subacti*, and whom he oppoſes to the Women called *Tribades*. And tho' he acknowledges, that thoſe abominable Inclinations were rather Vices or Diſeaſes of the Mind, than the Body, and the Fruits of a Corruption of Manners, he was yet of Opinion, that the Birth of thoſe unhappy Perſons, or the Manner in which they had been conceived, contributed ſomething towards it; and he entertains us, with the Conjectures of the Philoſopher *Parmenides*, on that Subject. The Poets alſo ſpeak of thoſe enormous Vices, as if they were Diſeaſes: Thus

Hiſpo ſubit juvenes, & Morbo *pallet utroque*: Juvenal.
Campanum in Morbum, *in Faciem permulta jocatus*. Hor.

MALTHACTICOS μαλθακτικὸς, the ſame as MALACTICOS.

MALTHAXIS, μάλθαξις, the ſame as *Malaxis*, an Emollition.

MALTHEORUM, Sal Gem. *Rulandus.*

MALTHODES, μαλθώδης. Emollient.

MALVA.

The Characters are;

The Root is fibrous; the Leaves are ſomewhat jagged and round, or angulous; and more or leſs hairy. The firſt Calyx, at the End of the Pedicle, is monophyllous, multifid, and contains a ſecond Calyx, which is larger (the former, or exterior one, is ſhorter, and often triphyllous, and the interior quinquefid). The Flower is monopetalous, Bell-ſhaped, expanded, pentapetaloidal, and cut almoſt to the Unguis. The Unguis of the Flower, being raiſed, ſupplies the aſcending Tube of the Ovary with an external Covering, and ſurrounds it on the Outſide. This Involucrum, or Covering, produces on every ſide Male Stamina, which bear the Teſticuli, in ſuch a manner as to make them appear growing on all Sides to the pyramidal Tube. In the Centre of the Calyx is ſeated the Placenta, whence proceeds a long Tube, concealed within the ſtaminiferous Tube before deſcribed, and producing from its Apex a multitude of Tubes, opening into the very Centre of the Male Stamina. To the Placenta grow little Pods round about, and compacted into the Form of a Cheeſe. Theſe Pods, for the moſt part, contain Multitudes of Seeds, placed one upon another in an orderly Series, and often Kidney-ſhaped.

Boerhaave mentions fifteen Species of this Plant; which are,

1. Malva; arvenſis; erecta; lucida; flore majore. *T.* 95.

2. Malva; vulgaris; flore minore; folio rotundo. *J. B.* 2. 949. *Tourn. Inſt.* 95. *Boerh. Ind. A.* 267. *Malva minor*. Offic. *Malva ſylveſtris minor*. Theat. 299. Raii Hiſt. 1. 599. Synop. 3. 251. *Malva ſylveſtris pumila*. Ger. 785. Emac. 930. *Malva ſylveſtris folio rotundo*. C. B. P. 314. SMALL WILD or DWARF MALLOW.

It flowers in *June*, and the Leaves are in Uſe, which agree in Virtues with thoſe of the ſixth Species, or the common Mallow. *Dale.*

3. Malva; procerior; flore minore. *Flor.* 2. 10.

4. Malva; Syriaca; pumila; floſculis albidis, cauliculis adhæreſcentibus. *Bob.*

5. Malva; Sinenſis; erecta; floſculis albis, minimis.

6. Malva; vulgaris; flore majore; folio ſinuato. *J. B.* 2. 949. *Tourn. Inſt.* 95. *Boerh. Ind. A.* 268. *Malva*. Offic. *Malva vulgaris*, Park. Theat. 299. Raii Hiſt. 1. 599. Synop. 3. 251. *Malva ſylveſtris*, Ger. 785. Emac. 930. *Malva ſylveſtris folio ſinuato*. C. B. P. 314. COMMON MALLOWS.

The common Mallow has a thick whitiſh Root, running down deep into the Ground, with ſeveral Branches and Fibres. The lower Leaves have very long hairy Foot-ſtalks, being of a round Form, but divided into five blunt indented Sections; the Stalk is large, two or three Feet high, ſomewhat hairy, beſet with Leaves, which are leſs round, and having the indented Sections more conſpicuous; the Flowers grow among theſe, ſeveral together, being large and monopetalous, but cut into five Segments, of a bright-red Colour, with a pretty many deep-coloured Veins interſperſed; they grow in a double Calyx, the outer conſiſting of three, and the inner of five Parts. The Seeds, as they lie together, are flatiſh and round, repreſenting a Cheeſe. It grows every where by the Way-ſides, and flowers in *May* and *June*. The Leaves, Flowers, Root, and Seed are uſed.

Mallows is one of the five emollient Herbs, being looſening, cooling, and mollifying. A Decoction of the Leaves is good to keep the Body ſoluble, to aſſwage cholerick Humours, and to allay the Heat and Sharpneſs of Urine, ſweetened with Syrup of Violets, and drank now and then to the Quantity of a Quarter of a Pint. It likewiſe provokes Urine, and is good for the Stone and Gravel; and where Marſhmallows are not to be had, this may very well ſupply its Place. A Cataplaſm of the Leaves, applied to the Place ſtung by Bees or Waſps, eaſes the Smart.

Officinal Preparations are only a Conſerve of the Tops. *Miller's Bot. Offic.*

From the *Analyſis* of the common Mallow, its manner of acting may be diſcovered. From five Pounds of the Leaves and Roots, are obtained four Pounds of Phlegm, two Ounces of urinous Liquor, about forty-eight Grains of concrete urinous Salt; four Ounces of Oil, partly fluid, and partly thick; ſix Drams of fixed Salt, and an Ounce of Earth. Whence it appears, that this Plant contains an ammoniacal Salt, joined with Earth;

Earth; and that the large Quantity of Oil is, by its Union with the acid Phlegm, converted into a Mucilage; which, tho' it be deſtroy'd by the Fire, is, in the Plant itſelf, the Cauſe of its emollient and lenient Effects. Oil, long beat up with Water, and fine Earth, turns to a Mucilage; eſpecially if a ſmall Quantity of any acid Spirit be thrown into the Mixture. The Juice of this Plant, taken either inwardly, or by Clyſter, is laxative; both as it moiſtens and ſoftens the hard Excrements, and as it relaxes the Fibres of the Inteſtines, dried by Heat, and ſo become too tenſe and rigid for their natural Actions. *Geoffry.*

The Mallow is uſed outwardly in Cataplaſms for maturating Tumors, and mitigating Pains; and inwardly in Clyſters for mollifying the Belly, and eaſing nephritic Pains. The Viſcidity of its Juice renders it a proper Remedy, in a Syrup or Conſerve, for the Pain of the Stone; and the ſmall Degree of Heat with which it is endu'd, qualifies it, when fry'd in Butter, as a Medicine againſt the Colic, in Infants. Of this, ſays *C. Hoffman de Medic. Offic.* I have had Experience in my own Children; *S. Pauli* writes the ſame. Three Ounces of the Decoction, or diſtilled Water, of the Leaves of Mallows, with half an Ounce of Syrup of Violets, mitigates the Heat and Acrimony of Urine immediately at the firſt Doſe. *Grulingius*, in his *Praxis*, ſays, that he knew not a more preſent Remedy under that Diſtemper, to whoſe Opinion, ſays Dr. *Hulſe*, I can ſubſcribe from my own Experience. For a Dyſury take a Decoction of Mallows with Violets. With this Medicine, *Foreſtus* ſays, he cured himſelf of that Diſtemper. *Raii H. P. p.* 599.

It is cultivated in Gardens, and flowers in *June*; as to its Virtues, it agrees with the other Mallows. *Dale.*

14. Malva; ſylveſtris; foliis ſinuatis minoribus; floſculis minimis Anglica. *Rand.*

15. Malva; Americana; ulmifolia; floribus conglobatis ad foliorum alas. *Plum. T.* 95. *Boer. Ind. alt. Plant. Vol.* 1. *p.* 267.

The Name *Malva* is from the Greeks μαλάχη, of μαλάσσω, to mollify. The Roots, Leaves, Stalks, Flowers, and Seeds, conſiſt of a mucilaginous Subſtance, which is very mollifying. The Antients reckon'd it among eſculent Plants, as appears from a noted Verſe of *Heſiod.* The Herb is a proper Remedy, firſt, where exceſſive Acrimony requires Demulcents; ſecondly, where too great a Siricture requires Relaxation; thirdly, where Pains are to be mitigated; fourthly, under an exceſſive Glutinoſity. Hence it is effectual for dry and rigid Fibres; for rendering the hard Inteſtines lubricous; and for the Vertigo in thoſe who labour under hypochondriacal Diſorders. The Surgeons alſo make great uſe of this Plant, and there is ſcarce a Cataplaſm deſign'd for maturating, but has Mallows for an Ingredient: It is of Efficacy in Affections of the Lungs and Inteſtines, a Phthiſis, Hoarſeneſs, and Cough. The Flowers are good for Inflammations of the Gums and Uvula; a Cataplaſm of the Herb is commended for the Eryſipelas, and an Infuſion of the Leaves after the manner of Tea cures an inveterate Heat of Urine. *Hiſt. Plant. aſcript. Boerhaav.*

MALVA is alſo a Name for the ALCEA and ALTHEA; which ſee.

MALVA, BETONICÆ FOLIO. A Name for the *Malacoides*; *Betonicæ folio.*

MALVA ROSEA.

The Characters are;

The Flower is fully expanded, larger than that of the common Mallow, cloſely adhering to the Stalk, and in full-grown Plants bearing copious Petals, inſtead of a Style, as in the common Mallow: In ſhort, all things are larger, rougher, and more ſhrubby, in this Plant than in the other.

Boerhaave mentions thirteen Species of this Plant, none of which have any medicinal Virtues aſcrib'd to them, except the firſt which is.

Malva; roſea; folio ſubrotundo. *C. B. P.* 315. *Tourn. Inſt.* 94. *Boerh. Ind. A.* 269. *Malva arborea.* Offic. *Malva hortenſis.* Ger. 782. Emac. 928. *Malva roſea.* Offic. *Malva roſea ſive hortenſis.* J. B. 2. 951. Raii Hiſt. 1. 600. *Malva hortenſis roſea.* Park. Parad. 369. HOLLYHOCKS.

This is a large tall Plant, ſix or ſeven Feet high, with thick round Stalks, and very large hairy round Leaves, a great deal bigger than the common Mallow, but much of its Shape; the Flowers grow upon the Stalk, coming forth with the Leaves, being very large, of one Leaf cut into five Segments, of a pale red Colour, having a ſpiked Umbo in the middle, full of duſty Apices. The Roots are white, large, and branched. It grows only in Gardens, flowering in *July* and *Auguſt.*

This Species of Mallows is much of the Nature of the common Mallow, but leſs mollifying: It is moſtly uſed in Gargles, for the Swelling of the Tonſils, and the Relaxation of the Uvula; but it is not often met with in Preſcriptions. *Miller's Bot. Off.*

Hollyhocks have the ſame Virtues with the common Mallow. The Flowers boiled in old Wine cure the Scurf; they are alſo uſed for the Eryſipelas, eſpecially the red, or what appears like a Roſe, in Conformity to the Colour. I uſe the Decoction of the Flowers, ſays *J. Baubine*, with good Succeſs, in Heat and Dryneſs of the Tongue and Fauces. Take of the Roots and Seeds of this Plant, each an equal and ſufficient Quantity; and boil them in Water with Barley-meal, and mix therewith Oil of Olive or Oil of Roſes, and make the Whole into a Plaiſter, which is very proper to be apply'd to Tumors of the Liver, Spleen, and Matrix, as being qualified for reſolving, diſcuſſing, and mollifying hot Abſceſſes. The ſame Plaiſter is effectual in the Eryſipelas, and other Inflammations of that kind, and extracts Spl'nters fixed in the Body. *Tragus.* This Plaiſter, ſays Dr. *Tancred Robinſon*, is of frequent Uſe in the Hoſpitals of *Italy*, for mitigating and reſtraining Inflammations, and violent hot Tumors. I have known, ſays *Ray*, a ſimple Ointment prepared of the Leaves of the *Malva Hortenſis*, boiled in unſalted May-butter and ſtrained, apply'd to an Eryſipelas, and *Ignes ſacri*, with extraordinary Succeſs, ſo as very rarely to fail of a perfect Cure after the ſecond or third Inunction. *Raii H. P. p.* 600.

It is called *Malva roſea*, becauſe its Flowers reſemble expanded Roſes; the Flowers are emollient and moiſtening, and are proper in Hæmorrhages, Dryneſs and Heat of the Fauces, and the Eryſipelas.

Beſides all the foregoing Species of *Malva*, *Dale* mentions the following; which is the

Malva arborea maritima. Offic. *Malva arborea marina noſtras.* Park. Theat. 301. Raii Hiſt. 1. 601. Synop. 252. *Althæa arborea maritima Gallica.* Tourn. Inſt. 97. SEA MALLOW-TREE.

It is common in Gardens, flowers in *June*, and the Leaves are in Uſe, which agree in Virtues with thoſe of the other Mallows.

MALVASIA, *Malmſey*, a generous ſort of Wine, prepared after the antient manner, of Grapes left to wither in the Sun, or dry'd by twiſting the Pedicles, and taking off the Leaves, or by placing them upon ſuſpended Hurdles, and ſprinkling them, for ſeven Days together, with a very thin ſort of Lime or Gypſum. Others call this Wine *Malviſium*, and *Marviſium*, and ſuppoſe it to be the *Arviſium* of the Iſland of *Scio.*

MALVAVISCUM, a Name in *Blancard* for the ALTHÆA.

MALUM, an ambiguous Term, ſignifying an Apple, and a Diſeaſe. *Malum mortuum* is a very malignant Species of Lepra or Scabies, ſo called, becauſe it renders the Body black and livid, and, as it were, mortify'd with black, foul, cruſty Ulcers, void of Sanies, Senſe, or Pain, eſpecially in the Hips and Legs, proceeding from a very high Corruption of the Blood, and nutritious Juices. *Malum*, in a ſtrict Senſe, ſignifies the Diſeaſe called the *Procidentia Oculi*, when the Eye exceeds the Bounds of the Eyelids.

MALUS.

The Characters are;

The End of the Pedicle becomes an Ovary, whoſe ſuperior Margin is expanded into a Crown, like a monophyllous Calyx, which unfolds itſelf into five large expanded Segments. The Flower is roſaceous, pentapetalous, growing on the Ovary within the Crown, with its Petals proceeding from the Interſtices of the Segments, and furniſhed with many Stamina, which ariſe from the internal Circumference of the Calyx. When the Ovary is increaſed, the Petals fallen off, and the Stamina vaniſhed, the five long Tubes, produced from the Centre of the Ovary, alſo wither; the Calyx is contracted, and paſſes into an umbilicated quinquecapſular, carnous Fruit, called an Apple.

Boerhaave mentions two Species of this Plant; which are,

1. Malus; flore pleno. *C. B. P.* 433. *Poma flore multiplici.* H. Eyſt. o. 1. F. 5. Fig. 1.

2. Malus; ſive Pomum. *C. B. P.* 433. *Boerh. Ind. A.* 2. 249. *Malus.* Offic. J. B. 1. 1. Tourn. Inſt. 634. Ger. 1272. Emac. 1459. *Malus ſativa.* Raii Hiſt. 2. 1445. Synop. 3. 451. *Malus vulgaris.* Park. Theat. 1502. THE APPLE-TREE.

This is a Tree ſo well known, that it would be ſuperfluous to give any Deſcription of it. Among the numerous Variety of Apples, thoſe which are accounted beſt for medicinal Uſe, are the Pearmain and Pippin, being the Poma fragrantia of the Shops, yielding a pleaſant vinous Juice, with a little Sharpneſs.

They are cordial, comforting the Heart, chearing the Spirits, and driving away Melancholy; and are very grateful and ſtrengthening to the Stomach. Of the Juice of theſe are made Syrup of Apples; and it is an Ingredient in the Confectio Alkermes. *Gerard* ſays, that the Pulp of four or five roaſted Apples, mixed well with a Quart of fair Water, and all drank within the Space of an Hour, is a moſt certain Relief for a Stoppage of Urine,

or Strangury; as alſo for a Gonorrhœa, and Heat of Urine. The Ointment called *Pomatum* ought to be made of a large green juicy Apple, called a *Pomewater*; but the Pomatum now in Uſe is made after another Manner. *Miller's Bot. Off.*

Malum, with the firſt Syllable long, comes from the *Doric* and *Æolic* μᾶλον; for μῆλον, which ſignifies not only a Sheep and a Breaſt, but alſo a kind of Apple. The Tree is called *Malus*, in *Greek* μηλέα. *Voſſius.*

The Word *Pomum* has a larger Signification than *Malum*; for ſome, under the former, comprehend, alſo, the *Nux*, or Nut, which the *Greeks* call ἀκρόδρυον (*Acrodryon*). Some diſtinguiſh the *Nux* from the *Pomum*, in that the latter has all its eatable Part on the Outſide, incloſing what is hard; whereas the *Nux*, on the contrary, includes what is eſculent within a hard Shell; but the Genus is commonly taken for the Species. *Julius Scaliger* thinks the Word *Pomum* derived from πόμα, or rather πῶμα, which latter we, alſo, meet with [πόμα, or πῶμα (*Poma*) from πίνω (*Pino*) to drink]; becauſe *Poma* (Apples) remove a Thirſt, and are both Meat and Drink at once.

The *Malus* is a Tree, ſo well known in all Parts of *Europe*, as to need no Deſcription. Of the *Malum* I acknowledge but one Species; for what are commonly taken for Species, are only Varieties, differing from one another by ſome Accidents, as Size, Figure, Colour, Taſte, and Time of Maturity. Now I think theſe Varieties make no Difference of Species, becauſe they owe their Original to Sowing, and are infinite without any certain or determinate Number, ſince new ones continually ariſe from ſowing the Seed. Both the *Bauhines* aſſert the Variety of Apples to proceed chiefly from the Variety of Inſition; but we think it is to be aſcribed to the Seed ſown, ſince, in Inſitions, the Fruit almoſt perpetually follows the Nature of the Graff, or Bud: We grant, however, that the Fruit may be improved by Inſition, in the Alteration of its Juice from tart and acid, to mild and pleaſant.

The Virtues of Apples are various, according to their different Taſtes; the acid, harſh, and auſtere, are aſtringent, and therefore bind the Belly; but, boiled with Butter, are a proper Food in feveriſh Diſorders, according to *Schroder*. Sweet Apples are of an hotter Nature, and have a looſening Quality: The ſouriſh, or vinous, are of a mix'd Nature, and agreeable to the Stomach and Heart. *J. Bauhine* approves the Judgment of *Ariſtotle*, that Apples ſhould be eaten before Food; for, in that Caſe, ſays he, they are very eaſy of Paſſage, and looſen the Belly; but, taken after Food, they only generate Inflations, and diſturb the Stomach, as we know, he ſays, by Experience. We find, ſays *Ray*, upon Trial, that the moſt convenient Time for eating of Apples is not in the Morning before Dinner, upon an empty Stomach, becauſe of Crudities and Acidity; nor before Supper, for the ſame Reaſon. Neither are Apples proper to be eaten immediately after Dinner or Supper; but two, three, or four Hours after either Meal, when the Stomach is not wholly exhauſted, nor too full. Apples are indeed fungous and ſpongy, ſo as to ſwim in Water, whereas Pears ſink therein; whence Apples are difficult of Concoction. Pears, whether crude or depreſſed, agree better with me, ſays *J. Bauhine*, and are more eaſily digeſted, than Apples. Tho' Apples may, perhaps, be hurtful to a cold and humid Stomach, they are, however, very agreeable to a hot and bilious one, and render the Body ſoluble. Almoſt all Apples have a Property in common; that, if their expreſſed Juice be drank with a little Saffron, it becomes an Antidote againſt Poiſons, and expels Worms, or other Animals, from the Belly. For pungent Pains in the Sides *Camerarius* adviſes a Cataplaſm prepared of a ſweet Apple roaſted with ſome pounded Frankincenſe in it. The ſame Author, for an Ambuſtion by Gunpowder, preſcribes boiling a ſweet Apple in Water of the broad-leaved Plantane till it be exhauſted; and then making it with Milk into a Cataplaſm, to be applied to the Wound.

There is a Medicine, which very often comes in our Practice, and which we highly value; it is prepared of Apples boiled in Water, and applied in form of a Poultice to an Inflammation of the Eye. The Apples may, alſo, be boiled in Milk of Goats or Women, or in Roſe-water, Water of Eyebright, or any other cooling Water; but I have frequently tried this Medicine without Milk, and with good Succeſs. *J. Bauhine.* It is common, in our Country, to apply a putrid Apple to all Sorts of Tumors and Inflammations of the Eyes. We have a memorable Experiment to this Purpoſe related by *Simon Paulus*. I remember, ſays he, that a Gentlewoman of a very good Family once told me, that ſhe was cured of a Gangrene in her Thigh, by following the Advice of a certain Lithotomiſt of *Stralſund*, in applying to the Part a Cataplaſm of putrid Apples bruiſed, and boiled without an Affuſion of any Liquor; and that the Cure was completed by two Applications. *Geſner*, with good Succeſs, adviſed eating a roaſted Apple hollowed, and filled with a Dram of Frankincenſe for a Dyſpnœa, and other Diſorders of the Lungs. *Raii H. P.*

MAMANGA *Frutex.* Piſon. An arboreſcent Shrub in *Braſil*, called by the *Portugueſe* LAVAPRATAS. The Leaves are like thoſe of the Citron-tree, but ſomewhat longer and ſofter, and uſed by the Surgeons in the Cure of Wounds and Ulcers. The expreſſed oily Juice of the Pods is reſerved for the Maturation of Abſceſſes. *Raii Index.*

MAMAY *Arbor.* Park. The ſame as MAMEI; which ſee.

MAMBU, a Name for the *Arundo Tabaxifera.*

MAMEI. The Mammæ, Momin, or Toddy-tree. A very beautiful Tree in the *Weſt-Indies*, tall and green, like a large Walnut-tree, with a lofty and broad Top, but ſomewhat pyramidical, like the Cypreſs. The Fruit is the ſweeteſt that grows on the Iſland of *Hiſpaniola*, ſometimes perfectly, ſometimes imperfectly round, and of the Bigneſs of two Fiſts. From Inciſions made in the Branches of this Tree diſtils a copious pellucid Liquor, which the Natives receive in Gourds hung under the Wound. They call this Liquor *Momin* or *Toddy* Wine, but it muſt be drank ſparingly, and not above a Glaſs at a time; for it is an extraordinary Diuretic, eaſily penetrates and incides, and is an effectual Preſervative againſt the Stone, as well as Diſſolvent of it when generated. There are two Species of this Tree, which are diſtinguiſhed by the different Size of their Fruit. *Raii H. P.* 1665.

MAMIRA. The Name of an Ingredient in what *Myrepſus*, and others of the Antients, call the Antidote of the Doctor and Prophet *Eſdras*. *Actuarius*, according to the Verſion of *Ruellius*, reads the Word *Mamera*. *Mamiras*, or *Mamira*, is deſcribed by *P. Ægineta*, *Lib.* 7. to be a ſmall Root of an Herb, very full of Knots and Joints, and ſuppoſed to be effectual in attenuating Cicatrices and Albugines in the Eye, becauſe it is endued with a deterſive Virtue. This Deſcription of *Paulus* ſeems to agree to the Root, now called in the Shops *Doronicum*; for this is a ſlender Root, diſtinguiſhed by very frequent Nodes or Extuberances, like Joints. If the Palate be conſulted, it has a ſweet Taſte, which is immediately ſucceeded by a ſlight and tranſient Bitterneſs: Hence it is manifeſt by the Taſte, that it is of Service for exterging Cicatrices and Albugines. *Aetius* and *Paulus*, in their Deſcription of the Antidote of *Eſdras*, make no mention of the *Mamira*. *Fuchſius Not. in Myrepſ. Antid* 138.

MAMMÆ. The Breaſts.

The Name of *Mammæ*, or Breaſts, is given to two Eminences, more or leſs round, ſituated in the anterior, and a little toward the lateral Parts of the Thorax; their Centre, or middle Part, lying almoſt oppoſite to the bony Extremity of the ſixth true Rib on each Side. Their Size and Figure vary in the different Sexes, and different Ages.

In Children of both Sexes, and in Males of all Ages, they are commonly no more than cutaneous Tubercles, or ſoft Verrucæ of a reddiſh Colour, called *Papillæ*, or Nipples; each of them being ſurrounded by a ſmall, thin, and pretty broad Circle or Diſk, more or leſs of a browniſh Colour, and an uneven Surface, termed *Areola*.

In Females, come to the Age of Puberty, which is ſometimes ſooner, ſometimes later, a third Part is joined to the two former, which is a convex Protuberance, more or leſs round, of about five or ſix Fingers in Breadth; the *Papilla* and *Areola* being ſituated near the middle of the convex Surface. This is what is properly termed *Mamma*, and it may be termed the Body of the Breaſt, when compared with the other two Parts. It increaſes with Age, and is very large in Women with Child, and in thoſe that give Suck. In old Age it decreaſes and becomes flabby, loſing its natural Conſiſtence and Solidity.

The Body of the *Mammæ* is partly glandular, and partly made up of Fat; or it is a glandular Subſtance, mixed with Portions of the *Membrana Adipoſa*, the cellulous Pellicles of which ſupport a great many Blood-veſſels, Lymphatics, and ſerous or lactiferous Ducts, together with ſmall glandular Moleculæ, which depend on the former; all of them being cloſely ſurrounded by two Membranes, continued from the Pelliculæ.

The innermoſt of theſe two Membranes, which is, in a manner, the Baſis of the Body of the Mamma, is thick, and almoſt flat, adhering to the Muſculus Pectoralis major. The ſecond or external Membrane is thinner, forming a particular Integument for the Body of the Mamma, more or leſs convex, and adhering cloſely to the Skin.

The Corpus Adipoſum of the Mamma in particular is a ſpongy Cluſter, more or leſs interlarded with Fat, or a Collection of membranous Pelliculæ, which, by the particular Diſpoſition of their outer Sides, form a kind of Membrane in Shape of a Bag, in which all the reſt of the Corpus Adipoſum is contained. The anterior or outer Portion of this Bag, or that which touches the Skin, is very thin; but that Side next the Pectoralis major is thick.

DUCTUS LACTIFERI.

The glandular Body contains a white Maſs, which is merely a Collection of membranous Ducts, narrow at their Origin, broad in the middle, and which contract again as they approach the Papillæ,

Papillæ, near which they form a kind of Circle of Communication. They are named Ductus Lactiferi.

Areola.

The coloured Circle, or Disk, already mentioned, is formed by the Skin; the inner Surface of which ſuſtains a great Number of ſmall glandular Moleculæ, of that kind which *Morgagni* calls *Glandulæ Sebaceæ*. They appear very plainly all over the *Areola*, even on the Outſide, where they form little flat Heights or Eminences, at different Diſtances, quite round the Circle.

Theſe Tubercles are perforated by ſmall Holes, through which a kind of ſebaceous or cheeſy Matter, more or leſs liquid, may be ſqueezed out. Sometimes this is a ſerous Liquor, ſometimes a milky Serum, and ſometimes pure Milk, eſpecially in Nurſes; and I have ſeen both ſerous and milky Drops come out at the ſame time.

From thence I am inclined to think, that theſe Holes communicate with the lactiferous Ducts, and that the Tubercles are a kind of auxiliary Papillæ added to the true ones. The different Matters, or Liquors, that may be ſqueezed from the ſame glandular Body, give, alſo, room to think, that the Holes in them communicate by their Extremities with ſeveral other ſmaller Holes.

Papilla.

The Tubercle, which lies in the Centre of the Areola, is term'd *Papilla*, or the Nipple: It is of different Sizes in different Ages and Conſtitutions, and in the different Conditions of Females in particular. In Women with Child, or who give Suck, it is pretty large, and generally longer and higher than it is thick or broad; and, when it happens to be ſhort, it cauſes great Uneaſineſs to the Child.

The Texture of the Nipple is ſpongy, elaſtic, and liable to divers Changes of Conſiſtence, being ſometimes harder, ſometimes more flaccid: It ſeems to be made up, principally, of ligamentary Faſciculi, the Extremities of which form the Baſis and Apex of the Nipple: Theſe Faſciculi appear to be gently folded or curled, during their whole Length; and if, by drawing the Fibres out, theſe Folds be deſtroy'd, they return again as ſoon as that Action ceaſes.

Between theſe ſpongy and elaſtic Faſciculi lie ſeven or eight particular Tubes, at ſmall Diſtances from each other, and all in the ſame Direction: Theſe Tubes end at the Baſis of the Papilla, in the irregular Circle of Communication of the lactiferous Ducts, and at the Apex, in the ſame Number of almoſt imperceptible Holes or Orifices; and, as they are cloſely united to the elaſtic Faſciculi, they are folded in the ſame manner with them.

The Body of the Papilla is cover'd by a thin cutaneous Production, and by the Epidermis; its outer Surface is uneven, being full of ſmall Tubercles and Wrinkles; among which thoſe near the Circumference of the Nipple ſeem to have a tranſverſe or annular Diſpoſition, which, however, is not uniform.

This Diſpoſition or Direction ſeems to be owing to the elaſtic Folds already mentioned; and, from this ſimple Structure, it is eaſy to explain how Infants in ſucking the Nipple, and Women in drawing the Teats of Cows, bring out the Milk: For the excretory Tubes, being wrinkled in the ſame manner as the Faſciculi, do, by theſe Wrinkles or Folds, as by ſo many Valves, hinder the Milk contained in the Ducts from flowing out; but when the Nipple is drawn and elongated, the Tubes loſe their Folds, and the Paſſage becomes ſtrait. Beſides this, when they are drawn with a conſiderable Force, the whole Body of the Mamma is increaſed in Length, and contracted in Breadth, and thereby the Milk is preſſed into the open Tubes; and thus, by barely preſſing the Body of the Breaſt, the Milk may be forced toward the Nipple, and even through the Tubes.

The Arteries and Veins diſtributed through the Mammæ, are Ramifications of the Arteriæ and Venæ Mammariæ; of which one kind comes from the Subclaviæ, and are named *Mammariæ Internæ*; the other from the Axillares, called *Mammariæ Externæ*.

Theſe Veſſels communicate with each other, with thoſe near them, and with the Vaſa Epigaſtrica. The Nerves come principally from the Coſtales, and, by means of theſe, communicate with the great Nervi Sympathetici.

The Uſe of the Mammæ in the Nouriſhment of Children is known to all the World: But it is not certainly known what the Papillæ and Areolæ in Men can be deſigned for. Milk has been obſerved in them in Children of both Sexes; and this happen'd to one of my own Brothers, when he was about two Years of Age. *Winſlow's Anatomy.*

The Breaſts are ſubject to various Imperfections and Diſorders.

Thus ſome young Women, after being deliver'd of their firſt Child, have their Nipples ſo ſmall, and ſunk into the Breaſts, that the new-born Child cannot take them in its Mouth, in order to obtain the Milk: It may, therefore, be neceſſary, to procure an older and ſtronger Child, or an adult Perſon uſed to ſuck, who, by Strength of Suction, may make the Nipple protuberate, and extract the Milk. But if this Experiment cannot be conveniently tried, or proves unſucceſsful,

1. Take a Glaſs, like that repreſented in *Tab.* XLII. *Fig.* 18. and apply the larger Part, marked A, like a Cupping-glaſs, upon the Nipple; and at the Tube B B let it be ſucked by the Patient: This Operation muſt be repeated, till the Nipple is ſufficiently extended for the Child.

2. If no ſuch Glaſs is at hand, a Tobacco-pipe may be uſed in the ſame manner.

3. Others apply a ſmall Cucurbit (Cupping-glaſs) of Ivory or Alabaſter, in the Form of an Hat, as in *Fig.* 19. which they ſuck ſtrongly with their Mouth.

I have, ſays *Heiſter*, another ſort of Glaſs, which may be called a Sucking-glaſs, repreſented in *Fig.* 20. which being heated in warm Water, or before the Fire, in order to rarefy and expel the Air, and having its Mouth A applied to the Nipple, it will not only be protruded, but the Milk will be extracted, and Inflammations of the Breaſt will be thereby abated. When the Suction of the Glaſs diminiſhes, the Milk may be let out at the Aperture B, which was before cloſed with Wax. The Glaſs being again heated, as in Cupping, and the Whole ſtopped with Wax, the Application may be repeated till the Intention is anſwer'd.

Laſtly, Young Whelps, before they have Teeth, have been ſucceſsfully uſed for this Purpoſe.

Fissures and Exulcerations of the Nipple.

Women in Child-bed, who ſuckle their own Children, are frequently afflicted with very painful Fiſſures and Ulcerations in their Breaſts: In theſe Caſes, a Mucilage of Quince-ſeed may be very beneficial; or anoint the Nipples with the Oil of Eggs, mixed with a little of the Oil of Wax; or the Oil of Myrrh per Deliquium may advantageouſly be uſed in the ſame manner; or, laſtly, a fine Powder of Gum Tragacanth may be ſprinkled on them through a Piece of Muſlin. The Child ſhould be ſuffered to ſuck as ſeldom as poſſible, as the Suction muſt impede the Cure; and the Shift of the Patient muſt be carefully kept from adhering to the Nipple, which, after the Child has done Sucking, ſhould be waſhed with a Solution of a ſmall Quantity of the Sugar of Lead, in Plantane-water, and then covered with a Cap of Ivory, Marble, or white Wax, like that in *Tab.* XLII. *Fig.* 19.

Inflammations of the Breast.

Inflammations of the Breaſts frequently happen to Child-bearing Women, and generally a few Days after their Delivery. If the Milk ſhould be impelled into the Breaſt with too much Force, or in too great a Quantity, which, at ſuch times, is often the Caſe, and if the Woman ſhould be attacked with a Cold, or have her Mind diſturbed by Fear, Anger, or Grief, or drink cold Liquors, the ſanguiferous and lactiferous Veſſels being by theſe means obſtructed, the Breaſts muſt conſequently become tumefied, and be affected with great Heat, Redneſs, Hardneſs, and violent Pain. Theſe Tumors ſometimes proceed from the ſame Cauſes in Women who give Suck, even a conſiderable Time after their Delivery, and ſometimes in thoſe who have no Milk. I have even obſerved, ſays *Heiſter*, the ſame Caſe in a Man, which was occaſioned by a great Fright; one Breaſt was prodigiouſly tumefied, and had degenerated into an Abſceſs, from which I extracted, at the firſt Opening, above two Pounds of Matter, to the great Surprize of the Patient and By-ſtanders. This kind of Inflammation is uſually accompanied with a Fever, or great Heat over all the Body, with a quick Pulſe, Thirſt, Head-ach, and difficult Reſpiration; and it is generally preceded by a Shivering.

Tho' theſe Inflammations moſt frequently happen to Women who have been lately deliver'd, and do not ſuckle the Child, yet they may often ariſe from the Cauſes above-mentioned, in thoſe who have left off giving Suck, or from a Blow, Contuſion, or other external Injury.

Theſe Inflammations are not always equally violent. Sometimes the whole Breaſt, ſometimes one Side of it, and ſometimes but a ſmall Portion of it, is affected: Sometimes the Inflammation is near the Skin, and at other times deeply ſeated: Sometimes the Symptoms, ſuch as the Redneſs, Heat, Tenſion, and Pain, are more intenſe; and ſometimes of a milder Nature.

The ſmaller the Tumor, and the ſlighter the Inflammation and Fever, the leſs is the Danger; becauſe it may then be diſperſed, without being brought to a Suppuration: On the contrary, the more violent the Symptoms, the greater is like to be the Suppuration; which ſometimes degenerates into a Scirrhus, and a Scirrhus is almoſt always ſucceeded by a Cancer.

This Diſorder may be eaſily prevented, in thoſe who will not, or cannot, ſuckle their Children, by ſpreading Sperma Ceti Plaiſter upon Linen, with a Perforation in the Middle, to tranſmit the Nipple, and applying it warm to the Breaſt, ſoon after Delivery, faſtening it with a Bandage ſomewhat tight, in order to prevent the Acceſſion of the Milk. It may, alſo, be proper

to hang the Galactites, or Milk-ſtone, or ſome Quickſilver, in a Nut-ſhell from the Neck, down the Back of the Patient, and to apply between the Scapulæ a Plaiſter of Frog-ſpawn mixed with Sugar of Lead, and Oil of Henbane. The moſt efficacious internal Medicines are thoſe which promote the Lochia, if their Flux be not already ſufficient; ſuch as the Eſſences of Myrrh, Amber, and Saffron, or the Elixir Proprietatis. The Diet muſt, at the ſame time, be very low, till the Afflux of Milk to the Breaſts is much diminiſhed; for which Purpoſe Broths, Tea, and the like thin watry Aliments, ſhould be continued ſome Days. But, if the Mother is deſirous to ſuckle her own Child, the beſt Means to prevent an Inflammation of the Breaſt is to keep free from Colds, and carefully to avoid all violent Affections of the Mind; letting the Child ſuck often, to prevent the Stagnation of the Milk. The Diet ſhould principally conſiſt of Broths, and thin Fluids, for the firſt Week, in order to leſſen the Quantity of Milk, and hinder its being inſpiſſated in the Veſſels: But when a Tumor and Inflammation begin to diſcover themſelves in the Breaſts, let Diſcutients be applied, both externally and internally, without Delay; by which means a Suppuration or Scirrhus may be prevented, which often leave unſeemly Cicatrices behind them.

La Motte's Method of treating thoſe Caſes, as appears by *Obſ.* 134. *p.* 668. is to endeavour firſt to reſolve the Tumor, by Bleeding, emollient Clyſters, and a low Regimen, by Applications of warm Milk and Brandy, and an Ointment of Oil of Roſes, Lilies, and Chamomile.

Heiſter affirms, that the moſt powerful Diſcutient which he has experienced on theſe Occaſions, is the Sperma Ceti Plaiſter. Over the Plaiſter may be laid a digeſtive Bag, made warm, and ſtuffed with Bran and Salt, or with the Flowers of Elder, Chamomile, Melilot, and Lavender; and the Seeds of Fennel, Cumin, and Aniſe. Some, inſtead of theſe Bags, put Lamb-skin over the Plaiſter, which not only defends the Breaſt from the external Cold, but is a proper Diſcutient on theſe Occaſions. Another ſucceſsful digeſtive Application for theſe Tumors, is a Calf's Bladder, filled with a warm Decoction of the Flowers of Elder and Chamomile, which ſhould be often laid to the tumefied Breaſt, having its Heat renewed when neceſſary. Of the ſame Virtue is the Plaiſter of ſimple Diachylon, either alone, or mixed with Sperma Ceti. The Rob of Elder, or *Venice* Treacle, mixed with the Salt of Wormwood, being ſpread upon Linen, and applied warm by way of Liniment, have excellent Effects in diſpelling theſe Tumors, eſpecially if covered with warm digeſtive Bags: But theſe Applications are to ſome diſagreeable, as they daub the Skin, Linen, and Bed-clothes. To theſe we may add Vinegar of Litharge, Vinegar in which Cumin has been boiled, and Lime-water, which may be applied by means of Linen Compreſſes impregnated with the hot Liquors, and often repeated. Many eſteem the Expreſſion of the Milk upon burning Coals, an excellent Remedy; but, however idle and ſuperſtitious it may appear, it ought not to be entirely rejected, as it may operate ſucceſsfully, by ſtrongly influencing the Imagination of a ſuperſtitious Woman. If the Breaſts are greatly diſtended with Milk, let it be ſucked out by a Child, an old Woman, or a Puppy, or by the Application of the Glaſs Inſtrument already deſcribed, till the Tumor ſubſides, and the Pain ceaſes.

But if the Inflammation will not yield in four or five Days, or if, as is often the Caſe, the Surgeon is conſulted too late, the ſafeſt Method is to haſten the Suppuration with all Expedition, rather than hazard its degenerating into a Scirrhus or Cancer by Delay. For this Purpoſe the Diachylon-plaiſter, with the Gums, or Plaiſter of Henbane, ſhould be ſpeedily applied. But the following Cataplaſms, or ſome of thoſe deſcribed under the Article ABSCESSUS, for the Maturation of Abſceſſes, will be more effectual:

Take of Ryemeal, half an Ounce, or an Ounce; of Honey a ſufficient Quantity to form a Cataplaſm: Then add a ſmall Quantity of Milk and Saffron, and let it be ſpread warm upon Linen, applied to the Breaſts, and often renewed. Or,

Take of Ryemeal, four Ounces; of Galbanum diſſolved in the Yolk of an Egg, one Ounce; Vinegar, three Ounces; Water, a ſufficient Quantity for boiling theſe Ingredients into a Cataplaſm. Or,

Take of Leaven, two Ounces; Honey, half an Ounce; *Venice* Soap ſliced, and Oil of Chamomile, each two Ounces: Let theſe be mixed together in a Pot, over the Fire, into the Form of a Cataplaſm.

Theſe Cataplaſms are to be applied hot, and very often, to the Breaſts, keeping them on by Linen Compreſſes, or Bolſters, to retain the Heat, till the Tumor burſts of itſelf, which it often does from the Thinneſs of the Skin in this Part; or otherwiſe it may be conveniently opened by the Knife. If Neceſſity will permit, the Inciſion ſhould always be made in the lower Part of the Breaſt, to conceal the Cicatrix from View. Some Surgeons uſe the Cautery in opening theſe Suppurations; but as they uſually leave unſeemly Cicatrices, the Knife ought to be preferred.

After the Pus has been diſcharged, the Treatment muſt proceed as directed under the Articles ABSCESSUS and VULNUS. Let the Ulcer be firſt mundified with ſome digeſtive Ointment, and then apply ſome healing Balſam, as that of *Peru*, with the Oil of Eggs, and of Wax. But when the Suppuration has penetrated deep, inject into the Wound the cleanſing Decoction of Sanicle and Ladies-mantle, mixed with Honey of Roſes; and, to prevent the Lips of the Wound from cloſing before the Bottom is incarned, introduce a ſoft Tent, or ſcraped Lint, which, as the new Fleſh riſes from the Bottom, may be gradually leſſened, and at laſt removed.

Sometimes theſe Tumors will neither yield to Diſcuſſion nor Suppuration, but will continue for Months, and even Years. In young and healthy People, this Sort is not very troubleſome, nor is there much Danger of their growing ſcirrhous or cancerous, or that they ſhould always remain. In ſuch Caſes, let the Patient be kept always chearful, and let the Sperma Ceti Plaiſter be kept conſtantly applied to the Tumor, which muſt be carefully defended from the external Cold. By this Method Tumors of long Duration have gradually diminiſhed, and, at laſt, diſappeared. But in Women advanced in Years, and of a melancholy ſorrowful Diſpoſition, ſuch inveterate Tumors are ſubject to degenerate into a Scirrhus, or Cancer. *Heiſter Chirurg.* See CANCER, and AMPUTATIO.

MAMMARIA VASA. The Mammary Veſſels; that is, the Veins and Arteries of the Breaſts.

MAMMIFORMES PROCESSUS. The Mammiform or Maſtoide Proceſſes of the Temporal Bone. See CAPUT. Theſe Proceſſes are, likewiſe, called *Mammillares*.

MAMMOERA MAS. A Name for the PAPAYA MAS.

MAMMOERA FOEMINA. A Name for the *Papaya*; *Fructus Melopeponis effigie*.

MANACA. *Marcgr. Piſon.* A *Braſilian* bacciferous Shrub, with an umbilicated Fruit, like that of the Juniper; containing three elliptical Seeds, of the Size of Lentils. The Part uſed in Medicine is the Root, which is great, ſolid, and whitiſh; its medullary Subſtance, reduced to Powder, has very conſiderable Effects; but becauſe it works too violently, both upwards and downwards, in the ſame manner as Scammony, or the Eſula, it is uſually given only to very robuſt Perſons, and then with Correctives, and in a juſt Doſe. It has ſomewhat of a Bitterneſs and Acor. The Root, macerated in Water, makes a Fomentation, or Bath, for thoſe who are afflicted with wandering Pains of the Joints, eſpecially ſuch as are contracted by Cold. The Plant is uſed as a Vulnerary by the *Braſilians*. *Raii Hiſt. Plant.*

MANATI. Offic. Schrod. 5. 327. Hern. 323. Charlt. de Piſc. 49. *Manati Indorum.* Aldrov. de Piſc. 728. Jonſ. de Piſc. 156. Rondel. de Piſc. 1. 490. *Manati Phocæ genus.* Cluſ. Exot. 132. *Manati, ſeu Vacca marina.* Raii Synop. A. 193. Sloan. Jam. 2. 329. THE SEA-COW.

The Part of this Animal, which is in Uſe, is the Os Petroſum of the Head, which is cruſtaceous, white, and like Ivory, of various Forms. It is much recommended for wearing away the Stone in the Kidneys and Bladder, and for eaſing nephritic and colic Pains. *Schroder. Geoffroy* ſays, that it has the Reputation of preventing an Hæmorrhage, if worn about the Neck. *Fred. Hoffman* recommends it in the Epilepſy.

This Animal is ſaid to be very fond of Mankind.

MANBRUX. Silver. *Rulandus.*

MANCANILLA. The Manchineel-tree.

The Characters are;

It has male Flowers, or Catkins, which are produced at remote Diſtances from the Embryos on the ſame Tree; the Embryo becomes a round fleſhy Fruit, in which is contained a rough woody Nut, incloſing four or five flat Seeds.

Miller mentions three Species of this Tree; which are,

1. Mancanilla Pyri facie. *Plum. Nov. Gen.* 50. THE MANCHINEAL, WITH THE FACE OF A PEAR-TREE.

2. Mancanilla aquefolii foliis. *Plum. Nov. Gen.* 50. THE MANCHINEEL, WITH LEAVES LIKE HOLLY.

3. Mancanilla Lauri foliis oblongis. *Plum. Nov. Gen.* 50. THE MANCHINEEL, WITH OBLONG LAUREL-LEAVES.

The Manchineel, is a Native of the *Weſt Indies*, where it grows on low ſandy Ground, or near Gullies where Water runs. The three Sorts here mentioned are diſtinguiſhed by Botaniſts; but I believe their Difference is not remarked by the Natives. They grow to be very large Trees equal to the Size of an Oak, and are much eſteemed for their Wood, which is ſawn out into Planks, and brought over to *England*. It is uſed for Cabinets, Book-caſes, *&c.* and will poliſh very well, is of a beautiful Grain, and will laſt a long time. In cutting down theſe Trees they are very careful to burn out the Juice of the Bark, before they begin; otherwiſe they are in Danger of loſing their Eyes, by ſome of the Sap getting into them, which is of a milky Colour, and ſo very cauſtic, that it will raiſe Bliſters on the Skin, and burn Holes in Linen. The Fruit of the Tree, when ripe, is of the Colour

and

and Size of a Golden-pippin, for which many of the *Europeans* have taken it; and ſome, by eating it, loſt their Lives, and others have greatly ſuffered. The Fleſh is not much thicker than a Crown Piece, and not very diſagreeable to the Taſte, but will corrode the Mouth and the Throat. The Leaves of theſe Trees abound, alſo, with a milky Juice, which is of the ſame Nature, ſo that it is dangerous being under their Drip. The Cattle in *America* never ſhelter themſelves under them; and ſcarcely will any Vegetable grow under their Shade; yet the Goats eat this Fruit without any manifeſt Injury to themſelves, or their Milk. *Miller's Bot. Off.*

The Remedy for the Affections, or Diſorders, induced by the Juice or Dew of this Tree, which mitigates and repreſſes the Inflammation and Inflations, is a clear Water found within the Shell of a Snail, called the *Soldier*, or the Oil extracted from the ſame Inſect, without the Help of Fire. *Raii Hiſt. Plant.*

MANCORON. *Oribaſius, in Collect. Med. L.* 11. thus deſcribes the Mancoron: It is, ſays he, a Sort of concreted Honey, contained in Canes, of the Conſiſtence of Salt, found in *Arabia Felix* and *India*, and breaking under the Teeth like Salt. By this Deſcription it ſhould ſeem to be a Sort of Sugar.

MANCURANA, *μαϛιχεγια*. Marjoram. *N. Myrepſus, Sect.* 1. *Cap.* 21.

MANDARU, or THE POD-BEARING MALABARIAN TREE, WITH BIFID LEAVES. This Tree, in *Jacob. Zanoni Hiſt.* is deſcribed under the Name of *Aſſitra*, or *Arbor S. Thomæ*. A Branch of this Tree, under the Name of *Arbor S. Thomæ*, was, ſent by Dr. *Herman* to Dr. *Syen*, from the Iſland of *Zeylon*, with this Obſervation, that ſtriated Marks of Blood appeared in the Flowers, from their being ſprinkled with the Blood of St. *Thomas*, who is believed to have preached the Goſpel in *Malabar* and *Zeylon*. *Ray* mentions four Species of this Tree.

The firſt is the *Chovanna Mandaru prima*. S. M. *Arbor S. Thomæ*. D. Herman. *Arbor ſiliquoſa, Malabarica, foliis bifidis, flore purpuraſcente ſtriato*. D. Syen.

The Flowers of this Species, boiled with Sugar, are ſucceſsfully uſed, inſtead of Sugar of Roſes, as a gentle Purgative.

The ſecond Species is the *Chovanna Mandaru ſecunda*. H. M. *Arbor ſiliquoſa Malabarica foliis befidis majoribus, flore intenſius purpuraſcente.*

The Root chewed is good for Pains of the Head and Teeth; bruiſed with dry Ginger, and applied to the Part, it mitigates the Pain of the Gout. The Vapour of a Decoction of the Leaves eaſes Pains in the Body, being received by the affected Part. The Flowers ſimply eaten are purgative; the Bark, Flowers, and Fruit bruiſed together, and mixed with Water, in which Rice has been macerated, are effectual for maturating and breaking Abſceſſes.

The third is the *Volutta Mandaru* H. M. *Arbor ſiliquoſa Malab. foliis bifidis minor, flore candido, ſtriato*. D. Syen. It agrees in Virtues with the others.

The laſt is the *Canſchena pou*. H. M. *Arbor ſiliquoſa Malab. foliis bifidis minoribus flore albo flaveſcente ſtriato*. D. Syen. *Mandaru quarta Species, Flos Divi Thomæ.*

The Right Rev. Dr. *Compton*, Biſhop of *London*, had one of this Species growing in his Garden in the Year 1687. *Raii H. P. p.* 1751.

MAND.BULÆ LUCII PISCIS. Theſe are abſorbent, and paſs with ſome for a good Sudorific, being taken in the Quantity of a Dram in Carduus-water. They are by others recommended in Pleuriſies. *Geoffroy*. See LUCIUS.

MANDIHOCA. See MANIHOT.

MANDOBI. See ARACHYDNA.

MANDRAGORA.

The Characters are;

The Flower is monopetalous, bell-ſhaped, and multifid; the Fruit is ſoft, globular, and contains Seeds, which are for the moſt part kidney-ſhaped.

Boerhaave mentions three Species of this Plant; which are,

1. Mandragora; flore ſubcœruleo purpuraſcente. *C. B. P.* 169. *M. H.* 531. *Mandragora fœmina*. J. B. 618.

2. Mandragora; fructu rotundo. *C. B. P.* 169. *Raii Hiſt.* 1. 668. *Tourn. Inſt.* 76. *Boerh. Ind. A.* 2. 70. *Mandragora*. Offic. *Mandragoras mas*. Ger. 281. Emac. 352. Park. Parad. 377. J. B. 3. 617. *Mandragoras mas vulgatior*. Park. Theat. 343. MANDRAKE.

The Mandrake has a large browniſh Root, ſometimes ſingle, and ſometimes divided into two or three Parts, growing deep in the Earth, from which ſpring ſeveral large dark-green Leaves, a Foot and more in Length, and four or five Inches broad, ſharp-pointed at the Ends, of a fetid Smell; from among theſe ſpring the Flowers, each on a ſeparate Foot-ſtalk, about the Height and Bigneſs of a Primroſe, of a whitiſh Colour, of one bell-faſhioned Leaf, cut into five Segments, ſtanding in a large five-corner'd Calyx; and are ſucceeded by ſmooth round Fruit, about as big as a ſmall Apple, of a deep-yellow Colour when ripe, and of a very ſtrong Smell. It grows wild in *Spain*, *Italy*, and *Turkey*, but in cold Countries only in Gardens. The Leaves and Roots are uſed.

This Plant is rarely uſed inwardly, many eſteeming it to be a Narcotic, and of a poiſonous Nature; though others deny it, and ſay, that the Fruit may be eaten without any ill Effects. Outwardly, it is uſeful in all kinds of Inflammations, hot Tumors, and ſcrophulous Swellings: The Juice, dropt into the Eyes, is good to take away their Heat and Redneſs. It is ſeldom to be met with; and, though an Ingredient in the *Unguentum Populeon*, its Place is generally either ſupplied by Henbane, or *Engliſh* Tobacco. *Miller's Bot. Off.*

The Mandrake is commonly reckoned among Narcotics and Hypnotics; whether this be true of the Bark of the Root, which is the Part uſed in the Shops, I am not certain; but the Fruit is without doubt unjuſtly ſuſpected. *Caſp. Hoffman* confeſſes himſelf unable to determine, whether the Apple, either with or without the Rind, may be eaten with Safety or not. *Aetius* ſeems to aſcribe all the Malignity to the Seeds, as if the Pulp without them was harmleſs, unleſs eaten in an exceſſive Quantity. That the Pulp, however, may be eaten together with the Seeds, without Injury, appears from the Example of *J. Faber Lyncent* Profeſſor of Botany at *Rome*, who, as we are aſſured by *J. Terrent.* in his Notes on *Hernandez de Plantis Mexic.* before his Auditors eat up a large Mandrake-apple, Seed and all, in the Morning faſting, without any conſequent Sleeping, or any the leaſt ill Symptom. And, that the Experiment might be the ſurer, he continued, he ſays, without taking any thing elſe till Dinner-time, which was ſome Hours. The ſaid *J. Terrentius* ſays, he has very often tried the ſame Experiment.

Since, therefore, Mandrake-apples are both eſculent and ſweet-ſcented, we need ſearch for no other Interpretation of the *Hebrew* Word *Dudaim*, which *Reuben* brought to his Mother *Leah*; and ſince, as the Antients aſſure us, the Seed of the Mandrake, taken inwardly, purges the Uterus, it is probable, that *Rachel*, being acquainted with this Property of the Seed, might be very deſirous of theſe Apples, that, after cleanſing, by their means, the Uterus, ſhe might be the better diſpoſed to conceive. *J. Bauhine.*

The Bark of the Root, which is imported from other Countries, chiefly from *Italy*, is narcotic, ſays *Schroder*, and ſoporiferous, and ſeldom uſed internally; outwardly, it is of Service in Redneſs and Pains of the Eyes, Eryſipelas, hard Tumors, Strumæ, and the like. It is uſual with ſtrolling Quacks and Mountebanks to expoſe and ſell to ignorant Perſons for Mandrakes, certain Images formed out of the freſh Roots of ſome other Plants, as of the Althæa and Arundo, but principally of the Bryony. *Raii Hiſt. Plant.*

3. Mandragora; flore cœruleo; foliis undulatis, non aſperis; fructu ovato. *Boerhaave Index alter Plant. Vol.* 1. *p.* 70.

The Plant, brought into a Chamber, or cloſed Room, procures Sleep to thoſe who want it. The Root works violently, both upwards and downwards, the Conſequence of which is a Loſs of Strength, and ſometimes Convulſions. The Leaves, boiled in Milk, and reduced to the Form of a Cataplaſm, are effectual in all ſcrophulous and ſcirrhous Tumors. *Hiſt. Plant. aſcript. Boerhaav.*

MANDRAGORAS. The ſame as MANDRAGORA.

MANDRAGORITES, *μανδραγοριτης*, Mandrake-wine, is thus prepared:

> Take of the Bark of the Root of Mandrake, half a Pound: Cut it into thin Slices, ſtring them, and let them down into nine Gallons of Wine, there to hang for three Months; after which, draw off the Liquor into another Veſſel.

The ordinary Doſe is a quarter of a Pint, in double the Quantity of Paſſum. They ſay, that half a Pint of this Liquor, mixed in ſix Pints of Wine, induces Sleep and a Carus; but that a Cyathus (the twelfth Part of a Pint) in a Pint of Wine, proves mortal. The moderate Uſe of it takes away the Senſe of Pain, and thickens Rheums. It works the ſame Effects, if ſmelled to, or injected in Clyſters. *Dioſcorides, Lib.* 5. *Cap.* 81.

MANDSJADI. *H. M.* Is an *Indian* ſiliquous or Pod-bearing Tree, with a ſpiked pentapetalous Flower, and long Pods, containing nodous ſcarlet-coloured Beans. The Tree is one of the talleſt in the Kingdom of *Malabar*, bears Fruit the twentieth Year after planting, and lives two hundred Years.

The Wood is of common Uſe for various Purpoſes, on account of its Solidity. The Leaves, reduced to Powder, are uſed in the Pagan religious Rites. The Seeds, which are not ungrateful to the Taſte, are eaten by the common People, either boil'd whole, or ground to a Meal; and are, beſides, of great Uſe to Goldſmiths and Jewellers, who, on account of their exact Equality, employ them inſtead of Grains in weighing their Wares; for each *Matjelina*, as they call them, weighs four Grains, ſuch as are in Uſe among the Goldſmiths, who, alſo, of the bruiſed Seeds, moiſtened with Water, and Borax, prepare a Glue for conglutinating the finer Sort of Veſſels, when broken. Of the bruiſed Leaves the Phyſicians prepare a Potion for mitigating Pains in the Loins. *Raii Hiſt. Plant.*

MANGA. Offic. *Manga Indica fructu magno reniformi.* Raii Hiſt. 2. 1550. Commel. Flo. Mal. 1. 170. *Mangas*. Park. Theat. 1631. *Mangas, ſive Amba*. J. B. 1. 173. *Amygdalam referens fructus birſutus*. Ejuſd. 1. 173. *Mangas & Amba Linſchotani.*

Tab. 1. 2. *Amba Perſica Indica fructú villoſo.* Herm. Muſ. Zeyl. 54.

The MANGO TREE.

It is a vaſt Tree, forty Foot in Height, and eighteen in Thickneſs, and ſpreads its numerous Branches all around at a great Diſtance, being always green, and bearing Fruit once or twice every Year, from ſix or ſeven Years old to an hundred. It is propagated by Inſition, or ſowing the Seed, in *Malabar, Goa, Bengall, Pegu,* and many other Countries of the *Eaſt Indies.*

The Fruit is of a round oblong Figure, flat, ſlightly ſinuated, or hollow'd at the Sides, and ſhaped much like a Kidney, bigger than a Gooſe Egg, ſmooth, ſhining, firſt green, ſpeckled with white, then inclining to yellow, and at laſt of a Gold-Colour; it has a yellowiſh and ſucculent Pulp, not unlike that of a Peach; or rather a Plumb, firſt acid, then acidodulcid, and pleaſant to the Taſte. Within the Pulp is contained an oblong, compreſſed and lanuginous Stone, thin, yet very hard and tenacious, and including a calous, oblong Kernel, very like an oblong Almond, and of the ſame Bigneſs, and of a bitteriſh, though not unpleaſant Taſte.

There are various Sorts of this Fruit, as there are of our Apples and Pears, which are very different, according to the Countries where they grow: That Species, which is without a Stone, and is very grateful to the Palate, ſeems to us only a Variety, or a degenerated Fruit. The Fruit is cut into Slices, and eaten either without Wine, or macerated in Wine; it is alſo candy'd, in order to its Preſervation. Sometimes they open it with a Kniſe, and fill up the Middle with freſh Ginger, Garlick, Muſtard and Salt, with Oil or Vinegar, that they may eat it with Rice, or after the Manner of pickled Olive.

As to its Temperament; this Fruit is cold and moiſt, though the *Indian* Phyſicians affirm the contrary. We make uſe of pickled Mangoes, which are imported to us, as we do of pickled Cucumbers, for Sauce to roaſted Meat. The Stones roaſted are ſaid to cure a Looſeneſs, which *Garcias* found to be true. The Wood of the Tree, with Cinders, is uſed for burning the Carcaſes of the Pagans, as being conſecrated to this Rite; whence it ſerves alſo for Coffins, in which they repoſit their Dead; but it is but of a ſoft Subſtance, and of ſhort Duration.

The Stalks ſupply the Place of *Arequa*, or *Caunga*, in the chewing of Betel; the ſame calcined and reduced to Powder, take away Warts. Of the tender Leaves, with the Bark of the *Avanacoe*, that is, the *Ricinus*, the Seed of Cummin, and *Parpadagam*, is made a Decoction, which is highly beneficial in the Cough, Aſthma, and other Affections of the Thorax. The Bark of the Tree pulverized, and taken in Chicken-broth, is an excellent Diſſolvent of extravaſated and coagulated Blood, occaſioned by a Fall, in any Part of the Body. The Juice of the Bark, with the White of an Egg, and a very little Opium, taken inwardly, is a preſent Remedy againſt the Diarrhæa, Dyſentery and Teneſmus. Of the Gum of the Tree, and the Flowers of Rice, with the Addition of a ſmall Quantity of Opium and Pepper, are prepared Pills, which alſo cure all ſorts of Fluxes of the Belly. Of the Flower of the dry'd Kernels, the Natives have the Art of preparing various kinds of Food.

MANGAIBA, *Marcgr. & Piſon.* is a pruniferous or Plumb-bearing Tree of *Braſil*, with an oval Fruit, containing many Seeds. It is a beautiful Tree, of the Bigneſs and Shape of our acid Cherry-tree; the Fruit is of the Size of a Plumb, or a Hen's Egg, roundiſh or oval, and of a Gold-Colour, ſpeckled with red. The Seeds are yellow, flat, and from ſix or ſeven, to twelve or more in Number; and containing, under a thin Skin, like that of ſweet Almonds, but viſcid, a very white Kernel, of a ſweet Taſte; for which Reaſon the Seeds are ſwallow'd entire in eating the Fruit. The Fruit is not eatable before it falls off ſpontaneouſly; for while it continues on the Tree, it is full of a tart and bitter Milk, ſo that the Cattle will hardly meddle with it before it is ripe; but as ſoon as it falls to the Ground, it acquires a Maturity. Great Quantities are daily gathered under the Trees, and ſuch as are not throughly ſoft, are ſet aſide for a Night, that they may ſoften. When it is duly ripe, it is eaſy of Digeſtion, qualifies the burning Heats of the Viſcera, and refreſhes thoſe who labour under Fevers. In ſhort, the Fruit is not ſubject to injure the Stomach, though very freely eaten by a Perſon faſting, except that, being of a cold, humid and diſſipable Nature, it excites Flatulencies, and cauſes a Stool.

At the End of Winter, that is, in *Auguſt*, the Tree begins to flower, and for above nine Months is loaded with Plumbs. *Raii Hiſt. Plant. p.* 1644.

MANGANESE. *See* MAGNESIA.

MANGARATIA. *See* ZINGIBER.

MANGAS, *The ſame as* MANGA.

MANGIER-BLANCE, a Species of *Anona*; the ſame with the Cuſtard-Apple. *See* ANONA.

MANGLE, the Mangrove Tree. *See* GUAPARAIBA.

MANGO, a Slave-Merchant. Theſe People, as *Galen* informs us, were verſed in the Art of ſetting off their Slaves to the beſt Advantage, by employing Unctions, Pication, and ſtriking emaciated Parts gently with proper Inſtruments, in order to render them plump and beautiful.

MANGOSTANS, *Bontii*, is an *Indian* Fruit, of the Size of a ſmall Orange; it is cardiac and ſtomachic, and its Rind or Peel is aſtringent. *Lemery des Drogues.*

MANGOUSTE, MANGOUSE, an *Indian* Quadruped, much like our Weaſels, only a little longer and thicker. The *Indians* aſcribe ſeveral Virtues to its Parts: The Liver, they ſay, is good for the Epilepſy; the Fleſh pulverized and applied, cures the Bites of venomous Beaſts; the Gall is good for Diſeaſes of the Eyes; the Fat is an excellent Remedy for cold Humours, Rheumatiſms, and the Pains of the Gout. *Lemery des Drogues.*

MANGUE, *The ſame as* MANGLE. *See* GUAPARAIBA.

MANHEB. Scoria. *Rulandus.*

MANIA, Madneſs.

There is an abſolute Neceſſity for reducing Melancholy and Madneſs to one Species of Diſorder, and conſequently of conſidering them in one joint View, ſince, from daily Obſervation and Experience, we find, that they both ariſe from the ſame common Cauſe and Origin, that is, an exceſſive Congeſtion of the Blood in the Brain, which is a weak and tender Part of the Body; and that they only differ in Degrees, and with reſpect to the Time of Invaſion; ſo that Melancholy may be juſtly taken for the primary Diſorder, and Madneſs for an Augmentation, or an accidental Effect of it. This was the Opinion of the ancient Phyſicians. Thus *Alexander Trallian*, in *Lib.* 1. *Cap.* 16. informs us, that Madneſs is nothing but Melancholy arrived at a higher Degree, and that the Connection between theſe two Diſorders is ſo great, that a Tranſition from the one to the other eaſily happens. *Aretæus* alſo, in *Lib.* 3. *Cap.* 5. tells us, that Melancholy is the Beginning and Origin of Madneſs, which is brought on rather by the Increaſe of Melancholy than by any other Cauſe. This Doctrine is confirm'd by daily Experience and accurate Obſervation, ſince we find that melancholic Patients, eſpecially if their Diſorder is inveterate, eaſily fall into Madneſs, which, when removed, the Melancholy again diſcovers itſelf, though the Madneſs afterwards returns at certain Periods: Nor are the Meaſures to be taken for the Cure of theſe two Diſorders greatly different from each other, ſince the Phyſician, who knows how to remove or leſſen the immediate Cauſe of Melancholy, is by this very Means qualified either for preventing or curing Madneſs.

But before we conſider the Nature, Generation and Difference of theſe Diſorders, we ſhall, from the Antients, and eſpecially the *Greeks*, among whom various Species of Deliriums were very common, give an Account of the ſeveral Phenomena, Signs and Marks, by which Melancholy and Madneſs diſcover themſelves. But none has given a more juſt and accurate Hiſtory of theſe Diſorders than *Aretæus*, who, in *Lib.* 3. gives us the following Marks of Melancholic Patients. Thoſe, ſays he, who are afflicted with Melancholy, are ſad, dejected and dull, without any apparent Cauſe. They tremble for Fear, are deſtitute of Courage, afflicted with Watchings, and fond of Solitude. They are prone to Anger, changeable in their Temper, and ask a Reaſon for the moſt trifling and inconſiderable Occurrences. They are at ſome Seaſons ſo covetous, that they will part with nothing, but ſoon after become ſilly and prodigal. They are generally coſtive, ſometimes diſcharge no Fœces at all, and at other Times their Excrements are dry, round, and covered with a black and bilious Humour. They diſcharge a ſmall Quantity of Urine, which is acrid and bilious. A large Quantity of Flatulences is lodged in their Præcordia. Putrid and fetid Eructations are diſcharged from their Mouths: Sometimes alſo they vomit a certain acrid Humour with the Bile. Their Countenances become pale: Their Pulſe is ſlow. They are lazy and weak, but diſcover a preternatural Voracity in eating their Aliments.

The Signs of Madneſs are alſo given by the ſame Author, who tells us, that Maniacal Patients, when provok'd to Anger, become raging mad. Some, ſays he, wander far from home: Some cry out in a hideous manner: Some ſhun the Sight of Men, betake

betake themſelves to Solitude, and only converſe with themſelves. Others tear and mangle their Bodies. In the higheſt Degree of the Diſorder, they perceive red Images before their Eyes, ſo that they in a manner think themſelves ſtruck with Lightening. They are immoderately inclined to Venery, ſo that they careſs publickly without either Dread or Shame. But when the Diſeaſe is in the Decline they become Stupid, Calm and Mournful, and coming to the Knowledge of their Misfortune, they are dejected on account of their calamitous and miſerable Situation. Theſe are the Signs of Madneſs in its Beginning, Progreſs, and Declenſion. I ſhall therefore enumerate ſome of its antecedent Signs, which I have obſerved in the Courſe of my Practice: the moſt conſiderable of theſe, are a Redneſs and Suffuſion of the Eyes with Blood; a tremulous and inconſtant Vibration of the Eye-lids; a Change of Diſpoſition and Behaviour; a Pride diſcovering itſelf in the Countenance, the Voice, and the Geſtures, a Grinding of the Teeth; an uncommon Hatred to particular Perſons. Little Sleep, a violent Cephalalgia, a Quickneſs of Hearing, a Ringing and Kind of muſical Sounding of the Ears. Among theſe Signs we may alſo reckon the incredible Strength, and the ſurpriſing Capacity of bearing Cold, obſervable in maniac Patients; and in Women an accumulation of Blood in the Breaſts in the Increaſe of the Diſorder.

But as theſe Signs of Madneſs frequently accompany an acute Delirium, commonly called a Phrenitis, we muſt be careful to deſtinguiſh theſe two Diſorders. When therefore a Delirium happens in the Beginning of an acute Fever, or comes on when it is at its Height, but is removed when the Fever is alleviated, the Diſorder is in this Caſe generally called a Phrenitis, nor does it call for any other Remedies than thoſe, which are proper for the Cure of the Fever. But if the Diſorder is long continued, unaccompanied with a Fever, and ſucceeds a melancholic State, it is univerſally called Madneſs. There is alſo a certain Privation of Reaſon, which cannot be properly called either Melancholy, Madneſs, or a Phrenitis; that Diſorder, for Inſtance which is excied in a ſound Perſon, by the Uſe of certain Narcoties, ſuch as the Solanum Furioſum, or its Berries, the Lolium Temulentum, Hen-bane and its Seeds, and Thorn-apple. But this Species of Diſorder is ſoon and totally removed by proper Medicines.

But that we may the more accurately inveſtigate the true and immediate Cauſes of Melancholy and Madneſs, to the Removal of which the principal Intention of Cure ought to be directed, we ſhall give an Account of what has been obſerved in diſſecting Perſons who have died of theſe Diſorders. In the *Miſcell. Nat. Curioſ. Dec.* 2. *an.* 6. we are told, that on diſſecting a maniac Perſon, many Ramifications of the caroted and vertebral Veſſels were obſerved twiſted together like a Net in the Baſe of the Brain. After taking out the Brain, almoſt ſix Ounces of bloody Serum were left in the Cranium. Then raiſing the Medulla-oblongata at the Baſe of the Brain, with the Fingers, and diſcovering the Ventricles ſituated on each Side the Plexus-Choroides was found to be preternaturally large, on both Sides diſtributed over all the internal Surface, of the Ventricles, and conſiſting of a great Number of conſiderable Blood-veſſels. This Plexus was every where full of lived Veſſels as large as a Pea, which when opened with a Lancet, diſcharged a gelatinous Serum. Thus alſo *Henricus ab Heer, in Obſ.* 3. tells us, that upon diſſecting a maniac Perſon, the Brain was found highly dry, hard, and its ſuperior Part friable upon the Application of the Fingers. Its Subſtance alſo was, for a Fingers-length, every where tinged with a yellow Colour reſembling that of a Citron. It was preternaturally moiſt and ſoft about the Ventricles, and the Origins of the Nerves appeared dry.

In the *Miſcell. Nat. curioſ. Dec.* 2. *an.* 4. *Obſ.* 162. we have an Account of the Diſſection of a phrenitic Patient, in whom the Gall-bladder was full of a Bile, which reſembled Tar; and the Sinus Falciformus contained a Kind of Polypous Subſtance. The *Pia Mater*, which was turgid with many Blood-veſſels, could be accurately ſeparated from the Brain; it was alſo far thicker, and furniſhed with larger Veſſels than the *Dura Mater*. A ſimilar Caſe occurred to me more than thirty Years ago in a Gentleman of Diſtinction, of a ſtudious and melancholic Turn, who died of a Delirium in the Height of the ſmall-Pox: In diſſecting his Body, all the Muſcles were found highly denſe, compact, robuſt, and covered with no Fat, for the *Membrana Adipoſa* was almoſt entirely wanting. The Gall-bladder was full of a Bile, which was thick, and as black as Pitch. The Panereas was large, thick and hard. The Veſſels of the *Dura* and *Pia Mater* were turgid with a thick Blood, and in the latter appeared varicoſe. From the *Sinus Falciformis*, a Concretion of Blood formed into a polypous Maſs was extracted, and in the Ventricles of the Brain there was a lived Serum.

A due Conſideration of theſe Circumſtances will lead us to the immediate Cauſes of theſe Diſorders, and enable us to give a more accurate Account of them than otherwiſe we could have done. Melancholy, then, is a ſtrong and lively working of the Fancy, dwelling intently on certain Objects, accompanied with Alienation of Mind, long continued Dejection, Dread and Sadneſs without any manifeſt Cauſe, and ariſing from a difficult Circulation of the Blood thro' the Veſſels of the Brain, where it is too copiouſly congeſted and becomes ſtagnant. A *Mania* is a violent Madneſs accompanied with Temerity and a preternatural Strength, ariſing from a violent Conveyance of a thick copious and melancholic Blood thro' the Veſſels of the Brain. Whereas a *Phrenitis* is a Madneſs accompanied with a Fever, and ariſing from an inflammatory Stagnation of the Blood in the Veſſels of the Brain.

That the Brain, therefore, is the Seat of all Diſorders of this Kind, is ſufficiently Obvious; and *Hippocrates*, in his Book *de Morbo Sacro*, tells us, "That it is by Means of the Brain that "we reaſon, underſtand, ſee, hear, and diſtinguiſh between "Good and Evil. By its Means it, alſo, is that we become "Mad." For the Brain is the moſt noble Part of the Body, which, tho' in a manner inconceivable by us, the wiſe and bountiful Parent of Mankind Species has made the common Receptacle or Repoſitory of the Soul, the Genius, the Fancy, the Memory, and the external Senſes. But though the Nature and Eſſence of this intelligent and ſenſible Principle, whence its Effects and Faculties proceed, are ſo abſtruſe as not to be comprehended by the human Mind, yet Phyſicians, from careful and accurate Obſervation, have learned, that according to the different Nature and Condition of the Blood, and its Motion through the Veſſels of the Brain, both the rational and ſenſitive Powers are ſo ſurpriſingly changed and altered, that the Difference of moral Characters, Inclinations and Appetites, is to be accounted for from theſe Circumſtances.

The Antients, who were Strangers to the Circulation of the Blood, aſſigned various, though abſurd and unſatisfactory proximate Cauſes of Deliriums. Thus ſome of them accounted for them from an Exſudation of the black Bile, and its Conveyance to the Head; as alſo from a preternatural Dryneſs of the Brain. Other later Phyſicians, as the Cauſe of Melancholy, have accuſed the dry Nature of the animal Spirits, by which they in ſome Meaſure partake of the Quality of Aqua Fortis. Whereas they aſſign the Inflammatory and ſulphureous Nature of the animal Spirits as the Cauſe of Madneſs. But at preſent we are capable of accounting far more accurately, not only for the Diſeaſes of the Body, but alſo thoſe of the Mind, from the State and Condition of the Blood. *Hippocrates* alſo ſeems to have been of this Opinion; for in his Book *de Flatibus*, he tells us, "That the Blood contributes ſo greatly "to Prudence that this is changed, and other Notions and "Sentiments poſſeſs the Mind, if the Motion of the Blood is "diſturbed and irregular." And in the ſame Place he ſays, "if the Condition of the Blood is good, Prudence takes Place; "but when the former is changed the latter fails with it."

And certainly it is evinced by Obſervation and Experience, that all the Functions of the Mind, ſuch as Reaſon, Genius, Fancy, and Inclination, are in their due and natural State, if Blood of a laudable Quality is in a due Quantity conveyed to the Brain, and carried thro' its Veſſels in a free uninterrupted and equable manner; ſo that, in Conſequence of this, the external Senſes, unleſs there is ſome fault in the Organs of Senſation, are preſerved in their natural and proper Condition. But all theſe noble Functions are changed or depraved, diminiſhed, or totally deſtroyed, when the Blood and Humours receding from their natural Temperature and Quantity, are not conveyed to the Brain in a moderate and equable manner, but with a difficult, ſlow and langued Motion, or with too briſk and violent an Impetus.

Hence we may reaſonable affirm, that the immediate Cauſe of Melancholy conſiſts in a preternatural Congeſtion, Stagnation, and difficult Motion of a thick Blood in the Brain, which is a weak Part of the Body; whereas the Origin and Foundation of Madneſs, conſiſts in a violent and impetuous Motion of a thick and melancholic Blood, thro' the Veſſels and ſmall Fibres of the Brain. The Truth of this will be afterwards evinced, when we ſhew the Connection between the antecedent and remote Cauſes of theſe Diſorders.

Since we have already obſerved, that in diſſecting Perſons cut off by a Delirium, the Motion of the Blood thro' the Head, was found to be changed and perverted, whilſt the Veſſels were not only ſo infarcted with a Redundance of Blood, and ſo varicoſe, that in Conſequence of the Stagnation, a large

Quan-

Quantity of extravaſated Serum was found in the Baſe of the Brain, but alſo, that the Medullary and cortical Subſtances of the Brain appeared affected, it can no longer be doubted but the Cauſe of theſe Diſorders, and of Death, conſiſts in this preternatural State and Condition.

Having ſpecified the immediate Cauſes of theſe Diſorders, we now come to inveſtigate and trace thoſe more remote and ſecondary Cauſes, which contribute to this perverſe and diſorderly Circulation of the Blood thro' the Veſſels of the Head and Brain: Among theſe, a certain Weakneſs of the Brain may juſtly be eſteemed the mediate Cauſe of Diliriums; ſince, without the Pre-exiſtence of ſuch a Weakneſs, ſuch a faulty Motion of the Blood could not be produced in the Brain. But ſuch a Weakneſs is principally produced by violent Diſorders of Mind, eſpecially long continued Grief, Sadneſs, Dread, Uneaſineſs and Terror; all which have an unhappy Influence on all the Parts, and greatly contribute to impair the Strength of the Brain, and weaken the ſyſtaltic Force of the Veſſels. The ſame Effect is, alſo, produced by intenſe Application of Mind, or too long protracted Lucubrations; by which means, in Conſequence of a Diſſipation of the animal Spirits, the moving, and ſenſitive Force of the Stamina lodged in the Brain, and *Medulla Oblongata* are greatly impaired. Hence the Reaſon is Obvious, why the Literati, and Men of a ſtudious Turn, are more Subject to Alienations of Mind than the common People.

But among the Cauſes which diſpoſe to the moſt violent Delirium, and, by weakening the Tone of the Membranes and Stamina, deſtroy the Force both of the Mind and Body, none is more powerful than an Exceſs of Love. Inſtances of which are found in *Foreſtus*, *Lib.* 10. *Obſ.* 29. and 30. *Barthol. Cent.* 2. *Hiſt.* 69. and *Valeriola*, *Lib.* 2. *Obſ.* 7. But in Women fit for Marriage, and as yet ſtrangers to the Matrimonial State, that Species of Love is principally injurious, which proceeds from a long Continuance and Corruption of the genital Fluid, which eſpecially, in a State of Idleneſs and Luxury, is copiouſly ſecreted in the vaginal Glands. Of this there are Inſtances found in *Platerus*, *Lib.* 1. *Prax. Cap.* 3. *Geor. Horſt. T.* 2. *Op. Lib.* 2. *Obſ.* 68. And *Ephemerid*, *Nat. Curioſ. Obſ.* 126. *Decad.* 2. *An.* 10. for in Conſequence of the mutual Union between the Soul and the Body, together with the Motion of the Fluid and ſolid Parts, venereal Ideas are, by a Congeſtion and Stagnation of the Juices in the ſpermatic Organs, excited in the Fancy, which often dwelling intently upon theſe Ideas, depraves and perverts Reaſon in a ſurpriſing manner. Nor is it abſurd to ſuppoſe, that the ſpirituous ſeminal Fluid, corrupted by its Continuance, returns thro' the lymphatic Veſſels to the Blood, and as it were, by Sympathy, contaminates that Fluid in the Blood, which is conveyed to the Brain and Nerves, for the ſeveral Purpoſes of Senſation and Motion, ſo that in Conſequence of this, a great Dejection of Strength is produced.

Beſides, it is certain, from medicinal Obſervations, that an exceſſive Evacuation of Semen, whether voluntary or involuntary, has proved the Cauſe and Origin not only of Melancholy, but alſo of Madneſs. Thus *Henricus ab Heer*, *in Obſ.* 60. gives us an Inſtance of a Man of ſixty Years of Age, who, in Conſequence of an exceſſive Evacuation of Semen, during the Dog days, became Melancholy. And *Foreſtus in Obſ. Lib.* 10. *Obſ.* 25. gives us an Inſtance of a young Man, who marrying a young wife about the Middle of Summer, became mad by an exceſſive Uſe of Venery; for it is well known that the Semen is the moſt fine and active Part of the Blood; and that it partakes almoſt of the ſame Nature with the nervous Fluid. Hence we obſerve that immoderate Evacuations of the Semen not only weaken the Functions of the Senſes, and the Force of the Genius, but alſo produce other Diſorders ariſing from a Weakneſs of the Brain.

It is, alſo, carefully to be obſerved, that long protracted Deliriums are very common to certain Families; and may therefore be juſtly claſſed among the Number of Hereditary diſorders. The Reaſon of this, in my Opinion, is, that the morbid and weak Nature and Texture of the ſolid and moving Parts, is propagated from the Parents to the Children; eſpecially if the former, in the Generation of the latter, were affected with theſe Diſorders.

But nothing ſo ſuddenly, unexpectedly, and even without any proceeding Cauſe, throws a Perſon, otherwiſe Sound, into Madneſs, as Narcotic and ſtupefactive Medicines, ignorantly taken. Thus it is certain, from Experience, that the Seeds of the Thorn-apple, and Henbane, as alſo the Berries of the deadly Night-ſhade, are capable of inducing a perfect Madneſs, ſoon after they are exhibited. Thoſe who are curious to enquire into the pernicious Energy of ſuch hurtful Subſtances, may conſult *Miſcell. Nat. Curioſ. Decad.* 3. *an* 3. *Obſ.* 170. *Willis de anim. Brut. Cap.* 12. *Matthiol in Dioſcorid. Lobelius in Novis Sterpium adverſariis. Borelli. Cent.* 4. *Obſ.* 45. and *Helmont*, in his *Demens Idea*. Beſides, it is well known to skilful and attentive Phyſicians, that Medicines, in which Opium is an ingredient, when prepoſterouſly exhibited in a Delirium, are ſo far from alleviating it, that they rather increaſe and render it more obſtinate. It will not be hard to aſſign a Reaſon for this, if we conſider that theſe Remedies abound with a certain volatile and fetid Sulphur, highly unfriendly to Nature; and which, when reſolved by the Heat of the Body, aſſumes the Form of Exhalations, which inſinuating themſelves deeply into the minute Pores of the Brain and Nerves, weaken the moving Force of the pure Fluid there contained, and impair the Elaſticity of the nervous Fibres, ſo that a remarkable Diminution and Depravation of all the Powers of Senſation and Motion ſucceed.

Previous Diſeaſes, and eſpecially acute Fevers, alſo contribute greatlyto deſtroy the natural Tone and Tenſion of the Veſſels and Stamina of the Brain. Hence nothing is more frequent than to obſerve, firſt, a Phrenitis, and, after that, a Species of chronical Delirium, produced after burning Fevers, eſpecially when long protracted, after the *Hungarian* Fever, that Species of Fever called a putred Synoche, a choleric Fever or *Cauſus*, and ſometimes after a variolous Fever. The Reaſon of this is Obvious; becauſe, under ſo intenſe a febrile Heat, which is generally accompanied with continual Watchings, the nervous Fluid, which is in a particular manner ſubſervient to Senſation and Motion, is diſſipated. By this means, alſo, the fibrous Texture and Structure of the Brain is conſiderably injured; in Conſequence of which the Secretion of the animal Fluids can not be duely carried on.

The Brain is alſo greatly weakened, and the Nature of the nervous Fluid exhaled by Drunkenneſs, and an immoderate Uſe of Spirituous Liquors; for which Reaſon *Seneca*, in *Epiſt.* 83. no leſs juſtly than beautifully affirms Drunkenneſs to be Madneſs; for ſays he, "Cruelty follows Drunkenneſs; for by its means, the "Reaſon and Soundneſs of the Mind is violated and vanquiſhed.

We now come to conſider thoſe Cauſes, by which the Blood is impetuouſly conveyed from the inferior Parts to the Head. And among theſe, we find none capable of ſooner converting Melancholy into Madneſs, or of exciting freſh Paroxyſms of theſe Diſorders, than violent Anger, *Galen*, *in Lib.* 6. *Aph.* 23. declares himſelf of the ſame Opinion, eſpecially if Pride Haughtineſs, Hatred, or an inſatiable Deſire of Revenge, reign in the Patients Breaſt. It is true, melancholic Perſons are not naturally prove to Anger; but when their Mind is once ruffled by that Paſſion, they rage ſo furiouſly, that the Diſorder is not eaſily allayed. But Anger is principally injurious to melancholic Patients, becauſe their Blood, which is thick and compact, being thrown into a violent Motion, not only greatly injures the fine and tender Texture of the Brain, but alſo may be eaſily ſtopt in its Courſe.

To this Claſs of Cauſes alſo belongs external Cold admitted to the Body, and eſpecially to its inferior Parts. That this contributes greatly to create theſe Diſorders, is ſufficiently obvious from the Paroxyſms and Fits of melancholic Patients, which we always obſerve to be preceded by Horripilation and a Senſe of Cold in the external Parts. Nor will it be difficult, from a careful Conſideration of theſe Circumſtances, to account, in a rational manner, for the numerous terrible Symptoms with which Melancholy is accompanied; for ſince, under ſuch a Horror and Senſe of Cold, the external Parts are, as it were, ſpaſmodically conſtricted; the Blood, in Conſequence of the Diminution of the Space it poſſeſſed, and the leſſening the Cavities of the Veſſels, is, with a greater Force and Impetus, conveyed to the internal Parts; after which becoming ſtagnant in the greater Veſſels, eſpecially the Lungs, Heart and Brain, it creates various Diſorders, according to the Variety of theſe Parts. Thus oppreſſive Anxieties, Sighs and Shortneſs of Breathing, about the Præcordia, Tremors and Palpitations of the Heart, Vertigo's, and a Senſation of Weight in the Head, Fierceneſs of the Eyes, long Watchings, and various Workings of the Fancy, intenſely dwelling upon one Object, are produced by this Means.

To this Claſs of Cauſes, we may alſo juſtly refer the Diminution or Suppreſſion of the Excretions of Blood, whether natural or artificial in both Sexes. Thus it is certain from Experience, that Melancholy has been produced by an Omiſſion of accuſtomed Veneſection in plethoric Patients; by an irregular Diſcharge of the Hæmorrhoids or Menſes, or an imprudent Obſtruction of them, and by prepoſterouſly ſtopping Hæmorrhages of the Noſe. The ſame Effect is alſo produced, if, after Labour, the Lochia are too ſcantily evacuated or totally ſuppreſſed; or,

if about the Years of Puberty the Eruption of the Menſes ſhould prove difficult; for that both Melancholy and Madneſs have been produced by theſe Circumſtances, is obvious from numberleſs Obſervations, which occur in the beſt practical Authors. Thus *Hippocrates*, in his Book *de Superfœtat.* informs us, that, from long Experience, he found that the Interception of an uſual Evacuation of Blood produced Madneſs. *Foreſtus* alſo, *in Lib.* 10. *Obſ.* 23. and 24. and *Binningerus*, in *Cent.* 1. *Obſ.* 37. give us Inſtances of Madneſs produced by a Suppreſſion of the Menſes. And *Zacutus Luſitanus*, *Lib.* 1. *Prax. Admirand. Obſ.* 37. and 57. informs us, that both Melancholy and Madneſs may be produced by a Suppreſſion of the hæmorrhoidal Diſcharge. For by the Blood too copiouſly congeſted, and becoming ſtagnant about the Inteſtines, their nervous Coats being compreſſed, are ſtimulated to ſpaſmodic Motions, by the Force of which the Blood there accumulated is tranſlated to the ſuperior Parts, and eſpecially to the Head. See HÆMORRHOIDES. *Hippocrates*, in his Treatiſe *de Virgin. Morb.* has a beautiful Paſſage relating to this inverted Motion of the redundant Blood. "Young "Women, ſays he, fit for Marriage, are afflicted with a Spe- "cies of Delirium, in which they think they ſee certain De- "mons, about the firſt Appearance of the Menſes, tho' free "from ſuch Diſorders before; for after the Blood is accumu- "lated in the Uterus, as if it was ready to be diſcharged, if "the Mouth of the Uterus is not open, and the Blood is at "the ſame time increaſed by the Aliments and Growth of "the Body, then the Blood, not finding a free Paſſage, in "conſequence of its large Quantity, recoils to the Heart and "Diaphragm. And, when theſe are filled, the Patient be- "comes fooliſh, then torpid, and laſtly delirious."

From what has been ſaid, we may eaſily aſſign a Reaſon why Melancholy is a Symptom very frequently attending hyſteric and hypochondriac Diſorders; for it is certain, that a want of a due Tone of the Viſcera, and a ſlow Circulation of a thick and redundant Blood thro' them, produce in the Abdomen Spaſms and Flatulences, from which all the Symptoms accompanying hypochondriacal and hyſterical Diſorder, may be derived and accounted for.

We now come to inveſtigate thoſe Cauſes, which contribute to the Generation of a thick Blood, and its Stagnation in theſe Parts. Among theſe, the moſt conſiderable is Idleneſs and Eaſe, which powerfully generates not only hypochondriacal and hyſterical Diſorders, but alſo the Deliriums generally ſubſequent to them; for as due Exerciſe procures Strength to the ſolid Parts, and not only renders the Humours more fluid, but, alſo, puts them in a briſker Motion, ſo we find it confirmed, from daily Experience, that, in conſequence of a want of due Exerciſe, the Strength of the Body is weakened, all its Functions impaired, the ſalutary and uſual Excretions diminiſhed, and the Humours rendered thick, viſcid, and ſtagnant. All theſe Misfortunes are ſtill heightened by Solitude, during which various deluſory and gloomy Ideas preſent themſelves to the Mind of the Patient, and deſtroy his Happineſs.

Nor are we to ſeclude Aliments and Drink from the Number of Cauſes, which, in a remote and ſecondary manner, produce Melancholy and Madneſs; for if, in conſequence of an exceſſive Collection of acid Humours in the Stomach, Perſons become voracious, acquire too large an Appetite, or eat Aliments of a groſs Texture, ſuch as are hard, flatulent, or leſs ſoluble, without, at the ſame Time, uſing a ſufficient Quantity of Drink, crude and compact Humours, which ſupply Matter and Nouriſhment to Melancholy and Madneſs, are generated; and when theſe Humours are conveyed to the Blood, they render the Stamina and fleſhy Fibres more rigid, hard, and, conſequently, leſs fit and proper for performing their reſpective Motions.

But that we may be the better enabled to explain the Nature of Melancholy and Madneſs, we muſt obſerve, that the Blood of Perſons labouring under theſe Diſorders, when taken from the Veins, is black, and hotter than in a natural State, as we are told by *Etmuller*, *in Colleg. Pract.* And *Lindanus* obſerves, that the Blood of ſuch Patients depoſites its Serum more ſlowly, and in a ſmaller Quantity, than in a natural State; that, when weighed, it is found heavier, evaporates more ſlowly, and leaves a larger Quantity of a thick Magma, than the Blood of ſound Perſons. As for the Excrements of melancholic and maniac Patients, they are generally diſcharged in a ſmall Quantity, hard, of a dark red, and ſome Times of a greyiſh Colour. The Urine, alſo, diſcharged by them under the Paroxyſm, is light and thin.

As for the Perſons moſt ſubject to Melancholy and Madneſs, we muſt obſerve, that not only dull, ſtupid, and forgetful Perſons, but alſo, and that more frequently, ingenious Men, Poets, Philoſophers, and thoſe charmed with the more deep and abſtruſe Parts of Mathematics and Algebra, are ſubject to Melancholy. And we find, from Experience, that Perſons of melancholico-choleric Temperaments, lean Habits of Body, rigid and tenſe Fibres, and a quick Pulſe, as alſo thoſe who, being prone to Anger, are daily and eaſily provoked by Family Altercations, eſpecially at Meals, are above all others ſubject to Madneſs. Nor are thoſe who are naturally languid, weak, timorous, or whoſe Fleſh is moiſt and lax, totally exempt from theſe Diſorders; as is obvious from this, that when the Menſes in young Women, or the Lochia in Child-bed Women, are not duly evacuated, ſuch Women are ſubject to Diſorders, accompanied with Alienation of Mind. *Hippocrates* alſo, *in Lib.* 2. *Epidem.* 6. *Sect.* 3. and *Galen* alſo, *Lib.* 3. *de Locis affectis*, *Cap.* 6. juſtly obſerve, that Perſons of ſanguine Habits are ſubject to melancholic and hypochondriac Diſorders; and this is alſo confirmed by Experience.

But ſince, in order to know the particular Nature and Genius of Diſeaſes of the Mind, and form a right Judgment with reſpect to their Events and Cure, it is of great Importance to be well acquainted with the various Circumſtances capable of producing them; we are, for this Reaſon, carefully to conſider, whether the Diſorder proceeds from a moral Cauſe in the Mind, or one of a phyſical Nature in the Body; for in the Courſe of Practice, nothing more frequently happens, than that, upon inquiring into the firſt Cauſe of the Diſorder, we are told, that ſome quick and ſudden Commotion of Mind, Anger, Terror, long Grief, and Uneaſineſs, or an Exceſs of Love, laid the firſt Foundation for it. To which Circumſtances if an hereditary Weakneſs of the Brain, and internal Senſes, or a remarkable Error in Regimen, ſuch as Drunkenneſs, exceſſive Refrigeration of the Body, or immoderate Venery, are joined, it is uſual for Men, otherwiſe ſound and vigorous, without any manifeſt Sign of any chronical Diſorder, to fall into ſuch Diſeaſes of the Mind, which are removed but ſlowly and with Difficulty. And when this happens, the Diſeaſe is to be eſteemed of the idiopathic and primary Kind; in conſequence of which, it will more remarkably affect the Mind.

But more juſt and rational Hopes of Recovery may be entertained, if the melancholic Delirium is of the ſymptomatic Kind; and in Men accompanies the hypochondriac, and in Women the hyſteric Diſorder; which may be known, when the *Primæ Viæ* are affected with Spaſms, Flatulences, Rumblings, and Eructations; when the Diaphragm is compreſſed and uneaſy; when the Excrements are hard; and when there are violent Tenſions of the Hypochondria, accompanied with a kind of Twitchings; to all which, lacerating Pains of the Head, Vertigos, Ringing of the Ears, and Watchings, are frequently joined. There is the ſame Hope of an eaſy Cure, if the Madneſs ariſes from an ill-cured intermittent Fever, a Suppreſſion of the Menſes, the Lochia, or hæmorrhoidal Diſcharge, or from Narcotics; for a Madneſs of this Kind is greatly alleviated, or totally removed, by proper Medicines, and a Return of theſe natural Excretions.

Beſides, as all the Diſeaſes of the Brain, and animal Spirits, have their Degrees of Intenſion, and Remiſſion, and ſtated Periods, at which they return; ſo this is alſo obſervable in all the Species of Madneſs. When therefore the Paroxyſms are ſlight, and, as it were, beginning, the Cure is not very difficult. But if the Diſorder is inveterate, and has taken deep Roots, or if it has but ſhort Remiſſion, it is certain, that it is almoſt incurable; for in Proceſs of Time, the Brain, which is the Seat of the Mind, and nervous Fluid, has its Texture ſo ſurpriſingly depraved, that the greateſt Skill and Judgment are neceſſary to repair the Misfortune. That mad Perſons are ſo rarely cured, is, in my Opinion, owing to this, that they reject their Phyſicians, and dread their Medicines as Poiſon; whereas melancholic, and eſpecially hypochondriac Patients, indulge themſelves too much in Medicines, which they daily demand from their Phyſicians, whom they often change; by which means their Condition is rendered ſtill worſe. But it is a very bad Sign, and denotes an increaſed and deſperate Degree of Madneſs, when the Patients, after profound Sleep, are continually delirious, and inſenſible of the Force of Cold, Efficacy of ſtrong and draſtic Medicines, whether of the emetic or purgative Kind. And if, in conſequence of a want of Sleep, and long Abſtinence, a great Loſs of Strength is brought on, or if the Patient becomes epileptic, convulſive, or lethargic, we may juſtly conclude, that Death is not far off.

The ſkilful Phyſician alſo knows, that the Diſeaſes of the Mind are of ſuch a particular Nature and Genius, and ſo different from other Diſorders, that ſome times they remit for a long time; ſo that the Patients are thought entirely ſound

and well, but return at certain Periods, eſpecially about the Solſtices and Equinoxes, the Times at which they firſt appeared. If the Diſorder is of this kind, the Recovery of the Patient is not to be deſpaired of, if the Phyſician endeavours totally to remove the Misfortune, and the Patient obſerves due Caution and Regularity. *Aretæus*, in *Lib.* 3. ſpeaks in the following manner: "Madneſs both remits, and is capable of being totally removed by ſufficient Care. But the Intermiſſion is not of the genuine Kind, when the Madneſs terminates ſpontaneouſly, when it is not properly removed by Medicines, or cured by the Clemency of the Seaſon of the Year; for ſome, who have appeared quite free from the Diſorder, have again become mad, either in the Spring, or by an Error in Regimen, or by Anger excited by any means."

It is, alſo, worth our Obſervation, that, in maniac Patients, Nature often excellently performs both the natural and vital Functions; ſo that ſuch Perſons are rarely ſeized with any other Diſorders, though many external diſpoſing Cauſes ſhould concur to produce them. Hence it is, that mad Perſons are ſeldom ſubject to epidemical Diſorders. Nor are there Inſtances wanting, of Perſons, who, under theſe violent and afflicting Diſeaſes of the Mind, have lived ſeventy Years and more.

A ſalutary Solution of theſe Diſeaſes ſometimes happens by the Force of Nature, without any Aſſiſtance from Medicines or Phyſicians, by critical Excretions of Blood, whether from the Noſe, the Uterus, or the Anus. And ſuch a Solution happens the more certainly, if the Diſorder derived its Origin from a Suppreſſion of theſe Evacuations. And *Hippocrates* juſtly obſerves, in *Aph.* 21. *Sect.* 6. that Madneſs is terminated by Varices and the Hæmorrhoids. I myſelf know Inſtances of Perſons, who, in their Youth being afflicted with a violent hypochondriac Melancholy, have at a more advanced Age been freed from that Diſorder, by the hæmorrhoidal Diſcharge. Hence it alſo happens, that Fluxes and Dyſenteries terminate theſe Diſorders, as *Hippocrates* juſtly obſerves in *Aphor.* 9. *Sect.* 7. And I lately knew Madneſs brought on in a young Man by a Fright, happily terminated by a Diarrhœa. We muſt alſo carefully advert to an Obſervation made by *Hippocrates*, in *Aphor.* 65. *Sect.* 5. where he tells us, "that when Tumors appear upon Ulcers, the Patients ſeldom go mad; but, when theſe are ſuddenly diſſipated, Madneſs is excited." This Doctrine is confirm'd by other Obſervations, which evince, that Melancholy has been terminated by Puſtules, and the Itch appearing on the Skin. Thus *Foreſtus*, in *Lib.* 10. *Obſ.* 24. informs us, that a mad Girl was cur'd of her Diſorder by Ulcers ariſing in her Legs. And *Amatus Luſitanus*, in *Cent.* 2. *Obſ.* 47. informs us, that Melancholy was produc'd by ſtopping an Ulcer.

The Cure.

As the Method of curing every Diſorder conſiſts in checking and removing its Cauſes, and as from a Knowledge of theſe Cauſes curatory Intentions ought to be form'd, and proper Remedies ſelected, ſo I think we ought to proceed in the ſame manner with the Diſeaſes of the Mind. Now we have already demonſtrated, that the proximate and immediate Cauſe of a Delirium, whether of the low and timid, or of the bold and furious Kind, conſiſts in an impetuous Motion of the Blood and Humours to the Head, and their languid, or too much accelerated Circulation thro' the Veſſels of the Brain; a Circumſtance immediately ſucceeded by the various Effects of a diſturb'd and irregular Fancy; hence the principal Intentions, to be purſued both in preventing, and alleviating theſe Diſorders, are,

1. To derive the Blood too copiouſly collected in the Brain to the inferior Parts; and to procure its free and equable Circulation thro' the Head and the whole Body.

2. To remove the material and occaſional Cauſes which pervert the natural Temperature of the Blood, and occaſion its Tranſlation to the Head; and to reſtore the uſual, natural, and ſalutary Excretions to their due and proper Condition.

3. To reſtore the natural ſyſtaſtic Force to the Veſſels and Membranes of the Brain.

But it muſt be obſerv'd, that the Antients, and eſpecially the *Greeks*, were far more dexterous, not only in diſtinguiſhing, but, alſo, in curing theſe Diſorders, than the Moderns; not only becauſe, in conſequence of the Variety and Abundance of Deliriums raging in their Country, they could acquire greater Experience, but, alſo, becauſe they had a better Opportunity of inveſtigating the Force and Virtues of their Remedies. This is ſufficiently certain from the Inſtance of *Hippocrates* alone, who, in his Book *de Inſania*, gives the true Cauſe of Deliriums: "After, ſays he, the Brain is ſuddenly heated by the Efferveſcence of the Blood in the Veins, the Patients have frightful Dreams, the Face and Eyes become red, and the Mind meditates ſome Miſchief; but when the Blood is again diſpers'd to the Veins, theſe Symptoms ceaſe." For the Cure of the Diſorder, he afterwards orders Veneſection, drinking of Water, and a Potion of white Hellebore: Nor do the other antient Phyſicians recede from this highly ſimple Method of Cure; for, if we carefully look into their Works, we find them preſcribing, with great Succeſs, the moſt ſimple Remedies for the Removal of theſe terrible Diſorders; ſuch as Veneſection, Baths prepared of ſweet Water, the drinking of pure Water, and mineral Springs, Milk and Whey, and gentle or ſtrong Evacuations, according as the State of the Patient required.

But among all the Remedies by the Antients recommended in ſuch Caſes, none is more celebrated than Veneſection; concerning the Uſe and Advantage of which, there is a celebrated Paſſage in *Axand. Trall. Lib.* 1. *Cap.* 16. "Melancholy, ſays that Author, is generated by a Redundance of Blood: If the Patients are of a lean Habit of Body; if they are in the Vigour of their Age; or if the menſtrual, or hæmorrhoidal Diſcharges are ſuppreſs'd; if the Face is much more red, and the Veins more turgid, than in a natural State; in this Caſe, liberal Veneſection is, with all Expedition, and above all things, to be inſtituted, if the Patient's Strength admits of it: But, if the Patient's Strength does not admit of a large Evacuation, a ſufficient Quantity is to be taken away, at two or more different times. But if the Blood is, as it were, impacted in the Brain, we are boldly to open the frontal Vein." But he ſubjoins a neceſſary Caution, that this ſhould not be done without a previous Evacuation of the Body: "For, ſays he, if any Attempt is made upon the Head, before the whole Body is purged from its recrementitious Humours, more Injury than Good is done; ſince by this means a greater Quantity of Matter is attracted to the Head."

Aretæus, alſo, highly extols Veneſection in the Cure of Melancholy, and lays down uſeful Cautions, with reſpect to its Inſtitution: "If, *ſays he*, the Blood is thick, bilious, and black, a Vein is to be open'd, and the Operation repeated, not on the ſame, but on the ſubſequent Days, till a ſufficient Quantity of Blood is taken away. But the Quantity of Blood to be taken away in one Day is to be determined by the Strength of the Patient. In the mean time the Body is to be liberally nouriſhed, that the Patient may be able to bear a future Evacuation. If the Patient is lean, and deficient in Blood, a ſmall Quantity is only to be evacuated, that the Strength may be ſenſible of the Evacuation, but not injured by it: Hence, if too large a Quantity of Blood is evacuated, Nature, for want of a due Supply, will be weaken'd." Nor is there any Species of Remedy more efficacious and neceſſary, for removing the moſt obſtinate Diſorders of the Mind, according to *Cœlius Aurelianus*, in *Lib.* 1. *Cap.* 5. where, beſides Phlebotomy, he, at the ſame time, highly extols Scarification, and the Application of Leeches, in the following manner: "When the Diſorder is in its Height, the Head is to be ſhaved, and Cupping, with Scarification, uſed." *Galen*, alſo, recommends Veneſection, in that Species of Melancholy which has its Seat in the Veins, and affects the whole Body; whereas, on the contrary, the *Arabians*, in curing it, recommend Veneſection in particular Veins, ſuch as the Jugular, Frontal, or Temporal Veins; or uſe Cupping with Scarification between the Shoulders; or open the hæmorrhoidal Veins, by means of Leeches.

Some celebrated Phyſicians of the laſt Age, as *Fernelius*, *Riverius*, *Hieronymus Mercurialis*, *Hornius*, *Sylvaticus*, *Joannes Fortis*, and *Ballonius*, after having uſed the ſame Remedy, not only for preventing but, alſo, for removing theſe Diſorders, unanimouſly affirm, that it is of all others the moſt efficacious; and from my own Experience I can affirm, that Veneſection is juſtly to be reckon'd among the moſt valuable Remedies for theſe Diſorders; only with this Caution, that, where there is a Redundance of thick and grumous Blood, a Vein is firſt to be opened in the Foot; and, a few Days after, in the Arm; then in the Head, or in the Neck, let the Jugular Vein be cautiouſly open'd, or with a Straw let the Noſtrils be irritated to a Diſcharge of Blood. And, laſt of all, it is expedient to open the Frontal Vein with a blunt Lancet, for fear of injuring the Pericranium, after having applied a Ligature about the Neck, in ſuch a manner as to render the Veins of the Face tumid.

But there were other Remedies highly extolled by the Antients for their ſingular Efficacy, both in Melancholy and Madneſs, the moſt conſiderable of which were Baths of warm Water, in which the Patient was either wholly, or only as far as the Præcordia, immerſed; and Semicupiums, and Baths for the Feet: Thus *Alexander Trallian*, in *Lib.* 1. informs us, "That Baths of ſweet Water are, above all other things, beneficial to melancholic Patients: But the Patients muſt remain long in the hot Bath, and even ſit for a long time in it, if it is in the Summer." *Aretæus*, alſo, in *Lib.* 7. orders melancholic Patients often to uſe Baths naturally hot, "For, *ſays he*, a Softneſs and Relaxation of the Fleſh greatly contribute to the Remiſſion of the Diſorder; for the Fleſh of melancholic Patients is dry and tenſe." Among the Methodic Sect, *Proſper Alpinus*, in *Med. Ægypt.* informs us, that melancholic Patients have been perfectly cured by warm Baths dropping on all the Parts of the Body, but eſpecially on the Sutures of the Head. The Antients, in like manner, preſcribed Baths for the Cure of Madneſs, as we find from *Cœlius Aurelianus*; who, to maniac Patients, greatly recommends the Uſe of mineral Waters, ſuch as thoſe of the nitrous Kind, eſpecially if they have not a fetid Smell, capable of injuring the Membranes of the Head. *Galen*, alſo,

alſo, in his Book *de Locis affectis*, *Cap.* 9. informs us, that he cured many melancholic and mad Patients, by Baths of tepid Water.

But, that Baths are highly efficacious in the Cure of theſe Diſorders, is ſufficiently obvious, if we but attentively conſider their Method of acting. The Paroxyſms of Madneſs, which, at certain times, ſeize Perſons of atrabilarious Conſtitutions, are hardly owing to any other Reaſon, than that, by the violent Conſtriction of the fibrous and nervous Parts in the Surface and Extremities of the Body, the Blood is impetuouſly carried to the ſuperior Parts. Hence *Hippocrates*, in *Sect.* 1. *Aph.* 56. informs us, that, in atrabilarious Diſorders, Tranſlations of the Humours from one Part to another are dangerous, ſince they either prognoſticate a Palſy, Convulſions, or Madneſs. Now, as moderately warm Water, by ſoftening and relaxing the hard and conſtricted Parts, eſpecially in the Extremities, not only diminiſhes and averts the Impetus of the Blood from the Head, but, alſo, by enlarging the Veſſels, derives the Humours from the Head to the inferior Parts, ſo that an equable Circulation of the Humours through the whole Body, and eſpecially through its Extremities, being reſtored, the Body becomes perſpirable, it is not to be doubted, but, in Melancholy and Madneſs, great Relief is to be expected from warm Baths.

As for the beſt Method of preparing Baths, it is obvious from what has been ſaid, that light and ſubtile Waters, ſuch as Rain and River-waters, are far more proper for anſwering the abovementioned Intention, than hard and fountain Waters; and this ſeems to be the Reaſon why the hot mineral Waters, which, beſides their Fineneſs, contain a ſubtile alcaline Mineral, ſuch as theſe of *Embſen* and *Teunacen*, both internally and externally uſed, are found far more effectual for removing theſe Diſorders of the Head, than any others. But, if light Waters cannot be had for Baths of this kind, the hard and fountain Waters are to be corrected with Wheat, and its Bran, Barley, Mallows, Linſeed, and Marſhmallow-roots, tied up in a Bag. Some, for the ſame Purpoſe, mix Milk with the Water, or add a ſufficient Quantity of Pot-aſh.

Theſe Baths are by no means to be uſed too hot, but only tepid, or moderately warm. But that the Energy of theſe Baths for removing ſuch Diſorders may be the more certain and infallible, and that the Blood ſtagnating in the Veins of the Head may be the more effectually derived to the inferior Parts, it is expedient, that, before the Patient enters the Bath, his Head ſhould have cold Water poured upon it, or be cover'd with a Cloth dipt in cold Water. That this Method was known to *Celſus*, we find in *Lib.* 6. *Cap.* 18. where, before the Patient's Body is immerſed in the Bath, or in Oil, he orders cold Water to be pour'd upon his Head. And in *Lib.* 1. *Cap.* 4. he tells us, that "Nothing is "ſo beneficial for ſtrengthening the Head, as cold Water, which "is to be longer poured upon the Head, than upon the other "Parts; or the Head is to be daily plunged in a large Veſſel full "of cold Water." *Aretæus* was of the ſame Opinion, who tells us, if the Patients are mad, he orders cold Water to be poured upon the Head. The Reaſon of this Practice is obvious; ſince ſuch is the Force and Energy of Cold, that, by penetrating to the Membranes and Veſſels of the Brain, dilated and weakened by the ſtagnant Blood, it ſo conſtricts and corroborates them, as to promote a more free and eaſy Diſcuſſion of the Humours ſtagnating in them.

Having conſider'd Baths, we now come to take a View of other Remedies; none of the leaſt conſiderable of which are Purgatives, which, by the Antients as well as the Moderns, were always highly eſteemed, for removing theſe Diſorders of the Mind. But as Purgatives operate in various manners, ſince ſome are mild, and others draſtic, it is expedient to ſpecify ſuch of them as beſt contribute to the Removal both of Madneſs and Melancholy: But it is agreed upon among skilful Phyſicians, that the mild and gentle Purgatives, ſuch as Manna, Caſſia, Rhubarb, Agaric, Sena-leaves, Polypody of the Oak, Cream of Tartar, vitriolated Tartar, and the neutral Salts of mineral Waters, uſed in various Forms in Madneſs and Melancholy, eſpecially when ariſing from the hypochondriac Diſorder, and a Stagnation of Blood in the Inteſtines, and Ramifications of the Vena Portæ, are preferable to thoſe of a more acrid and draſtic Kind, on account of their more ſafe, gentle, and leſs tumultuary Operation, eſpecially when they are taken in Decoctions or Infuſions, not all at once, but at repeated Intervals, ſo as to operate in an alterative manner.

Indeed, if we look into the Writings of Phyſicians, and eſpecially of the Antients, we find them recommending both white and black Hellebore, tho' poſſeſſed of a ſubtile and virulent Acrimony, as the moſt powerful Specifics for removing Melancholy and Madneſs. Thus *Hippocrates*, in his Book *de Inſomniis*, in order to prevent Madneſs, preſcribes Purging with white Hellebore, and afterwards a fit and proper Regimen. And in his firſt Book *de Diæta*, he thinks Purging with white Hellebore highly beneficial in melancholic, timid, and dejected Patients. Of the ſame Opinion is *Celſus*, who in *Lib.* 3. *Cap.* 18. informs us, that Melancholy is greatly alleviated by purging with white Hellebore; and if this Medicine once exhibited does not prove effectual, he orders it to be repeated at proper Intervals. But tho' the Antients almoſt always uſed Hellebore, Elaterium, and other draſtic Purgatives, yet it is probable, they were induced to this Practice by a want of more mild and gentle Medicines. Beſides, it is probable, as *Galen*, in his Book *de Articulis*, inſinuates, that they ſo frequently uſed draſtic Purgatives, becauſe they were acquainted with ſafe Preparations thereof. But it is to be lamented, that Time has deſtroy'd a great many of their Works: Of this *Hippocrates*'s Book *de Helleboro* is a ſufficient Proof; ſince only the Beginning of that Work is preſerved.

Beſides, if we carefully conſider thoſe Paſſages of *Hippocrates*, and the other Founders of Phyſic, where, in theſe Diſorders, Purging by Hellebore is recommended, we find that they only exhibited this Medicine in ſuch a manner, with ſuch a Vehicle, and in Conjunction with ſuch other Medicines, as corrected and obtunded its Acrimony, ſo as to render its Operation not ſtrong and draſtic, but mild and gentle: Thus, according to *Dioſcorides*, in *Lib.* 4. *Philonides*, a Native of *Enna* in *Sicily*, deſcribed a particular Preparation and Regimen, as previouſly neceſſary to the Exhibition of Hellebore; but that Work has not reached our Hands. Various Inſtances confirming this may be found in the Works of *Hippocrates*, who, in his Book *de Diæta*, orders Purging by white Hellebore, after the Uſe of Fomentations, and the Obſervation of a proper Regimen. In his Book *de Veratro*, he informs us, that, before the Uſe of white Hellebore, the Body is to be moiſten'd by copious Aliments, and Reſt. And in *Lib.* 6. *Epid.* he orders the Body to be prepared for its Exhibition by Baths and Aliments. For the ſame Purpoſe he, alſo, order'd a ſufficient Quantity of Aſſes Milk to be drank, both before and after the Uſe of draſtic Purgatives.

But ſince it is well-known, that not only draſtic Purgatives, but, alſo, arſenical Poiſons, may, without any Prejudice to Health, be exhibited, if the Body is previouſly render'd ſufficiently moiſt, and prepar'd by demulcent, nutritive, and oleous Aliments, and Preparations of Milk, or if ſuch Subſtances are taken after the Exhibition of ſuch Poiſons, we may eaſily be convinc'd, that the Antients were not faulty in exhibiting draſtic Purgatives; ſince, by correcting and obtunding their Force, they reduced them to a mild and gentle Quality. This Method was known to *Alexander Trallian*: "For, ſays he, in Melancholy, gentle "Purging, a moiſtening Diet, and the Interpoſition of the "Bath, are neceſſary; for thoſe who preſcribe hot Anti-"dotes and Purgatives, eſpecially Hiera, render their Patients "more furious and mad; ſince, by that means, the Blood be-"comes more dry and acrid. After purging, therefore, with "ſuch ſimple Medicines as do not heat the whole Body, it is "expedient to uſe a moiſtening Diet; and I have often cured "Patients labouring under Melancholy, rather by Diet and Re-"gimen, than by Medicines."

Reaſon, alſo, confirms the Truth of this; for in Madneſs, where all the Parts of the Conſtitution are in a preternatural Tumult and Commotion, there is no manner of Indication for an additional Irritation of the nervous Syſtem. Nor do the atrabilarious, or melancholic, glutinous, thick, acid, and ſaline Humours, lodged in the Veſſels, call for acrid Purgatives; but when they are diluted, corrected, and rendered fit for an Evacuation, they are eaſily ſtimulated to an Excretion. And, certainly, greater Caution is not neceſſary in the Exhibition of any Medicine, than of Purgatives; for, as *Joannes Heurnius*, *in Lib.* 3. has juſtly obſerved, Temerity is highly culpable in the Uſe of important Medicines; ſince, by an Overſight, we may do an irreparable Injury, inſtead of a grateful Service. Hence *Plato* wiſely obſerved, that chronical Diſeaſes, among which he claſſes Melancholy, had certain Periods, before they arrived at which, they were rendered worſe, if they were irritated by Medicines. *Hippocrates* has, by his own Conduct, taught us the Neceſſity of Caution in the Exhibition of Purgatives; ſince, in attempting the Cure of *Democritus*, he would not allow him to uſe Hellebore, except in his own Preſence.

Since, as we have already obſerved, the Antients had a ſafe and innocent Method of exhibiting Hellebore, to us unknown, it is expedient to ſay ſomething upon this Subject. Among the later Phyſicians, there were various skilful and ingenious Authors, who ſpent much Time and Labour in finding out this Method of the Antients; and, among the reſt, *Lindenius*, who, *in Coll. MS. ad Praxim Chym.* where he commends a Preparation of Hellebore, has given us a particular Method of correcting that Medicine; and aſſerts, that by this means he has cured, not only a beginning, but, alſo, a confirmed Madneſs. For this Purpoſe, that Author took between half a Dram and a Dram of white Hellebore; this he boiled in Wine, till it became ſoft; when thus boiled, he took it out, and, throwing away the Wine of the firſt Decoction, he added new Wine to it, and left it for a Night in a warm Place. Then he expreſſed the Wine of the Infuſion, ſometimes gently, and ſometimes ſtrongly, according as he intended the Medicine ſhould be ſtrong or weak; and of this expreſſed Wine he exhibited one Dram, which, he ſays, operated ſufficiently well.

My Opinion of this Correction of Hellebore is, that Phyſicians ought rather to abſtain from draſtic Medicines, by whatever means corrected, and deprived of their acrid cauſtic Quality; ſince they may expect far happier Effects from a judicious Uſe of the gentle Evacuants before enumerated. But, if any one is reſolved to uſe Hellebore, he is not to be diſſuaded from it, provided it is duly prepared; for 'tis certain, that the deleterious Quality of draſtic Purgatives, which conſiſt in their highly ſubtle acrid Salt, may, by means of long boiling, be totally deſtroyed: And when, by boiling with Water or Wine, the ſubtile Acrimony of the Hellebore is extracted, 'tis certain that it is deprived of its draſtic Quality.

Having thus conſider'd Purgatives, we now come to conſider mineral Waters, or pure Spring-waters, which are highly efficacious in Melancholy and Madneſs; for ſince Madneſs generally draws its Origin from Melancholy, and Melancholy from the hypochondriac Diſorder, and the hypochondriac Diſorder from impure and peccant Fluids, ſlowly circulating thro' the Inteſtines and Viſcera of the lower Abdomen; ſince, in order to remove Obſtructions of the Viſcera, the Circulation of the Blood ought to be rendered free and eaſy; and ſince both antient and modern Phyſicians have repoſed great Confidence in the cautious Uſe of mineral Waters, whether of the hot or cold kind, 'tis obvious that great Relief is to be expected from theſe, in removing Melancholy and Madneſs. And I myſelf frankly declare, that I would not chooſe to be a Phyſician, if I was ignorant of the Virtues of mineral Waters; for, as the Buſineſs of the skilful Phyſician, in a great meaſure, conſiſts in preventing and curing chronical Diſorders, ſo nothing effectual can be done in theſe without a prudent internal and external Uſe of mineral Waters: For which Reaſon it is neceſſary, that the Phyſician ſhould be well acquainted with the Virtues and Ingredients of theſe Waters.

If, therefore, we carefully inveſtigate the Nature of theſe Waters, we cannot help admiring their peculiar Virtue, in anſwering various Intentions in almoſt all Diſeaſes; for being impregnated withan highly pure, alcaline, neutral, and mineral Salt, if they are exhibited in a due Quantity, they not only change the peccant Humours, incide ſuch as are thick, render ſuch as are glutinous fluid, and remove the Obſtructions of the Veſſels, but, alſo, exert their happy Influence on the Solids, ſince they relax and ſoften the hard and tenſe Fibres, corroborate ſuch as are weak and tender, ſtimulate the Emunctories whoſe due Tone is loſt, and, conſequently, promote all the ſalutary Excretions, whether by Stool, Urine, Perſpiration, the Menſes, or the Hæmorrhoids.

Of ſimilar and almoſt equal Virtues with mineral Waters are Aſſes Milk, and Whey of Cows and Goats Milk, duly prepared; The Virtues and Efficacy of theſe, in removing chronical Diſorders, were not only extolled by *Hippocrates*, and the Antients, but, alſo, by the more modern Phyſicians; ſuch as *Hieronymus Mercurialis*, *Riverius*, *Raymund*, *Joannes a Fortis*, *Baglivi*, and the celebrated *Boerhaave*. This I can, from Experience, affirm to be true, ſince chronical Diſorders, which ariſe from a ſubtile and virulent Acrimony of the Humours, and which have their Seat in the weak and faulty nervous Syſtem, are rarely well cured, without a due and proper Uſe of Milk and Whey.

But, among all the various Claſſes of Medicines, I know none better calculated for removing the Cauſes of theſe Diſorders, than Nitre depurated from its heterogeneous Parts; for its Uſe is ſo univerſal, as to extend to all Diſorders, provided it be duly exhibited: But it is in a ſurpriſing manner beneficial in that Species of Madneſs which inclines to Melancholy; nor does it fail to produce a ſalutary Effect in Madneſs itſelf, ſince it not only corrects the bilious Acrimony of the Humours; but, alſo, ſtops the tumultuous Motions of the Solids, by allaying the preternatural Heat. 'Tis, therefore, to be lamented, not only that this Medicine was entirely unknown to the Antients, but, alſo, that its ſingular Efficacy, in the Cure of Diſorders, is neither ſufficiently known nor eſteemed by the Moderns. But, among the Moderns, *Sennertus* and *Riverius* affirm, that Nitre, in Conjunction with a little Camphire, is a Specific in Madneſs.

Having thus enumerated the beſt and moſt general Medicines, approved of by the Phyſicians of all Ages, for the Removal of Melancholy and Madneſs, I ſhall now, from my own Experience, give my Opinion concerning ſome particular and ſpecific Medicines, by ſome highly extolled for the Cure of theſe Diſorders. Now, among vegetable Subſtances, the Herbs Baum, Betony, Vervain, Brook-lime, Sage, Wormwood, Flowers of St. John's-wort, and the Lime-tree, and Camphire; among animal Subſtances, Aſſes Blood dried, and exhibited in Drink; and, among mineral Subſtances, Preparations of Steel, Cinnabar, Sugar of Lead, together with the Calx and Tincture of Silver. But, tho' theſe Medicines are not to be totally rejected, but the Uſe of ſome of them accurately inveſtigated, yet I ſhall not heſitate to affirm, that little Good is to be expected from them alone, unleſs both the remote and proximate Cauſes of theſe Diſorders are previouſly corrected or ſubdued by the general Remedies beforementioned.

Beſides theſe Simples, there are, alſo, various compound Medicines highly extolled; to which belongs that, ſo much recommended againſt Madneſs by *Riverius*, who looked upon it as an Arcanum of Importance. It is thus prepared:

> Take of Baum-leaves, one Handful, cut them down into four Ounces of Spirit of Wine; then add half a Dram of prepared Pearls: Mix all together, and let two Spoonfuls be exhibited for a Doſe.

This Medicine is not, in my Opinion, to be altogether condemned; and tho' I myſelf had never an Opportunity of making a Trial of its Efficacy, yet it deſerves due Encomiums; ſince, by its means, I know many mad Perſons cured by a Shepherd, who frequently preſcribed it for that Purpoſe.

'Tis, alſo, to be obſerved, that a certain celebrated Phyſician of *Brunſwick*, in Melancholy and Madneſs, ſucceſsfully uſed a certain black Decoction, prepar'd, as I was told by an Apothecary, of Aſſes Blood, boiled with Baum-water and Wine-vinegar. Nor can I think this Medicine deſtitute of its proper Uſes, ſince, beſides the ſedative Quality poſſeſſed by the Aſſes Blood, the Wine-vinegar is a conſiderable Diſcutient and Reſolvent.

The Decoction of *Michaeli*, and his Eſſence of red male Pimpernel, are highly extolled againſt theſe Diſorders; and that Author affirms, that he has a thouſand times experienced the ſingular Efficacy of theſe two Remedies in Melancholy and Madneſs; but of the Truth of this Aſſertion I am not ſufficiently convinced: But, in my Opinion, the Powder by Mr. *Charas*, deſcrib'd in his *Pharmacop.* recommended againſt the Madneſs ariſing from the Bite of a mad Dog, and prepared of Baum, Vervain, Wormwood, Mugwort, Plantane, and Rue, is productive of happy Effects, both becauſe it diſcuſſes the ſtagnant Humours, and corroborates the ſolid Parts.

Among chymical Preparations, to this Claſs belong Flowers of Antimony; the Uſe of which ſome Phyſicians highly extol, and appeal to Experience for the Support of their Aſſertion. Nor have I found this repugnant to my own Experience; for if tenacious, viſcid, and bilious Humours, lodged in the Duodenum, are to be evacuated by Vomit, theſe Flowers, which, beyond the other Preparations of Antimony, contain a certain mild Sulphur, of an anodyne Virtue, produce happy Effects. As for the Medicines in which Opium is an Ingredient, we ſhall afterwards conſider them.

But whether for preventing or curing theſe Diſorders, no Remedy more juſtly deſerves the Name of a Specific, than Motion and Exerciſe, duly adjuſted and proportioned to the Strength of the Body; for, provided a due Degree of Moiſture is not wanting in the Blood, Exerciſe, by reſolving the viſcid Humours, and promoting the free and eaſy Circulation of the Blood thro' all the Veſſels, increaſes Perſpiration; and, by that means, frees the Body from Sordes, and removes Obſtructions; in conſequence of which 'tis far preferable to all other kinds of Remedies.

Since 'tis both ſafer and eaſier to prevent Diſorders, or guard againſt their returning Paroxyſms, than to remove them when preſent, it is of great Importance both to the Phyſician and Patient, to be well acquainted with the moſt proper Meaſures of preventing theſe Diſorders: For which Purpoſe 'tis, therefore, abſolutely neceſſary, that we have a due Regard to the Redundance of the Blood, which is to be leſſened by ſeaſonable Veneſection, eſpecially about the Solſtices and Æquinoxes, or by increaſing the hæmorrhoidal or menſtrual Diſcharges, or recalling them, if they are totally ſuppreſſed. But before Veneſection, it is expedient, by ſome gentle Medicine, to purge off the Sordes of the Primæ Viæ; for, by this means, after the Vein is opened, the Diſtribution of the Blood thro' all the Parts of the Body will be the quicker, in conſequence of which it will be the better depurated by Perſpiration.

Nothing, alſo, is a more powerful Preſervative againſt Melancholy and Madneſs, than a due Moderation and Subjection of the Paſſions; which will be eaſily obtained, if we take care not to indulge ourſelves too far. Vain Deſires, therefore, capable of diſturbing the Mind, or laying a Foundation for Speculations or anxious Fears, are carefully to be ſuppreſſed. Profound Thoughts, intenſely fixed upon one Object, and abſtruſe and long-protracted Speculations, are, alſo, to be carefully avoided. Venery muſt, alſo, be very moderately uſed, Solitude muſt be ſhun'd, and the Mind be diverted with grateful and agreeable Company.

Nor is it ſafe liberally to uſe every Species of Aliment, but only ſuch as is of eaſy Digeſtion, and not offenſive to the Stomach by its Bulk. Hence Patients ſubject to Melancholy or Madneſs ought carefully to abſtain from ſmoked Fleſhes, whether Pork or Beef; from Shell-fiſh; from Fiſh of an heavy and noxious Quality; from vaporous Subſtances, and Aliments prepared with Onions and Garlick; for all theſe, by loading the Stomach, and generating a thick Blood, prove highly injurious. But, above all, the Patient is to take care to eat no more than is ſufficient for the Support of Nature, tho' not the Satisfaction of Appetite; for we generally obſerve, that thro' preternatural Voracity, to which melancholic Patients are highly ſubject, on account of the Redundance of acid Humours in the Primæ Viæ, very unhappy Effects are produced.

The Drink muſt, alſo, be duly choſen, ſince every Liquor is not found beneficial to every Patient. It is, however, to be obſerved, that the lighteſt, ſuch as ſmall Beer, or pure cold Water, is to be made Choice of. Among Wines, a ſmall Quantity of rough White-wine, ſuch as the *Moſelle* Wine, is to be allowed at Meals, to melancholic Patients, ſince, by refreſhing their Bodies and Minds, it has a Tendency to render them chearful. But I have always obſerved, that ſweet and ſtrong Wines, ſuch as the *Hungarian*, *Italian*, and *French* Sacks, are highly prejudicial, both to melancholic and mad Patients. Nothing, alſo, is more injurious, or contributes more effectually to the Generation of Madneſs, than the Uſe of ſuch ſpirituous Liquors, or of large Quantities of cold Liquors, after a violent Sally of Paſſion; for which Reaſon thoſe who regard their Intereſt, ought, at ſuch times, to abſtain from ſuch Liquors.

As the exceſſive Smoking of Tobacco is unfriendly to Digeſtion, and not only generates thick Humours, but, alſo, throws them into preternatural and tumultuous Commotions, it is highly prejudicial to melancholic and maniac Patients; but a moderate Uſe of it may, in my Opinion, be allowed, in order to preſerve the Body ſoluble.

Changes of Air, and travelling from Climates exceſſively cold or hot, to thoſe of a more temperate Air, are excellent Preſervatives againſt theſe Diſorders; ſince they not only correct erroneous and perverſe Ideas; but, alſo, in conſequence of the Exerciſe to be uſed, prevent Obſtructions of the Viſcera, and by that means preſerve an equable Circulation of the Blood thro' the whole Body.

Practical Cautions and Observations.

Since I have frequently ſeen Madneſs produced by a prepoſterous Cure of acute Fevers, eſpecially of the bilious Kind, accompanied with a Phrenitis, by means of Opiates, and too refrigerating Medicines, I think it is the Duty of every good and skilful Phyſician, not only to treat theſe choleric Fevers in a prudent and rational manner, but, alſo, in their Decline, to preſcribe an exact Regimen, and a due Moderation of the Paſſions; otherwiſe a Phrenitis eaſily degenerates into a chronical Madneſs. Obſtinate intermitting Fevers require the ſame Caution; for, when theſe are ill treated by reiterated Veneſections, or often repeated acrid Purgatives, or when they are too ſoon checked by Aſtringents or Opiates, it is certain from Experience, that Melancholy, the hypochondriac Diſorder, and Madneſs, have ſucceeded. Phyſicians ought, therefore, to abſtain from ſuch, leſt they ſhould, by their Management, bring on theſe terrible Diſorders.

Tho', in Deliriums, Veneſection is highly uſeful, yet it ought to be varied according to the different States of Patients, both with reſpect to the Place, the Quantity, and the Time. Thus, when Madneſs ſeizes plethoric, and choleric Patients in the Vigour their Youth, reiterated Veneſections, interpoſing, at the ſame time, frequent Purges of corrected Hellebore, are not prejudicial, eſpecially if after them we repair and recruit the Strength by cardiac, corroborating, and anodyne Sedatives. When, on the contrary, by long Abſtinence, protracted Watchings, and continual Evacuations, the Strength and temperate Humours of mad Patients have been exhauſted, they are more weakened by Veneſection; for which Reaſon, their Situation rather calls for nutritive Subſtances, and gentle Analeptics.

As for Veneſection in the Forehead, it is to be obſerved, that it is never uſeful in the Payoxyſm, when, by reaſon of the ſpaſmodic Stricture of the inferior Parts, the Impetus of the Blood is directed to the Head; but rather prejudicial, by attracting a greater Quantity of Humours thither. But Veneſection is more advantageouſly and ſafely uſed, either when the Primæ Viæ are duly purged from Sordes, or when, after the Ceſſation of the Spaſms, there is a conſiderable Remiſſion of the Diſorder. This uſeful Caution I learned from attempting the Cure of an Hemicrania by the ſame Method; ſince, without any Succeſs, I have known the frontal Vein opened more than ten times. Of this Opinion, among the antient Phyſicians, was *Celſus*, who, when treating of the Cure of Deliriums, has this remarkable Obſervation: "To exhibit Medicines, ſays he, when the Patient "is in the Height of Madneſs, is an injurious Practice, becauſe "by that means the Fever is, at the ſame time, increaſed. In "this Caſe, therefore, the Patient is only to be kept temperate; "but, when his Situation admits of it, we are, with all Expedi- "tion, to attempt his Relief. *Aſclepiades* affirmed, that bleed- "ing mad Patients was, in a manner, equivalent to killing them, "becauſe all Madneſs was accompanied with an intenſe Fever, "and Blood could not be taken with Advantage from them, "except in the Intermiſſion of that Fever."

Since, according to *Hippocrates*, *in Sect. 6. Aph.* 56. melancholic Patients are ſubject to dangerous Tranſlations of the Humours to the Brain, which are ſometimes ſucceeded by Apoplexies, Epilepſies, Blindneſs, or Madneſs, diligent Care is to be taken not to procure ſuch fatal Tranſlations and Congeſtions of the Blood to the Head, which are principally brought on by violent Perturbations of Mind, an immoderate Uſe of ſtrong Wine during the Dog-days, or by every Medicine, which, by throwing the Fluids of the Body into too violent Commotions, is capable of impairing the Strength.

But ſuch Tranſlations are moſt powerfully occaſioned by draſtic Purgatives, which, by ſtimulating the Inteſtines to violent Spaſms, propel the Blood to the ſuperior Parts. Hence, in the Exhibition of Purgatives, we are to obſerve the Rule of *Meſue*, which runs thus: "In melancholic Diſorders, we are not once, or "twice, but at repeated Intervals, to make ſo ſmall an Evacu- "ation, that Nature may govern the Evacuation, and not the "Evacuation Nature. But it is expedient to keep the Body al- "ways ſoluble; and, if it is not ſo, it is to be rendered ſo by "a Clyſter, or every Week a gentle Evacuant."

In Virgins arrived at Maturity, and rendered mad by Love, Marriage is the moſt efficacious Remedy; the incomparable Virtues of which, in curing this Species of Madneſs, are not only confirmed by Reaſon, but, alſo, adverted to by *Hippocrates*, who, for that Reaſon, ordered ſuch Patients to be married as ſoon as poſſible; for, ſays he, if they conceive, their Madneſs is removed; which, I believe, is ſufficiently agreeable to Experience.

In Madneſs produced by the Bite of a mad Perſon, or Dog, we are not to confide in the external Specifics, ſo much extol'd by *Galen*, *Aetius* and *Ruffus*; ſuch as burnt Crabs, or their Aſhes mix'd with Theriaca, and the Root of the *Cynosbatos*, the Aſh-colour'd Liverwort, or the Liver of the mad Dog, applied externally; but, after a deep Scarification of the Part affected, we are to apply a large Cupping-glaſs; or, having cauteriz'd the Part affected pretty deeply with an ignited Iron, we are to promote a Suppuration.

Since 'tis certain from Experience, that maniac Patients have been greatly reliev'd by an Itch ſo loathſome as to reſemble an Elephantiaſis, and that a Madneſs ariſing from the Cure of Ulcers in the inferior Parts, has been remov'd by Trepanning, I think it would, in ſuch Caſes, be highly expedient to make Fontanels and Ulcers, with a potential Cautery about the Spine of the Back.

Veſicatories are ſo far from being beneficial in the Cure of Madneſs, that they rather augment the Diſorder; for the cauſtic Salts of the Cantharides, convey'd to the Blood thro' the Pores, by proving an additional Stimulus to the nervous Membranes, and the Dura Mater, by their ſpaſmodic Stricture, increaſe the Motion of the groſs and bilious Blood thro' the Head, and all the other Parts of the Body; whereas ſuch Medicines ought rather to be us'd, as, by their mild anodyne and antiſpaſmodic Virtues, ſooth the intenſe Conſtrictions of the nervous Parts, and check the tumultuous Motions of the Humours.

But tho' theſe ſedative and anodyne Medicines are of great Importance and Efficacy in removing Madneſs, yet we are not to refer to this Claſs Opiates and Narcotics, and for that Reaſon exhibit them, ſince theſe, by ſtupefying the nervous Fibres and Membranes, and eſpecially thoſe of the Brain, leſſen the Paroxyſms of the Madneſs, and bring on another Extreme, which is unaccountable Stupidity and Folly. But, if any Relief is to be expected from Anodynes, ſuch of this Claſs are to be choſen, as are beneficial in an Epilepſy, the immediate Cauſe of which conſiſts in a ſpaſmodic Stricture of the Dura Mater: Of this kind the moſt conſiderable are Caſtor, the Shavings of Elk's Hoof, of the human Scull, and Hartshorn philoſophically prepar'd, the Roots and Seeds of Piony, the antiepileptic Powder, Valerian-root, the anodyne mineral Liquor, the Waters prepar'd from the Flowers of Lily of the Valley, the Lime-tree, and Cowſlips, all which may be confided in, as ſafe and approved Medicines.

In *Poland*, upon cutting of the Plicæ of the Hairs, in a Diſeaſe well known in that Country, I have known not only violent Diſorders of the Head; but, alſo, Madneſs, produc'd. In this Caſe, Waſhing the Head twice a Day with a Decoction of the Club-moſs, is highly recommended, becauſe by this means 'tis ſaid the Eruption of the peecant Matter will again appear. A Liniment of Clubmoſs, highly uſeful for this Purpoſe, is deſcrib'd in *Miſcell. Nat. curioſ. Decad.* 1. *an.* 2. *Obſ.* 54.

In a Phrenitis, which is, as it were, a particular Fever of the Dura Mater, in which its increaſed Elaſticity and ſyſtaltic Force produce a preternaturally briſk and tumultuous Motion of the Blood, and nervous Fluid, beſides Preparations of Nitre exhibited internally, mild and anodyne Animals, ſuch as Hens and Pigeons, cut up alive, are found to produce happy Effects, if applied to the ſhaved Head, ſince their mild Exhalations, by relaxing the too much conſtricted Fibres, greatly contribute to reſtore their natural Tone and Motions. *Frederic Hoffman.*

Melancholia.

Melancholy is by Phyſicians call'd that Diſorder, in which the Patient is long and obſtinately delirious, without any concomitant Fever, and with his Mind almoſt perpetually and intenſely fix'd upon one Object.

This Diſorder ariſes from that Malignity of the Blood and Humours, which the Antients call'd black Bile; and, on the contrary, the ſame Diſeaſe beginning in the Mind ſoon generates black Bile in the ſoundeſt Body.

'Tis, therefore, neceſſary briefly to deſcribe the Nature of this Diſorder, the Accounts of which are eſteem'd ſo obſcure, as to lay a Foundation for a groundleſs and unjuſt Charge againſt the Antients, for their Neglect in a Diſeaſe of ſuch Importance.

If in the whole Maſs of Blood the more fluid and moveable Parts being diſſipated, they leave the more immoveable Parts united, then the Blood will be thick, black, pinguious, and terreſtrial. Blood of this Quality and Condition we ſhall call an *Atrabiliarious Humour*, or *Melancholic Juice*.

The Cauſes of ſuch a State and Condition of the Blood are, every thing which expels the more moveable and fluid, and fixes the other Parts of the Blood; violent Exerciſe of the Mind employ'd almoſt Day and Night on one and the ſame Object; obſtinate Watchings; violent Commotions of Mind, whether in the way of Mirth, or Sorrow; painful and laborious Exerciſes of Body often repeated, eſpecially in a highly dry and warm Air; immoderate Venery; auſtere, hard, dry, and terreſtrial Aliments, us'd in Conjunction with a State of Reſt and Lazineſs; Liquors of a ſimilar Nature. Of this kind are the Parts eſpecially of hard and old Animals indurated either by Smoke, the Air, or Salt; unripe Fruits; farinaceous Subſtances, not fermented; aſtringent, coagulating, fixing and refrigerating Medicines; ſlow Poiſons; and other Things of a like Nature; ſuch burning Fevers as continue long, recur often, and are remov'd without a laudable Criſis, and without the Uſe of Diluents.

When this Diſorder, produc'd by the Cauſes already enumerated, equally infects the whole Maſs of the circulating Fluids, it will forthwith produce ſome ſufficiently conſpicuous Phenomena, which are generally theſe following: The Colour of the external and internal Parts becomes firſt pale, then yellow, then dark brown, then livid, and, laſt of all, black, with Spots of a ſimilar Colour. The Pulſe becomes ſlow, the Patient is intenſely cold; the Reſpiration is languid; the Circulation in the large Blood-veſſels is good and laudable; but that in the lateral Veſſels is languid and peccant. Hence all the Humours being inſpiſſated, their Secretion and Excretion are leſs and ſlower, and their Conſumption and Diſſipation leſs conſiderable; the Patient's Appetite is impair'd, he becomes extenuated, dejected, fond of Solitude, and ſubject to obſtinate and violent Commotions of Mind; in other reſpects he is in an indifferent Condition; he is averſe to Motion, but perſeveres with Reſolution in his Purſuit of any Study or Acquiſition.

This Diſorder has, for its material Cauſe, the Earth, and the inſpiſſated Oil, of the Blood, united and compacted together, which the more they are depriv'd of the liquid, mild and diluting Parts, and the more they are condenſed, and tenaciouſly mix'd, or the longer they have continued in this State, the more terrible the Effects of the Diſorder will be, and its Cure the more difficulty obtained.

Hence 'tis obvious, what the diagnoſtic and prognoſtic Signs of this Diſeaſe are; hence, alſo, the moſt rational Method of Cure is to be deduced.

For as ſoon as the Diſorder diſcovers itſelf by its firſt Beginnings, its Cauſe, or any of its Effects, a continually varied Series of Objects is to be laid before the Patient's Mind, without letting him know for what Reaſon. But ſuch Objects are to be choſen, as excite Diſpoſitions directly oppoſite to that which predominates and reigns in the Patient: Sleep is to be procured by diluting, demulcent, paregoric, and narcotic Medicines, and by keeping the Patient in a State of Reſt. Perſons labouring under Melancholy ought, alſo, to live in a moderately warm moiſt Air; the Aliments they uſe ſhould be light; the Liquors they drink, ſhould, like the ſound and laudable Humours of the Body, be recent, mild, and laxative, by their gently ſaponaceous Quality; and the Uſe of theſe is to be perſiſted in for a long time. Such Medicines as dilute, correct Acrimony, reſolve the oleous and terreſtrial Parts of the Blood, relax the Veſſels, and, by their gently ſtimulating Quality, expel the peccant Matter, are to be exhibited; ſuch as the Juices of ſufficiently ripe Summer Fruits, Preparations of Honey, Pot-herbs, and Broths prepared of them, and mineral Waters. The moſt proper Drink is Ptiſan, gently edulcorated with Honey. Such Things as produce the Diſorder, are carefully to be abſtained from.

But if the Matter of the Diſorder is, by the Cauſes already enumerated, rendered more denſe, tenacious, and incapable of Motion, it will neceſſarily be forced into the hypochondriac Veſſels, as is obvious from the Nature of this Humour, the Situation and Condition of theſe Veſſels, and the known Laws of Hydraulics. Hence it will gradually remain, be accumulated, and become ſtagnant there. In this Caſe the Indiſpoſition is called the *Hypochondriac Diſorder*, and affects the Spleen, Stomach, Pancreas, Omentum, and Meſentery.

Hence it there produces a continual Senſe of Weight, Uneaſineſs, and Repletion, eſpecially after Eating and Drinking; a Difficulty of Reſpiration, in conſequence of the Oppreſſion of the abdominal Viſcera; an Hindrance to the cyſtic and hepatic Bile, as, alſo, to the pancreatic, ſtomachic, inteſtinal, and meſeraic Juices, in their Generation, Secretion, Mixture, and Action on the Aliments. Hence the firſt Digeſtion becomes totally peccant, and the Aliments are corrupted into a crude Acid, if they are Vegetables; but the Corruption is of the putrid alcaline Kind; if Animals, and of a rancid or oleous Nature. Hence ariſe Eructations, Flatulences, Spaſms, Coſtiveneſs, Induration of the Fæces, a Jaundice more violent in Degree, than that beforementioned: And, in this caſe, all the Symptoms are augmented, and rendered more terrible.

When the Diſorder is thus inveterate, and diſcovers itſelf by the Symptoms laſt enumerated, both Expedition and Care are neceſſary in the Cure; otherwiſe the Diſorder quickly aſſumes a malignant Nature; and this perplexing Circumſtance is, if poſſible, to be avoided: If the Diſeaſe continues, it becomes incurable, and often mortal, as will afterwards appear; if, on the contrary, the laudable and eaſily moveable Humours are evacuated by Purgatives, the peccant viſcid Juices remain in the Body, by which means the Diſorder is rendered worſe. If, alſo, the Diſorder is treated with draſtic, ſtimulating, and reſolvent Medicines, the ſuddenly reſolved Matter often becomes acrid, and, ruſhing impetuouſly into the tender hepatic Veſſels, deſtroys them, and by that means produces various, and thoſe incurable Diſorders. Hence,

1. The Matter is to be rendered gradually moveable, inveſtigating the Nature of its predominant Acrimony, and then exhibiting ſaponaceous Medicines poſſeſſed of an Acrimony, oppoſite to that of the Humour to be corrected. And the Uſe of theſe is to be perſiſted in, till the Weakneſs and Inequality of the Pulſe, the Nauſea, or Teneſmus, the Uneaſineſs and ſlight Fever, are Proofs that the Matter is moved. Then,

2. When the Matter is thus mov'd, it is forthwith to be expelled by a gentle laxative Purge, a Clyſter of the ſame Nature, Whey, mineral Waters, or other Things of a like Nature.

But if this Matter, already fixed and compacted, has remained long there, it begins by means of its Stagnation, the Motion of the Viſcera, and the Heat of the adjacent Parts to aſſume an acrid and corroſive Quality; freſh Matter is continually accumulated, becauſe an Obſtruction is already formed, and the ſame Cauſes continue to act. Hence, in conſequence of its increaſed Quantity, its acrimonious Quality, and its continual Motion, it diſtends, corrodes and corrupts the Veſſels. Hence a ſimilar Deſtruction of the Spleen, Stomach, Pancreas, Omentum, Meſentery, Inteſtines, and Liver, will happen. This conſequently greatly increaſes all the beforementioned Symptoms; but, principally, in conſequence of the continual Reception of a putrefy'd Vapour into the Veins, it diſturbs and diſorders all the Functions, and eſpecially thoſe of the Brain. In this caſe, the Diſorder is called *Atra Bilis*.

When this is diſcovered by the Signs already enumerated, the Matter is not, without the greateſt Art and Caution, to be attenuated, mov'd and eliminated, on account of perplexing Circumſtances of the laſt Importance, and the Eaſineſs of bringing on ſo acrimonious a Condition of the Matter as can hardly be corrected or ſubdued. For this Reaſon let the Patient's Aliments be oppoſite to the particular Acrimony of the predominant Humour. His Food ought, alſo, to be always gently reſolvent, ſtimulating, purgative, and ſuch as after Digeſtion leaves few Fæces. Let his Drink be Ptiſan, edulcorated with Honey, the Juices of ripe Fruits, or Whey. Let his Exerciſe be gentle, but as continual as poſſibly may be. Let him be kept in a very moderate Heat, and take much Sleep. Baths, alſo, Fomentations, Clyſters, and Drinks, are, for the Cure of this Diſorder, often prepared of ſuch Things, as, without any acrimonious Quality, by diluting, reſolving, and abſterging, attenuate the Matter, and ſlowly and gently eliminate it thro' thoſe very Emunctories and Paſſages previouſly pointed out by Nature. But we are always to have a due Regard to the particular Nature and Quality of the Acrimony.

But when this Matter has already acquired an high Degree of Acrimony, and the Viſcera are conſiderably corrupted, if, during the Action of the Cauſes before enumerated, it is mov'd, either by muſcular Motion, the Heat of the Sun or Fire, acrid, and too copious Aliments, acrid and draſtic Medicines, which produce an Effervеſcence with the Acrimony of the Humours, Poiſons which operate in a ſimilar manner, or ſome violent Diſeaſes, then the Acrimony being rendered greater, more moveable, and active; it breaks, corrupts, putrifies, and reſolves its Veſſels; and, in Conjunction with the black Bile, converts them into putrid Impoſtumations. This is call'd *Bilis Atra Turgens*, or a Redundance of the black Bile. If this Species of Humour is attenuated in its Veſſels, convey'd towards the Liver, diſtributed to the corroded Ramifications of the Vena Cava, and introduced into the Heart, it produces highly terrible Diſorders; for, if it partakes of an acid coagulating Nature, it produces Polypuſes of the Heart, Lungs, Aorta, and the Carotids, and even Death. If it proceeds to the Brain, it gives Riſe to Apoplexies, Palſeys, Cataleptics, Epilepſies, Deliriums, and Madneſs of ſuch bad kinds, as to be almoſt incurable. It produces ſurpriſing Changes in the nervous Syſtem, and brings on violent Fevers, which ſoon putrify all the Parts. If, on the other hand, it partakes of an alcaline putrifying Quality, it produces Gangrenes, which ſuddenly prove mortal, in thoſe Parts to which it is convey'd. Hence, unleſs this Fomes, or Matter is extinguiſh'd and deſtroy'd, an infinite Number of

incurable Diſorders will be produced in the whole Body, and in particular Parts of it. But if, in conſequence of a Rupture of the Veſſels of the Viſcera, the diſcharged Matter is lodg'd in the Cavities of the Peritonæum, a ſurpriſing and inſuperable Weakneſs ariſes; the acrid diſcharged Matter is putrefied and accumulated. Then a gangrenous Corroſion of all the abdominal Viſcera happens, by which means ſurpriſing Phenomena are produc'd; ſuch as a Tympanitis, and Death, attended with an inſupportable Stench: But if, after it is mov'd, it is convey'd to the Liver, and thence thro' the corroded and weaken'd biliary Ducts to the Gall-bladder, and thro' the Ductus hepaticus and Ductus communis to the Inteſtines, it excites Vomitings, nauſeas, and atrabilarious Dyſenteries, accompanied with Uneaſineſs, impetuous Efforts, Pains, and intolerable Corroſions. Hence ariſe Inflammations, Exulcerations and Putrefactions of the Inteſtines, Stomach, Oeſophagus, Fauces, and Mouth. Hence are produced terrible Convulſions, and at laſt generally a gentle Death, which for the moſt part happens in a Gangrene, and conſequently in an Indolence of all the Parts.

The Matter, thus mov'd and render'd active, is, together with its uncommon, and almoſt Pitch-like Tenaciouſneſs, poſſeſs'd of an intenſely acid Acrimony, which corrodes Metals, and ferments with Earth; or elſe of an Acrimony of an alcaline and ſaline, and highly corroſive, or which is worſt of all, of an oleous and putrefactive kind; and 'tis neceſſary the Phyſician ſhould know whence theſe various Species of Acrimony ariſe, how they may be known, and by what means they may be corrected and remov'd.

He who diligently adverts to what has been ſaid, and carefully conſiders the Situation, Structure of, and Circulation in the Viſcera, in which this malignant Humour is lodg'd, muſt eaſily perceive, that the *Turgens Atra Bilis*, or a Redundance of Melancholy, is a Diſorder not to be cur'd without the greateſt Difficulty. The principal Medicines capable of alleviating it are Diluters in Conjunction with Opium, and acrid Subſtances oppoſite to the predominating Acrimony.

Hence we may eaſily underſtand the Nature of Melancholy, and the hypochondriac diſorder; for 'tis obvious, that, by a long protracted previous Dejection of Mind, the conſtricted Veſſels of the abdominal Viſcera muſt produce a Stagnation, a Change and an Accumulation of the *Atra Bilis*, which gradually increaſe, tho' the Body was but a little before perfectly ſound; and that, on the other hand, this *Atra Bilis*, or Melancholy produc'd by phyſical Cauſes, produces a Delirium.

The Cauſes then evidently productive of Melancholy are obſerved to be,

1. All Things which fix, exhauſt, or diſturb, the nervous Fluid of the Brain; ſuch as violent and ſudden Frights, intenſe Thinking upon any Object, exceſſive Love, Watchings, Solitude, Fear, and hyſteric Diſorders.

2. Such Things as hinder and diſturb the Generation, Reparation, Circulation, and various Secretions and Excretions of the Blood, eſpecially in the Spleen, Stomach, Omentum, Pancreas, Meſentery, Inteſtines, Liver, Uterus, and hæmorrhoidal Veſſels: So that, of conſequence, Melancholy may be produc'd by the hypochondriacal Diſorder; by acute Diſeaſes ill cur'd, and eſpecially a Phrenitis, and burning Fever; by an Exceſs of all the Secretions and Excretions; by ſuch Aliments and Drinks as are cold, tenacious, terreſtrial, tart, and aſtringent; by violent Heat long protracted and parching the Blood; as alſo by a ſtagnant, moiſt and cloudy Air.

3. A naturally black, hairy, dry, ſlender, and robuſt Conſtitution of Body; a middle Age, a quick, penetrating, and diſcerning Genius.

If this Diſorder continues long, it produces Stupidity, Epilepſies, Apoplexies, Madneſs, Convulſions, Blindneſs, ſurpriſing Fancies, Laughter, Weeping, Singing, Sighs, Eructations, Flatulences, Anxieties; an Urine ſometimes copious and limpid like Water, and at others highly thick; a Retention, Accumulation of the excrementitious Blood in the Veſſels of the abdominal Viſcera, and often a ſudden Excretion of it; obſtinate Coſtiveneſs; frequent Spitting of a thin Matter; and an incredible Ability of enduring Watchings, Hunger, and Cold.

This Diſorder has often been cur'd by a ſupervening unſeemly Itch, ſometimes reſembling an Elephantiaſis; by numerous and large Varices; by a copious Diſcharge from the turgid hæmorrhoidal Veins; and an Evacuation of the black Bile by Vomit and Stool.

Patients labouring under this Diſorder are generally greatly injur'd by all Medicines which impair the Strength, and evacuate too forcibly; as alſo by thoſe which throw the Humours into too violent Commotions, whether Cordials, or Medicines of whatever other Denomination.

Hence the beſt Method of curing this Diſorder is, after a due Obſervation of the firſt Cauſe, and the Variety of Patients Conſtitutions, to accommodate various Medicines to theſe Cauſes, and various Conſtitutions.

The ſeveral Intentions of Cure to be purſued, therefore, are.

1. To rouſe, augment and regulate the Fluids of the Brain and Nerves; which is done, firſt, by diverting the Mind from its uſual Object to others of an oppoſite Nature: Secondly, by inducing cautiouſly another Diſpoſition, or Affection of Mind, oppoſite to Melancholy: Thirdly, by humouring the perverſe and falſe Turn of the Imagination: Or, fourthly, by frequently oppoſing it with great Vigour.

2. To remove thoſe Obſtructions which are either the Cauſe, or the Effect, of a perverted Imagination, by ſoftening, inciding, and ſtimulating the obſtructing Matter, by means of Mineral Waters, Whey, viſceral, hepatic, and antihypochondriac Decoctions, Waters invigorated with lixivial or compound Salts, laxative Preparations of Mercury, Emetics, Motion, Exerciſe, Riding, Sailing, uterine Medicines, and ſuch as promote the *Lochia*, Remedies which procure hæmorrhoidal Diſcharges, Baths, Liniments, and Plaiſters.

3. To alleviate the Symptoms by Veneſection, Immerſion in cold Water, and the Uſe of Carminatives and Opiates.

4. After due Evacuations, to exhibit ſuch Things as are from Experience known to exhilarate the Mind, and corroborate all the Parts of the Body.

From what has been ſaid, 'tis obvious that the perfect Cure of this Diſorder, as well as of a great many others falſly accounted incurable, conſiſts in the Correction of the Bilis Atra, or melancholic Humour.

When Melancholy increaſes ſo far as to bring on an Agitation of the Fluids of the Brain, capable of driving the Patient into a raging Fury, the Diſorder is call'd *Madneſs*.

This only differs in Degree from a dejected Melancholy, is its Offspring, ariſes from the ſame Cauſes, and is generally to be cured by the ſame Medicines.

In Madneſs the Muſcles are generally ſurpriſingly ſtrong, the Patient is afflicted with Watchings, incredibly capable of enduring Hunger and Cold, diſtracted by terrible Imaginations, and ſubject to thoſe Diſorders call'd LYCANTHROPIA and CYNANTHROPIA; which ſee.

'Tis obſervable, that, upon diſſecting thoſe who have died of Madneſs, the Brain has been found dry, hard, and friable, with its cortical Subſtance of a yellow Colour, and its Veſſels turgid, varicoſe, and diſtended with black and viſcid Blood.

'Tis alſo obſervable, that, during this Diſorder, all the Excretions have, in like manner, almoſt ceas'd.

Unexpected Precipitation into the Sea, and a Submerſion in it, continued as long as poſſible, conſtitute the principal Remedy for it.

Madneſſes obſtinate againſt all Remedies have often been remov'd upon the approach of Varices, hæmorrhoidal Diſcharges, Dyſenteries, Dropſies, copious ſpontaneous Hemorrhages, Tertain and Quartan Fevers.

Such a ſort of Madneſs ſometimes ariſes after the Body is by an autumnal, violent and long-continued intermittent Fever, weaken'd and exhauſted, both by the Force of the Diſeaſe, and repeated Veneſections and Purgings. The Madneſs is alſo generally brought on again by theſe very Means.

This Species of the Diſorder is only to be cur'd by the Uſe of Reſtoratives, Cardiacs, and Corroboratives, long perſiſted in: But, if it is treated with Evacuation, it brings on an Atrophy, a Weakneſs, and an unſurmountable Fooliſhneſs.

But a Madneſs ariſing in robuſt vigorous Perſons in the Flower of their Age, or of hot and plethoric Habits, is to be cur'd by repeated Veneſections, interpoſing a brisk Purge between each; and, when the Diſorder is alleviated, it is to be treated with Opiates and Cardiacs. *Boerhaav. Aphoriſms.*

MANJAPUMERAM. H. M. *An Arbor triſtis* Garciæ & Acoſtæ? This is a large Tree growing in the *Weſt Indies*. The Flowers, which are of a watry White, and ſmell like the beſt Honey, are of a bitteriſh Taſte, and believ'd by the Inhabitants to comfort the Heart, and the Pagan Phyſicians reckon the Seed among Cardiacs. The diſtilled Water of the Flowers is ſuppoſed to be good for the Eyes, if a Linen Cloth be dipped in the ſame, and apply'd to the Part; for which Purpoſe, and for the Fragrancy of their Smell, the Flowers are carefully gather'd by the Inhabitants. *Raii H. P. p.* 1698.

MANICA Properly a Sleeve; but, in Pharmacy, the *Manica Hippocratis*, is a Bag in the Shape of an inverted Cone, thro' which Things were ſtrain'd: It is now generally made of Flannel; but the Antients us'd a *Manica Hippocratis*, made of Ruſhes, or Wicker, as we learn from *Rhodius*'s Notes to *Scribonius Largus*.

Hildanus calls by this Name a particular ſort of Purſe open at both Ends, which he deſcribes in his Treatiſe *de Gangræna & Sphacelo*, and gives a Figure thereof. This he directs to be put about a Limb, juſt above the Place of Amputation, before the Operation is perform'd.

MANIHOT, *Indorum, ſive Yucca Foliis Cannabinis.* C. B. *Manihot Theveti, Yucca & Caſſavi.* J. B. *Hiucca ſive Mandioca ex qua Caſſavi fit.* Park. *Maniiba & Mandiiba Braſilienſibus, cujus Radix Mandihoca.* Piſon. Margr.

Many Countries of the *Indies* have been deſtitute of frumentaceous Grain to theſe Times, inſtead of which the bountiful Hand of Nature has ſupply'd them with a Plant, the Root of which, called by the Barbarians *Mandioca*, being reduced into Flour,

Flour, is made into Bread, which may be compared with the beſt Bread made of Wheat.

The Inhabitants of *Hiſpaniola*, and other Iſlands, are not deſtitute of this Plant; the Root of which they call *Yuca*, but the other *Mexicans*, *Quanhcamotli*; and, after it is prepared and reduced to a Flour, *Caſſavi*, as we are aſſured by *Monardes*. All the other People of *America*, from *Florida*, even to the Streights of *Magellan*, make their Bread of it, tho' they are not deſtitute of the frumentaceous Grain called *Mayz**.

The Manihot, which is natural to *Braſil*, and there moſt carefully cultivated, is a ſhrubby Plant, which grows from five to eight Feet in Height, with a woody, twiſted, nodous, brittle Stalk, containing a Pith like that of Elder; the Leaves are digitated, like thoſe of the Lupine, or black Hellebore, the Flowers pentapetalous, and of a pale-yellow Colour; the Seed like that of the Ricinus, but of no Uſe. The Root is not unlike a Parſnip, and turgid with a lacteous Juice; after it is taken out of the Ground, it is put into an Hand-mill, with Iron Teeth, turned by two Men, and ground to a Meal, which is afterwards ſubjected to a Preſs, by which all the ſuperfluous and noxious Humour is evacuated, and the Maſs left quite dry: This done, they paſs it through a Sieve, called *Urupeba*; then ſet it over the Fire in a flat-bottom'd Veſſel of Earth or Copper, and ſtir it about till it is duly dreſſed. What is half-dreſſed, is ſtill moiſt and eſculent, and they call it *Farinha relada*, that is, Meal dreſſed, but not dried. What remains, and is intended to be reſerved, they keep ſtirring over the Fire, till it is perfectly dried; for the drier and better dreſſed, the more durable it becomes.

The Plant, being preſſed, yields a Liquor, called by the Natives *Manipuera*, which, poured into a Veſſel, after two Hours, ſticks to the Bottom: Hence is produced another Sort of Meal, better than the former, and yielding more Flour; this they call Cream of *Tipioca*. Of the Water of this Meal, what ſubſides to the Bottom, ſerves to make a ſort of Comfit, called *Tipioceto*, of an excellent Taſte: There is, alſo, a ſort of Gum, or rather Amylum, which ſerves for the ſame Uſe. This Liquor Manipuera is moſt greedily coveted by all ſorts of Animals, for its pleaſant and ſweet Taſte, but is preſent Death to them; yet, what is ſtrange and remarkable, while it remains unpreſſed in the Root, nouriſhes every Animal, except Man: Beſides the former Preparations of the Root, dried in the Sun, there is made another Sort of Meal, and a whitiſh Flour, which make fine white Bread, and Biſcuits, as good as thoſe made of Wheat, and very much reſembling them. The Root reſerved entire, without grinding, ſerves to feed Cattle, and Beaſts of Burden. The Plant is miſerably infeſted by Worms and whole Swarms of Ants and not only the Stalks and Leaves, but the very Roots, are greedily devoured by wild Beaſts, as well as domeſtic Animals. The Natives of *Braſil*, the *Negroes*, and many *Europeans*, are ſo great Lovers of the Leaves, that they bruiſe them, boil them, and pickle them, and eat them inſtead of Lettuces, forming them into Maſſes, which the *Braſilians* call *Manicoba*. The Root macerated four or five Days in Water, and render'd ſoft, is called *Mandiopiba*, which, being fried, is greedily eaten, by the vulgar ſort of *Indians* and Savages: Of the Sediment of this Conſiſtence is made a ſoft and finer Sort of Meal, which the *Braſilians* call *Vipeba*, and the *Portugueſe Farinha freſca*. Of the *Mandihoca* bruiſed, and prepared with Butter and Sugar, are made excellent Sweetmeats; there is, alſo, a kind of Pudding prepared of the Mandiopela, which they call *Mingan petinga*. The ſoft Mandihoca, which they call *Puba*, being dried over the Fire, is called *Carima*; of this the Negroes make a ſort of Bread, which is very much eſteem'd, and called by them *Muſam*, or *Angu*, and ſometimes *Enfonde*: But they make a moſt excellent ſort of Pudding of the ſame, which they call *Mingau de Carima*, ſeaſoning it with *Braſilian* Pepper inſtead of Spice, and the Flowers of *Nhambs*; this kind of Food being very grateful to the Palate, as well as conducive to Health, they ſeldom make a Dinner without it, and never think they fare well, if this Aliment be wanting. Of the ſame Carima they prepare Emulſions and Ptiſans, which are eſteemed very wholſome, and proper for ſick as well as healthy Perſons; for the Tipioca and Carima being drank, or taken in the Form of a Syrup, with Water of Orange-flowers, with a little Sugar, generally ſerves for an Antidote. The Tipioca, being defecated by many Waſhings, then dried, and carefully preſerved from all Humidity, cures conſumptive Perſons, and thoſe who labour under a Dyſentery; reſtores ſuch as are feveriſh, labouring under Faintings, or infected with Poiſon: Beſides, the ſimple Ptiſan, prepared of it, recovers thoſe who have their Strength exhauſted by violent Exerciſe, and repreſſes immoderate Sweat; taken inwardly, or applied outwardly, it puts a Stop to all ſorts of Hæmorrhages, and eſpecially ſuch as proceed from Wounds.

Of the Species of Manihot, called *Mataxera*, they make a very good Sort of Wine, which taſtes like Whey. The Shavings of the Mandihoca, applied to Wounds, and old Ulcers, cleanſes and reduces them to a juſt Temperament. The Manipuera, boiled, thickens into a Pudding, and becomes good Aliment; and if you add thereto Rice and Sugar, with diſtilled Water of Orange-flowers, it acquires the Form of a moſt grateful Conſerve, and, changing its Name, is called *Marmelada de Mandioca*. The Macaxera, beſides ſupplying the room of the Meal before ſpoken of, being fried over the Fire, is eaten without any other Preparation, and called *Macapera*.

From the Roots of the other Species you muſt abſtain, becauſe they are preſent Poiſon; and there are even ſome, which you may ſooner burn than deprive of their Poiſon, and render them fit to eat; and the Natives of the Country themſelves, who were not ſo well exerciſed in ſeparating the Eſculent from the Poiſonous, have ſometimes loſt their Lives through their Ignorance; but they are now better inſtructed to chuſe the wholſome Kinds, which are not only the principal Support of their own Lives, but of all the *Europeans* who live in *America*, who ſcruple not to prefer the Bread made thereof to wheaten Bread, tho' it is eſteem'd to afford leſs Nutriment.

The Negroes and *Braſilians*, in their Eating, throw whole Handfuls of the Meal into their Mouths, with ſuch Dexterity as not to loſe a Bit, though they keep their Hands remote from their Mouth: They ſeldom or never drink in eating it, becauſe it imbibes Water exceſſively, and ſo cauſes Inflations in the Stomach.

We have been the fuller in our Account of this Plant, becauſe it is of ſuch univerſal Uſe, that it feeds many of the human Race; for moſt of the Inhabitants of that vaſt Part of the World called *America* live principally upon it.

Piſo ſpeaks of another wild Sort of Mandihoca, and has given us a Figure of it; he calls it an arboreſcent Shrub, but it is very like the cultivated Kind, in Stalk and Leaves, tho' far inferior to it in Value.

All who have written of the Mandihoca, aſſure us, that the expreſſed Juice of the Root is preſent Poiſon to all Animals; but that, after it has ſtood four-and-twenty Hours, it loſes its malignant and pernicious Quality. *Raii Hiſt. Plant.*

MANIODES, *μανιώδης*. Maniacal. An Epithet in *Galen* for a violent kind of Delirium.

MANIPULUS. An Handful; that is, as much as can be contain'd at once in the Hand. It is a Meaſure frequently mentioned in Pharmacy, relative to Flowers, Herbs, and other things; and is expreſſed in Abbreviation by M.

MANNA. This has various different Significations: Thus *Manna Thuris* is a Species of Frankincenſe, in ſmall Grains; ſee THUS: And *Manna Guaiacana* is an Extract of Guaiacum. *Libavius* mentions a *Manna Magnetis*. *Manna Cœleſtis*, in *Quercetan's Pharmacop. Reſtit.* is explain'd by *Schroder*, Bees-wax, tho' ſome take it to be purify'd Sugar. The *Manna Solaris*, or *Unicornu Solare*, is a Preparation of Gold, deſcribed by *Schroder*, *Lib.* 3. *Cap.* 9. The *Manna Martis*, is a Tincture of Iron, deſcribed by the ſame Author, *Lib.* 3. *Cap.* 11. And, in *Cap.* 13. of the ſame Book, he directs a Tincture of Lead, with Spirit of Wine, under the Title of *Manna Saturni*. *Manna Vomitoriorum* is Salt of Vitriol. *Caſtellus* from *Rolfincius*. *Rulandus* ſays, the Name of *Manna* is applied to all ſweet Subſtances, from whatever extracted.

But what is commonly known by the Name of *Manna*, is a common cathartic Drug, of which *Frederick Hoffman* gives a much better Account than the celebrated *Salmaſius*.

As in many Diſorders Purgatives are the beſt of Medicines, ſo Manna may, on many Accounts, be ſaid to be the beſt of Purgatives; for which Reaſon we ſhall firſt conſider its Origin, Name, and Hiſtory; and then take a View of its ſingular Uſe and Efficacy in Medicine. But, ſince various Subſtances are comprehended under the general and extenſive Word *Manna*, it is therefore expedient, previouſly, to aſcertain the preciſe Idea we affix to it. The Word *Manna* is, therefore, properly, of an *Hebraico-Syriac* Extract, and, ſtrictly taken, ſignifies a Gift gratuitouſly conferred, without any Obligation thereto on the Donor's Part: From this Signification the Word *Man* was firſt, by the inſpired Writers, transferred to that Species of Aliment, with which bountiful Heaven ſupplied the *Iſraelites* for forty Years in the Wilderneſs. And ſince this Species of Aliment fell early in the Morning, in the Form of Dew on the Earth, and was poſſeſſed of a ſweetiſh Taſte, the *Greek* and *Latin* Writers afterwards by the Word *Manna* underſtood, a Dew reſembling Honey, which fell in the Morning, as *Celſus*, in *Lib.* 13. *Cap.* 46. obſerves. But, at laſt, the Denomination of *Manna* was, by the Antients, confined to a certain Medicine, which they believed

* There are ſeveral Species of the *Mandihoca*, which, tho' at firſt Sight they may ſeem not to differ, are yet diſtinguiſhed by experienced Planters, with reſpect to their Worth, their Stalks, and Bark. The firſt Species is called by the *Braſilians*, who live near the Sea, *Mandiibabuara*; this has whitiſh Stalks and Roots. The Mandiibparata, Mandiipeba, Mandiipuca, Mandiibumana, Aipi, (which is ſubdivided into ſeveral Species, whoſe Names may be found in *Maregrave*) Tapecima, Aipipoca, Mandijupeba, and Aipimacoxera, are all diſtinguiſhed by red Stalks, and Roots which abound with a lacteous Humour. The Roots and Stalks of all theſe Species paſs under the common Name *Mandihoca*.

to be, as it were, the Offspring and Product of Dew; ſo that, among Phyſicians, the Word *Manna* ſignifies no more than a grumous Subſtance, of a white and ſomewhat yelloviſh Colour, of a ſweetiſh Taſte, ſomewhat acrid, pinguious, and poſſeſſed of a laxative Virtue: Of this Species of Manna we intend to treat. But, beſides this, there is another Manna, generally called the Manna of Frankincenſe, which is no more than ſmall Portions of that Commodity, broken off by the Concuſſion in Carriage, according to *Pliny*, and *Galen*, in *Lib.* 4. *de Compoſit. Medicam.* and theſe broken Portions were, perhaps, called *Manna*, on account of their Colour and Figure. The Name of *Manna* is, alſo, given to *Ruſſia* Seeds, which being not unlike the Seeds of Gromwell, are produced in the Confines of *Sileſia* and *Poland*, and are called *Manna*, becauſe, in the Opinion of the Vulgar, they in a miraculous manner fall from Heaven.

Having premiſed theſe Things, we now come to trace the Origin of this medicinal Manna: When, therefore, we carefully look into the Works of thoſe who have wrote on this Subject, we find that Phyſicians generally run into three different Opinions, with reſpect to the Generation of Manna; for *Chriſtophorus a Vega* affirmed, that the Manna was diſcharged in a liquid Form, Drop by Drop, from Graſhoppers, and ſmall Bees; and that, being depoſited on Leaves, it was indurated by the Heat of the Sun. But as this Opinion is abſolutely inconſiſtent with Truth, *Frederic Hoffman* the elder has, in his *Clavis Schroederiana*, exploded it as falſe and imaginary.

Another, and indeed an almoſt generally received, Opinion among the Antients, is, that Manna deſcended from the Air, and conſiſted of ſweet and ſulphureous Exhalations, previouſly raiſed from the Earth and Waters by the Heat of the Sun in warm and dry Days; after which theſe Vapours, being condenſed by the Cold of the ſubſequent Night, fell down early in the Morning, in the Form of Dew, on the Earth and Trees. Thus *Pliny*, in his *Natural Hiſtory*, *Lib.* 11. *Cap.* 12. informs us, that Manna deſcends from the Air, eſpecially early in the Morning; and leaves it undetermined whether it is what he calls a Sweat of the Heavens, a certain Saliva of the Stars, or the Juice of the Air purifying itſelf. And *Galen*, in his Treatiſe *de Aliment. Facult. Lib.* 3. *Cap.* 39. calls Manna, aerial Honey; and tells us that, according to the moſt skilful Naturaliſts, the Exhalations ariſing from the Earth and Waters, being attenuated and concocted by the Heat of the Sun, were by the Cold of the ſucceeding Night condenſed into the Subſtance called *Manna*. Of the ſame Opinion are *Zacutus Luſitanus*, in *Med. Princ. Hiſt. Fuchſius de Comp. Med. Lib.* 1. *C.* 76. *Schroder*, in *Pharmac. Medico-chym.* and ſome others, but more eſpecially *Matthiolus*, in *Comment.* in *Lib.* 1. *Dioſcorid.*

But beſides the Circumſtances diſcovered by thoſe who have travelled into the Countries where Manna is produced, there are many important Reaſons concurring, to demonſtrate that it is neither Dew, nor the Produce of Dew. *Fallopius*, *Op. Tom.* 1. calls the Truth of this Opinion into Queſtion; and other Authors, juſtly celebrated for their Learning, have ſhewn it to be abſolutely falſe. For if Manna was either Dew, or the Produce of Dew, it would, without Doubt, be colliquated and exhaled by Heat; or it would be found on all Herbs, Trees, Rocks, or the whole Ground of the Countries where it is produced. But 'tis certain, that Manna is rather condenſed by the Heat of the Sun, and is only found on certain Trees, which afford more or leſs of it, according as they abound more or leſs with Juice.

The third Opinion, which is indeed moſt agreeable to Truth, is, that Manna is the nutritious Juice ſpontaneouſly dropping, or artificially obtained, from Trees, eſpecially from the Fraxinus, and the Ornus; for, as we are in general to obſerve, that the honey-like Dews, ſaid to fall from the Heavens on Trees, and eſpecially on frumentaceous Plants, have no Exiſtence in Nature, becauſe they are found concreted not ſo much on the ſuperior, as on the inferior Parts of the Leaves, and are only got on certain Species of Vegetables in the ſame Countries; ſo it muſt of courſe follow, that this roſcid, ſweetiſh, and ſomewhat pinguious Subſtance, which, after a Series of hot Weather, eſpecially about the Summer Solſtice, is, immediately after a ſmall Shower of Rain, found on frumentacous Plants, eſpecially on Wheat and Rye, is nothing but the nutritious Juice contained in the Tubes of the Plants, rendered ſweet, and maturated, by the Heat of the Sun. And a Rain happening, this Juice, being diſſolved in theſe Tubes, is carried to their Extremities, where it breaks out. Beſides, this Juice, and eſpecially that produced by Rye, is poſſeſſed of a laxative Quality, which diſcovers itſelf, if the Stalks, abounding with it, are chewed; in the ſame manner as the Juice of the tender Blades of Corn, expreſſed, or obtained by Infuſion with hot Water, proves an excellent Purgative. This Opinion is efficaciouſly confirmed by that ſweetiſh nutritious Juice, which, in the Beginning of the Spring, is obtained from an Inciſion made in the Bark of a Birch-tree; for this Juice, if inſpiſſated by means of a gentle Evaporation, is concreted like Honey, and is, alſo, poſſeſſed of a laxative Quality.

It is, therefore, certain, that Manna is the nutritious Juice of Trees, of the Fraxinus and Ornus, for Inſtance, in *Calabria*, *Apulia*, and *Sicily*; rendered ſweet, and maturated, by the intenſe Heat of the Sun in theſe warm Climates. Then, by the nocturnal Dew, which frequently falls in theſe Countries, and which eaſily penetrates into theſe Trees, the Juice is melted, and protruded to the Stamina of the Leaves; or it is diſcharged from an Inciſion made in the Trunk, and, at laſt, inſpiſſated by the Heat of the Sun. This Opinion is confirmed by the Experience and Obſervation of Mr. *Ray*, who, when travelling in *Italy*, found that the Manna was produced by the Tree called *Fraxinus*, even when covered in ſuch a manner, that the Dew could have no Acceſs to it. The ſame Author affirms, that others have wrapt up ſome Branches of theſe Trees in Linen Cloths; or, cutting them off, have lodged them, in the Night-time, in Cheſts, notwithſtanding which Precautions, the Manna was found concreted on them.

Manna is therefore a nutritious Juice, ſpontaneouſly dropping, or artificially obtained, from the Leaves or Barks of Trees. As this Juice is yielded in different Countries, ſo there are various Species of Manna. Thus there is a liquid Manna, which, by ſome, is thought to be the Mel Cedrinum of *Hippocrates*. Of this Species *Linſchotus* informs us there is a large Quantity produced about Mount *Sinai*. According to *Rauwolfius*, in his *Itinerarium*, there is another Species of Manna produced in *Perſia* from a thorny Shrub, by the *Arabians* called *Algul* and *Alhagi*. This Species is of the Shape of Coriander-ſeeds, and as large as common Grains. There is, alſo, a Species of Manna brought from *Syria*, which was principally known to the Antients; who diſtinguiſhed it into the *Manna Maſtichina*, which was the beſt; and the *Manna Bombycina*, which was leſs valuable. Of this Species *Matthiolus*, in *Lib.* 1. *Dioſcorid.* gives us a full Deſcription. There is, alſo, a Species of Manna brought from *Calabria*, in Pieces as large as one's Fiſt, and of a browniſh Colour. But Manna is moſt copiouſly produced in *Sicily*, *Apulia*, and *Calabria*; from which laſt Country it is called *Calabrian Manna*. Since, therefore, this *Calabrian* Manna is moſt generally uſed in the Shops, omitting the other Species, we ſhall confine ourſelves to the Conſideration of this.

But that we may, with the greater Accuracy, execute this Deſign, we ſhall, from Mr. *Charas*, who, in his *Pharmac. Reg.* has collected the Opinions of *Ray*, and ſome others, give the Method of obtaining and gathering the *Calabrian* Manna. This Author, then, affirms, that Manna is a Juice flowing from the common Aſh, called *Fraxinus*, or the wild Aſh, called *Ornus*, when the Sun enters the Sign *Cancer*: That this Juice is every Year collected in hot and dry Weather, about or a little before, the Dog-days, and the *Auguſt* Rains, becauſe, when rainy Weather begins, it ceaſes to flow: That there are three Kinds of this *Calabrian* Manna, one by the *Italians* called *Manna di Corpo*, which is the moſt elegant of all the others, is either ſpontaneouſly diſcharged from the Trunk, and larger Branches of the Tree, in form of a cryſtalline Liquor, and becomes concreted into Grains, ſome larger, and ſome ſmaller, which are, the ſucceeding Day, carefully gathered, leſt they ſhould be again melted by the Rains, or the Fogs; or that about the Riſing of the Sun the Bark of the Tree is divided with a Knife, the diſcharged Liquor received in Veſſels, put upon Paper, and expoſed to the Sun, in order to be dried: That the ſecond Species, by them called *Forcata*, which is obtained by Art, is, by the ſame Trees, after they ceaſe to drop ſpontaneouſly, yielded in the Month of *Auguſt*, from Inciſions made in the Bark to the Wood. That, from theſe Inciſions, the Manna flows copiouſly from Noon till Ten o'Clock at Night, and is next Day expoſed to the Sun in order to be dried; but that this Species is leſs eſteemed, on account of its Impurity and yellow Colour: That the third Species is called *Manna di Frondi*, and is ſpontaneouſly, by way of Sweat, diſcharged from the Leaves of the Trees, on which the Drops are indurated; but, that this laſt Species is not very carefully collected, becauſe it is not, without the greateſt Difficulty, to be ſeparated from the Leaves.

Tho' *Hippocrates* ſeems to have been unacquainted with Manna, yet it was a Medicine known to many of the antient Phyſicians and Naturaliſts; for we have already obſerved, that *Pliny* and *Galen* make mention of its Origin. And *Matthiolus*, *Lib.* 3. *Cap.* 9. *de Plantarum Hiſtoria*, informs us, that long before the Days of theſe Authors, *Theophraſtus* had made mention of it. But, becauſe none of theſe mention the Uſe and purgative Quality of Manna, 'tis probable theſe were unknown to them, and that they were at laſt diſcovered by the *Arabians*; for, as the *Arabian* Phyſicians, ſuch as *Avicenna*, *Meſues*, *Serapion*, and *Averroes*, lived in a Country where large Quantities of Manna were produced, they not only every-where make mention of it, under the Names *Tereniabin*, *Siracoſt*, and *Mel de Cuſuram*, but were, alſo, the firſt who deſcribed its various Uſes, and ſurpriſing Virtues; aſſerting that it was ſymmetrical in its Temperament, with reſpect to Activity hot in the firſt Degree, and temperate with reſpect to Paſſiveneſs.

Theſe were, afterwards, followed by the *Italian* Phyſicians; eſpecially *Braſſavolus*, *Ruellius*, *Fernandus*, and others; who, with ſingular Succeſs, made uſe of Manna, in a Nation whoſe Inhabitants, in conſequence of their tender and delicate nervous Syſtems, cannot bear highly acrid and draſtic Medicines. But in

Germany, and the adjacent temperate Climates, the Uſe of Manna was later introduced; for Phyſicians were of Opinion, that ſo mild and gentle a Medicine would prove but ineffectual, when exhibited to a Set of Men of Habits ſo vigorous and robuſt as the *Germans*. But this Perſuaſion has from Experience been found to be entirely falſe and grounleſs.

Having thus traced the Origin and moſt antient Uſe of Manna, we now come to examine by what Elements or Principles it operates, and what Effects it principally produces. Upon a ſtrict Inquiry we, therefore, find, that in Manna there is a certain ſubtile and volatile Acrimony, which is ſoon diſſipated and exhal'd; in conſequence of which it not only loſes its Virtue by Length of Time, and is diveſted of a great Part of its Efficacy by long boiling, but, alſo, becomes nauſeous and ungrateful to the Taſte. Now ſince it is certain, that frequent Stools are produced by the increaſed and accelerated periſtaltic Motion of the Inteſtines, and that this increaſed Motion is principally excited by thoſe Things, whoſe penetrating and ſubtile Acrimony intimately inſinuates itſelf into the ſlender nervous Fibres of the inteſtinal Coats, which it ſtimulates to quicker and ſtronger ſyſtaltic Contractions; ſo 'tis ſufficiently obvious, that it is by means of this acrid, ſubtile, volatile, and ſalino-ſulphureous Principle, that Manna proves purgative.

But as that Acrimony, by means of which Purgatives operate, is of various Kinds, not only according to their more or leſs cauſtic, fixed, or volatile Natures, but, alſo, according as they are more or leſs united and mixed with ſulphureous, mucilaginous, earthy, or bitter Particles; ſo they produce various Effects, both in evacuating and changing the State of the Fluids. Hence it is, that one Purgative is better, ſafer, and more efficacious, than another. Now, if we conſider that mucilaginous, temperate, ſweet, earthly, and oleous Subſtance, which commodiouſly ſheaths up the acrid and ſtimulating Principle in Manna, we may readily conclude, that the mild and gentle purgative Quality of this Medicine is, in a great meaſure, derived from the former; for 'tis certain, that all mucilaginous and earthy Subſtances are highly efficacious, not only in moiſtening and ſoftening hard Parts, but, alſo, by their mucilaginous Contexture, in covering and correcting ſaline, acid, bilious, and other acrid volatile Particles; and thus, by removing what retarded the Evacuation of the Fæces, they facilitate and promote the ſame; ſo that it is not to be doubted, but that this mucilaginous Subſtance of Manna, by correcting the acrid and noxious Quality of the Humours, and paving a Way for their free Diſcharge, excellently contributes to the Purpoſes of Evacuation.

Now that the ſweetiſh and mucilaginous Juices of Vegetables are poſſeſſed of an highly correcting, emollient, and laxative Quality, is not only obvious, from what has been ſaid concerning the expreſſed Juice of the tender Leaves of growing Corn, and that diſcharged from the Birch-tree; but, alſo, from Inſtances of other Juices, eſpecially when mixed with Sugar. Remarkable Inſtances of this are found in the Juices of Peas, red Chiches, ſweet Apples, whether recent or putrid; as, alſo, in the Syrup of putrid Apples, the Juice of Prunes, of Apricots, of Peach-flowers, of the *Egyptian* Thorn, and of Roſes; the Syrups prepared from all theſe; the Robs of Raiſins, Currants, and Elder; the Juices of Liquorice, Polypody of the Oak, and Buckthorn; Honey; the Pulps of Caſſia and Tamarinds, Damask Prunes, and other Vegetables full of a ſweetiſh Juice.

Since, therefore, Manna is not only purgative, but, alſo, poſſeſſed of a correcting and temperating Quality, it is juſtly to be accounted a Medicine of all others the moſt mild, ſafe, and friendly to Nature; for though, eſpecially when exhibited in large Doſes, it powerfully purges the Primæ Viæ from all Sordes and, in ſome Patients, procures, perhaps, twenty Stools, when three or more Ounces of it are taken; yet ſo wonderful and ſalutary are its Virtues, that it expeditiouſly produces its Effects without bringing on violent Pain, Loſs of Strength, Ebullition of the Blood, an Augmentation of the Thirſt and Pulſe, or a preternatural Heat. We may, therefore, in general, affirm of Manna, that its Uſe is more extenſive, and its Nature better accommodated to moſt Perſons, than that of any other lenitive or purgative Medicine, ſo that it is poſſeſſed of ſome peculiar Virtues, which are not to be found in other Purgatives.

Such is the Nature of Manna, that it expeditiouſly diſcharges from the Body all kinds of Humours, whether ſerous, bilious, or acid; it corrects and ſheaths up the Acrimony of the bilious Humours; and, which generally happens with other Purgatives, it is neither entangled, nor its Force impaired, by acid Humours, but, by correcting and ſubduing them, rather facilitates their Evacuation by the Anus. Beſides, the Uſe of Manna is ſuited and adapted to all thoſe, who, in conſequence either of their Weakneſs, or the Delicacy of their nervous Syſtems, cannot bear acrid Medicines, though, at the ſame time, their Primæ Viæ are to be freed from the Sordes lodged in them. This Medicine is calculated for Perſons of all Ages, Sexes, Conſtitutions, and Countries. For which Reaſon, *Zacutus Luſitanus*, in *Medic. Princ. Inſt. Lib.* 6. *Hiſt.* 8. gives a compendious, but juſt Account of the Virtues of Manna, in the following Words: "Manna may be exhibited to Perſons of all Conſti-
"tutions; for it purges the whole Body from excrementitious
"Humours, and eſpecially from Bile. It cleanſes the Breaſt, is
"of a lenitive Nature, and, together with the thin, expels the
"viſcid Humours from the Thorax, without doing any Injury
"to the Head, or nervous Syſtem. It ſtrengthens the Viſcera,
"corroborates the Stomach, purifies the Blood, exhilarates the
"Heart, renders the Breathing free, allays Thirſt, and excites
"the Appetite: In a Word, every Part of the Body receives
"ſingular Benefit and Advantage from it."

It is found from Experience, that Manna is, in a principal manner, beneficial to Children; for it often happens, that the Milk, ſtagnating in the Stomach, is coagulated, and, fermenting with the Bile, aſſumes, not only an acrimonious, but even a corroſive Quality; in which State, being conveyed to the highly ſenſible nervous Coats of the Inteſtines, it excites intolerable Gripes, accompanied with Reſtleſſneſs, Convulſions, and Epilepſies, which frequently prove mortal. In this Caſe the principal Intention of the Phyſician ought to be to correct the ſuperfluous and corroding Acrimony, and to eliminate the corrupted Humours. But, in order to obtain this End, acrid Purgatives and Evacuants are by no means proper; ſince, tho' they purge efficaciouſly, they are nevertheleſs rather hurtful than beneficial; becauſe, in conſequence of the highly tender and nervous Texture of the Stomach and Inteſtines, they ſhock the whole nervous Syſtem, and induce Symptoms of a more formidable Nature than thoſe they were deſigned to remove. In Caſes of this Nature, the moſt efficacious Medicine of all others is Manna, which, on account of its mild Nature, induces no violent Symptom; but, correcting the Acrimony of the peccant Humours, quickly eliminates them, to the great Relief of the Patient. For anſwering this Intention, the Syrup of Manna is of ſingular Service, either by itſelf, in Conjunction with Rhubarb, or in the Form of Mixtures and Potions, which may be variouſly prepared according to the various Ingredients added to them. But from Experience I can recommend the following Mixture, as efficacious in an uncommon Degree:

Take of the Waters of the Flowers of the *Egyptian* Thorn, of black Cherries, and of Lime-flowers, each an Ounce; of Crabs-eyes, one Dram; of the Extract of Rhubarb, twelve Grains; of the Syrup of Manna, half an Ounce; and of the aniſated Spirit of Sal Ammoniac, ten Drops: Make into a Mixture, of which the Doſe is from one to two Spoonfuls.

For the ſame Reaſon Manna is highly beneficial to old Perſons; for ſince in Old-age, according to the Maxim of *Celſus*, every thing taken into the Stomach becomes aceſcent, and eſpecially ſince, by reaſon of a Defect of the Secretions, a great Impurity of the Humours is contracted, it is for this Reaſon of ſingular Service to free the Primæ Viæ from the Sordes lodged in them. But if an Evacuation of theſe by Stool ſhould be attempted by means of ſtrong and draſtic Medicines, the Patients would ſuſtain a great and ſcarcely reparable Injury, ſince ſuch is the peculiar and pernicious Quality of theſe draſtic Purgatives, that they ſurpriſingly impair the Strength, ſo that an Exhibition of them to old Perſons of weak nervous Syſtems, would make them fall undoubted Victims to that which was intended for their Relief. On the contrary, Manna is of a mild Nature, and excellently calculated for evacuating any acid Sordes, which may be lodged in the Body; for which Reaſon nothing is more proper and efficacious for rendering the Bodies of old Perſons ſoluble.

Beſides, pregnant Women are juſtly to be claſſed among the Number of thoſe who are to be treated with highly gentle Evacuants; for it is very common for Women in this Condition, in conſequence of a Plethora, to fall into a Cacochymy. All Care is, therefore, to be taken, that the impure Juices ſhould be expelled from the Body; and this End is principally obtained by an Elimination of the peccant Humours from the Primæ Viæ. But, for anſwering this Purpoſe, draſtic Purgatives are by no means proper; ſince, by inducing Contorſions in the Membranes of the Inteſtines, and other nervous Parts of the Body, and by exciting violent Spaſms, they ſtimulate the Uterus to an Excluſion of the Fœtus, and, alſo, deſtroy the due Tone of the Stomach. For Women, therefore, in this Condition, gentle Evacuants are far more proper; the beſt of which are the Pilulæ Balſamicæ, Preparations of Rhubarb and Raiſins, and, in a particular manner, Manna, eſpecially with an Addition of ſuch things as corroborate the Stomach, and whole nervous Syſtem. This we are told by *Zacutus Luſitanus*, in *Hiſt. Medic. Princip. Lib.* 2. in the following Words: "Manna, ſays he, may be ſafely exhibited
"to pregnant Women, when either Advantage, or abſolute Ne-
"ceſſity, calls for it."

If we inquire to what particular Diſeaſes the Uſe of Manna is principally appropriated, we may eaſily perceive, that it is highly beneficial in thoſe Diſorders which are ſupported by a Colluvies of acid and bilious Juices, accompanied with a great Acrimony of the Humours; as, alſo, in Caſes where the nervous Parts are ſpaſmodically conſtricted, or agitated by preternatural Commotions. For this Reaſon, ſince in Coughs, Co-

tyzas, rheumatic, gouty, arthritic, and ſcorbutic Diſorders, there is a conſiderable Acrimony and Impurity of the Humours, Manna muſt in theſe be an highly efficacious Medicine; becauſe, by the Uſe of it, the acrid Humours lodged in the Primæ Viæ are corrected, and, together with a large Quantity of the Serum, eliminated, which might otherwiſe induce a freſh Train of Misfortunes. But Manna is poſſeſſed of a peculiar and uncommon Efficacy, in curing long-protracted Chin-coughs, ſince theſe can hardly be removed without the Uſe of this Medicine. Hence *Proſper Alpinus*, in his Treatiſe *de Medic. Method. Lib.* 9. *Cap.* 12. in a Cough, adviſes the Body to be rendered ſoluble by means of Manna; for this Medicine, by its ſweet and mucilaginous Nature, not only ſheaths up and blunts the acrid Particles which produced the Stimulus internally, but, alſo, ſoftens and ſooths the Parts which are worn, and become rough and dry, by the Cough. Beſides, the acrid Sordes is, by this Medicine, advantageouſly eliminated by Stool, and ſometimes by Vomit.

Beſides, in order either to remove, prevent, or mitigate Catarrhs, Coughs, and Pains of the Joints, nothing is ſo efficacious, as, in the Beginning of theſe Diſorders, to take Manna in Milk, Water-gruel, or Tea; and afterwards to drink Aſſes or Goats Milk, either with, or without the *Selteran* Waters, for ſome Mornings ſucceſſively: By which means the Acrimony lodged within is totally ſubdued and deſtroyed.

Manna is, beſides, an excellent Medicine in Fevers of all Kinds; for, ſince the Fomes of intermittent Fevers is generally lodged in the Primæ Viæ, and eſpecially in the Duodenum, where large Quantities of acid, bilious, and ill-concocted Humours are collected, nothing is, certainly, of greater Uſe, than expeditiouſly to eliminate theſe, and free the Body from them, which is commodiouſly and efficaciouſly done by means of Manna. But that the Operation of this Medicine may be the more effectual, and the better ſuited to the Nature of theſe Diſorders, it is to be mixed with a due Quantity of Bitters, ſuch as the Decoctions of Wormwood, and the leſſer Centaury, as, alſo, with detergent Salts; or, if Neceſſity requires it, with ſome emetic Stimulus; and exhibited on the Days of Remiſſion; by which means every thing, which favours the Production of febrile Diſorders, is remov'd: In like manner, if in burning and bilious Fevers, or in Tertian Fevers, of the bilious and double kind, the Primæ Viæ are to be cleans'd, Manna is an efficacious Laxative, and excellently ſuited to the Intention of the Phyſician, ſince in theſe Diſorders the Quality of the Bile is peccant, and ſince a Flux ſometimes ſpontaneouſly comes on, and happily terminates the Diſorders. But, in bilious Fevers, the moſt commodious Method of exhibiting Manna, is to prepare it into a laxative Julap, in Conjunction with Tamarinds.

But the ſingular Efficacy of Manna is moſt conſpicuous in ſpaſmodic, hypochondriac, and melancholic Diſorders, in which the Patient is not only coſtive, in conſequence of the want of due Moiſture, and the Redundance of acid Juices in the Primæ Viæ, but, alſo, by means of the ſpaſmodic Strictures of the inteſtinal Coats, the Fæces are totally retain'd for ſome Days. Now we are certain from Experience, that it is an infallible Sign of the Obſtinacy of theſe Diſorders, when the Patient remains coſtive, and does not diſcharge his Fæces, unleſs by means of a Clyſter, or the Exhibition of a Laxative. Beſides, if, in conſequence of the Spaſms with which theſe Diſorders are generally accompanied, the periſtaltic Motion of the Inteſtines is conſiderably injur'd; if neither the Chyle can paſs thro' the ſmall Inteſtines, nor the Fæces into the Cavities of the large Inteſtines, nor the Flatulences be diſcharg'd, but the Sordes remain in the Body, aſſume a worſe Quality, and become more acrid by their Stay there, and the Flatulences are repreſs'd, principally to the ſuperior Parts, where they inflate the Stomach, it happens, that by this preternatural Diſtenſion, the Eighth Pair of Nerves, being affected, in conſequence of the Conſent of Parts, ſeverely affects all the nervous Parts of the Body, eſpecially thoſe of the Head and Breaſt, by which means the State of the Patient is render'd worſe.

When this happens to be the Caſe, the principal Intention of Cure is to reſtore the diſorderly periſtaltic Motion to its natural State, and to render the Body ſoluble, that by this means the Sordes and Flatulences may be freely diſcharg'd. But this requires Judgment and Skill, ſince 'tis hardly credible what fatal Errors are, in this reſpect, committed by the common Herd of Phyſicians; for Purgatives, and acrid ſtimulating Medicines, increaſe the Stricture, render the periſtaltic Motion of the Inteſtines more diſorderly, and impair the Strength; for which Reaſon they are rather injurious than beneficial. Tho' Preparations of Aloes are of a ſomewhat mild and gentle Quality, yet, by throwing the Blood into Commotions, they have a Tendency to produce the Hæmorrhoids; and, when the Blood is not diſcharg'd, they excite Pains, and increaſe the Symptoms. Tho' Sena, and the Preparations of it, are neither acrid, nor excite an Effervеſcence of the Blood, yet they generate Flatulences; for which Reaſon they are carefully to be avoided in this flatulent Species of Diſorder. But, ſince Manna is of all other Laxatives the moſt mild and ſafe, 'tis therefore the moſt proper and commodious for rendering the Body ſoluble in hypochondriac Diſorders, ſince it ſooths, alleviates, and relaxes, the ſpaſmodically conſtricted Fibres of the Inteſtines; corrects the acrid Quality of the Humours, leſt they ſhould by their Vellication induce freſh Strictures; and, without impairing the Strength of the Inteſtines, eliminates the Fæces. But we muſt obſerve, that, in Diſorders of this kind, its Conjunction with neutral Salts, as alſo with Rhubarb, is highly beneficial and friendly to Nature, ſince, by an Addition of theſe, its Efficacy is not only greatly increas'd, but the Generation of Flatulences prevented.

As Manna is of ſingular Uſe in that ſpaſmodico-flatulent Diſorder, commonly diſtinguiſh'd by the Epithet hypochondriac, ſo 'tis no leſs conſiderably efficacious in other Diſeaſes, where the Parts contained in the Cavity of the Abdomen are afflicted with Spaſms. Of this we have a remarkable and ſatisfactory Proof in the ſpaſmodic Colic, which racks the Patient with intolerable Pain, and is generally accompanied with an obſtinate Conſtipation; for tho' 'tis cuſtomary, in order to allay the intenſe Pain, to inject large Numbers of Clyſters, with no ſmall Fatigue to the Inteſtines, yet ſuch is often the Violence of the Diſorder, that the Patient receives no Degree of Relief from them. For this Reaſon 'tis certain both from Reaſon and Experience, that, in ſuch a Caſe the beſt and moſt efficacious Medicine is that which, as it were, anoints or covers over the whole internal Coats of the Inteſtines, that by this means the Stricture may be relax'd, and the Collection of acrid Humours, an additional Source of Diſorders, convey'd to the inferior Parts, and eliminated by Stool. Since, therefore, Manna is poſſeſs'd of Qualities ſuited to both theſe Intentions, 'tis ſufficiently obvious, that its Uſe muſt be highly beneficial in colic Pains, eſpecially if, according to the Advice of *Lazarus Riverius*, in his *Prax. Tom.* 1. *Lib.* 5. *Cap.* 1. it is exhibited with Oil of ſweet Almonds, and fat Broth prepared with Fowls.

Among thoſe Diſorders which affect the Kidneys, Bladder, and urinary Paſſages, and which excite uncommon Pains, we may juſtly reckon the Stone, a Suppreſſion, and Heat of Urine, the moſt conſiderable. With reſpect to theſe Diſorders, practical Phyſicians lay it down as a Maxim, that they call for the Uſe of ſuch Medicines, as evacuate by the inferior Parts, that by this means the recrementitious Sordes, which foment and heighten the Diſorder, may be evacuated by Stool; ſince in theſe Caſes the Patient is generally coſtive. But *Fuchſius* in his Treatiſe *de Medend. Morb. Lib.* 1. *Cap.* 38. juſtly obſerves, that by the uſe of draſtic Medicines the urinary Paſſages are irritated and contracted; for which Reaſon we are to uſe ſuch things as gently evacuate the peccant Matter, and operate without exagitating the nervous Parts already too much diſorder'd. Since therefore, 'tis obvious, from what has been already ſaid, that Manna is of all others the moſt ſafe and gentle Laxative, it muſt of courſe follow, that in theſe Diſorders it is of ſingular Service, and excellently calculated for rendering the Body ſoluble.

Nor is Manna only to be commended as a valuable Evacuant in Diſorders of the Bladder, and urinary Paſſages, but it is alſo poſſeſſed of a peculiar Quality, whereby it exquiſitely ſooths and allays the Contorſion and Stricture of theſe Parts, eſpecially when mixed with Oil of ſweet Almonds, before it is exhibited; for tho' this Medicine is not convey'd immediately to the Parts affected, but exerts its Efficacy firſt in the Cavity of the Inteſtines, yet by reaſon of the ſurpriſing Conſent between the Parts of the Abdomen, eſpecially the large Inteſtines, and the urinary Paſſages, its medicinal Virtues are convey'd from the former to the latter. Hence, if the Fibres of the Inteſtines are ſurpriſingly contorted and conſtricted, they are by a proper Doſe of Manna ſooth'd and relax'd; and this ſalutary Effect is convey'd to the Bladder and Urethra; by which means the Spaſms being remov'd, the Pain ceaſes, and a Stone, the Source of terrible Misfortunes, is often diſcharg'd thro' the relax'd and dilated Paſſages. A memorable Inſtance of this we have in *Sydenham*, recorded by himſelf in his Works, where he informs us, that by perſiſting for ſome time in the Uſe of Manna and Whey, he was not only freed from an intenſe Pain about the Kidneys, but, alſo, from a Diſcharge of bloody Urine, ſo that he found himſelf proportionably better after each Doſe. His Method of preſcribing Manna we ſhall here mention: The Potion, then, us'd for the Gravel and Stone by this celebrated Phyſician, was prepared in the following manner.

Take of the beſt Manna, two Ounces; Cream of Tartar, half a Dram; and of the nephritic Decoction of *Foreſtus*, four Ounces: Mix up for a Potion.

He alſo preſcribes a Potion, as highly beneficial in a Diſcharge of bloody Urine, which conſiſts of two Ounces and an half of Manna, diſſolv'd in two Pints of Whey, with the Addition of a ſufficient Quantity of Lemon or Orange juice.

'Tis alſo to be obſerv'd, that Manna is in ſome degree poſſeſs'd of a diuretic Quality, which it palpably exerts in a Difficulty and Suppreſſion of Urine. But, paſſing over other authentic Inſtances of this, we ſhall ſatisfy ourſelves with the memo-

rable

rable one of a Man of ſeventy Years of Age, who, after a Diſcharge of bloody Urine, was for ſeven Days afflicted with a Suppreſſion of Urine, accompanied with an intenſe Pain about the Region of the Pubes, and a total Retention of the Fæces. Tho' a Catheter was introduced, in order to procure a Diſcharge of the Urine, yet not a ſingle Drop was evacuated by that means. But at laſt I preſcrib'd a Decoction of Manna, which produced ſo happy Effects, that, without any violent Symptoms, ſeveral Stools, and the Diſcharge of ſome Pints of Urine, were procured.

Since, therefore, we aſcribe the Cauſe of this Suppreſſion of Urine to grumous Concretions of Blood lodg'd in the oblique Ducts of the Ureters about their Inſertions into theBladder; ſo 'tis not to be doubted, but, if, in conſequence of a Compreſſion of the Kidneys by Flatulences, or an Obſtruction of the urinary Ducts by tartareous and mucilaginous Sordes, the Urine ſhould be ſuppreſs'd, Manna is in like manner an efficacious Medicine, ſince it not only evacuates the Fæces, but, alſo, procures a Diſcharge of the urinous Serum; for 'tis highly probable, that the ſubtle, acid, ſulphureous, and volatile Principle, which, in Manna, ſtimulates the nervous Coats of the Inteſtines, does for the ſame Reaſon, in ſome meaſure, ſtimulate and ſolicit the urinary Ducts of the Kidneys to a Secretion and Expulſion of the Urine; ſo that Manna ſeems in this Caſe to be poſſeſs'd of the ſame Efficacy with the inſpiſſated Juice of the Birch-tree, a few Drams of which promote a liberal Diſcharge of Urine.

More Diſeaſes, to the Cure of which Manna contributes, might be enumerated; but at preſent 'tis ſufficient to have mention'd thoſe, in which its Efficacy is moſt conſpicuous; for from theſe the Uſe of Manna may be diſcovered in other Diſorders, eſpecially thoſe ariſing from ſpaſmodic Strictures of the internal Parts; ſuch as almoſt all the Species of Deliriums, Pains, and Convulſions: For from what has been ſaid 'tis obvious, that the continued and uninterrupted Uſe of Manna is of all other Meaſures the moſt efficacious, in Caſes where the Body is to be purged from any Sordes, and at the ſame time more draſtic Medicines cannot be ventured upon.

But, without inſiſting any longer on theſe Things, we ſhall only obſerve, that Manna is of ſingular Uſe in the Cure of thoſe Diſeaſes, for which medicinal Waters are to be us'd; for every body knows, that before the Uſe of Mineral Waters, whether of the cold or hot kind, the Body is to be previouſly prepared by a gentle Evacuant, that, by this means the Sordes being evacuated, theſe ſalutary Waters may, without any Obſtruction, waſh and paſs thro' the Primæ Viæ. But we are to take particular Care, that no Purgatives, containing any acrid Ingredient, be us'd for this Purpoſe; becauſe by injuring the periſtaltic Motion of the Inteſtines, and impairing the due Tone of the Stomach, they are ſo far from being beneficial, that they rather obſtruct and retard the free Paſſage of theſe Waters thro' the tubulous and villous Subſtance of the Inteſtines. In like manner, when the Cure is perfected, 'tis neceſſary, that the Remains of the Waters ſhould, by a pretty briſk Evacuation, be diſcharged from the Viſcera; for which Reaſon Phyſicians, who have the Charge of Perſons Healths, during their Uſe of Mineral Waters, generally preſcribe draſtic Purgatives, of Scammony, Gamboge, Extract of Coloquintida, and Reſin of Jalap, for the moſt part in the Form of Pills; which never fail to prove deleterious, and impair the Strength of the Patients: But the Diſadvantages accruing to the Patients from ſuch a Practice are hardly credible; for Perſons of delicate Conſtitutions, and whoſe Stomachs, and nervous Syſtems, are ſubject to ſpaſmodic Conſtrictions, are, by this means, afflicted with Cardialgias, Loſs of Strength, and violent Gripes; whilſt others are by the ſame means affected with ſuch violent Symptoms, as to induce Deliquiums, and a total Privation of Strength; ſo that they frequently return from theſe ſalutary Waters in a far worſe and dangerous Condition, than they came to them.

I myſelf, after having twenty times frequented the *Caroline* Springs, have often obſerved the ſalutary Effects of theſe Waters fruſtrated, and Health conſiderably impair'd, by the prepoſterous Uſe of draſtic Purgatives; ſo that, inquiring into the Reaſon of this Misfortune, I began to form a Deſign of ſafely evacuating the Remains of the Waters from the Viſcera, by means of Medicines more mild, gentle, and friendly to Nature; and, as I conceived Manna to be excellently ſuited to this Intention, I exhibited three or four Ounces of it diſſolv'd in ſome proper Water, ſometimes with an Addition of two Drams of Cream of Tartar: This Medicine produc'd the deſign'd Effect; for, after procuring ſometimes ten or more Stools, I found, by its means, a large Quantity of Water was eliminated without creating any Pain to the Patient; for which Reaſon, I did not heſitate to follow the ſame Method, both before and after the Uſe of theſe ſalutary Waters; and, having totally rejected the more violent and draſtic Purgatives, eſpecially for ſixteen Years paſt, I have in this manner treated thoſe who committed the Charge of their Health to me, ſo that in one Spring I have us'd twenty Pounds of Manna. Some of the more judicious Phyſicians afterwards followed the ſame Method with the like Succeſs.

Having now conſidered the Virtues of Manna, and the various Caſes in which it is ſingularly beneficial, we ſhall next conſider the moſt commodious and judicious Method of exhibiting it. Firſt of all, then, it is abſolutely requiſite, that we ſpecify and determine its due Doſe; for ſome condemn this excellent Medicine as productive of Flatulences, and for that Reaſon endeavour to diſcard its Uſe. But, if we inquire accurately into this, we ſhall find, that it is rather owing to the Averſion theſe Perſons have to ſweet Subſtances, or the leſs agreeable Method of preſcribing it, than to any faulty Quality really inherent in the Medicine itſelf; for it is cuſtomary with theſe Phyſicians, only to preſcribe half an Ounce, or, at moſt, an Ounce, of Manna. 'Tis not, therefore, to be wondered at, if, by this means, the peccant Matter being put into a Commotion, but not eliminated, the viſcid Sordes ſhould generate Flatulences, eſpecially in Patients already afflicted with them; of which kind, are principally thoſe who labour under hypochondriac and hyſteric Diſorders. That theſe Misfortunes may, therefore, be prevented, we lay it down as a Maxim, that, to Infants and Children, from two Drams to half an Ounce of Manna may be exhibited; and, to Adults, from two to three or four Ounces may be preſcribed, according to their greater or ſmaller Degrees of Strength and Vigour of Body. When exhibited in this Quantity, it will not readily excite Flatulences and Gripes, but prove effectually purgative, and ſometimes, in Caſes where the Stomach is overloaded with Sordes, excite a gentle Vomiting.

The preciſe Manner in which this Medicine is to be exhibited, is, alſo, to be determin'd by the Phyſician, according to the particular Effect he intends ſhould be produced by it; for, as 'tis certain in general, that all Evacuants produce their Effects far more expeditiouſly and happily, if they are diſſolved before their Exhibition, ſo the ſame holds true with reſpect to Manna. But there are various Liquors, which, according to the different Inclinations of different Perſons, are made ſubſervient to the Diſſolution of Manna. Thus, for Inſtance, according to *Proſper Alpinus*, in his Treatiſe *de Med. Method. Lib.* 3. *Cap.* 9. it was cuſtomary, among the *Egyptians*, to uſe it diſſolved in the Water of the *Nile* purified, or in Broth prepared with Fowls. And, in our own Days, the Method of exhibiting Manna is highly ſimple, ſince it may be diſſolved either in Milk, Whey, or Water-gruel; or, inſtead of Sugar, it may be put into Coffee, Chocolate, or Tea, and by that means gratefully convey'd to the Stomach. But if a Medicine is to be artificially prepared of Manna, the diſtil'd Waters of Flowers and Herbs are generally uſed; thoſe, for Inſtance, obtain'd from the Flowers of the *Egyptian* Thorn, Meadow-ſweet, and Elder; as, alſo, from black Cherries, and Paul's Betony. But as theſe fragrant and ſweet-ſmelling Waters are not equally grateful to all Patients, the moſt commodious Vehicles for Manna are pure Spring and Rain-water diſtil'd; or a proper Quantity of Mineral Waters of the cold kind; ſuch as thoſe of the *Spaw*, *Wildungen*, and the *Antonian* Waters: Or *May* Dew may be, alſo, uſed for this Purpoſe. But I generally order laxative Decoctions of Manna to be prepared, by taking an Ounce and an half of Water, to each Ounce of Manna. But, in order to diſſolve the Manna, it muſt be very gently boil'd, leſt, by a violent or too long-protracted Boiling, its ſubtile, volatile, and ſtimulating Principle ſhould be diſſipated in the Air.

But that ſuch a Decoction of Manna may, at once, more effectually anſwer the Intention, and prove more grateful to the Palate, 'tis expedient to add ſome Things which concur to promote the ſame End. Salts are, in a peculiar manner, conducive to this Purpoſe, ſuch as Cream of Tartar, the Arcanum Duplicatum, the Terra foliata Tartari, *Epſom*, and *Sedlitz* Salts; which, as they not only incide, reſolve, and abſterge the viſcid Sordes, but are, alſo, poſſeſſed of a certain ſtimulating Quality, ſo they greatly aſſiſt and heighten the Efficacy of the Manna. With ſuch a Potion a Dram or two of theſe Salts may be mix'd, and, leſt they ſhould be with Difficulty diſſolv'd, they may be melted ſeparately before the Manna is boiled. Then, in order at once to render the Preparation grateful to the Palate, and ſomewhat corroborative, after the Boiling is over, we may to the ſtrain'd Liquor add twenty Drops of the Eſſence of Orange-peel, or two Drops of ſome fragrant or aromatic diſtil'd Oil, ſuch as Oil of Cedar. This medicinal Potion is not to be drank all at once, but at different times, drinking immediately after a few Draughts of Water-gruel.

Beſides, according to the various Intentions of Phyſicians, and different Conditions of Patients, other things may be mix'd with Manna, of which there may be, alſo, other Formulas of Medicines prepared. For, beſides what we have ſaid, when enumerating the Diſeaſes in which Manna is beneficial, it is, alſo, to be obſerved, that this Subſtance is commodiouſly exhibited in burning and bilious Fevers, with Syrup of Lemon-juice, Rob of Tamarinds, Barley-water, Ptiſan, or Goats Whey. Beſides, in order to kill and diſlodge Worms, a Preparation of Manna, with Mercurius dulcis, and Rhubarb, is highly efficacious: This Subſtance is, alſo, with happy Effects, exhibited in the ſuffocative Aſthmas and Chin-coughs of Children, with Sperma Ceti, Oil of ſweet Almonds, and a little Saffron, uſing Water-gruel as a Vehicle for the Whole. Beſides, if the Symptoms of the Patient indicate the

Propriety

Propriety of evacuating the acrid, bilious, and viſcid Sordes, both by Stool and Vomit, to two Ounces of a Decoction of Manna, a few Grains of previouſly diſſolved emetic Tartar, are to be added; and this Preparation is to be taken at different times, drinking immediately after, a liberal Draught of thin Water-gruel. By this means a Vomiting is firſt excited, and ſoon after, a large Number of Stools is procured. This Method of proceeding is principally to be recommended in the Beginning of Fevers, both of the intermittent and acute Kind, when we are pretty certain, that a large Quantity of Sordes is lodg'd in the Primæ Viæ. I have frequently known this emetico-laxative Medicine, with great Succeſs, exhibited in the Beginnings of exanthematous and petechial Fevers, the purple Fever, the Small-pox, and Meaſles, eſpecially when raging in Camps; as, alſo, in the Beginning of that Species of Fever, which is endemial to the *Hungarians*.

Since among the other Diſorders in which Preparations of Manna are beneficial, we have aſſerted their Efficacy, about the Beginning and Eruption of the Small-pox, we ſhall now inquire, whether they may be, with equal Propriety and Safety, exhibited about the Maturation of the purulent Matter. Every one knows what terrible Dangers the Phyſician has to dread in the Small-pox, eſpecially thoſe of the confluent Kind, and what Prudence and Circumſpection are neceſſary in order to avert and prevent theſe Dangers; for, as in the Small-pox in general, ſo more eſpecially in thoſe of the confluent Kind, it generally happens, that about the ninth Day, in conſequence of a freſh Paroxyſm of the Fever, an Increaſe of the Inflammation, and the Violence of the Pain, all the Symptoms are heightened, and the Condition of the Patient rendered manifeſtly worſe. Then an uncommon Uneaſineſs is perceived about the Præcordia, the Patient breathes with Difficulty, his Reſtleſsneſs is increaſed, and his obſtinate Coſtiveneſs ſtill continues. All theſe Symptoms proceed from no other Cauſe, than the vellicating, acrid, and cauſtic Matter, either retained in the Blood, or returning to whence it came, when, being denied a Paſſage thro' the Skin, it is again thrown into violent Commotions, and creates ſo much Uneaſineſs to the Patient. 'Tis, therefore, ſufficiently obvious, that all the Hopes of the Patient's Recovery are juſtly to be placed in the due Excretion of this vellicating and acrid Matter.

In this Caſe, it may ſeem moſt expedient to follow the Tendency of Nature, and force the peccant Matter to the Surface of the Body, ſince this Method has hitherto been univerſally eſteem'd the moſt ſafe and rational of all others. But there are, ſometimes, very weighty Reaſons to forbid it; for ſince it often happens, that the peccant Matter of the Small pox, convey'd to the internal Parts, and eſpecially to the nervous Compages of the Inteſtines, is ſurpriſingly detain'd there by the Obſtruction of the Faeces, in conſequence of which, the Inflammation is increas'd frequently, 'tis ſufficiently obvious, that all bezoardic, alexpharmic, and other Medicines, which promote the Expulſion of this Matter to the Surface of the Body, are, at this time, ſo far from being proper, that they are rather hurtful and pernicious. And I cannot forbear looking upon it as a raſh and hazardous Attempt, to ſolicit the variolous Matter deeply lodg'd in the Inteſtines, to the Skin. A far more ſafe and commodious Method is to remove the Conſtipation, and by a gently ſtimulating Laxative, to evacuate the putrid Fæces, and impure Sordes, by Stool.

For anſwering this Intention, unleſs the Clyſters, prepared of the Ingredients appropriated to this Purpoſe, prove effectual, nothing is more proper than Manna, in conſequence of its mild Operation; and I muſt, in this Caſe, recommend it above all other Medicines. In aſſerting this, I do not rely on my own Experience alone, ſince I have many great and learned Phyſicians concurring with me; and among the reſt, the juſtly-celebrated *Sydenham* and *Freind*, who, in this Caſe, greatly extol lenitive Cathartics, and prefer Preparations of Manna to almoſt all other Medicines. *Freind*, in a particular manner, in his *Commentarii novem de Febribus*, highly extols Purgatives, and eſpecially Manna, in a putrid Fever, ſucceeding the confluent Small-pox; and ſufficiently confirms this Doctrine not only by his own Obſervations, but, alſo, thoſe of others, with reſpect to the happy Effects of Manna.

We now come to give an Account of ſome of the moſt ſalutary Preparations of Manna: The firſt which we ſhall mention, is that uſed by the Emperor of *Germany*, when he drank the *Caroline* Waters; and which is prepared in the following manner:

Take of Cream of Tartar, two Drams; diſſolve and boil in one Pint of Spring-water, to a Conſumption of the half; add three Ounces of the beſt Manna, clarify the Liquor with the Whites of Eggs; adding the whole Juice of a Citron: Then let them boil gently together. When the Liquor is cold, ſtrain it thro' a Linen Cloth, with Citron-peel in it, till it is highly clear and tranſparent. This Potion is, at once, highly efficacious, and ſingularly grateful to the Palate.

'Tis a laudable Cuſtom uſed by ſome, in the Beginning of the Spring, to purge their Bodies from the Sordes they have collected during the Inclemency of the Winter; and for this Purpoſe various Medicines are prepared and preſcribed. But I myſelf, for this Intention, warmly recommend the following Infuſion, of which ſix or eight Ounces are to be drank every other Day:

Take of the beſt Manna, four Ounces; of Currants, two Ounces; of the beſt Rhubarb, and crude Tartar, each an Ounce; of the Tops of the leſſer Centaury, four Pugils; of Cinnamon, and Cardamoms, each a Dram: Infuſe in a Pint and half of *Rhenish* Wine, and expoſe them to a due Degree of Heat for twenty-four Hours.

Beſides theſe, there are many other Medicines prepar'd in the Shops, of which Manna is either the Baſis, or an Ingredient; of theſe the moſt conſiderable are the Electuarium Diacaſſiæ with Manna, the Lenitive Electuary with Manna, and the Syrup of Manna; the Uſe of which may be more commodiouſly ſupplied by the following Medicine:

Take of the beſt Manna, one Pound; diſſolve and boil with a gentle Heat, in a Pint and an half of the Water of the Flowers of *Egyptian* Thorn: Infuſe in it, when warm, of the Flowers of the Peach-trees, *Egyptian* Thorn, and Violets, each an Handful; inſpiſſate the ſtrain'd Liquor over a gentle Fire, and, as it becomes cold, add twenty Drops of the Oil of Cedar.

Among the Pharmaceutic Preparations we may, alſo, reckon the liquid Manna, the Preparation of which is given by *Schroeder* in *Pharmac. Chym.* and amended by *Frederic Hoffman* in his *Clav. Schroed.* where he, alſo, gives Directions for preparing the Manna Julepata, and the Manna Tartariſata: But though theſe are, conſidered in themſelves, ſufficiently valuable Medicines, yet it eaſily happens, that they do not anſwer the Expectations of thoſe who uſe them, becauſe in preparing them the Manna is, by the violent Heat and Boiling, often deprived of its Virtues.

We now come, in the laſt Place, to treat of thoſe Medicines which are obtain'd from Manna by the Force and Influence of Fire. With reſpect to theſe, what *Helmont* ſays in his *Tractatu de Potestat. Medicam.* is abſolutely true; which is, that by a chymical Analyſis Subſtances of new Qualities, which had no previous Exiſtence, are produced from it, and that the Manna itſelf becomes acrid, by means of the Fire. I myſelf attempted the Diſtillation of Manna in a Sand Heat: For which Purpoſe putting about four Ounces of it in a Retort, previouſly warm'd with Sand, and increaſing the Fire a little, I firſt obtain'd an acid Liquor, and afterwards one of a dark-red Colour, of a thicker Conſiſtence, and an empyreumatic Smell. Of the former I had about an Ounce, and of the latter about a Dram and an half. As for this acid Liquor obtain'd from Manna, and commonly called its Spirit, 'tis univerſally agreed upon, that it is ſudorific; the Reaſon of which is, without Doubt, to be aſcribed to the empyreumatic Particles with which it is mix'd. This Liquor, alſo, proves a Menſtruum for the Diſſolution of ſome Bodies: In order to make the Experiment, I threw both Coral and Steel into ſome of this Liquor; and, after they were diſſolved, I was furniſhed with the Tinctures of Coral and Steel, poſſeſs'd of the ſame Virtues with thoſe prepared in the common manner by ſomewhat acid Menſtruums. On the contrary, in this Liquor, there did not happen a perfect Solution of Sulphur, as *Schroeder* in his *Pharmac.* and after him *Charas* in *Pharmac. Reg.* aſſert. But the thick, rediſh, oleous, and grumous Liquor had an highly empyreumatic Smell, exactly reſembling that of Sugar thrown on live Coals; and was capable of being mixed both with Water and Spirit of Wine, in each of which it was quickly diſſolved. Nor is it to be doubted but ten Drops of this Liquor are capable of exciting a liberal and profuſe Sweat.

From what has been ſaid 'tis ſufficiently obvious, that the Uſe of Manna has been hitherto unjuſtly rejected by Phyſicians, and that it juſtly recommends itſelf to the modern Practitioners; for I cannot forbear adviſing the Profeſſors of the Healing Art carefully to abſtain from all violent and draſtic Purgatives, ſince they are ſometimes productive of ſo formidable Conſequences, as are hardly to be dreaded from the moſt terrible Diſorder; for which Reaſon *Cassarius*, in his *Treatise de Criter. Medic.* juſtly calls them deleterious and curſed Medicines. Rejecting, therefore, Coloquintida, Scammony, White Hellebore, Tuppith, Elaterium, Spurge, and what was only diſcovered in the latter Age, Gamboge, let Phyſicians ſubſtitute, in their Room, far more ſafe and innocent Medicines, ſuch as neutral Salts, Manna, Rhubarb, Tamarinds, Caſſia, and Aloes duly corrected and prepared, eſpecially ſince, by ſufficiently large Doſes of theſe gentle Laxatives, the ſame Effects may be obtained, as by the more acrid, draſtic, and offenſive Purgatives. *F. Hoffman.*

Manna may be render'd of a vinous Quality, by diſſolving it in Water, in which a Fermentation may be produced in the following manner:

Diſſolve two Pounds of the beſt Manna, in eight Pints of pure River-water. Strain the Solution, and put about a third

third Part of it to be evaporated into an earthen Veſſel, placed in a Sand-heat. Pour the remaining Part of the Liquor into Bottles, which are to be cover'd with a Piece of ſingle Paper, and expoſed to the Influence of the Sun, and the Heat of the Fire, for ſix Months. By this means the Liquor will aſſume a vinous Quality, and this Wine of Manna will reſemble the vinous Hydromel; only it will be neither ſo ſtrong, nor ſo agreeable to the Taſte.

This Wine gently purges ſerous Humours, and the Doſe of it may be from three to ſix Ounces: If this Wine is ſubjected to Deſtillation in Balneo Mariæ, or in a Vapour-bath, we obtain from it a ſpirituous Liquor reſembling Aqua Vitæ; and by Rectification, in the ordinary manner, it yields an inflammable Spirit like Spirit of Wine, but which ſtill retains ſome Smell of the Manna. This Spirit is, alſo, poſſeſſed of the ſame Virtues with the Spirit of Wine.

If, after extracting this inflammable Spirit of Manna, we put the Liquor remaining in the Alembic, and ſuffer it to remain there for a conſiderable time, it will inſenſibly ferment a ſecond time, and become ſour. Then we find, at the Bottom of the Veſſel, a white eſſential Salt of Manna, which is hard, brittle, of the cryſtalline Kind, and formed into Needles reſembling thoſe of the eſſential Salts of Plants. This Salt is, alſo, of an acid and ſomewhat ſweetiſh Taſte; and a Dram of it taken in Broth proves purgative.

MANOBI. *Lemery* calls this a Fruit, but deſcribes it as a Truffle, which grows in *Braſil*, of a very good Taſte. It is ſaid to fortify the Stomach.

MANSORIUS *Muſculus*. The Maſſeter.

MANTICHORA, μαντίχωρα. The Name of an *Indian* Animal, which, according to *Ariſtotle*, is furniſhed with a triple Series of Teeth.

MANTILE. The Name of a Bandage. See FASCIA.

MANUCODIATA. The Bird of Paradiſe.

MANUS. The Hand. See BRACHIUM. Certain Troches made of Sugar of Roſes, with an Addition of Pearls, are called *Manus Chriſti perlatæ*; but without the Pearl *Manus Chriſti ſimplices*.

Manus Dei is a Name for a vulnerary, reſolvent, and fortifying Plaiſter, deſcribed in *Lemery's Pharmacopée Univerſelle*.

MANUTIGIUM. Rubbing with the Hand. *Cœlius Aurelianus, Acut. L.* 3. *C.* 17. and *Chronic. L.* 1. *C.* 4.

MANYL-RARA. H. M. The Name of a very tall Tree, which grows in the *Eaſt Indies*, bearing a Fruit not unlike an Olive, which is uſed, when ripe, in Food, and is much eſteem'd for exciting the Appetite, and promoting Digeſtion. Of the Leaves boiled with Turmeric-root, and the Leaves of Ginger, and contus'd, a Cataplaſm is made, which powerfully ripens Tumors. Of the Leaves boil'd in Oil of *Seſamum*, with an Addition of the Root of this Plant pulveriz'd, an Ointment is made, which is ſaid to be excellent in the endemial Diſtemper of that Country, called BERIBERI.

MANZIZANION. A Name for the *Colocaſia*. *Aetius. Tetrabib.* 1. *Serm.* 1.

MAON. A Name for the *Tagetes*; *Indicus*; *minor*; *multiplicato flore*.

MARACOT. A Name for the *Granadilla*; *Hiſpanis*; *Flos Paſſionis Italis*.

MARAGOSA. A Name for the *Momordica*; *Zeylanica*; *pampineâ fronde*; *fructu breviori*.

MARANDA *Zeylanenſibus*. *Myrtus Zeylanica odoratiſſima Baccis niveis monococcis*. *Herman.*

This is a Species of Myrtle, which grows in the Iſland of *Zeylon*, bearing a ſmall Berry. A Decoction of the Leaves is ſaid to be excellent againſt the Venereal Diſeaſe, if a ſlender Diet is, at the ſame time, obſerv'd.

MARASMODES, μαρασμώδης. The Name of a Hectic Fever, in its laſt and worſt Stage.

MARASMUS, μαρασμὸς, from μαραίνω, to render lean, or tabid. An Atrophy, or Conſumption, in its laſt and moſt deplorable Stage, is thus called.

MARATATABIBA. The Name of a Tree, which grows in *Braſil*, to which I find no medicinal Virtues aſcrib'd.

MARATHRITES, μαραθείτης. Wine impregnated with Fennel. *Dioſcorides. L.* 5. *C.* 75.

MARATHRUM. A Name for the *Fœniculum*; *vulgare*; *Germanicum*.

MARAUGIA. A Sort of Shell-fiſh, as it ſhould ſeem, of the Lobſter-kind, mentioned by *Oribaſius, Collect. Medic. L.* 2. *C.* 58.

MARCASITA, *Marcaſite*, is a ſort of metallic Mineral, making as it were, the Seed, or firſt Matter of Metals.

On this Principle, there ſhould be as many different Marcaſites as Metals, which is true in Effect, the Name being applied to every mineral Body that has metallic Particles in its Compoſition, though not enough to make it worth working; in which Caſe it would be called Ore.

There are only three Kinds in the Shops, which are, Marcaſite of Gold, of Silver, and of Copper; though ſome repute the Loadſtone, Marcaſite of Iron; Biſmuth, Marcaſite of Tin; and Zink, or Spelter, Marcaſite of Lead.

Marcaſites are found in Mines of Metals; they all contain Sulphur, and a vitriolic Salt, eſpecially that of Copper: Some of them, alſo, contain Antimony and Biſmuth.

MARCELLIUM, μαρκέλλιον. The Name of a Medicine ſaid to be good againſt Chilblains. *Paulus Ægineta, L.* 3. *C.* 79.

MARCELLUS EMPIRICUS. This Author was of *Bourdeaux*, and wrote, in the time of *Gratian* and *Theodoſius*, the Book now extant under his Name, *de Medicamentis*.

MARCHED. Litharge. *Rulandus*.

MARCHIONIS *Pulvis*. The Marquis's Powder. This is thus directed in the *Leyden Diſpenſatory*.

Take of Male Peony-roots, half an Ounce; of the Wood of Miſleto of the Oak, Raſpings of Ivory, Elks Hoof, Spodium, the Tooth of the Unicorn Fiſh, or, in its ſtead, the Anders of an Hart's Horn, red and white Coral, and prepar'd Pearls, each a Dram; twenty Leaves of pure Gold. Make a Powder. This is deſign'd for an Antiepileptic, and Abſorbent.

MARTIANI ANTIDOTUS. The Name of an Antidote deſcribed in *Marcellus Empiricus, C.* 177.

MARCIATON, μαρκιάτον. The Name of an Unguent in *Paulus Ægineta, L.* 7. *C.* 18.

1. MARGA. Offic. Schrod. 320. Mer. Pin. 218. Aldrov. Muſ. Metall. 221. MARLE.

This is not only of various Species, but, alſo, of different Colours, ſuch as reddiſh-brown, Grey, and Yellow. It is a ſort of pinguious and medullary Subſtance, found in ſome Stones and Rocks, when they are ſplit. It is of a drying, conſtricting, conſolidating, and ſarcotic Quality; but reſolves Tartar, and coagulated Blood. *Schrod. Kentman* enumerates various Species of Marles, ſuch as the white, the pinguious, the ſoft, the ſubcineritious, and the Stony Marle, uſed by Artiſts for making Images; the yellow, and the cruſtaceous Marle, which is found in ſandy Ground, and contains ſome Portion of Gold; and the hard, yellow, and ſandy Marle found in *Holland*, with which the Inhabitants, as in other Countries, dung the Land. *Dale*.

2. MARGA SAXATILIS CINEREA. Offic. Worm. 6. *Marga Goſelaria cineraria*. Agricol. 579. *Marga Goſlarica*. Charlt. Foſſ. 4. ASH COLOURED MARLE.

This Species of Marle is found in the Cavities and Fiſſures of Rocks, conſiſts of thick Cruſts, is of a cineritious Colour, and a ſomewhat acrid Taſte. It is of an aſtringent emplaſtic Quality, and ſtops Hæmorrhages; when externally applied, it agrees in Virtues with the *Samian* Earth. *Dale*.

3. MARGA SAXATILIS INCARNATA. Offic. Worm. 6. Charlt. Foſſ. 4. REDISH MARLE.

This Species is produced in the Mountains of *Bohemia* and *Liege*: It is a pinguious, lubricous, and ponderous Earth, of a carnation Colour, adhering to the Tongue, and tinging the Fingers with a yellowiſh Hue. This kind of Marle is not only beneficial in Ruptures, Fractures, Defluxions, Hæmorrhoids, and Dyſenteries; but, alſo, reſiſts Poiſons, and peſtilential Diſorders. *Dale*.

4. MARGA CANDIDA. Offic. *Marga Feroenſis*. Charlt. Foſſ. 4. *Marga ex inſulis Feroenſibus*, Worm. 6. *Stenomarga*. Agricol. 578. Morton. Northamp. 62. *Agaricus mineralis*. Imper. 129. Cod. Med. 5. *Lac Lunæ*. Woodw. Att. 8. Plot. Ox. 58. Boet. 413. WHITE STONE MARLE.

This is found in *Germany*, and is a fungous, white, and friable Subſtance. It is of an aſtringent, and refrigerating Quality; ſtops Hæmorrhages, and immoderate Diſcharges of the Menſes. The Powder of it is, by Surgeons, ſprinkled upon Ulcers, in order to dry and conſolidate them. *Geſner*. It is eſteemed a powerful Coſmetic. *Plot*. *Anſelmus Boetius*, when it is hard, refers it to the Lapis Galactites; but, if ſoft, he makes it a Species of Marle; for he is of Opinion, that the Morochthus, the Galactites, and the Lapis Melitites, are only indurated Marle. *Dale*.

MARGARITÆ & *Uniones*. Pearls.

Theſe are a kind of Bezoar, bred in Oyſters; and accordingly they conſiſt of ſeveral Strata, and are really ſtony Concretions. The beſt *Oriental* Pearls are found in the Iſland of *Ormus*, in the *Perſian* Gulf: They are likewiſe gathered in the Gulf of *Mexico*, in the Province of *Coſta Rica*, and in ſeveral other Places of *America*; but theſe *Occidental* Pearls are leſs eſteemed than the former. Small Pearls, commonly called Seed-pearls, are, likewiſe, found on the Coaſts of *Scotland*. Sometimes they are found from two to ſeven in one Oyſter; which ſhews how unjuſtly they are termed *Uniones*, as if there were only one in each Shell. *Valentini*, on the Credit of one *Kregger*, pretends, they are the Eggs of theſe Animals; but this needs Confirmation. When thrown into the Fire, they give an urinous Smell, in a ſmall Degree: They may ſometimes be whitened by taking off the outer Stratum, when yellowiſh; but this diminiſhes their Size. Pearls are a very good Abſorbent, being levigated on the Porphyry,

Porphyry, like Crabs-eyes; but they have, likewiſe, other Qualities, ſince they yield a volatile Salt by the Retort, being, on that account, cordial and depuratory. *Geoffroy.*

MARILE, μαιλη. In *Hippocrates*, *Lib.* 2. *de Morb. Mulier.* it ſeems to imply exactly what we call *Embers.*

MARIPENDAM. De Laet. *Balſamum fructu racemoſo ex Hiſpaniola.* C. B. *Novum Fructu racemoſo.* J. B. It ſometimes riſes to the Height of two Men, with an Aſh-coloured Stalk, and green Leaves, ſtanding on rediſh Pedicles; the Fruit grows in Cluſters. They gather the young Buds, and tender Shoots; to which ſome add the Cluſters of Fruit, and expreſs the Juice; this they boil in Water to one half, or leſs, till it is reduced to the Conſiſtence of Honey, or Sapa; then let it ſettle, and ſet it aſide for Uſe: It is an excellent Remedy for Wounds and Ulcers, cleanſing them, and repreſſing the Blood. From the Tops is diſtilled a Water more precious than Aqua Vitæ, being very ſerviceable in Wounds, and all Diſeaſes proceeding from Cold; as Pains of the Stomach, or any other Part, if it be drank for ſome Days together. *Raii Hiſt. Plant.*

MARIS, according to *Caſtellus*, and *Linden*, is a Meaſure containing eighty-three Pints, and four Ounces.

MARISCA. An Excreſcence about the Anus; the ſame as *Ficus.* See ANUS.

MARITUS. Authors who write about the Philoſophers Stone, call Sulphur the *Maritus*, or Husband, and Mercury the *Uxor*, or Wife.

MARMARYGÆ, μαρμαρυγαὶ, imports Sparks, or Coruſcations, which ſeem to flaſh before the Eyes.

MARMELADA. Marmelade. A Pharmaceutical Term, at preſent better known to the Confectioners than Apothecaries. It is uſually applied to a ſort of Jelly of Quinces.

MARMELOS. The ſame as MARMELADA.

MARMOR ALBUM. Offic. Worm. 42. *Marmor candidum.* Aldrov. Muſ. Metall. 749. Kentm. 52. *Marmor.* Schrod. 354. *Marmor Parium.* Boet. 489. Charlt. Foſſ. 17. WHITE MARBLE

It differs from Alabaſter only in Hardneſs, and in Splendor, when poliſhed. *Galen* tells us, that, taken internally, it diſſolves the Stone.

MARMORARIA, or MARMOLARIA. A Name for the Branca Urſina. *Blancard.*

MARMORATA *Aurium.* Ear-wax.

MARMOREUS *Tartarus.* The hardeſt Species of human Calculus. *Rulandus.*

MARMORACEA *Venena.* Poiſons of ſuch Efficacy and Virulence, that they produce Death, if taken only in a Quantity equal to a Grain of Wheat in Weight. *Caſtellus*, from *C. Rejes.*

MARMOTA. A Marmot, a ſort of large Mountain-Rat, very common in the *Alps.* See MUS ALPINUS.

MAROCOSTINUM. An Epithet for a cathartic Extract, deſcribed by *Zwelfer*, in the *Pharmacopeia Auguſtana.* It takes the Name from *Marum*, and *Coſtus*, two of the Ingredients.

Lemery, in his *Pharmacopeé Univerſelle*, deſcribes this under the Name of *Pilulæ Marocoſtinæ*; and gives another Preſcription for the *Pilulæ Marocoſtinæ Reformatæ.* *Bates* has taken the former into his *Pharmacopœia.* *Quincy* deſcribes the *Pilulæ Marocoſtinæ*; but ſomewhat different from *Zwelfer*; thus,

Take Gum Ammoniac, one Ounce and an half; Myrrh, ſix Drams; Aloes, one Pound; Agaric, ſix Drams; Rhubarb, three Ounces; Saffron, half an Ounce; Coſtus, ſix Drams; Aloes-wood, two Drams; Maſtich-herb, half an Ounce: Make a Decoction of the ſix laſt Ingredients, in two Pounds of Damask Roſe-juice, and a ſufficient Quantity of common Water; which preſs out hard, and put to it the Ammoniacum and Myrrh, ſtrained in four Ounces of Vinegar of Squills, and, with the Aloes, evaporate all together to a due Conſiſtence.

It is originally from *Mindererus*, and was calculated to purge off pituitous and watery Humours, which lodge in the Habit of the Body, and produce Dropſies, and other chronical Diſorders. It is, alſo, commended for expelling tartarous Humours, and cleanſing the Liver, and Kidneys. And it has obtained the Reputation of being a Strengthener of the Head and Stomach, and good againſt all Diſeaſes ariſing from the Diſorders of thoſe Parts. The Doſe is from fifteen Grains to two Scruples; but this Medicine is ſeldom made.

MAROGUS. A very ſtrong Narcotic. *Paracelſus.*

MAROTTI, H. M. is a tall Tree, growing in *Malabar*, with Leaves like thoſe of Bay, and bearing a round-oblong Fruit, including a very large, hard, and yellowiſh Stone, containing ten or eleven Kernels.

The Oil, extracted from the Seeds or Kernels of the Fruit, eaſes Pains, and cures the Scabies and Itchings, being rubbed on the Parts: It is good, alſo, for Eyes infeſted with ſalt Humours; and, mixed with Aſhes, it is ſucceſsfully applied to Impoſtumes and Abſceſſes in Cows, and other Cattle, and Beaſts of Burden. *Raii Hiſt. Plant.*

MARULLIUM, μαρυλλιον. The Lettuce. *N. Myrepſus*, *Sect.* 1. *Cap.* 74.

MARRUBIASTRUM.

The Characters are;

The little Flower-cup is cut into five ſmall Segments, upon each of which a ſmall Spine is produc'd; the Galea of the Flower is almoſt entire and plain; the Beard trifid, with a large entire Segment in the Middle, ſo as to make the Floſcule appear quadrifid. The Flowers are produced in thick Whorles.

Boerhaave mentions ſix Species of this Plant; which are,

1. Marrubiaſtrum; ſideritidis folio; caliculis aculeatis; flore candicante. *T.* 190. *Sideritidis genus, ſpinoſis verticillis.* J. B. 3. 428.

2. Marrubiaſtrum; ſideritidis folio; caliculis aculeatis; flore flavo cum limbo atro-purpureo. *T.* 190. *Sideritis, montana, parvo flore nigro-purpureo, capite medio croceo.* Col. 1. 196. *Sideritis montana, parvo, varioque flore.* C. B. P. 233.

3. Marrubiaſtrum; ſideritidis folio; caliculis aculeatis; flore flavo cum limbo atro-purpureo; comâ flaveſcente. *T. Cor.* 12.

4. Marrubiaſtrum; folio Cardiacæ. *Boec. Muſ. p.* 2. *Tab.* XCVIII.

5. Marrubiaſtrum; paluſtre; fœtidum. *T.* 190. *Lamium paludoſum, Belgicum, Meliſſæ folio.* H. L. *Sideritis, Alſines, hexaginis folio.* C. B. Prodr. 111. M. H. 3. 389.

6. Marrubiaſtrum; folio Cardiacæ; odore Meliſſæ. *Boerh. Ind. alt. Plant.*

MARRUBIUM.

The Characters are;

The Leaves are wrinkled; the Calyx is long, and generally furniſhed with five aculeated Appendicula; the Galea is erect, with two Horns; the Beard tripartite, with oblong ſlender Fauces.

Boerhaave mentions nine Species of this Plant; which are,

1. Marrubium; album; vulgare. *C. B. P.* 230. *Park. Theat.* 44. *Tourn. Inſt.* 192. *Boerh. Ind. alt.* 156. *Marrubium album, Praſſium.* Offic. *Marrubium album.* Ger. 561. Emac. 693. Raii Hiſt. 1. 556. Synop. 239. J. B. 316. WHITE HOREHOUND.

Horehound has ſquare, white, hoary Stalks, about a Foot high, having two Leaves at a Joint, which are rugged, white, and downy, roundiſh, and blunt-pointed, and ſerrated about the Edges, ſtanding on pretty broad Foot-ſtalks: Among theſe grow very thick Whorles, of white, labiated, and galeated Flowers, ſtanding in ſtiff hoary Calyces; which end in nine or ten hard, and almoſt prickly, Spinulæ; each Calyx contains four ſmall longiſh Seeds; the Root is woody, hard, and full of Fibres: It grows by the Sides of Roads, and in Lanes; and flowers in *June.* The Leaves and Tops are uſed.

They are hot and dry, pectoral, and good to free the Lungs from hot viſcid Phlegm, and thereby to help old Coughs, eſpecially in cold moiſt Conſtitutions; the Juice being made into a Syrup, with Sugar or Honey, they open Obſtructions of the Liver and Spleen, and are very ſerviceable againſt the Dropſy, Jaundice, Green-ſickneſs, and Obſtructions of the Catamenia, and Suppreſſion of the Lochia, and other Diſtempers of the Female Sex; for which few Herbs go beyond it.

Officinal Preparations are only the Syrupus de Praſſio. *Miller's Bot. Off.*

The Leaves of the white Horehound give no Tincture of Red to the blue Paper; they are very bitter, and have a penetrating Smell. It is probable, that in *Flanders* this Smell may approach to that of Musk; for *Dodonæus* affirms it does ſo. The bitter natural Salt of the Earth, compoſed of marine Salt, Sal Ammoniac, and Nitre, ſeem to be united in this Plant, with a conſiderable Quantity of Sulphur, Phlegm, and terreſtrial Parts.

This Plant, by the chymical Analyſis, yields a great deal of acid Phlegm, Oil, and Earth; a little urinous Spirit; ſome concreted, volatile, and a fixed Salt, a little lixivial.

Thus it is no Wonder, if the white Horehound ſhould be a great Diſſolver, and a good Aperitive; and excellent for thoſe who have the Aſthma or Jaundice. The Juice of this Plant is given to drink, from two Ounces to ſix, for Rheums and ſtubborn Coughs: One Glaſs-full of the Infuſion in White-wine, and ſeveral Glaſs-fulls of Ptiſan, two Pugils of the Tops of white Horehound, are ſufficient for one Decoction: But the Fat muſt firſt be taken off, by ſtraining it through a wet Cloth, and diſſolving it in half a Dram of chalybeated ſoluble Tartar; or twenty Grains of the chalybeated Flowers of Sal Ammoniac; one or two Ounces of the Syrup of Horehound; two Drams of the Tincture of Steel, and two Ounces of Orange-flower-water, may be preſcribed for the Suppreſſion of the Menſes. *Tabernæmontanus* recommends the following Ptiſan for a Retention of Urine:

Boil in four Quarts of Water, one Handful of Horehound-leaves, and as much Roſemary; half a Pugil of Parſley-ſeeds; one Ounce of dried Currants; and as much Sebeſtens and Jujubes; add, at laſt, one Stick of Liquorice, and three Spoonfuls of Honey. *Martin's Tournefort.*

The

The *Syrupus de Praſſio Meſuet* is a very hot Medicine, as *C. Hoffman* obſerves; and fitter for old than young Perſons, for cold than hot Conſtitutions.

Take of Syrupus de Praſſio, two Ounces; Oil of Tartar per Deliquium, one Scruple: Mix them.

The Doſe is one Spoonful, at frequent Intervals. There is no better Remedy than this for the Jaundice.

Dioſcorides ſays, that Marrubium is hurtful to the Bladder and Kidneys, which, by frequent Uſe, it exulcerates. The Antients uſed Marrubium as an Errhine in the Jaundice, to purge Bile by the Noſtrils, which often infeſts the Eyes in a very ſtubborn manner. The Tops of white Horehound, infuſed in White-wine, and drank for three Days together, I have found by innumerable Experiments, ſays *Borellus*, *Obſ. Med.* to be of ſurpriſing Efficacy in provoking the Menſes, [*Simon Paullus* adds, ſpeedily expelling the Secundines] corroborating the Stomach, and removing a Cachexy, and the Pica in Virgins; and the ſame is ſtill more effectual, if mixed with Germander, and the leſſer Centaury.

Conſerve of the Flowers of Horehound, prepared with Honey, and exhibited to the Quantity of an Ounce, for forty Days ſucceſſively, reſtored a Man of Diſtinction, who had long laboured under a Scirrhus of the Liver, to perfect Health, after other Medicines, ſuch as Chalybeates, and Preparations of Ebony, had proved unſucceſsful. *Simon Pauli, Quadripartit.* from *Zacutus Luſitanus, Prax. Admir. Lib.* 2. *Obſ.* 48. But I find in the Obſervations collected from *Cheſneau*, and ſent me by my learned Friend Dr. *Hulſe*, a Phyſician in *London*, that this Perſon drank every Morning after the Conſerve, a ſmall Quantity of the Water diſtilled from Horehound, and its Roots. *Raii Hiſt. Plant.*

MARS.

Ferrum. Offic. Aldrov. Muſ. Metall. 129. Fabr. 22. Charlt. Foſſ. 47. Worm. 122. Mer. Pin. 208. Schrod. 377. Schw. 378. *Ferrum. Mars.* Mont. Exot. 13. IRON.

Common Iron, called Σίδηρος in *Greek*, *Ferrum* in *Latin*, and *Mars* by the Chymiſts, is an ignoble, very hard, and ſonorous Metal; which, when poliſh'd, is of a ſhining Colour, between white and livid; but, when unpoliſhed, of a black Colour. Iron is of two Kinds, common and purified: This laſt is termed *Acies, Chalybs*, or *Steel.* No Metal is ſo neceſſary for the Uſes of Life as Iron; nor is any Metal found in ſo great Quantities, almoſt in every Country: It is dug out of the Earth in very different Forms. In ſome Mines it is found pure, either granulated, or in Lumps; in others it is met with in an heavy Stone, of a dark-yellow, or reddiſh Colour; or in an heavy, yellowiſh, or red Sand. Some Ores yield the pure Metal contained in them with little Trouble, requiring only to be broken into ſmall Pieces, and ſo to be melted with Charcoal, in the Space of a few Hours: Other Ores require a great deal of Labour to melt them; and, alſo, the Addition of Quick-lime, Marle, or Stones, to facilitate the Fuſion. The melted Metal is run into large Molds, and hardens into long thick Maſſes: Theſe Maſſes are melted a ſecond time; the flowing Metal being continually ſtirred with an Iron Rod; and, when harden'd, it is beat with great Hammers, till all the heterogeneous, vitrified, or burnt Parts are ſeparated. Iron, thus prepared, may be forged into any Shape, by being firſt ignited, and then beat on the Anvil with Hammers. All Iron is not, however, of the ſame Goodneſs; the toughеſt is the beſt, and that which is moſt brittle of the leaſt Value. This Difference does not proceed from the Metal itſelf, but from the Mixture of earthy and vitriolic Parts.

Steel is made of Iron by frequent Fuſion and Purification; and in the Iron of ſome Mines, this Converſion is eaſily obtain'd; in others, more difficultly; and, accordingly, the Ways of performing it are different. If the Iron be very good, it is melted in Furnaces; and to the melted Metal are added, gradually, equal Parts of Salt of Tartar, or any other alcaline Salt, Filings of Lead, and Shavings of Bullocks Horns, the Metal being kept continually ſtirred. Afterwards the harden'd Maſs is beat into ſmall Bars on an Anvil. But, if the Iron cannot be thus melted, they take Bars of about an Inch Diameter, or leſs, and lay them *Stratum ſuper Stratum* in a proper Earthen Veſſel, with a Mixture of equal Parts of Soot, Charcoal-duſt, and Filings of Bullocks or Cows Horns, or Hairs. When the Veſſel is full, it is cover'd and coated with a proper Lute, and ſet in a reverberatory Furnace. The Fire is gradually increaſed, till the Veſſel is red-hot, and continues ſo for ſeven or eight Hours: Then, the Fire being ſuffered to go out of itſelf, the Iron Rods are taken out, changed into Steel: This is known by breaking them; for if the ſhining metalline Sparks are very ſmall, and very cloſe together, through the whole Thickneſs of the Bar, the Steel is very good; but if they are at greater Diſtances from each other, and have viſible Pores between them, the Steel is of leſs Value. Sometimes theſe Sparks are very cloſe together near the Surface of the Bar, but more diſtant towards the Center; which is a Sign that the Calcination was imperfectly made; and then the Calcination is to be repeated till the Change be thoroughly completed.

Iron is the hardeſt of all Metals, and Steel is ſtill harder, and more rigid, than Iron, if, being ignited, it be thrown into cold Water. Its ſpecific Gravity is to that of Gold nearly as three to ſeven. Iron, long ſteeped in Water, communicates to it a ferrugineous Taſte, being diſſolved by the Water, and turned to a yellowiſh Ruſt. This Solution may be performed in a little time, if the Iron be ſucceſſively wetted with Water, and then dried, for ſeveral times; but, if ſuffered to remain in the Water without ever being dried, it is a long time before it is corroded. This makes it ſo difficult to preſerve Iron from Ruſt; for which the beſt way is to rub it over with ſome oily Subſtance. Filings of Iron, laid in a Heap, and ſprinkled with Water, will grow ſo hot as to ſet Fire to Sulphur, if the Heap be large. By calcining Iron in a reverberatory Furnace, it is reduced to a Calx of a dark-red or purpliſh Colour. When ignited in a ſtrong Fire, till it be near melting, and then beat by the Hammer, it throws off Scales, which are nothing but half-vitrified Iron. When it is melted in the refining Furnaces, a Part of it, mixed with the Charcoal, or other earthy Parts, runs into Scoriæ, which are a kind of Glaſs. This Metal is diſſolved by all Acids; but left untouched by alcaline Salts. Filings of Iron, thrown upon any Flame, take Fire, and emit green or red Sparks. Theſe Filings, mixed with an equal Portion of Nitre, preſently make an Ebullition, and emit copious Fumes of a fetid Smell, then flaſh, and deflagrate. If the Filings are put into Spirit of Sea-ſalt, or of Vitriol, a violent Effervеſcence and Fumes are raiſed. The Fumes are entirely ſulphureous; and, if a lighted Candle be held to them, they flame immediately, fulminating, and often breaking the Veſſels. Iron, expoſed to the Focus of a Burning-glaſs on a Tile, preſently melts, emits Fumes, and then becomes a brittle half-vitrified Subſtance: But, if laid on a Piece of Charcoal in the ſame Focus, it preſently melts as before, and then flies wholly off in Sparks. If the half-vitrified Subſtance, juſt mentioned, be expoſed on a Piece of Charcoal, it preſently recovers the Form of a Metal, that is, the ſhining Colour and Ductility, and afterwards is wholly diſſipated in Sparks. From theſe Experiments it is evident, that Iron conſiſts of a large Proportion of a bituminous Subſtance, which, being united with a vitriolic Salt, is involved in ſo large a Quantity of vitrifiable Earth, as difficultly to deflagrate with Nitre. That the vitriolic Salt is, likewiſe, in a conſiderable Quantity, is evident from the Solubility of Iron in ſimple Water, which ariſes from the Action of theſe Salts on the metallic Earth. There is, however, ſome Difference between the Sulphur contained in Charcoal, and that contained in Iron; ſince Iron, reſtored by the Mixture of Charcoal-ſulphur, and expoſed to the Rays of the Sun in the Focus of a Burning-glaſs, flies off entirely in Sparks. Iron, therefore, conſiſts of a bituminous inflammable Principle, a vitriolic Salt, and a vitriolic vitrifiable Earth. This Earth, united with any inflammable Subſtance by Fire, will become Iron, which accordingly happens in burning any inflammable Bodies, in the Aſhes of which Iron diſcovers itſelf to the Magnet, though before no Signs of Iron are diſcoverable in theſe Subſtances, even when reduced to the fineſt Powder.

Iron is the moſt uſeful of all Metals for human Life; for, beſides the innumerable Kinds of Inſtruments made of it, it furniſhes excellent Remedies in many Diſeaſes. The medicinal Virtues of Iron, taken inwardly, were not unknown to the Antients. *Dioſcorides* attributes to it an aſtringent Virtue, and recommends it in uterine Hæmorrhages. He, likewiſe, orders Wine, or Water, in which a red-hot Iron has been quenched, in the Cœliac Paſſion, Lientery, and Dyſentery, and for reſtoring weak Stomachs. Phyſicians now acknowledge a twofold Virtue in Iron, one

one aperient, the other aſtringent; for it is obſerved to cure a Suppreſſion of the Menſes, to open Obſtructions of the Liver, Spleen, and other Viſcera, to ſtop Hæmorrhages and Diarrhœas, and to ſtrengthen the relaxed Fibres of the Inteſtines. On theſe Accounts it is reckoned the grand Specific in hypochondriacal Affections, and all kinds of Chloroſes. Some attribute an aperient Virtue to ſome Preparations of Iron, and an aſtringent Virtue to others; but the Truth is, all theſe Preparations are both aſtringent and aperient, though not in the ſame Degree.

For medicinal Uſes, Iron is preferable to Steel; and the Filings of Iron, reduced to an Alcohol, or impalpable Powder, are preferred, by many, to all other Preparations, in promoting the Flux of the Menſes, and in removing Obſtructions of the Viſcera, being given from twelve Grains to half a Dram, once or twice in a Day, in Pills, Lozenges, or Boluſes.

Take of Filings of Iron finely powdered, and paſſed through the Sierce, half an Ounce; of powdered Cinnamon, half a Dram; of the Mucilage of Gum Tragacanth, a ſufficient Quantity to make Pills. The Doſe of theſe Pills is a Scruple, to be taken in the Morning, on an empty Stomach, and repeated four Hours after Dinner, drinking afterwards a Glaſs of Wine and Water.

Take of finely powdered Filings of Iron, an Ounce; of Cinnamon, one Dram; of Cloves, one Scruple; of white Sugar, diſſolved in any pleaſant Simple-water, and then boiled to the Conſiſtence of a ſolid Electuary, four Ounces: Mix them together, and make Lozenges, the Doſe of which is two Drams, Morning and Evening.

Take of the fine Filings of Iron, two Drams; of the Powder of dried Arum-roots, three Drams; Cryſtals of Tartar, two Drams; Gum Ammoniac, Myrrh, Cinnamon, and Nutmeg, of each a Dram; Powder of Saffron, half a Dram; Syrup of Wormwood, a ſufficient Quantity to make an Opiate, or ſoft Electuary. The Doſe is two Drams, to be taken Morning and Evening in a Chloroſis.

Filings of Iron, tied up in a Linen Bag, are, likewiſe, preſcribed to be infuſed in aperient Apozems, and alterative Broths. *Geoffroy.*

Sydenham tells us, "he has been informed, that the crude "Ore of Iron is more efficacious in curing Diſeaſes, than Iron "which has been refined by Fuſion; but, for the Truth of this, "ſays he, I had only the Author's Word, not being aſſured of ""it by my own Experience."

Some Years ago, at a Place in *Cheſhire*, I ſaw ſome Labourers taking out of a Ship ſomething which tinged their Skins in ſuch a manner, as to make them reſemble a bronzed Statue, only the Colour was more inclined to red. I found it was a particular ſort of Iron Ore, of the Conſiſtence of a fat Bole, which the Manufacturers of Iron call *Cumberland Ore*, though, I am informed, it is produced in *Lancaſhire*. Upon Enquiry, I was told, that if theſe Labourers waſhed themſelves ever ſo clean, and afterwards uſed any Exerciſe to make them ſweat, they immediately became of the ſame Colour. This Circumſtance made me conclude, that this Sort of Ore conſiſted of extremely fine Particles. I was farther aſſured, that theſe Labourers, whoſe conſtant Employment it was to unload Veſſels of this Ore, were very healthful, and never affected with Aſthmas, Gripings, or any of thoſe Diſorders which ſome metallic Ores are ſubject to communicate. Reflecting, therefore, upon what *Sydenham* relates, as quoted above, I procured ſome of the Ore, and, upon Experience, I found it equal in Efficacy to moſt of the celebrated Preparations of Iron; though I cannot ſay much ſuperior. I muſt, however, remark, that it readily unites with Mercury by Trituration, as in making Æthiops Mineral, in proportion of two Parts Mercury to three of the Ore; and thus a beautiful red Martial Cinnabar is found of conſiderable medicinal Virtue.

Preparations of Iron.

Dr. Willis's *Preparation of* Steel.

Take clean Filings of Iron, and Cream of Tartar in fine Powder, of each a like Quantity: Mix them well, and make them into a Paſte, with White-wine; then ſet them to dry in the Sun, or other gentle Heat: Break it, and, if it has not acquired a greeniſh Colour, powder it, moiſten, and dry it, as before.

This Preparation is as opening as any which are made of this Mineral, and is conveniently enough adminiſtered in Boles or Electuaries; for theſe Preparations render Pills ſo bulky, as to make a Doſe tireſome. It, alſo, yields its Virtues very readily in Tincture, with Wine, or any other Liquor. Its Doſe is from ten to thirty Grains.

Mars cum Saccharo præparatus.

A Preparation of Iron *with* Sugar.

Take Filings of Steel, three Ounces; and brown Sugar-candy, two Ounces: Let them be rubbed together in a dry Mortar, to a fine Powder.

This will certainly require great Labour before the Steel will be fine, though the Sugar will help to break it, and is of much the ſame Effect with it, as the Salt of Tartar; but may make it more pleaſant in ſome Forms. It is ſaid to be thus made in our Hoſpitals.

Crocus Martis aperiens. *Opening Saffron of Iron.*

Let thin Plates or Filings of Iron be expoſed to the Air in dewy Nights, and Rain, until they become very ruſty; then clear off the Ruſt, and do as before, until the Whole is ſo changed: Let all be rubbed in a Mortar, and paſſed thro' a fine Sieve.

This is the moſt proper aperient Preparation of all that are in Uſe; becauſe the Acids, which are in moſt others made uſe of to diſſolve the Iron, render it rather aſtringent, eſpecially in the Primæ Viæ; and what the College order under this Title, with Sulphur, is rather aſtringent than aperient.

Mars cum Tartaro rpæparatus.

Iron prepared with Tartar.

Take equal Quantities of Filings of Iron, and of common white Tartar; put them in a Crucible, and ſet it on a Fire ſtrong enough to make the Materials red-hot, in which Condition let them continue ſome time: afterwards remove it, and, when they are cool, powder them in a Mortar; and what will not paſs a fine Sieve, heat ſo again, and again powder; and this repeat until all goes through: Mix the ſeveral Siftings, and keep them in a Veſſel, cloſe ſtopt from the Air.

This is, indeed, more aperient than the former Preparations; but that Quality it receives from the Tartar. The laſt Burnings and Siftings will be more difficult to perform than the firſt, becauſe moſt of the Tartar goes off then. It muſt be kept from the Air, elſe it will run like the lixivious Salts, on account of the Tartar which is amongſt it; and, for this Reaſon, it is not fit to be preſcribed in any dry Forms, as Powders. There are other Ways of preparing this with Tartar; but that here deliver'd ſeems moſt ſuited to anſwer the Intention of an Opener.

Mars cum Sulphure præparatus.

Iron prepared with Sulphur.

Take equal Quantities of the Filings of Steel, and Flowers of Sulphur: Mix them together, and make them into a Paſte with Water, which leave to ferment for four or five Hours; after which, put it into a Crucible, over a good Fire, and ſtir the Matter with an Iron Spatula. It will flame, and, when the Sulphur is burnt, it will appear black; but, by raiſing and continuing the Heat, it will change to a red Colour, which ſhews when it is enough.

That which the College have lately given under this Title, is little elſe than Sulphur, it being only common Brimſtone, melted in an hot Iron.

This is called, alſo, an *aperient Saffron of Mars*; but the Salts it receives from the Sulphur make it more fixed, and leſs opening, than the former; and, indeed, there is not much Difference between this and the *Crocus Martis aſtringens.*

Extractum Martis aperiens. *Opening Extract of Iron.*

Take eight Ounces of the Ruſt of Iron; put it into an Iron Pot, and pour upon it three Pounds of the Water of Honey, and four Pounds of Muſt, or the Juice of white Grapes perfectly ripe; add to it four Ounces of the Juice of Lemons: Cover it with an Iron Cover, and ſet it in a Furnace, over a little Fire; leave the Matter in Digeſtion three Days; then boil it gently three or four Hours, uncovering the Pot every now-and-then, to ſtir up the Bottom with an Iron Slice; then cover it again, that the Moiſture may not evaporate too faſt. When you perceive the Liquor to be black, you muſt take away the Fire, and leave it a while to ſettle: Paſs warm through a Cloth that which is clear, and evaporate the Liquor in a Sand-fire, in an Earthen Pan, or Glaſs Veſſel, to the Conſiſtence of an Extract.

This may very conveniently be contrived to make other proper Ingredients into Pills, or may by itſelf be made in that Form,

and taken from ten Grains to half a Dram, in any Obſtructions, or where the opening Preparations of Steel are required.

Extractum Martis astringens.

The aſtringent Extract of Iron.

Take eight Ounces of the Ruſt of Iron powdered very fine; put it into an Iron Pot, and put upon it four Pints of a ſtrong red Wine: Set the Pot over the Fire, and, having covered it, make the Matter boil; ſtir it, from time to time, with an Iron Slice, till two thirds of it be conſumed; paſs the Liquor warm through a Cloth, and evaporate it to the Conſiſtence of an Extract.

This, alſo, may be given, as the foregoing, and in the ſame Quantity, in languid Habits, and where the Blood wants Warmth, and Invigoration; as, alſo, in Hæmorrhages, and all kinds of Fluxes.

A Vitriol of Iron.

Drop pure Oil of Vitriol into eight times its Quantity of fair Water, contained in an urinal Glaſs, and ſhake them well together, ſo as to make one pure Liquor; throw in a ſmall Proportion of clean and bright Filings of Iron; a great Ebullition will ariſe, and the Liquor become opaque, hot, and of a duſty Colour; and a perfectly foſſil Vapour, of a particular Odour, will ariſe, ſomewhat reſembling that of Garlick. When the Effervescence is over, and the former Iron diſſolved, throw in more, and continue thus till a Part of the Filings remain undiſſolved at the Bottom; then let the Liquor reſt to purify, and depoſite its Fœces: What floats above, then, will be green, and of a ſweetiſh ſtyptic Taſte.

Let this Liquor be filtred, and in a clean Glaſs evaporated to a Pellicule; ſet the Veſſel in a cold, low, ſtill Place, and there will ſoon ſhoot to the Bottom, bright tranſparent green Cryſtals like Emeralds. Let the Liquor be poured off from them; dry them gently, in a warm Air, upon Paper, and keep them in a Glaſs where they will long preſerve their Form. The remaining Liquor, being inſpiſſated as before, produces new Cryſtals; and thus at length almoſt the whole Liquor is converted into Vitriol; tho' the firſt Cryſtals are always the beſt.

REMARKS.

Iron attracts to itſelf the foſſil Acid of Oil of Vitriol diluted in Water, exactly as an Alcaline Salt does in the Preparation of Tartarus Vitriolatus; in which reſpect, therefore, Iron and Alcaline Salts agree. The Iron, thus united with the Acid, alſo becomes ſoluble in Water; and hence the Compound acquires the Nature of a metallic Salt. It conſiſts of Water, Metal, and Acid, united together in a certain Proportion; and ſo long as this Proportion remains, ſo long the Maſs continues ſhining and tranſparent; but as ſoon as only the Water is ſeparated from it by any conſiderable Heat, the whole Maſs preſently becomes opaque, loſes its Greenneſs, and acquires a grey Colour; in this reſpect, alſo, reſembling the Cryſtals of Salt; whence the Chymiſts have called it the Salt of Iron; as alſo becauſe it flows in the Fire: Others rather call it the Magiſtery of Iron, becauſe the whole Body of the Iron is concreted with its Solvent into an uniform ſolid Maſs. It is, alſo, called Vitriol of Iron, becauſe it perfectly, in every reſpect, reſembles native foſſil Vitriol. And hence we underſtand the Method, whereby the ſolid Bodies of Metals, upon uniting with Acids, may become like Salts, diſſolvable in Water, and potable, and thus acquire a new metallic ſaline Taſte, and alſo particular medicinal Virtues. If the Salt of Iron be diluted with an hundred times its Quantity of Water, and drank in the Doſe of twelve Ounces, upon an empty Stomach, walking gently after it, it opens and relaxes the Body, purges, proves diuretic, kills and expels Worms, tinges the Excrements black, or forms them into a Matter like Clay, ſtrengthens the Fibres, and thus cures many different Diſtempers. The like Taſte, Odour, and Colour, and the like Blackneſs of the Excrements, have occaſioned many to imagine, that the chalybeate Waters were thus produced by Nature; eſpecially becauſe thoſe Liquors, when expoſed to the Air, depoſite a copious yellow Sediment, or Oakre: But Dr. *Hoffman* has prudently corrected this Error, by means of Experiments, in his noble Work of Mineral Waters. However, we muſt obſerve, that this Salt of Iron, meeting with alcaleſcent and putrid Matters, and thus having its acid Solvent drank up thereby, is turned into an aſtringent, ponderous, ſluggiſh, metallic Calx, which occaſions inveterate Obſtructions, and therefore proves hurtful in putrid Fevers. And we know, that when Iron Filings are taken in Female Diſorders, where the Body is weak, languid, and abounds with Acidity, the Metal thus produces Eructations, as of Garlick and putrid Eggs, on account of the Acid it meets with; and hence the Heat, before wanting in the Body, is excited, and the Excrements generally turn black; and in this Caſe the Powder of Iron Filings proves much more ſerviceable, than when ever ſo laborioufly prepared by Chymiſtry. Whence Iron is known to prove uſeful, if Acids abound in the Body, but hurtful where the Body is bilious or hot. This Experiment, duly conſidered, ſhews us the Origin of green metalline Vitriol every where in the Earth; and that it proceeds from Iron corroded by a foſſil vitriolic Acid. Laſtly the Production of Inks principally depends upon this Experiment.

Ludovicus's Vitriol of Iron with Tartar.

Take one Part of the Vitriol of Iron, not acid, but perfectly ſaturated, four Parts of Cream of Tartar, and twenty Parts of Rain-water; boil them together in a Glaſs Veſſel, often ſtirring them with a Stick, till the Maſs becomes grey, thick, and almoſt conſiſtent; but with Care to avoid even the leaſt Burning. Put the Maſs into a tall Bolt-head; pour common Spirit of Wine thereon, ſo as to float four Inches above it; boil them together for an Hour or two, and a red Liquor will be obtained; when cold, decant, and filtre it: Treat the Remainder with freſh Spirit as before, and continue to do this ſo long as the Spirit acquires any Redneſs; then put the ſeveral Parcels together, which thus make *Ludovicus's* medicated Tincture of Iron.

If the Tincture thus prepared be evaporated to a Pellicule, it loſes its Spirit, and afterwards ſhoots along with the Salt into medicated Cryſtals. And if what remains after boiling with the Spirit, be ſtrongly boiled with ten times its Quantity of Water, and ſtrained through Flannel, till the Liquor becomes clear, and all the Matter be diſſolved by the frequent Addition of freſh Water, and this Liquor be at length exhaled to a Pellicule, and ſet in a cool quiet Place, we ſhall thus again have the opening martial Tartar of *Ludovicus*.

REMARKS.

Phyſicians, having obſerv'd that the excellent medicinal Virtues of Iron, ſomewhat explain'd in the preceding Proceſs, had their Effect ſo long as the Iron continu'd diſſolv'd in a mild Acid, but vaniſh'd, and were precipitated into an unctuous Calx, upon meeting with an Alcali, hence prudently joined the Salt of Iron with a vegetable Acid, in Expectation that it might thus paſs and act upon all the Veſſels of the Body, while it more permanently retain'd a ſaline Nature; and this was the Reaſon of joining the Salt of Iron with the vegetable oily Salt of Tartar, to prevent its being eaſily precipitated in the Body into a Croms, or aſtringent Calx. The Preparation has the Virtue of opening, attenuating, ſtrengthening, and gently evacuating by the Belly and Kidneys; and hence proves curative in leucophlegmatic, ſcorbutic, icteric, hypochondriacal, and hyſterical Caſes, or when the Body is relaxed, weak thro' the Sluggiſhneſs of the Parts, rickety, or abounding with Worms.

It is taken in a Morning faſting, in the Quantity of a Dram, diluted with ſix times its Weight of Water, repeating it thrice, and each time drinking after it a Quarter of a Pint of thin Whey, walking gently upon it, ſo as not to ſweat; this may be continued for nine Days with great Advantage. A few Drops of it may be given to Children troubled with the Rickets, or Worms, and thence become of a bad Habit, mixed with Syrup, or Honey. A Dram of the chalybeated Tartar, taken in the Morning, anſwers the ſame Purpoſes. And hence we ſee the Method of converting Metals into Medicines, and Forms fit for taking; but they are afterwards prudently to be employ'd: Theſe are found to have very good Effects, if they prove gently purgative, and bring away the Fæces of a black, or grey Colour.

The College Diſpenſatory, after the Example of *Riverius*, directs the Salt of Iron to be made in a manner ſomewhat different; that is, with four Ounces of Spirit of Wine, and two Ounces of Oil of Vitriol, kept together in an Iron Pot, till they ſhoot into Cryſtals.

There are ſeveral other ways to make this, all which agree as to the main Efficacy of the Medicine; for every way that impregnates a Liquor with Acid and Iron ſufficiently will enable it to ſhoot into green Cryſtals.

The Doſe recommended by *Boerhaave* of the Salt of Vitriol is very large. *Geoffroy* ſays, it is given from two Grains to a Scruple, in a proper Vehicle: If exhibited in too large a Doſe, it excites Vomiting.

The White, Grey, and Red Calx of the Vitriol of Iron.

1. Take half an Ounce of dry and good Vitriol of Iron, reduced to a Powder in a Glaſs Mortar; apply it in a glaz'd Diſh to a Heat of a hundred and fifty Degrees, keeping it continually ſtirring with a Stick; a little watery Vapour will

fly

fly off, and leave a light, white Powder, like Meal, of an inky, ſweet, ſtyptic Taſte; this is the white Calx of the Vitriol of Iron. 2. If this Calx be urged with a ſtronger Fire of near three hundred Degrees, it will become of a greyer Colour, and of a more auſtere Taſte. 3. If this ſecond Calx be calcined in a Crucible, in an open Fire, it grows yellow, red, and at length becomes a deep-purple Powder, of an auſtere Taſte, and ſomewhat cauſtic; which two Properties are the more increaſed, the ſtronger the Fire, and the longer the Calcination; ſo that at length the Powder will become almoſt cauſtic.

REMARKS.

Hence we ſee, that Vitriols, or metallic Salts, preſently loſe their Tranſparency, upon loſing their Water, and fall, as it were, into Aſhes; whence this Operation is called Calcination, and the thing produced a Calx. And when urged with a ſtronger Fire, they no longer remain ſoluble in Water, as conſtantly appears in the third Calx. The firſt is recommended in Medicine, becauſe it retains its native Virtue, may be eaſily mixed with Sugar, and thus commodiouſly given to Children. It is uſually imagined, that the ſuperabundant Acid may be driven away by this Calcination; but Oil of Vitriol does not riſe with ſo ſmall a Heat. The ſecond Calx has the like Virtues, but is ſomewhat more aſtringent, and leſs ſoluble in Water; but the third is not ſoluble in the Body, yet endowed with a cauſtic Virtue, ſo that it can ſeldom be given internally with Safety: Externally applied, it is excellent for eating down, and afterwards conſolidating, the Lips of Ulcers; it ſtops Fluxes of the Lymph, Blood, and Serum: But if this red Calx of Vitriol be long detained in a violent Fire, and afterwards boiled in Water, it impregnates the Water with a vitriolic Sharpneſs. If the Operation be continued till the laſt Water comes off taſteleſs, an inſipid, red, aſtringent Powder, called *Crocus Martis aſtringens*, will remain behind; and is the Body of the Iron calcined by Acid and the Fire; and therefore commonly uſed for aſtringing. The acid Waters, being evaporated to a Pellicule then ſet to ſhoot, afford ſomewhat of a vitriolic Salt.

Geoffroy directs the *Crocus Martis aſtringens* to be made, by firſt turning Filings of Iron into Ruſt, by ſprinkling them a ſufficient Number of times with Vinegar; then by calcining this Ruſt in a reverberatory Heat, till it turns to a very red Powder. It is given ſucceſsfully in Diarrhœas, Dyſenteries, and Hæmorrhages of all kinds. The Doſe is from fifteen Grains to a Dram, in the Form of a Bolus, Lozenges, or Pills.

The Liquor of Iron per Deliquium.

If the red Calx of the Vitriol of Iron be not waſhed with Water, but ſtrongly calcined, ground fine, put into an open Glaſs, and expoſed to the moiſt Air, it grows moiſt, and at length diſſolves into a kind of liquid red Matter, that may be called the Oil of Iron *per Deliquium*.

REMARKS.

The Vitriol of Iron contains a very acid and foſſil Water, ſo that the Water being ſeparated by Fire, the ſtrong and pure Acid remains dry, along with the metallic Part alone; but the Acid, being attractive of Moiſture, grows moiſt by the Water of the Air; and this is the true Reaſon of the Effect; the like obtains in all ſimilar Caſes. The Metals thus diſſolved in their reſpective Acids, then dried, moiſtened in the Air, and dried again, are thus, by repeated Operations, at length, wonderfully opened, reſolved, and even made volatile. The Calx of the Metals, thus diſſolved by the Moiſture of the Air, has the ſame Virtue it was poſſeſs'd of before this Diſſolution.

If Iron mixed with an equal Part of Sal Ammoniac is calcin'd by a very gradual Heat, in an unglaz'd earthen Veſſel, ſtirring it all the time, to prevent as much as poſſible its forming Lumps, and if this is afterwards expos'd to the moiſt Air, it diſſolves, *per Deliquium*, like Salt of Tartar, into a Liquid, five or ſix Drops of which may be taken for a Doſe in any proper Fluid.

The Golden Tincture of the Vitriol of Iron.

To a Quantity of the red Vitriol of Iron, prepared according to the third Operation on the Vitriol of Iron, made perfectly dry, and put into a tall Bolt-head, pour twenty times its Weight of dulcified Spirit of Sea-ſalt; digeſt for a Month, and thus a gold coloured, ſweetiſh, ſtyptic, inky Liquor will be obtained. If this be decanted, and new Spirit put on, and the Operation be thus ſeveral times repeated, the metallic Powder will, at length, remain exhauſted, and all the Tincture be thus extracted.

REMARKS.

This Experiment ſhews, that conſiderable Tinctures may be extracted from Metals, without diſſolving their Bodies; for this is a true Tincture of Iron, ſince one Drop thereof has an incredible Power of producing a black Colour. But this Spirit can never diſſolve all the Calx; but only extract its more ſoluble Part. A few Drops of this Liquor, being taken in *Spaniſh* Wine, upon an empty Stomach, are reſtorative, kill Worms, and raiſe the vital Powers. The chemical *Magi* plac'd their medicated Gold in Iron; poſſibly, therefore, this may be their medicated *Aurum potabile*.

Bates directs a *Tinctura Martis Aurea*, ſomewhat different from the preceding; and which is taken into the *London Diſpenſatory*, under the Title of *Tinctura Martis cum Spiritu Salis*.

Take an Ounce of Filings of Iron, and infuſe them in four Ounces of Spirit of Salt, for two Hours, ſtirring them often; then pour upon it four Ounces of rectify'd Spirit, and digeſt for three or four Hours longer: Then filtre it with a glaſs Funnel, (for it will corrode any Metal) and there will be a beautiful yellow Tincture.

This is very convenient for keeping in the Shops, as well as making; and is agreeably preſcribed in Draughts, or any liquid Forms, for preſent taking, from ten to thirty or forty Drops, at a Doſe, and has all the Virtues of the Metal.

Iron diſſolved in Rhenish Wine.

Put two Ounces of bright Iron Filings into a Bolt-head, and add thereto twenty Ounces, of generous *Rheniſh* Wine; digeſt them together in a gentle Heat, for three or four Days, often ſhaking the Glaſs: Let them afterwards ſtand to ſettle for twenty-four Hours, ſtrain off the Wine, which will appear black, and keep it in a cloſe-ſtopped Veſſel; it is of a ſweetiſh inky Taſte: Pour freſh Wine on the Remainder, and proceed as before. Thus, alſo, a chalybeate Wine will be obtained, but no way comparable to the former; for the particular Part hence obtainable is ſoon extracted from the Iron by the Wine; the whole Body of the Metal not being here diſſolved; ſo that the Production is not a Solution, but a Tincture.

REMARKS.

Hence it appears, that Iron contains one Part which is ſoluble, and another that is inſoluble, in this mild, fermented, oily, vegetable Acid. The former Part is the nobleſt Remedy I am acquainted with, for promoting that Power in the Body by which the Blood is made, as often as it happens to be weakened, through a bare Debility of the over-relaxed Solids, and an indolent, cold, aqueous Indiſpoſition of the Juices. If an excellent medicinal Virtue may, by any Experiment, be gained from Metals, certainly it is this; for no Virtue of any vegetable or animal Subſtance, no Diet, nor Regimen, can effect that in this Caſe, which is effected by Iron; but it proves pernicious where the vital Powers are too ſtrong, whether this proceeds from the Fluids or Solids. I have often thought, whether this was not the potable Sulphur of the Metal, that ſo powerfully reſiſts the Debility of Nature; a Medicine infinitely ſuperior to the boaſted *Aurum potabile*, and a Medicine that never proves pernicious when given where required. Hence we ſee, that Iron has a Part not very remote from a vegetable, and even an animal Nature, and which is extremely eaſy to diſſolve. If a Dram of this chalybeate Wine be mixed with thrice its Weight of Sugar, boiled to a proper Conſiſtence, and be prudently given in the proper Caſes, it makes an incomparable Remedy for the young of both Sexes.

Iron diſſolved in Vinegar.

Put an Ounce of clean Iron Filings into a tall Bolt-head; and pour thereto twenty Ounces of the ſtrongeſt diſtilled Vinegar; boil them together in a proper Furnace for twenty Hours; and, when cold, there will be obtained an highly red and ſtyptic Liquor, nauſeouſly ſweetiſh, and thicker than that made with Wine in the preceding Proceſs. This, being filtred, makes the aſtringent Tincture of Iron, and ſtains the Glaſſes in which it is kept, ſo that it is ſcarce poſſible to be got off again. If freſh Vinegar be pour'd upon the Remainder, it again extracts ſome Tincture, but leſs, and of a weaker Colour, than before, though ſtill chalybeate. At laſt there is left a conſiderable Quantity of metallic Matter, which can be no farther diſſolved by Vinegar.

REMARKS.

REMARKS.

It is ſurpriſing there ſhould be ſo great a Difference between the Tincture of Iron prepared with Vinegar, and that with Wine, both with reſpect to Colour, Taſte, Odour, Conſiſtence, and Effects. It is hence plain, that Iron may eaſily, and in very different Methods, be diſſolved by Acids. This Solution of Iron by Vinegar is wonderfully aſtringent, and, therefore, corroborating, and good againſt Worms; though not to be everywhere raſhly employed; it proves more agreeable, if mixed and taken with Sugar. Hence we ſee how eaſily Iron diſſolved may enter the human Body, and how often, ſince Iron is daily treated and diſſolved by Acids, and the Solution drank down; and hence poſſibly, by inſinuating into the Humours, it may contribute to generate the Stone in the Bladder, as Dr. *Liſter* conceived. Thus much is certain, that Iron grows almoſt every-where, is daily conſumed, riſes out of the Earth, and returns to it again. If any Metal be changeable, or deſtructible, it is certainly Iron.

Iron sublimed with Sal Ammoniac.

Take four Ounces of bright Iron Filings, and as much dry Flowers of Sal Ammoniac; grind them together in a glaſs Mortar, the longer the better. Though theſe two Bodies were ſeparately inodorous, there now riſes from them a volatile, ſubtle, and, as it were, an alcaline Vapour, becauſe the Acid of the Sal Ammoniac is attracted into the Iron; whence the volatile alcaline Part of that Salt, beginning to be ſet free ſpontaneouſly, flies off. Let a capacious and dry glaſs Body be at hand, with a wide Mouth; put the Powder into it, that it may lie thin ſpread at the Bottom. Lute on an Alembic-head, with a common Mixture of Meal; apply a Receiver, ſet the Body in a Sand-furnace, and bury it up to the lower Rim of the Head: Firſt make a Fire of two hundred and twenty Degrees, and there will come over a ſharp Vapour, which condenſes into an highly penetrating, volatile, alcaline Liquor. When no more aſcends with this Degree of Heat, raiſe the Fire, that the Alembic-head may grow hot: White Exhalations will now ariſe, and afterwards others of various Colours; the whole Cavity of the Head will be covered with mixed variegated Colours, White, Red, Yellow, Green, Blackiſh, ſo as to repreſent various Flowers, from whence the Preparations take their Name. Proceed with the ſame Degree of Fire for ſix or eight Hours; then let all cool, and there will be found in the Receiver a Gold-coloured, volatile, alcaline, and highly penetrating Liquor, along with a little white and yellow Matter. In the Alembic-head, and its Pipe, will be found a very ſubtile and dry Matter of various Colours: This is to be immediately taken out, and put into a dry and hot Glaſs, to be kept carefully ſtopped; for it would ſoon diſſolve by the Moiſture of the Air, and then run into a Gold-coloured, fattiſh, auſtere, ſaline Liquor. In the dry Form it is called the Flowers of Iron, and in the moiſt, the Oil of Iron *per Deliquium*. The ſame Matter of the Flowers every-where ſticks to the Sides of the Body, though it is here more compact, and as it were melted, and runs ſtrong together by the greater Force of the Fire: This, alſo, is to be taken out, and kept dry. At the Bottom of the Body there remains a browniſh-red Matter, of a very auſtere Taſte; this Matter attracts Moiſture, and preſently reſolves in a humid Air, and runs into a thick, Gold-coloured aſtringent Liquor, which is another metallic Oil *per Deliquium*. This Matter uſually ſwells greatly upon being expoſed to the Air, and thus reſembles ſome kind of Fermentation; but the Flowers, and this Remainder, differ in many reſpects.

REMARKS.

Sal Ammoniac, conſiſting of the Spirit of Sea-ſalt, and the volatile Alcali of Animals, being here ground with the Iron, unites ſome Part of its Acid with the Metal; at the ſame time letting go ſome Part of its Alcali, which, therefore, becomes volatile; the other Part of the Sal Ammoniac, retaining its Nature, and remaining mixed with the Iron, now corroded by the Acid, ſeparates a particular Part of the Iron, which is otherwiſe fixed in the Fire, and carries it up. But, it is not ſo eaſy, as ſome write, to ſublime all the Subſtance of Iron, by Sal Ammoniac; but it here ſeems to be divided into a more volatile Part, that riſes, and another more fixed Part, that ſtays behind; at leaſt, it appears thus to me; whence, I conceive, the Iron is thus ſeparable into different Parts. Hence, alſo, we may underſtand the particular Volatility of Sal Ammoniac, which is able to ſublime a Metal, naturally ſo fixed, and ſo hard to melt, as Iron; whence the Philoſophers have called this Salt the rapacious Bird, the white Eagle, and the Key that unlocks the Bodies of Metals. Theſe Flowers have the ſame Virtues as Mr. *Boyle* commends in the *Ens Veneris*; for they are a wonderful reſtorative, warming, and opening Medicine, containing the open Body of the metallic Sulphur. They have, alſo, an anodyne Virtue, and are often ſomewhat ſoporiferous. The dry Flowers, being digeſted with Alcohol, afford a copious golden Tincture, both metallic and ſulphureous; and the remaining *Caput Mortuum*, after the Sublimation, affords the ſame with Alcohol. The Curious and Induſtrious expoſe the remaining Body of the Oil and Salt to the Air, where it reſolves; then they coagulate and inſpiſſate it, and repeat the Operation, till at length, they ſo wonderfully and deeply disbowel the metallic Maſs, as not to repent their Trouble and Expence. What Chymiſt is ignorant of that Rule, ſo often inculcated, Diſſolve and coagluate? But whether, by repeating this Operation, Mercury might be obtained from the diſſolved Body of Metals, is another Queſtion. I have tried it, tho' ugh without Succeſs; but the Experiments upon Metals, by means of Sal Ammoniac, are of infinite Uſe. *Boerh. Chym.*

The *Tinctura Martis Ludovici* is, in the *Edinburgh* Diſpenſatory, directed to be prepared in the following manner:

Take of the Vitriol of Mars, and white Tartar, each two Ounces; and of Spring-water, twenty-four Ounces: Boil to the Conſiſtence of Honey; and, to the Maſs, when taken out, and put into a Matraſs, add a Pint and an half of rectify'd Spirit of Wine: Digeſt for two Days in a Sand-heat, then ſtrain the Tincture.

The *Tinctura Martis Mynſichti* is ordered to be thus prepared in the *Edinburgh* Diſpenſatory.

Take of the Filings of Iron, and of Sal Ammoniac in Powder, each two Ounces: Mix them together, and by degrees, caſt the Whole into an ignited Crucible, that the Vapours may aſcend; and when they riſe no longer, increaſe the Fire, ſo as that the Maſs may glow: Then being at length ſuffered to cool, reduce it to Powder; put it into a Matraſs, and pour upon it a Quart of *French* White-wine; then digeſt in a very gentle Fire, and laſtly filtre the Tincture.

Tinctura Martis Glauberi.

Glauber's *Tincture of Steel.*

Take of *Rheniſh* Tartar, and Filings of Steel, of each four Ounces: Reduce them into a fine Powder, and boil them in a ſufficient Quantity of Spring-water, in an Iron Pot, that two Gallons may remain after ſix Hours boiling: Filtre that hot, and then evaporate it to five Pints.

This hath now its firſt Appearance in the College Diſpenſatory; but what is intended to be done with it, cannot well be gueſſed; for it will neither keep, on ſeveral Accounts; nor is it fit to take, becauſe of its Nauſeouſneſs.

The *aſtringent Tincture of Iron*, or *Tinctura Antiphthiſica*, according to *Geoffroy*, is thus prepared:

Take of the Vitriol of Iron, an Ounce; Terra foliata Tartari, two Drams: Powder them ſeparately; then mix them by degrees in a Glaſs Mortar, rubbing them conſtantly, during the Mixture, till they turn to a kind of ſoft Paſte, of a red Colour: Then pour upon them, gently, four Ounces of rectified Spirit of Wine, which will preſently acquire a red Colour, and is then to be poured off by Inclination from the Fæces. The Doſe is from ten to thirty or forty Drops.

It ſtops Hæmorrhages, Gonorrhœas, and the Fluor albus in Women. It cleanſes and dries Ulcers in the Lungs, and is often preſcribed with Advantage in Conſumptions, mixed with equal Parts of Balſam of Capivi. In this Preparation, I have rejected the Sugar of Lead commonly uſed, and have ſubſtituted in its Place the Terra foliata Tartari, which extracts the Tincture full as well, and free from all the Inconveniences which attend the inward Uſe of Preparations of Lead. *Geoffroy.*

The bitter Infuſion of Dr. *Lower* is prepared in the following manner:

Take of the Tops of Wormwood, and the leſſer Centaury, each three Pugils; of the Seeds of Carduus Benedictus, ſix Drams; of Gentian-root, an Ounce and an half; and of the Filings of Steel, ſix Ounces: Let them be macerated for fourteen Days, in three Pints of alexiterial Milk-water, mix'd with one Pint of the leſſer compound Wormwood-water, as prepared in the *London* Diſpenſatory; and a Pint and an half of the leſſer compound Spirit of Wormwood, as prepared in the ſame Diſpenſatory. Let the Veſſel be ſhaken three or four times a Day, and the Infuſion only ſtrain'd immediately before it is to be uſed. The Doſe of this Infuſion is four or ſix Spoonfuls, to be taken each Morning on an empty Stomach.

Dr. *Pitcairn*, in his *Element. Medic. Phyſ. Mathemat. Lib.* 2. *Cap.* 22. adviſes, inſtead of the Gentian-root, always to ſubſtitute Peruvian Bark; and tells us, that this Infuſion ought to be uſed, without Interruption, for at leaſt a Month, in hypochondriacal Diſorders.

Extraordinary Effects upon applying Iron to Sulphur.

1. Take of Iron Filings, and Flowers of Sulphur, each an Ounce; grind them together in a Glaſs Mortar, the longer the better; they will thus grow hot, and ſmell ſtrong: Then boil the Powder in Water for half an Hour; pour off the Water, ſtrain and reſerve it; treat the Remainder as before: The ſeveral Waters, when put together, will taſte ſomewhat inky, and, when inſpiſſated, leave a little pure Vitriol of Iron behind.

2. Take eight Ounces of the like Mixture of Iron and Sulphur; make it up into a thick Paſte with Water, ſqueeze this Paſte ſtrongly into an earthen Pot, and ſet it by; it will ſoon ſpontaneouſly begin to grow hot, emit Fumes, and at length often takes Fire. When the Heat is over, the Matter will be found changed into an uniform Maſs; which, being well-ground, and boiled with Water, as in the former Caſe, affords a pure Vitriol of Iron for medicinal Uſe.

3. Melt Sulphur over the Fire, and plunge the End of an Iron Rod into it for ſome time; the Part ſo plunged will thus become calcined and brittle. In the ſame manner, if Iron Filings be put into melted Brimſtone, a Crocus of Iron may be obtained, which, when ground to Powder, becomes almoſt the ſame thing.

4. If Sulphur be apply'd to red-hot Iron, it makes the Iron preſently run into calcin'd metallic Drops, which, alſo, when ground, afford the like Calx.

REMARKS.

In theſe four Experiments, the highly acid Oil of Vitriol, which makes one Part of Sulphur, coming by means of Trituration, or Fuſion, to touch the metallic Part of the Iron, in numerous Surfaces, begins to act thereon, forſaking its oily Part, and uniting with the Iron. And as this Action always generates a violent Heat, it is no Wonder, if, at length, it fires the other oily Part, which is eaſily inflammable, eſpecially if the Quantity were large, ſufficiently compact, thoroughly ground, and cloſe compreſſed. And as ſoon as, by any of theſe Ways, the Acid of the Sulphur has corroded the Metal, a pure Vitriol of Iron is produced; becauſe there is no metallic Foulneſs in the Flowers of Sulphur: And by theſe means artificial chalybeate mineral Waters may be truly produced. Theſe Powders are called *Crocuſes*, by the Chymiſts, on account of their Colour, and are of the aperient Kind, as having an aperitive vitriolic Virtue; whereas other Powders, prepared by the means of Acids and Fire, are called Aſtringent. Theſe are the principal Ways whereby Iron is ſo changed, as, at length, to afford Preparations always of very different Forms, and ſometimes ſuch as the Metal would not have afforded by the means of Fire, or any thing elſe. But particular Metals require particular Treatments; in which reſpect a Variety of Operations is required. *Boerhaave's Chymiſtry.*

Having thus given an Account of the principal medicinal Preparations of Iron, it will be proper to ſay ſomething concerning the Virtues of this Metal, and the Cautions to be obſerved in the Uſe of all the Medicines prepared from it. We have already obſerved, that Phyſicians have aſcribed two kinds of Effects to Iron, one aperient, the other aſtringent. Hence Chymiſts have tortured it various Ways, into Croci, Tinctures, and Salts, by which the aperient or aſtringent Qualities might be extracted; but it is worth Obſervation, that the aſtringent Preparations are often found to prove cathartic and diuretic; that the aperient often ſtop Fluxes; and the Preparations of both kinds promote the Flux of the Menſes, and ſuppreſs them when immoderate. If we inquire into the Cauſe of thoſe various Phenomena, it will be found to be entirely in the Stypticity of Iron; which, according to the different Diſpoſitions of the Body of the Patient, produces different, and even contrary Effects. Therefore, though Iron may often act as an Aperient, yet even then it acts only by its Adſtriction. To conceive this, we are to conſider, that the morbid State of the Blood is of three kinds; the firſt is the glutinous State, in which the Blood, deprived, in a great meaſure, of its ſpirituous Part, ſwims in a thicker Serum; and thus ſticks in almoſt all the ſmall Veſſels, creating Obſtructions almoſt every-where, and, conſequently, Cachexies. The ſecond State is a thick Blood, deprived of a great Quantity of its Serum, whence it is ſaid to be aduſt or melancholic: In this State it eaſily ſtagnates in the ſmall Veſſels, and produces ſcirrhous and ſcorbutic Obſtructions. Thirdly, the Blood may abound with too great a Quantity of Serum, and thereby open to itſelf Paſſages and Chanels, into which the Blood does not naturally flow. All theſe morbid States proceed from the undue Contraction of the Veſſels, and their undue Action upon the Fluids, without which Action theſe Fluids cannot circulate.

Thus when the Serum is too thick, the Elaſticity of the Veſſels is too ſmall to propel the Blood as it ought to be; and hence follow Leucophlegmacies, Chloroſes, Suppreſſion of the Menſes, Cachexies, and other Diſeaſes of the ſame Kind. When the Quantity of Serum is too ſmall, the Blood, if we may ſo ſay, becomes ſolid, and thus eludes the Force of the Veſſels, forming very ſtubborn Obſtructions, ſuch as Scirrhuſes, and others of that kind. Theſe Obſtructions are often followed by Hæmorrhages, difficult to be cured, as is ſeen in Dropſies. Laſtly, when the Veſſels are continually bathed in a great Quantity of thin Serum, they loſe their Elaſticity, and the Blood, being too much dilu ed, relaxes and weakens the ſolid Parts, paſſes in unuſual Chanels, and thus produces Diarrhœas, Diabetes, Hæmorrhages, Dropſies, and the like.

What can be the Effect of Iron in all theſe Caſes, is evident from its Taſte, which, in crude Iron, as well as in all its Preparations, is ſtyptic, contracting the Fibres of the Tongue, Palate, and of the whole Mouth; whence follows a more copious and frequent Diſcharge of Saliva. Hence we may eaſily judge, what will be the Effect of all Martial Preparations, taken inwardly; that is, to conſtringe the Fibres, to reſtore and increaſe their Elaſticity, by which Effects the Fluids, ſtagnating in the Interſtices of the Fibres, will be expelled; the inſpiſſated Juices broken to Pieces, and made more fluid; and the Motion of all the Fluids accelerated. The ſame Effects are produced in the Fluids; the fibrous Part of the Blood is conſtricted, and the Serum ſqueez'd out of it; and that, either to the Advantage or Prejudice of the Patient, according to the State of his Solids and Fluids; and, therefore, great Judgment is requir'd in preſcribing Iron, and its ſeveral Preparations.

In cachectic Caſes, ſuch as Leucophlegmacy, Chloroſis, Suppreſſion of the Menſes, and other Diſeaſes, in which the Blood is glutinous and viſcid, the Preparations of Iron are of ſovereign Uſe; for, by its aſtringent Quality, it brings the Fibres of the ſolid Parts into Contact, expreſſes the Serum contain'd in the Interſtices between them, and throws it into the Veſſels. Thus the Blood is diſſolved, the Elaſticity of the ſolid Fibres reſtored, the viſcid Juices attenuated, and a due Circulation everywhere reſtored. Iron is far from being of the ſame Benefit in ſcirrhous, ſcorbutic, and melancholic Affections; for the Blood being, in theſe Caſes, too much deprived of Serum, the Veſſels, already too tenſe, are further corrugated by the Action of Iron, and their oſcillatory Motion thereby impaired. Hence the inſpiſſated Blood moves ſtill more ſlowly, the fibrous Part being gradually more compacted, and deprived of its Serum. In ſuch Caſes, therefore, Iron is prejudicial; and tho' it be called aperient, it can neither reſolve theſe kinds of Obſtructions, nor ſtop the Hæmorrhages ariſing from them. Exceſſive Evacuations, whether by Stool, Hæmorrhage, continual Sweats, Dropſies, or other Affections, proceeding from too large a Proportion of Serum, are accurately to be diſtinguiſhed by Phyſicians. Iron is of Service in all ſuch Diſeaſes, as it ſtrengthens the ſolid Fibres, expels the redundant Serum, and reſtores the Elaſticity of the Veſſels; but if theſe Evacuations ariſe from ſtubborn Obſtructions, as is uſually the Caſe in hectic Fevers, all Preparations of Iron are hurtful; for, by ſeparating the ſerous from the fibrous Parts of the Blood, and forcing that Serum out of the Body, they increaſe both the Evacuations and Obſtructions, Thus, though the Uſe of Iron may be proper in the Beginning of a Dropſy, it is always hurtful in Dropſies of long Standing; becauſe, in ſuch, the exceſſive Flux of the Serum, having already left the fibrous Part of the Blood almoſt dry, would be ſo much increaſed by the Uſe of Iron, that the Patient, gradually deprived of the Uſe of all his Limbs, would ſpeedily fall a Sacrifice to that Medicine, thus injudiciouſly applied.

Thus all the good and bad Effects of Iron proceed from its Stypticity; by this alone it binds and opens. But it is not to be thought, that all Styptics perform the ſame Effects with Iron in proportion to their Stypticity; Iron having this peculiar to itſelf, that, through all the Stages of Circulation, it preſerves this Quality; whereas vegetable Styptics are ſo much changed in the Primæ Viæ, that the Blood and ſmall Veſſels are hardly affected by them; whereas Iron is only opened by the Juices of the Stomach and Inteſtines, and thereby diſpoſed to Action, as it enters the Blood, by which its Efficacy is diffuſed through the whole Habit, its aſtringent Virtue being every-where exerted. It ought, however, to be obſerved, that Iron is better preſcribed in Subſtance, than impregnated with Salts; for, when united with Salts, it is not ſo eaſily penetrated and diſſolved by the Juices of the Stomach. Laſtly, Exerciſe is extremely proper during the Uſe of Martial Medicines, in order to diſtribute the Particles of the Iron through the whole Habit, to reſtore the oſcillatory Motion of the ſolid Fibres, and to accelerate the Motion of the Blood.

An infinite Number of other Preparations of Iron occur in chymical and pharmaceutical Authors; for which the Curious may conſult particularly the *Collectanea Chymica Leydenſia.*

Melampus is the firſt upon Record, who exhibited Iron by way of Medicine; for he is ſaid to have directed *Iphiclus* to take the Ruſt of a Knife, and drink it in Wine, ten Days together, in order to procure him Children.

MARSIPION, μαρσίπιον, in *Hippocrates's* Treatiſe *de Fiſtulis*, is a Sacculus, or Bag, in which he directs the green Leaves of Capers to be included, and thus applied to the Anus.

MARSUM, or MARSICUM VINUM. A Sort of *Italian* Wine produced in the County of the *Marci* in *Italy*; it is eſteem'd auſtere and aſtringent.

MARSUPIALIS MUSCULUS. The Name of a Muſcle of the Thigh, called, alſo, OBTURATOR INTERNUS.

This is a flat Muſcle, almoſt triangular, ſituated in the Bottom of the Pelvis. It covers the oval Foramen, and almoſt all the Inſide of the Os Pubis and Iſchium. It has its Name from a *Latin* Verb, which ſignifies *to fill up*, *cover*, or *ſtop*.

It is fixed to the internal Labium of all the anterior Half of the oval Foramen, a little to the neighbouring Part of the Obturator Ligament; and, alſo, both above and below the Foramen. It is, likewiſe, fixed to the upper Half of the Inſide of the Os Iſchium, from the upper oblique Notch of the oval Foramen, to the ſuperior Part of the great poſterior Sinus of the Os Ilium, which would be more properly named Sinus Iliacus, than Sinus Iſchiadicus.

From all this Extent the fleſhy Fibres, contracting in Breadth, run down below the Spine of the Iſchium, where they go out of the Pelvis, through the poſterior Notch of the Iſchium. The Inſide of the Body of this Muſcle, or that turned to the Cavity of the Pelvis, is pretty uniform; but the Outſide, or that turned toward the oval Foramen, and which touches the Bone, has four middle radiated Tendons; which, uniting at the poſterior Notch of the Iſchium, run over it, from behind forward, as over a Pulley, each Tendon ſliding in a particular cartilaginous Chanel.

Afterwards, the four Tendons, having got out of the Pelvis, are very ſtrictly united in one large flat Tendon; which, croſſing over that of the Pyriformis, unites with it, having firſt received ſome additional fleſhy Fibres from the two Gemelli.

The great Tendon ſlides freely in a ſort of membranous Vagina, formed by theſe Muſcles, and is inſerted in the Middle of the ſuperior Part of the Cavity of the great Trochanter, adhering cloſely to the capſular Ligament of the Joint, and being united to the Tendons of the Glutæus minimus, and Pyriformis.

The Obturator Internus has nearly the ſame Uſes with the Quadrigemini, in making the Rotation of the Thighs when extended, and the Abduction when bent. But the Mechaniſm of this Muſcle is ſingular in this reſpect, that, by the Paſſage of its Tendon over the ſmall iſchiadic Notch, it acquires a different Direction from that of the Belly, or fleſhy Body.

This Notch ſupplies the Place of a Pully, over which a Rope is thrown, one End of which is faſtened to a moveable Object, which, by pulling the other End, may be brought nearer the Pulley. In this the Pulley performs the Office of a fixed Point, or Fulcrum, with reſpect to the moveable Body. And, in like manner, the iſchiated Notch is a Fulcrum for the Motion of the Thigh by the Obturator Internus. *Winſlow's Anatomy.*

MARTACH or MARTATH. Litharge. *Rulandus.*

MARTAGON. A Species of Lily. See LILIUM. The Chymiſts, alſo, apply the Name to the Matter of the Philoſophers Stone. *Rulandus* explains Martagon, *Silphium.*

MARTECH. *Fallopius* ſuppoſes this to be the ſame as Martach, that is, Litharge.

MARTES. The Marten, an Animal more eſteem'd for the Excellence of its Fur, than any medicinal Virtues it is poſſeſſed of. There are two Sorts, principally found in the Northern Countries. The largeſt is called *Martes*, *Marta*, *Marterus*, *Foina*, *Gainus*, and *Sciſmus*. The ſmalleſt is named *Muſtela Zibelina*, *Mus Scythicus*, or *Sarmaticus*, and *Zobola*.

The Fleſh of the Marten is ſaid to be reſolutive, and good to fortify the Nerves.

MARTIANUM POMUM, is an Orange. *Suetonius.*

MARTIATUM UNGUENTUM. The Soldiers Ointment, is thus prepared:

> Take of freſh Bay-leaves, three Pounds; of Garden Rue, two Pounds and an half; of Marjoram, two Pounds; Mint, one Pound; Sage, Wormwood, Coſtmary, and Baſil, each half a Pound; Olive-oil, twenty Pounds; yellow Wax, four Pounds; *Malaga* Wine, two Pints; and make them all into an Ointment, by Bruiſing, Macerating, Boiling, and Expreſſion.

This is ſaid to have been the Contrivance of one *Martian*, for the Soldiers to preſerve their Limbs from the Injuries they were liable to in long Encampments, and by ſuſtaining Cold.

Nicolaus gives it with an intolerable Croud of Ingredients; and the *Auguſtane* and firſt *London* Diſpenſatories have tranſcribed it from him, with very little Alteration; but later Reviſes of the College have rejected the inſignificant Ingredients, and brought it to that conciſe uniform Compoſition it now ſtands in here; it is eſteemed enough to be pretty frequently preſcribed, and conſtantly kept in the Shops.

MARTYNIA.

This Name was given by the late Dr. *Houſtoun*, to this Genus of Plants, which he diſcover'd in *America*, in Honour to his Friend Mr. *John Martyn*, Profeſſor of Botany in *Cambridge*.

The Characters are;

It hath an anomalous Flower, conſiſting of one Leaf; which is divided into two Lips; the upper Lip is erect, and ſlightly cut into two Parts; but the under Lip is cut into three Parts; the middle Segment being larger than the other two. The Flower is ſucceeded by a Fruit, having a ſtrong thick Covering; in which is included a very hard Nut, having two ſharp crooked Horns at one End; and in the Nut are included four Seeds, lodged in ſo many ſeparate Cells.

Miller mentions three Species.

1. Martynia annua villoſa & viſcoſa, folio ſubrotundo, flore magno rubro. *Houſt.*

2. Martynia annua villoſa & viſcoſa, aceris folio, flore albo, tubo longiſſimo. *Houſt.*

3. Martynia perennis, folio ſubrotundo rugoſo, flore cœruleo, radice dentariæ. *Linn.*

There are no medicinal Virtues at preſent aſcribed to theſe Plants that I know of.

MARU. A Name for the *Cerinthe quorundam; major; verſicolore flore.* And for the *Horminum; ſylveſtre; Lavandulæ flore.*

MARUM.

The Characters are;

It has the Appearance of a Shrub; the Leaves are cuſpidated, like thoſe of the Serpyllum; the Flower reſembles that of the Teucrium, one growing in the Ala of each Leaf; it is of an acrid and volatile Smell.

Boerhaave mentions two Species of this Plant; which are,

1. Marum; Syriacum; vel Creticum. *Park. Theat.* 13. *Boerh. Ind. alt.* 182. *Marum Syriacum.* Offic. Ger. 544. Emac. 670. *Marum Cortuſi.* J. B. 3. 242. Raii Hiſt. 1. 527. *Marum Creticum.* Alp. Exot. 288. *Majorana Syriaca vel Cretica.* C. B. P. 224. *Chamædrys incana, maritima, fruteſcens, foliis lanceolatis.* Tourn. Inſt. 205. SYRIAN HERB MASTICH.

This is a lower and tenderer Plant than the Maſtichina, having white hoary Branches and Leaves, green above, and hoary underneath; but leſs than the Leaves of that: The Flowers grow on the Tops of the Stalks, in large, white, hoary Calyces, of a red Colour, and larger than the Maſtichina, having no Galea; and therefore it is, by *Tournefort*, reckon'd a Species of Chamædrys. The Root is ſmall and woody; the Leaves and Flowers have a very piercing grateful Scent, ſo quick that it will cauſe Sneezing. The Cats are great Admirers of this Plant, and it muſt be carefully defended, or they will eat and deſtroy it. It is nurſed up in the Gardens of the Curious, being leſs patient of Cold than the Maſtichina. It grows naturally in *Candia* and *Syria*.

This is accounted a good cephalic and nervous Plant, and is much uſed in cephalic Snuff; but is of little other Service in Phyſic. *Miller's Bot. Off.*

This Plant is very friendly to Nature; the Leaves, rubbed, emit an Odour, which affects the Brain like volatile Salt; but in Summer, when ſcorched, and, as it were, burnt by the fervent Heat of the Sun, they yield no Smell at all, though rubbed never ſo vehemently: Hence it appears to contain an acidulous volatile Salt, and that nothing in Art or Nature affords the like. This Salt is very good againſt Apoplexies, Lethargies, and hyſteric and epileptic Diſorders, provided they proceed from a cold Cauſe. The Spirit, ſprinkled in any Place, diffuſes a moſt grateful Scent; and Paper, impregnated with it, maintains its Fragrancy for a whole Year. It is a Plant of extraordinary Uſe in phlegmatic Diſeaſes, proceeding from the Stomach, the Anaſarca, and ſtomachic and uterine Diſorders. The Conſerve, with Spirit of Wine, yields a Spirit far exceeding *Hungary* Water. It is of Service, alſo, in venomous Bites, a fetid Breath, and is an Ingredient in Theriacal Compoſitions. *Hiſt. Plant. aſcript. Boerhaav.*

2. Marum; Hiſpanicum; nigrum; flore purpureo; Piperella Hiſpanis. *Barr. Ic.* 694. *Boerh. Ind. alt. Plant.*

MARUM VULGARE. See MASTICHINA.

MAS. A Male, among Animals. In Botany ſome Plants are called *male*, and others of the ſame Species, *female*; the male are thoſe which are barren, and bear no Seed; the Female are thoſe which produce Seed. Sometimes the male and female Flowers grow on the ſame Plant.

Sometimes Mercury, and ſometimes Sulphur, is called *Mas* by the Alchemiſts.

MASARANDIBA PISON. A Tree which grows in *Braſil*, very like our *European* Cherry-trees, in every reſpect, except that the Fruit it produces is not ſo round as our Cherries. This Fruit contains a very hard Stone, and a very agreeable milky Juice; which is expreſſed by the Inhabitants of *Braſil*, and taken, by way of Emulſion, as a Remedy for cold Affections of the Breaſt, and Hoarſneſs, either alone, or joined with other Pectorals.

MASCHALE, μασχάλη. The Axilla, or Arm-pit.

MASCHA-

MASCHALISTER, μασχαλιστής. A Name for the ſecond Vertebra of the Back.

MASCI. A Name for the *Phaſeolus*; *Oſtocaulis*; *Mungo Perſarum Turcarum maſc. Hiſpaniorum max. Boerh. Ind. alt.*

MASCULINITAS. A Conception of a male Child. *Maſculinans* is an Epithet for the Woman who conceives a male Child: Thus, alſo, *Fœminitas* is the Conception of a female Child; and *Fœminans*, the Woman who conceives it. *Caſtellus* from *Avicenna*.

MASELUC. A Name of the *Molucca*; *Spinoſa*. *Boerh. Ind. alt.*

MASLACH, a Medicine much in Uſe among the *Turks*; it is called, alſo, *Anſion*, or *Amphion*, and is prepared of Opium: They take a Dram of it at a time, and ſometimes two or three, in order to qualify themſelves the better for Venereal Exerciſes, or to raiſe their Courage when they are going into the Field of Battle. *Caſtellus*.

MASNAPHII, *Confectio*. The Name of a medicinal Compoſition, deſcribed by *Aetius Tetrabib.* 4. *Serm.* 1. *Cap.* 118.

MASPETA, a Name by which ſome call the Leaves of the *Silphium*. *Dioſcorides*, *Lib.* 3. *Cap.* 94.

MASSA. See MAZA.

MASSALIOTICON, the Name of a Plaiſter, commended by *Galen* for a Carbuncle. It takes its Name from *Demoſthenes Maſſaliotes*, and is deſcribed by *Ægineta*, *Lib.* 7. *Cap.* 13.

MASSALIS, *Moſel*, *Maſſariam*, *Mater*. Mercury. *Rulandus*.

MASSETER. The Name of a Muſcle which ſerves to move the lower Jaw. See CAPUT.

MASSICOT. Ceruſs, or white Lead, calcined by a moderate Fire. There are three Sorts of it, the white, the yellow, and the Gold-colour'd; their Difference proceeds only from the different Degrees of Fire, which gives them different Colours. The white Maſſicot is of a yelloviſh-white, and is what has received the leaſt Degree of Heat; the Yellow has received more, and the Gold-colour'd the greateſt Heat of all. They ought to be in the Form of an impalpable Powder, ponderous, and deeply coloured; they are uſed by Painters.

Outwardly applied, they are ſerviceable as Driers; for which Purpoſe they may enter the Compoſition of Ointments, or Plaiſters. *Lemery des Drogues.*

MASSINILIA. A Name for the Species of Tithymalus, called by *Boerhaave*, *Tithymalus*; *Americanus*; *arboreſcens*; *folio cotini.*

MASSOY. A ſort of Bark mentioned by *Ray*, in his Hiſtory of Plants, from the *German Ephemerides*, *An.* 11. It grows in *New Guinea*, where it is beat to a Pulp with Water, and uſed for anointing the Body, in cold and rainy Seaſons. It has a grateful Fragrance, heats, and eaſes Gripes, and Pains of the Belly.

MASTHLE, μάσθλη, or MASTHLES, μάσθλης. A Skin, Hide, or Thong of Leather. *Hippocrates.*

MASTICATIO. Maſtication. The Action of Chewing the Aliment.

MASTICATORIUM. A Maſticatory; an Apophlegmatiſm in a ſolid Form. See APOPHLEGMATISMUS.

MASTICHE. Maſtich. See LENTISCUS, and BALSAMUM.

MASTICHELÆON, μαστιχέλαιον. Oil of Maſtich. *Dioſcorides*, *Lib.* 1. *Cap.* 51.

MASTICHINA.

The Characters are;

The Leaves are larger than thoſe of Serpyllum; the Stalks erect and ſhrubby; the Calyx is long, narrow, tubulous, and expanded at the Top into five long and very ſlender Segments, which are overſpread with a ſubtile Down, to ſuch a Degree as to appear compoſed of nothing elſe: The Galea is erect and bifid, and the Beard trifid, ſo as to make the Flower appear in a manner pentapetaloidal: The Whorles of the Flowers are cloſely ſet, and the Flowers collected into white, lanuginous, oblong Heads.

Boerhaave mentions but one Sort of this Plant; which is,

Maſtichina. *Boerh. Ind. alt.* 156. *Marum.* Offic. Ger. 544. Emac. 670. Raii Hiſt. 1. 520. *Marum vulgare.* Park. Theat. 12. *Sampſuchus ſive Marum Maſtichen redolens.* C. B. P. 244. *Clinopodium quibuſdam*, *Maſtichina Gallorum.* J. B. 3. 243. *Thymbra Hiſpanica*, *Majoranæ folio.* Tourn. Inſt. 197. HERB MASTICH.

This is a ſhrubby Plant, full of round, ſlender, brown Stalks, a Foot high or more, having two ſmall Leaves at a Joint, ſomewhat bigger than Thyme, but elſe much like them: The Flowers grow on the Tops of the Stalks, in ſoft, downy, verticillated Spikes; by which alone it may be known from all other Plants of this Kind; they are ſmall, white, and galeated. The whole Plant has a pleaſant grateful Smell: It is planted in Gardens, continuing ſeveral Years, if not deſtroyed by ſevere Cold: It flowers in *June* and *July*. The Leaves and Heads are uſed.

This is much of the Nature of Marjoram; but differs from it in being, as ſome write, of great Service in the too great Flux of the Catamenia; a Dram of the Powder being given in rough Wine. It is an Ingredient in the Trochiſci Hedychroi. *Miller's Bot. Off.*

It take its Name from *Maſtiche*, Maſtich, becauſe it has the Smell and Virtues of Maſtich.

This Plant is ſudorific, cephalic, and aperient; it is of Service againſt venomous Bites, and a cadaverous Breath. It is hotter than Betony, and not ſo hot as Serpyllum and Thyme, tho' it has the ſame Virtues, only is a little more aſtringent. *Hiſt. Plant. aſcript. Boerhaave.*

MASTICOT. *Helmont* ſays this is a Colour us'd by the Painters, prepar'd from Tin.

MASTIERON. A Name of the Stalk of the Plant, which produces the *Silphium*. *Oribaſii Collect. Medicinal.* L. 12.

MASTOIDÆUS *Muſculus*. The Maſtoide Muſcle.

Winſlow takes notice of two Muſcles under this Name. The firſt is the *Maſtoidæus Anterior*, or *Sterno-Maſtoidæus*.

This is a long, narrow, pretty thick, and moſtly fleſhy Muſcle, ſituated obliquely between the back Part of the Ear, and lower Part of the Throat. It is in a manner, compoſed of two Muſcles, united at the upper Part through their whole Breadth, and ſeparated at the lower.

It has two Inſertions below, both of them flat, and a little tendinous. The firſt is in the upper Edge of the Sternum, near the Articulation of the Clavicula; the other in the Clavicula at a ſmall Diſtance from the Sternum. Theſe two Portions run up obliquely, and unite together at about an Inch above their lower Inſertions, the triangular Space left between them being filled by a Membrane.

The ſternal Portion paſſes foremoſt, and covers the clavicular, both forming one Body or Belly, which, running in the ſame oblique Direction to the Apophyſis Maſtoidæus, is inſerted in the upper and back Part of that Proceſs; over which it likewiſe ſends off a very broad Aponeuroſis, which covers the Splenius, and is inſerted in the Os Occipitis.

The two anterior Maſtoidæi repreſent a great Roman V, the Angle being at the lower Part of the Throat, and the two Crura running up behind the Ears, as may be plainly ſeen without Diſſection.

The Action of the Sterno-Maſtoidæi is different, according as either both Muſcles or only one of them acts, and according to different Situation of the Head and Trunk.

When we keep the Head and Trunk ſtreight, whether in ſtanding or ſitting, both Muſcles preſerve the Head in that Poſture, againſt any Force by which it would otherwiſe be moved backward. This we may be convinced of by laying the Hand on theſe Muſcles, while we endeavour to reſiſt a Force which puſhes back the Head.

One of theſe Muſcles acting alone may have the ſame Uſe, if the Force to puſh the Head back be applied between the anterior and lateral Parts of it. In that Caſe the Sterno-maſtoidæus on the ſame Side would oppoſe this Force; but if it were applied directly on the Side of the Head, that Oppoſition would have no Effect without the Aſſiſtance of the Splenius on the ſame Side.

They both ſerve likewiſe to perform the Rotations of the Head, that is, to make it turn to either Side, as on a Pivot; and in this Caſe, when we turn the Head to one Side, the Sterno-maſtoidæus on the other Side acts, and not that on the ſame Side; this is an Obſervation of Conſequence in paralytical Diſorders.

They both ſerve, in the next Place, to bring the Head near the Thorax, when we lie on the Back, or bend backward in ſitting. And the lower the Head is in theſe Situations, the more Force muſt theſe Muſcles exert to raiſe it. In this Caſe the Sternum, being the fixed Point, muſt remain immoveable; but as its Connexion with the firſt Rib, and the Inflexibility of the Cartilage of that Rib, are not always ſufficient for this, the Muſculi Recti of the Abdomen muſt lend their Aſſiſtance in great Efforts.

In moſt People, we may call this the Co-operation of the abdominal Muſcles, in raiſing the Head, when they lie on their Back, by laying the Hand on theſe Muſcles. But when the Cartilage of the firſt Rib is very much hardened, and the Articulation quite depriv'd of Motion, as where the firſt and ſecond Ribs are partly confounded together, of which I have ſeen Inſtances, in ſuch People the Sternum does not want any other Aſſiſtance to keep it immoveable, and therefore the Co-operation of the Muſcles of the Abdomen will not be perceivable

When, being in an erect Poſture, either ſtanding or ſitting, we lower the Head, the Sterno-maſtoidæi do not act, neither have they any Share in that Poſture. It is produced only by the Relaxations of the poſterior Muſcles, by which alone the Head is ſuſtained in this erect Poſture, and without which it would naturally fall forward, as we ſee in thoſe who fall aſleep, or are taken ſuddenly ill, while ſitting.

The Inſertions of theſe Muſcles in the poſterior Part of the Maſtoide Apophyſes, has made ſome Anatomiſts believe, that they are more proper to bend the Head backward than forward; their Inſertions being behind the Condyloide Articulation of the Os Occipitis; and to this they might have added, that the Neck,

from

from the natural Diſpoſition of the Vertebræ, is better fitted for Flexion backward than forward.

But, in the firſt place, as theſe Inſertions take up a great deal of Room, the moveable Point can only be determined to that Part, which is neareſt the fleſhy Body, and the moſt anterior; and conſequently not ſituated ſo far back as is imagined.

In the ſecond place, as the Motions of the Head forward, by theſe Muſcles, is diſtinct from that of the Neck, the anterior Muſcles of the Vertebræ of the Neck muſt act at the ſame Time, and hinder them from bending backward; ſo that, in this Caſe, the Neck may be looked on as a Pillar, the upper Part of which ſupports the Head, while the Head, acted upon by the Muſcles, carries the lower Part of it forward. It is for want of this Co-operation, that Experiments made on dead Bodies, have been ready to miſlead Anatomiſts.

The ſecond is the *Splenius, ſive Maſtoidæus poſterior.*

This is a flat, broad, oblong Muſcle, ſituated obliquely between the back Partof the Ear, and the poſterior and lower Part of the Neck. It is partly ſingle, and partly made of two Portions, one ſuperior, the other inferior. Theſe two Portions are cloſely united backward, making only one Plane; but they are divided above.

The ſuperior Portion is fixed to the Extremities of the three or four loweſt ſpinal Apophyſes of the Neck, and of the firſt, or firſt and ſecond, of the Back. It is not fixed immediately to the Atrophyſes of the Neck, which are above the laſt, but only by the Intervention of the poſterior cervical Ligament.

It is, likewiſe, fixed to the Edge of the internal ſpinal Ligaments of the other Vertebræ; and, therefore, its Inſertions in the ſpinal Apophyſes are not interrupted by the Diſtances between theſe Apophyſes, but form one thin continued Plane, a little tendinous.

From thence it runs up obliquely toward the Maſtoide Apophyſis, partly under the upper Extremity of the Sterno-maſtoidæus, and is inſerted in the upper Part of that Proceſs, and along the neighbouring curve Portion of the tranſverſe Ridge of the Os Occipitis.

The inferior Portion of the Splenius is fixed to three or four ſpinal Apophyſes of the Back, beginning by the ſecond or third. From thence it runs up, being cloſely united to the other Portion, till it reaches the ſuperior and lateral Part of the Neck, where it ſeparates from it, and is inſerted in the tranſverſe Apophyſes of the three or four ſuperior Vertebræ of the Neck, by the ſame Number of Extremities a little tendinous; which, however, are ſometimes only two in Number. This Portion of the Splenius belongs rather to the Neck than to the Head.

The two Splenii repreſent a great *Roman* V, and the Splenius and Sterno maſtoidæus, of the ſame Side, form a Figure like a *Roman* A, or the Legs of a Pair of Compaſſes, the Points whereof are in an horizontal Plane. Thus theſe four Muſcles, ſurrounding the Neck, meet alternately at their upper and lower Extremities.

The two Splenii ſerve to ſupport the Head in an erect Poſture, whether in Standing or Sitting; to moderate the Flexion of the Head forward, and to bring it back again to its natural Poſture.

They ſerve alternately to co-operate with either of the Sterno-maſtoidæi for the Rotation of the Head; thus when the Right Sterno-maſtoidæus turns the Head, the Left Splenius correſponds with it by its upper Part; while the lower Part, at the ſame time, turns the Vertebræ of the Neck.

When we lie on one Side, and raiſe the Head laterally, the Splenius and Sterno-maſtoidæus of the oppoſite Side act in Concert. Alſo, when we ſtand, and incline the Head to one Side, it is the Splenius and Sterno-maſtoidæus of the other Side which moderate that lateral Flexion, and afterwards extend the Head, And as the Sterno-maſtoidæus is partly inſerted in the Clavicula, the Latiſſimus Dorſi concurs, alſo, in this Action, and fixes the Clavicle by means of its Connexion with the Os Humeri, which is of conſiderable Advantage in the Action of the Sterno-maſtoidæus. *Winſlow's Anatomy.*

MASTOIDÆUS LATERALIS. See COMPLEXUS MINOR.

MASTOS, *μαστὸς*. A Breaſt. See MAMMA.

MASTUPRATIO, or MANUSTUPRATIO. Manual Stupration, a Vice not decent to name, but productive of the moſt deplorable and generally incurable Diſorders. Thus we have given a remarkable Hiſtory, under the Article AMAUROSIS, of a Series of Diſtempers cauſed by this abominable and unmanly Practice. And, under the Article GONORRHOEA, to this we have attributed the moſt obſtinate Gleets. Beſides theſe, incureable Impotence, Loweneſs of Spirits, hypochondriacal Diſorders, and almoſt all Sorts of chronical Diſtempers, are excited by it. And it is worthy of Remark, that People accuſtomed to ſuch Filthineſs, are not ſo eaſily cured of chronical Diſtempers, as others who are Strangers to it. For, as *Celſus*, ſpeaking about Venereal Intercourſes, prudently remarks, *Cavendum, ne in ſecunda valetudine adverſæ præſidia conſumantur.* That is, "We ſhould "take care, during Health, not to laviſh away that Strength of "Conſtitution which ſhould ſupport us in Sickneſs."

MASUCHA, *μασυχὰ*. The Name of a compound Medicine deſcribed by *Paulus Ægineta, Lib. 7. Cap. 23.* He, alſo, calls it *Maſuaphium.*

MATALISTA. *Caſtellus*, from *Wedelius*, defines this to be the third Species of Jalap, or Mechoacan, called by the *Indians Matbaliſtic.*

MATER. In Anatomy, the two Membranes inveſting the Brain are called *Dura Mater*, and *Pia Mater.* See CAPUT. In Botany, the *Artemiſia*, Mugwort, is called *Mater Herbarum.* In Chymiſtry, Quickſilver is known by the Name of *Mater Metallorum.*

MATER PERLARVM. Offic. Schrodr. 5. 530. *Concha Margaritifera.* Mont. Exot. 6. Jonſ. Evang. Tab. XIII. Bellon. Aquat. 402. Aldrov. Exang. 418. Charlt. Exer. 64. *Concha Mater Unionum.* Rondel. Aquat. 2. 33. *Concha, Mater Unionum dicta, aut Margaritifera.* Bonan. 93. 11. n. 1. *Concha Margaritifera plerique Berberis antiquis Indis dicta.* Liſt. Hiſt. Conch. 3. n. 56. *Concha valvis æqualibus, inæquilatera mediocriter vel leviter umbonata, &c.* Lang. Meth. Teſt. 69. MOTHER OF PEARL.

This is not the Shell in which the Pearl is found, as is commonly ſaid, but a Shell of another Kind, called *Concha Margaritifera*, though it produces no Pearls. This is abſorbent and cordial, in the ſame Degree with Pearls; but then only the pureſt and moſt ſhining Parts of the Shells muſt be uſed, being firſt well levigated on the Porphyry; and theſe, by the Retort, yield a volatile Salt. *Geoffroy.* See CONCHA.

MATERIATURA. *Caſtellus* explains *Morbi Materiaturæ*, Diſeaſes of Intemperature.

MATES. The Name of a Fruit mentioned by *Cluſius*; and by *Caſp. Bauhine*, by the Name of *Fructus, ſubrotundus, durus, eleganter rubens.* They are deſcribed to be of an elegant red, and about the Size of the Seeds of Caſſia, or the Carob-tree.

MATHEDORAM. Sal Gemmæ. *Rulandus.*

MATORIUM. Gum Ammoniac, or Galbanum, *Rulandus.*

MATRACIUM. A Matras, in Chymiſtry, is a round Glaſs Veſſel, with a long Neck, uſed in Digeſtions, and other Operations.

MATRICALIA. Medicines appropriated to Diſorders of the Uterus.

MATRICARIA.

The Characters are;

The Root is annual and fibrous; the Leaves are cut many Ways, and by Conjugations; the Calyx is hemiſpherical and ſquamous; the Flowers are collected into Bunches, or form Umbellas, and are generally marked with white Rays.

Boerhaave mentions eleven Species of this Plant; which are,

1. Matricaria; vulgaris; vel ſativa. *C. B. P.* 133. *Tourn. Inſt.* 493. *Boerh. Ind. A.* 110. *Matricaria, Parthenium.* Offic. *Matricaria.* Ger. 526. Emac. 652. Raii Hiſt. 1. 557. Synop. 93. *Matricaria vulgaris ſimplex.* Park. 83. *Matricaria vulgo minus Parthenium.* J. B. 3. 129. FEVERFEW.

The Leaves of Feverfew are large and winged, divided into ſeveral Sections, uſually about ſeven, that at the End being the largeſt; they are deeply cut-in, or laciniated, of a pale yellow-green Colour. The Stalks are ſtiff, round, or ſtriated, two Foot high, or more, cloathed with ſmaller Leaves, and pretty much branched towards the Top, on which grow large flat Umbels of Flowers, made of ſeveral white Petals, broader and ſhorter than thoſe of the Chamomile, ſet about a yellow Thrum. The Root is thick at the Head, having many Fibres under it; the whole Plant has a very ſtrong, and, to moſt, an unpleaſant Smell. It grows in Hedges and Lanes, and flowers in *June* and *July*. The Leaves and Flowers are uſed.

This is an Herb, particularly appropriated to the Female Sex, being of great Service in all cold flatulent Diſorders of the Womb, and hyſteric Affections; procuring the Catamenia, and expelling the Birth and Secundines. The Juice, to the Quantity of two Ounces, given an Hour before the Fit, is good for all Kinds of Agues. It, likewiſe, deſtroys Worms, provokes Urine, and is good for the Dropſy and Jaundice. *Miller's Bot. Offic.*

It is of conſiderable Service, the Decoction of it being drank, in uterine Affections, as may be inferred from its very Name, in provoking the Menſes, expelling the Secundines, and for hyſteric Diſorders. It performs all the Effects of Bitters, in a commodious manner; and the Herb itſelf, or its expreſſed Juice, expels Worms from the Belly as effectually as Centaury or Wormwood: It is good, alſo, in the Gout. The *Engliſh* and *Germans* call it *Feverfew*, that is *Febrifuge*, from its Effects. Some, as *Braſſavola*, in *Exam. Simpl.* and ſome skilful experienced Women, as *Tragus* obſerves, 1. *Hiſt.* 50. aſcribe to it a purgative Quality; as *Dioſcorides* does to his Parthenion. Bees cannot bear the Smell of Feverfew; for which Reaſon, plethoric Perſons, who are principally ſubject to be ſtung by Bees and Gnats, would do well to carry about them a Bunch of Feverfew, when they walk in Gardens: The ſame Effect may be expected from the *Cotula fetida S. Pauli.* For the Hemicrania, take an Handful of the Leaves of Feverfew, heat them in a Frying-pan, and apply them to the Crown of the Head. *Cheſneau.* Crude Feverfew, applied ro the Crown of the Head, is often found effectual in the Head-ach. *S. Pauli.* The ſame Author tells us, that he uſed

used to prepare a Decoction of Feverfew, and the Flowers of Chamomile, and a little Balm, by which he frequently ceased a present Cessation of hysteric Symptoms, with a free and plentiful Flux of the Lochia. *Raii Hist. Plant.*

2. Matricaria; vulgaris; vel sativa; barbulis exiguis.

3. Matricaria; vulgaris; vel sativa; caulibus rubentibus.

4. Matricaria; vulgaris; vel sativa; floribus mudis, bullatis.

5. Matricaria; vulgaris; vel sativa; florum petalis fistulosis.

6. Matricaria; vulgaris; vel sativa; florum petalis fistulosis & brevioribus.

7. Matricaria; flore pleno. *C. B. P.* 134. *J. B.* 3. 130.

8. Matricaria; flore pleno, petalis fistulosis.

9. Matricaria; flore pleno, petalis marginalibus planis, discoidibus fistulosis.

10. Matricaria; foliis elegantissime crispis; & petalis florum fistulosis. *T.* 493.

11. Matricaria; Americana; Ambrosiæ folio; parvo flore albo. *T. App.* 666. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 110.

It is called *Matricaria* from *Matrix*, because it is of singular Efficacy in Diseases of the Matrix; it is, also, called *Parthenium*, from παρθένος, *Parthenos*, a Virgin, for the same Reason. There is in all the Species a peculiar Smell, except in the eleventh, which has no Smell. It is proper in all cold Diseases of the Uterus, and has a more bitter, oleous, and acrid Taste than Chamomile, as favouring somewhat of Camphire and Castor. Hence it is of Service in provoking the Menses, expelling the Reliques of the Secundines, false Conceptions, and the Lochia, when retained by a cold Cause. All the Species are medicinal, and retain their Strength for Years. Their Virtues consist in an inflammable, aromatic, and highly volatile Oil: They are of the same Use as Chamomile; and Baths for the Feet are prepared of them, in order to provoke the Menses. Feverfew, in Clysters, discusses Flatulences, and is of excellent Service in Surgery, for discussing Tumors and Contusions. A Salt is prepared of the Ashes; and, also, a Water of the recent or fermented Plant; and an Oil, Conserve, and Syrup. The Oil, which has the Name of *Oleum Parthenicum*, dissolves all Tumors, being rubbed on the affected Part. *Hist. Plant. adscript. Boerhaav.*

MATRICARIA MARITIMA. A Name for the *Chamæmelum marinum*.

MATRICARIA *Tanaceti folio*. A Name for the *Leucanthemum Tanaceti folio*; *flore majore*.

MATRISYLVA. A Name for the CAPRIFOLIUM.

MATRIX. The same as UTERUS; which see. In Botany, it sometimes imports the Pith of a Plant. *Blancard.*

MATRONALIS VIOLA. A Species of Violet, call'd *Dame Violet*.

MATURANTIA. Maturatives; that is, Remedies which promote the due Formation of Matter.

MATURATIO, Maturation, is properly used, with respect to Fruits; but it is employ'd relative to the noxious and morbid Humours in the Body, which generate Diseases; and, in this Sense, it imports their Concoction, Attenuation, or Preparation, in order to their being discharged out of the Body.

MATZATLI. A Name for the *Ananas*; *aculeatus*; *fructu Pyramidato*; *Carne Aurea*. See ANANAS.

MAURÓMARSON. A Name in *N. Myrepsus*, *Sect.* 7. *Cap.* 6. for the *Marrhubium*, Horehound; probably the black Horehound; for *Myrepsus* uses sometimes μαῦρος, to signify Black.

MAUZ. A Name for the *Musa*; *fructu cucumerino*, *longiore*.

MAXEINOS, μάξινος. A Name for the *Asellus*, Cod-fish.

MAXILLA. The Cheek; or the Jaw.

MAYS.

The Characters are;

It has the Appearance of the Reed; the male Flowers consist of two long, hollow, carinated, fibrous Leaves, with hairy Margins; within these Leaves are two others more tender, hollow, and carinated, in the Place and Function of Petals; in the Middle of those is the Cotyla, or Cotyledon, whence proceed three Stamina; all these Parts are seated in one Place of the Plant.

In another Place of the same Plant are situated the round Ovaries, growing in a short and peculiar Calyx, and furnished with a very long Tube, and compacted into a close Spike, straitly involved in vaginal Leaves; from whose Apex appear eminent the Tubes of the Ovaries.

Boerhaave mentions three Species of this Plant; which are,

1. Mays; granis aureis. *Tourn. Inst.* 531. *Boerh. Ind. A.* 2. 266. *Triticum Indicum*. Offic. J. B. 2. 493. Raii Hist. 2. 1249. *Frumentum Asiaticum & Turcicum*. Ger. 75. Emac. 82. *Frumentum Indicum Mays dictum*. C. B. P. 25. Theat. 490. *Milium Indicum maximum Mays dictum*, *seu Frumentum Indicum*. Park. Theat. 1138. *Thaolli seu Mayz*. Hern. 242. *Medicinum Mexicanum Thaolli*, *vulgo Frumentum Turcicum vel Indicum*. Pif. Mexic. Arom. 199. INDIAN WHEAT.

Our Countryman *Gerard*, after *Tabernæmontanus*, multiplies the Species of this Plant, according to the various Colours of the Grain: But they are mistaken; for most of these Varieties may be obtained from the same Seed. We are of Opinion, with *Matthiolus*, that *Mays* is native to the *West Indies*, in almost all Parts of which it is to be found; and that from thence it was transplanted into *Africa*, *Asia*, and *Europe*. As for the *Indian* Millet of *Pliny*, which, he says, was brought into *Italy* in the Time of the Emperor *Nero*, we make no Doubt but it was the *Holcus*, or *Sorgum*.

Mays is sown in Pits five Feet asunder, four or five Grains in a Pit; it springs up in a few Days, and in the *Indies* it is reaped the fourth Month. In *Germany* we have observed it sown in the Fields, where it delights in a fat, humid, and well-dung'd Soil, and is impatient of Cold and Frosts. The Time of sowing it varies according to the Quality and Temperature of the Climate; for, in some Countries, it perfects and brings its Seed to Maturity in a shorter, in others in a longer time. There is one Species, which is sown and reap'd in three Months; another, which requires only two; and a third, which is ripe in forty Days after Sowing, if we may believe Authors. That it grows remarkable high, and produces several Ears, is owing to the Fertility of the Soil, or the Temperature of the Climate.

Of what Use this Grain is in Medicine, (says *J. Bauhine*) we are not as yet well apprised; however, from its Sweetness, and a kind of Viscidity which belongs to it, we may conclude, that it is of the same Temperament with Wheat, and, therefore, must of Necessity have the same Qualities. Hence its Grains are broken and reduced to a very white Meal, which is made into Bread, and other things of that Nature, tho' this Bread has somewhat of a viscous and obstruent Quality; for which Reason, as it is said, they make no use of it in *Asia* and *Turkey*, but under a Dearth of other Corn. The Bread made of it, says *Dodonæus*, is, indeed, moderately white, when cleansed from the Bran, but hard and dry like Biscuit, without the least Clamminess; for which Reasons it is difficult of Concoction, and affords very little or no Nourishment to the Body; but is slow of Passage, and binding to the Belly, like Bread made of Millet, or Panic.

Fr. Hernandez is very lavish in his Commendation of *Mays*. It is, says he, temperate in Quality, or a little inclining to Heat and Moisture, of a moderate Substance, easy of Digestion, especially to those who are accustomed to it, not of a gross, or, as some think, of an obstruent and viscous Substance, as we may learn by Observation of the *Indians*, who live on this sort of Bread made into Cakes, and yet are not affected with Obstructions, or appear ill-coloured: For these People affirm, that they are sensible of no Oppression of the Stomach, after a hearty Meal; but that, a few Hours after, they are as hungry as if they had eaten nothing, and could fall greedily upon any Food which came in their Way; and that they never knew what the Stone was, before the *Spaniards* came among them: That, among the *Mexicans*, there is no kind of Food more celebrated, or more commodious in acute Distempers, being prefer'd even to Ptisan, as appears from a thousand Experiments. It is quick of Digestion, say they, and Passage; affords a Sufficiency of Nutriment to the Body; excites no Sense of Oppression; mollifies the Belly, and the Breast; is a Demulcent of the natural Heat, especially if the Powder of it is suffered to freeze in Water in the Winter Season; provokes Urine; and cleanses all the Passages.

C. Bauhine, I know not upon whose Authority, writes, that the *Indians*, from an excessive Use of this Grain in Food, become tumid, and affected with the Scabies; and that the Negro Boys, who often feed on this sort of Corn, which they beat out of the Ears, instead of Bread, washing and parching it, can never preserve themselves clean from the Scabies, on account of this Grain, which generates Blood too hot, and, in a manner, adust. The manner of making Bread and Wine of *Mays*, by the *Indians*, is described *Histor. C. B. Lib.* 1. The Meal is of Service in emollient and suppurating Cataplasms; for, by its Viscidity, it obstructs the Pores, and is very proper for suppurating Impostumes. The Juice of the fresh Leaves has a refrigerating Quality, and is good for an Erysipelas, if Cloths be moistened with it, and apply'd to the Part affected. *Raii Hist. Plant.* 1250.

Mays is nutritious like Wheat, but somewhat heavier, and with more Difficulty raised into a Fermentation, for which Reason the Peasants in *France* usually roast, or parch it, by which means it loses its Viscidity; it is very aperitive, and therefore proper in the nephritic Colic. *Hist. Plant. adscript. Boerhaav.* Dale says, it is used in the making of Chocolate.

2. Mays; granis rubris. *T.* 531.

3. Mays; granis albis. *T.* 531. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 16.

MAZA, μάζα, a Greek Word, for which there is no Latin one, unless it may be expounded by Offa from *Pliny*. *Maza* was made of the Meal of parched Barley, sprinkled with some Liquid, and was the Food of the antient sort of People, being eaten crude with *Bafrutum*, or Honey, as we are informed by *Aetius* and *Athenæus*. *Erotian in Hippoc.* says, that *Maza* is the Meal of parched Barley, wetted up with some Liquid; as *Oxymel*, *Posca*, *Hydromel*, or Water. It is certain, that *Maza* was a more ordinary Food than Bread, because it was made of Barley, and the eater of Wheat, as *Hippocrates* writes. *Lib. de prisca Medicina*; and the same Author, almost every-where opposes Ἄρτος, Bread, to μάζα, *Maza*; particularly, *Lib. de Salubri Dieta*, where

he adviſes, in the Spring, to exchange Bread, which was moſt proper in the Winter, for *Maza*, as a ſofter and leſs nutritious Aliment; and, *Lib. de priſca Medicina*, he conſiders Bread and *Maza*, in reſpect of Diet, the former as the drier, the other as the moiſter Food.

Maza atriptos, μάζα ἄτριπτος, in *Hippocrates*, is Barley-meal, work'd up with little or no Liquid, *Maza* not work'd at all, or leſs than it ought to be; and ſo it ſignifies in *Ariſtotle*'s Phyſical Queſtions. To this is oppoſed *Maza tripte & rante*, μάζα τριπτὴ καὶ ῥαντὴ, *Maza* work'd up or kneaded, and ſprinkled or moiſtened with ſome Liquid, as appears *Lib* 2. *de Diæta*. Μάζα τριπτὴ is *Maza* kneaded and mixed with ſome Subſtance, either actually humid, as Honey, Wine, or Oil; or dry, as Seeds, or Spices, in reſpect of which latter, it is called ξηρὰ, *xera*, dry, as in relation to the other, it is ſtyled ῥαντὴ καὶ ὑγρὴ (*rante & hygre*) ſprinkled, and moiſt.

MAZAMA. A Name of the *Cervus minor Americanus, Bezoarticus*. See BEZOAR.

MAZION, μάζιον. A Diminutive of MAZA

MEATUS. A Duct, or Paſſage. Every Canal in the Body, which conveys any Fluid, may be thus called. The auditory Paſſage is called *Meatus Auditorius*. The Euſtachian Tube is term'd *Meatus a Palato ad Aurem*. The Urethra is called the *Meatus Urinarius*. And the *Meatus Cyſticus* is the Duct which conveys the Bile from the Gall-bladder towards the *Duodenum*.

MECAPATLI. *Hernandez* mentions four Species of *Sarſaparilla*, the firſt of which is called *Mecapatli*. See SARSAPARILLA.

MECAXOCHITL. Offic. Hern. 144. & 873. Nieremb. 320. Raii Hiſt. 2. 1671. Laet. 231. *Piper longum humilius fructu e ſummitate caulis propendente*. Cat. Jamaic. 45. Hiſt. 1. 136. *Saururus humilis folio carnoſo ſubrotundo*. Plum. 53. Fig. 70. Raii Hiſt. 3. 643. *Arbor Piperifera fructu longo Floridana*. Jonſ. Dendr. 180. *Arum moſchatum Ophioglosſoides ſive pene nudo, Jamaicenſe; an melius Ophioglosſum moſchatum Jamaicenſe Limonii foliis in extremo ſinuatis?* Almag. 51. SMALL AMERICAN LONG PEPPER.

It is deſcribed by *Fr. Hernandez* as a twining Herb, two Spans in Length, creeping on the Ground, with large fat and roundiſh Leaves, ſweet-ſcented, and of an acrimonious Taſte; the Stalks round, ſmooth, and twiſted, whence ariſe ſmooth Pedicles, which creep on the Ground. At the Origin of each Leaf grow fibrous Roots, like Filaments; the Fruit is very like long Pepper.

Mecaxochitl is hot and dry, and may be reckon'd as a Species of Long-pepper. It is drank with Chocolate, to which it gives a grateful Reliſh: It is corroborative; heats the Stomach, and corrects a fetid Breath; attenuates groſs and viſcid Humours; reſiſts Poiſon; is good for the Colic, and Iliac Paſſion; provokes Urine; and, being mixed with *Tlixochitl*, promotes the Menſes; expels the dead Child, and accelerates the Birth; opens Obſtructions; removes Colds, and Pains proceeding from them; and gives Relief under the Rigors of Fevers. *Raii H. P.*

It grows in *New Spain*, and is an Ingredient in Chocolate, but is rarely found in our Shops. *Dale*.

MECHANICE. Mechanics. In the laſt Age Mechanics began to be much employed for explaining the Phænomena of Health and Diſeaſes; and is ſtill much cultivated in Medicine. See the PREFACE.

MECHOACANNA ALBA. Offic. *Mechocan*. J. B. 2. 149. Ger. 723. Emac. 873. *Mechoacan Rhabarbarum album*. Chab. 120. *Bryonia Mechoacana alba*. C. B. P. 297. *Bryonia alba Peruana ſive Mechoacan*. Park. Theat. 179. *Convolvulus Americanus Mechoacan dictus*. Raii Hiſt. 1. 723. Tourn. Inſt. 84. *Jeticucu Braſilienſibus, ſeu Radix Mechoacan*. Marcg. 41. Piſ. 253. *Tacuache ſeu Radix Michuacanica*. Hern. 164. WHITE MECHOACAN.

Though this is called Bryony by *C. Bauhine* and *Parkinſon*, they being led into that Miſtake by *Monardus*, who calls it ſo; yet ſince their Time it has been found to be a *Convolvulus*; Mr. *Ray* calling it *Convolvulus Americanus Mechoacan dictus*. It has long, ſlender, trailing Branches, twiſting about every thing like the great Convolvulus, with large Leaves not much unlike that, but rounder pointed at the Ends next the Stalk. The Flowers, likewiſe, are much alike, being white, with a little Redneſs on the Outſide; the Root is large, brown outwardly, and white within; uſually parted in two towards the Bottom. It grows in the *Spaniſh Weſt Indies*, from whence the Root is brought to us, in large, round, flat, tranſverſe Slices, of a white Colour, having little Smell or Taſte, eaſy to cut or powder, being not ſo firm and hard as Jalap.

It purges ſerous Humours from all Parts of the Body; and helps the Dropſy, Jaundice, and Rheumatiſm, working with a great deal of Gentleneſs, and without Griping, and therefore it is fit for weakly tender Conſtitutions: But by reaſon that a larger Quantity muſt be given, than moſt People are willing to take, it is grown very much out of Uſe. *Miller's Bot. Off.*

This Root is diſtinguiſhed from Bryony-root, by being more viſcid, being without Acrimony, and of a faint nauſeous Taſte. It is ſaid to be a ſtrengthening Purge, being given in Subſtance from half a Dram to an Ounce; but is not purgative in Decoction. The *Spaniards* prepare from it a white Fecula, called by them *Lac Mechoacanna*, half an Ounce of which is a Doſe, powdered and mixed in Broth. *Geoff.*

Mechoacan took its Name from the Country where it was firſt diſcover'd, tho' it was afterwards found in ſeveral other Parts of *South America*, as *Nicaragua*, *Quito*, and *Braſil*.

It purges pituitous, aqueous, and ſerous Humours from all Parts of the Body, and eſpecially from the Head, and nervous Syſtem, and from the Breaſt. It works, alſo, upon Bile, and purges the yellow Water of hydropic Patients; by which very thing we may know, ſays *C. Hoffman*, that it is no ſuch gentle Cathartic. It is of very good Service in an inveterate Cough, the Colic, Gout, and Lues Venerea; but becauſe it is of an hot and dry Nature. *Schroder* adviſes not to continue the Uſe of it for any conſiderable Time in hot Conſtitutions. It is hardly ever taken but in Subſtance, as in Powder, in ſome proper Liquor, generally Wine, though it may, alſo, be taken in Broth. It is never exhibited in Decoction, for it is found by Experience to loſe all its Strength and Virtue in ſuch a Preparation. The Liquor is not to be exhibited by itſelf, but in Conjunction with the infuſed Powder, though *C. Hoffman* writes, that the Liquor taken alone is a Purge. It is not to be kept in Powder; for in this, as in other Powders, the Strength eaſily exhales; the Powder is to be ſomewhat groſs; the Doſe is from half a Dram to a Dram, or two Drams; it is corrected with a third Part of Cinnamon, Aniſe, or Maſtich. Chuſe your *Mechoacan* freſh, whitiſh on the Inſide, but not of a ſplendid White, and covered with an Aſh-colour'd, and not carious Bark. *Raii H. P.*

MECON, μήκων. The *Greek* Name for the *Papaver*, or Poppy.

MECONIUM, μηκώνιον. The concreted Juice of the Poppy, in which Senſe it is the ſame as *Opium*. *Galen de S. F. & de C. M. P. G.* Some, who pretend to more Accuracy, make Opium to be a Tear diſtilling from the Heads of the Poppy, after a ſlight Inciſion; but *Meconium* they will have to be the expreſſed Juice of the Heads and Leaves, or of the whole Plant, which is, therefore, leſs valuable and efficacious than Opium. *Dioſcorid. Pliny, Rhodius ad Scribon. Schroder.* See DIACODIUM.

Meconium is, alſo, a Name for the Excrements contained in the Inteſtines of the Child, after the Birth. See INFANS.

MEDEA. The Name of a Compoſition prepared of Sulphur and humid Bitumen, which, rubbed on the Body, kindles by the Acceſſion of Heat. *Galen de Temper.* It is, alſo, the Name of a Gem, ſo called, becauſe it is ſuppoſed to be the firſt diſcovered by the famous Sorcereſs of that Name; but perhaps it would be more properly called *Lapis Medius*, becauſe brought out of *Media*. It is black, with a Gold-coloured Vein; and yields a Juice of the Colour of Saffron, and the Taſte of Wine; and is commended, eſpecially by the *Magi*, as a Preſervative againſt Drunkenneſs, and a Procurer of Love. *Rulandus* takes it to be a Species of the *Hæmatites niger*, which yields a Saffron-colour'd Juice. The *Medea* is, alſo, found in the Territory of *Mansfeld* in *Germany*, which yields the *Hæmatites niger*, but the Veins are rather of a pale than a Gold-colour. *Pliny* mentions the *Medea*, *Lib.* 37. *Cap.* 10.

MEDENA, in *Paracelſus*, is a Species of Ulcer.

According to *Caſtellus*, *Vena Medena* is the ſame as *Vena Medinenſis*. See DRACUNCULI.

MEDIANA VENA. A remarkable Vein on the Inſide of the Flexure of the Cubit, betwixt the Cephalic, and Baſilic Veins, which is frequently opened in Phlebotomy. See VENA.

MEDIASTINUM, or, as it is ſometimes called, MEDIANUM. This is a double Membrane, formed by the Continuation of the Pleura, which comes from the Sternum, and goes ſtraight down through the Middle of the Thorax to the Vertebræ, dividing the Cavity in two. It contains, in its Duplicature, the Heart; in its Pericardium, the Vena Cava, the Oeſophagus, and ſtomachic Nerves. For a farther Deſcription of the *Mediaſtinum*, ſee PLEURA.

Dr. *Freind* remarks, that the *Mediaſtinum* has a Cavity; at leaſt as it riſes from the Sternum, its two Membranes lie at ſuch a Diſtance, that it is capable of having an Humour or Pus fall down between them, as *Columbus* firſt obſerved, and which he and *Barbette*, order to be taken out by trepanning the Sternum. A Gentleman of Experience and Judgment in every thing relating to Surgery, informed Dr. *Freind*, that Abſceſſes of the Mediaſtinum particularly happen in Venereal Diſtempers, and that in ſuch Caſes he had frequently uſed the Trepan with Succeſs.

Avenzoar gives a very ſingular Caſe of his own, an Inflammation and Abſceſs in the *Mediaſtinum*. Upon his firſt Diſorder, which happened in a Journey, he felt ſome Pain in that Place, which increaſed with a Cough; he found his Pulſe very hard, and his Fever very acute. The fourth Night he took away a Pint of Blood. His Symptoms were but little relieved; however, as he was obliged to travel all Day, he fell aſleep at Night; and during that time the Bandage of the Arm came off. Upon waking he found the Bed ſwimming with Blood, and his Strength very much weakened. The next Day he began to expectorate a ſanious Matter; and though afterwards he grew

delirious, and large Quantities of Barley-water, as he had beforehand ordered himſelf, were given him, yet he attributes his Cure to the great Evacuation of Blood, which he had. The Symptoms in this Sort of Abſceſs, in general, he ſays, are a continual ſucceſſive Cough; a tenſive Pain Lengthways, a Diſorder in Breathing, which makes it frequent and ſmall; an acute Fever; a great Thirſt, and a hard unequal Pulſe. Therefore Bleeding, in the Beginning, is abſolutely neceſſary.

MEDICA.

The Characters are;

The Fruit is a Pod, which is bent and crooked like a Ram's Horn.

Boerhaave mentions ſix Species of this Plant; which are,

1. Medica; major; erectior; floribus purpuraſcentibus. *J. B.* 2. 382. *Raii Hiſt.* 1. 960. *Tourn. Inſt.* 410. *Boerh. Ind. A.* 2. 35. *Medica.* Offic. *Trifolium Burgundicum.* Ger. 1020. Emac. 1189. *Falcata ſiliqua cornuta ſive Medica.* C. B. P. *Fœnum Burgundiacum ſive Medica legitima.* Park. Theat. 1113. MEDIC-FODDER.

Medica is ſo called, as *Pliny* ſays, from *Media*, becauſe it was brought from thence into *Greece*, in the Time of the *Perſian* Invaſion, under *Darius Hyſtaſpis*.

It grows not only ſpontaneouſly in ſeveral Parts of *Spain*, but is, alſo, carefully cultivated for the Uſe of Cattle eſpecially, inſtead of common Hay, becauſe it is ſo fruitful as to yield ſeveral Crops in a Year. The *French* call it *St. Foin*, and *Foin de Bourgogne*; and in the Southern Parts of *France* they ſow their water'd Meadows with it, and mow it three times every Year, the Root being perennial, and retaining its Fertility: It delights in a fat and well-manured Soil, as the *Onobrychis*, on the contrary, does in a dry and gritty, or ſandy one. In *Spain*, where it is conſtantly uſed, it is found, by Experience, to nouriſh and fatten Cattle, and improve them far beyond any other Fodder, dry or green; but it muſt be given them with Moderation, becauſe it inflates, and generates much Blood. It fattens the Soil, and is ſo ſweet and nutritive, that it is neceſſary to reſtrain Cattle in their feeding on it, leſt they ſhould burſt, or require Bleeding. It cures moſt Diſeaſes in Cattle, and *Columella* writes, that nothing is ſo effectual towards the Cure of Mules when Hide-bound, as *Medica*. The dry Seed, ſays *Dioſcorides*, on account of its grateful Reliſh, is mixed with Salt in Pickles; the green Seed, made into a Cataplaſm, relieves thoſe who want Refrigeration.

2. Eadem (1) flore cæruleo.
3. Eadem (1) flore violaceo.
4. Eadem (1) flore fuſco.
5. Eadem (1) flore viridi.
6. Eadem (1) flore ex luteo & violaceo miſto. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 34.

Beſides the foregoing Species of *Medica*, *Boerhaave* mentions twenty-two other Sorts, with a cochleated Fruit, none of which have particular medicinal Virtues aſcribed to them, at preſent, that I know of.

MEDICAGO.

The Characters are;

The Fruit is flat, orbiculated, and, as it were, full of Seeds, which are generally Kidney-ſhaped.

Boerhaave mentions three Species of this Plant; which are,

1. Medicago, trifolia; fruteſcens; incana. *Tourn. Inſt.* 412. *Boerh. Ind. A.* 2. 35. *Cytiſus.* Offic. *Cytiſus incanus ſiliquis falcatis.* C. B. P. 389. Raii Hiſt. 1. 973. *Cytiſus ſeptimus cornutus.* Ger. 1124. Emac. 1305. *Cytiſus ſiliqua incurva.* Chab. 78. *Cytiſus Galeni creditus, Maranthæ cornutus.* Park. Theat. 1471. SHRUB-TREFOIL.

It is cultivated in Gardens, and flowers in the Summer. The Leaves are uſed, which are of a refrigerating Quality, and diſcuſs Tumors. The Decoction, drank, provokes Urine. *Dioſcorides.* Of the Wood hereof the *Turks* make the Hilts of their Swords; and the *Colvieri*, or Monks of the Iſle of *Patmos*, their Beads, on which they number their Prayers.

Though the Antients have deſcribed but one Species of Cytiſus, and that in an imperfect manner, the Moderns have diſcovered a Multitude of Plants to which they give that Name; and, therefore, the Plant here propoſed is as likely to be the Cytiſus of *Dioſcorides*, as any other of them; and ſeems to claim that Name before the reſt, becauſe *Volckamer* aſſures us, that the *Turks* make ſuch Uſe of it, as was ſaid before; whence it follows, that, if it be not a Native of thoſe Countries, it is, at leaſt, well-known there. *Dale.*

2. Medicago; annua; trifolii facie. *T.* 412. *Trifolium, ſiliqua falcata.* C. B. P. 330. *Medica Lunata*, J. B. 2. 386.

3. Medicago; vulnerariæ facie; Hiſpanica. See ANTHYLLIS PRIOR. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 35.

MEDICAMENTOSUS LAPIS. This Stone is prepared in the following manner;

Pulverize, and mix together, of the Colcothar, or red Vitriol, remaining in the Retort after Diſtillation, or, if it cannot be had, of Vitriol calcined to Redneſs, two Ounces; of Litharge, Alum, and Armenian Bole, each four Ounces: Put this Mixture into a vernithed Veſſel, and pour as much good Vinegar upon it, as ariſes two Inches above the Ingredients; ſtop the Veſſel, and leave the Whole in Digeſtion, for two Days. Then add eight Ounces of Nitre, and two Ounces of Sal Ammoniac: Place the Veſſel on a Fire, and conſume the Moiſture; calcine the remaining Maſs, which will amount to eighteen Ounces two Drams, for about an Hour, over a ſtrong Fire, and preſerve it for Uſe.

This is a good Remedy for ſtopping Gonorrhœas; and the Method of uſing it for this Purpoſe is, to diſſolve a Dram of it in Plantain or Forge-water, to be injected into the Penis. It is, alſo, excellent for cleanſing the Eyes in the Small-pox; for which End, ſeven or eight Grains of it muſt be diſſolved in four Ounces of Plantain or Eyebright-water, which is to be uſed as a Collyrium. It is, alſo, proper for ſtopping Hæmorrhages, when externally applied to Wounds. When diſſolved in the Water of Knot-graſs, it produces almoſt the ſame Effects with the ſtyptic Water, and is of a vulnerary Quality.

This Stone is dignified with the pompous Epithet *Medicinal*, on account of the happy and ſurpriſing Effects it produces.

The Colcothar remaining in the Retort after the Diſtillation of Vitriol muſt neceſſarily be more proper for this Purpoſe than any other; becauſe, being deprived of the greateſt Part of its Spirits, it muſt, of courſe, be of a more aſtringent Quality.

Litharge, which is a calcined Lead, Alum, and Armenian Bole, are, alſo, very conſiderable Aſtringents, productive of happy Effects in this Compoſition.

The Vinegar is uſed in order to unite all theſe Ingredients, and make them ferment with each other; after which, the Nitre and Sal Ammoniac are eaſily mixed with the other Materials.

The laſt Calcination is in order to carry off a Part of the Acid, and augment the Aſtringency of the Medicine. It, alſo, renders the Stone of a more fixed Nature, and, conſequently, more capable of being kept.

This Medicine, among others, I have, from Experience, found proper for ſtopping Gonorrhœas, when it is expedient to do ſo by means of Injections.

In many Caſes I prefer the Lapis Medicamentoſus thus prepared, to that directed by *Crollius*, in the following manner:

Pulverize, and mix together, of Alum, nine Ounces; of green and white Vitriol, each ſix Ounces; of Anatron, one Ounce and an half; or, if that cannot be had, an equal Quantity of common Salt; of the Salts of Tartar, Wormwood, Mugwort, Succory, Arſe-ſmart, and Plantain, each two Drams: Put the Mixture in a pretty large verniſhed Earthen Veſſel; pour upon it a ſmall Quantity of the Vinegar of Roſes: Mix all well together. Put the Veſſel on a moderately brisk Fire, and the Matter will boil, and riſe in Bubbles; ſtir it frequently with a Spatula, and, when it begins to grow thick, add of the Powder of Ceruſs, three Ounces; and of the Powder of Armenian Bole, two Ounces: Mix intimately, and continue to conſume the Moiſture of the Maſs, till it aſſumes the Conſiſtence of a Stone. After which, preſerve it carefully, becauſe it eaſily admits the Moiſture of the Air.

Towards the End of this Proceſs we may add ſome Gums, ſuch as the Powders of Myrrh, and male Frankincenſe, of each half an Ounce. But, in this Caſe, there muſt only be a very gentle Fire under the Veſſel, for fear of burning the Gums, and diſſipating their Virtue, which principally conſiſts in their volatile Parts.

This Species of Lapis Medicamentoſus is of a vulnerary, detergent, drying Quality; and is uſed for the Cure of Itches, ſcald Heads, Wounds, and Ulcers; for which Purpoſes, an Ounce of it is diſſolved in a Pint of Rain or River-water, in which Linen Cloths are to be dipt, and applied to the Part affected; it is, alſo, like the former, uſed for drying Injections.

The green and white Vitriols are of the ſame Virtues, and produce the ſame Effects, in this Preparation; for which Reaſon either may be uſed without the other.

There is, alſo, another Species of Lapis Medicamentoſus, commonly called *Lapis Philoſophorum*, and prepared in the following manner:

Pulverize, and mix together, of Roch-alum, and *Roman* Vitriol, each twelve Ounces; of Ceruſs, and white Bole, each two Ounces; of the Salt of Tartar, one Ounce; of Camphire, and male Frankincenſe, each two Drams. Put the Mixture in an Earthen Veſſel; pour upon it ſix Ounces of Vinegar, agitating it with a Spatula. Place the Veſſel over a gentle Fire, and ſuffer the Matter to be indurated to the Conſiſtence of a Stone.

This

This Preparation is detergent, drying, and proper for curing Ulcers. An Ounce of it, powdered, is to be infused in twelve Ounces of White-wine, and Plantain-water; and, after the Infusion is filtrated, small Linen Cloths are to be dipt in it, and applied to the Part affected. *Lemery Cours de Chymie.*

MEDICAMENTUM. A Medicine.

MEDICINA. Medicine. See the PREFACE.

MEDICINALES DIES are those Days, in Fevers, which are neither critical, nor indicatory; and on which it is proper to administer Remedies of Importance, and to evacuate.

MEDI COCTIO. A sort of medicated Apomeli, described by *N. Myrepsus, Sect.* 34. *Cap.* 20.

MEDICON. The Name of a poisonous Composition; the same as PHARICUM; which see.

MEDICUS. A Physician.

MEDI MALAGMA. The Name of a Malagma described by *Celsus, Lib.* 5. *Cap.* 18.

MEDIMNUS, μέδιμνος. A *Greek* or *Attic* Measure of Capacity for things dry, such as Wheat, Barley, Flour, and the like; it contained forty-eight Chœnices, that is, about four Pecks six Pints, *English* Measure. *Arbuthnot.*

MEDITULLIUM, is used sometimes to express the spongy Substance contained betwixt the two Tables of the Cranium, otherwise called *Diploe:* And sometimes it imports the Pith of Vegetables.

MEDIUM. See CAMPANULA.

MEDO. Mead, or Hydromel. *Castellus.*

MEDULLA, in Anatomy, has various Significations. Thus the white Substance of the Brain is called the *Medulla*, or medullary Part thereof, to distinguish it from the cortical Part; and the spinal Marrow is called the *Medulla Spinalis*. See CEREBRUM. But, properly, *Medulla* imports the Marrow of the Bones. See Os. In Pharmacy the Marrows of many Animals are recommended as Medicines: Thus *Schroder* takes notice of the Marrow of the Ox, the Dog, the Stag, the Horse, the Goat, the Kid, the Sheep, and the Calf. *Dioscorides, Lib.* 2. *Cap.* 95. informs us, that the best Marrow is that of the Stag; next to which is that of a Calf; and after them, in Order, are those of the Bull, Goat, and Sheep. The best Time for collecting Marrows is towards Autumn; for at other Seasons of the Year they appear bloody, and are found to be brittle like Flesh. This is an Observation not so easy to be made, and obvious to none but those who make it their Business to extract them from the Bones, and reserve them for Use.

All Marrows are mollifying, rarefying, give Relief by Friction under Lassitudes, and incarnate Ulcers. The Marrow of a Stag, rubbed on any Part, preserves it from the Bites of venomous Beasts. The Way of curing it, when taken fresh out of the Bones, is the same as for Fat; for first they work it in Water, then strain it through a Linen Cloth, and repeat the Operation till the Water appears pure. After this, they melt it *in Diplomate*, (a double Vessel), taking off the Scum with a Feather; and pour it into a Mortar, where, suffering it to cool, they carefully take away the Fæces, which had subsided to the Bottom, and reposite it in a new Earthen Vessel. If you think fit to reserve it uncured, you are to take exactly the same Method as directed for the Fat of Hens and Geese.

MEELCAGE. See AGE VITA.

MEERN. The Name of a Species of *Indian* Reed, the same as CANNACORUS.

MEGALEION, μεγαλεῖον. The Name of an Unguent described by *Dioscorides, Lib.* 1. *Cap.* 69. as different from the Mendesium; though *Galen* says, they are the same, in his Treatise *de C. M. S. L. Cap.* 2. *Lib.* 2.

MEGALOSPLANCHNOS, μεγαλόσπλαγχνος, from μέγας, great, and σπλάγχνον, a Bowel, in *Hippocrates*, is one who has large and tumefy'd Viscera, through some preternatural Affection, as a Schirrhus, œdematous Tumor, or an Inflammation, and especially the last. Thus, 3 *Epid. Stat. pest. Ægr.* 13. *Apollonius* of *Abdera*, who, after a long and obstinate Pain of the Liver, was at length seized with an Inflammation of that Part, is said to be μεγαλόσπλαγχνος. And, *Lib. de R. V. I. A.* Hydromel is pronounced to be prejudicial to bilious Persons, and μεγαλοσπλάγχνοισι, that is, to such as labour under an Inflammation of some one of the Viscera; for so *Galen* expounds the Word; "For, "says he, in this Place, the common Name (μεγαλόσπλαγχνος) "is appropriated to those who labour under an Inflammation; "since the Fever is not excited by a Scirrhus, or Oedema. It "is certain then, that in acute Diseases, of which he is now "treating, if a Tumor should arise in the Viscera, it can be no "Symptom of a Scirrhus, or Oedema, but of an Inflammation, and the Patient in that Case is called *Megalosplanchnus.*" *Erotian* gives the same Explication of the Word, expounding it of one who has the Viscera tumefy'd by an Inflammation. In much the same Sense is the Spleen, in several Places, said, by *Hippocrates*, to be μέγας, great, when it is tumefied or inflamed; and μέγα ὑποχόνδριον, "A great Hypochondrium," 6 *Epid. Sect.* 2. *Aph.* 28. is one affected with an Inflammation. In a different and metaphorical Sense, *Megalosplanchnus* is applied to a Person of great Generosity and Virtue; agreeably to which μεγαλόσπλαγχνος, in *Euripides*, is called μεγαλόψυχος, magnanimous; and, with the Antients, the Word frequently signified, one of large and robust Viscera, and qualified, above the common measure, for the Discharge of all bodily Functions. Again, the Term is applied to such Things as cause a Tumefaction of the Viscera; thus, *Lib. de R. V. I. A.* sweet Wine is said to be μεγαλόσπλαγχνος of the Spleen and Liver, that is, tumefactive of those Parts, by the Slowness of its Passage causing Obstructions, and so producing a Tumor and Distension of those Viscera.

MEL. Honey.

Theophrastus distinguishes Honey into three Kinds; the first is, that which the Bees make from Flowers; the second descends from the Air, when, for Instance, a certain Liquor, raised from the Earth, falls down upon it again, after having been concocted by the Sun; the third, which he called μέλι καλάμινον, or Honey of Reeds, is Sugar. *Hippocrates* mentions a Species of Honey, which he calls κέδρινον μέλι, or Honey of Cedar. Some are of Opinion, that this was a sort of Manna produced by the Cedar-tree: But *Salmasius* imagines, that it was rather an Oil, or an oleous Liquor, called *Honey*, because it was of the same Consistence with that Substance, which Turpentine almost is.

That Species of Honey which is produced on Mount *Hymettus*, in *Attica*, and derives its Name from that Mountain, is of all others the best. Next to that, is the Honey produced in the *Cyclades*, and that found in *Sicily*, known by the Name of *Hyblæan Honey*. That Species is best, which is sweet and acrid, fragrant, of a yellowish Colour, not liquid, but glutinous and firm; and which, when handled, is so viscid, as, when drawn out, to shrink back to the Fingers. This Substance is of an abstergent Quality, opens the Mouths of the Vessels, and promotes an Evacuation of the Humours; for which Reason it is very proper to be instilled into sordid Ulcers, and Sinuses. When boiled, it conglutinates disjoined and separated Parts, if applied to them. An Ointment prepared of Honey, and liquid Alum, cures the Lichen: When triturated with fossile Salt, and dropt into the Ears, it is good for Ringings and Pains thereof: If used by way of Ointment, it kills Lice and Nits. A Denudation of the Glans Penis, not proceeding from Circumcision, is perfectly cured, if for thirty Days, especially after Bathing, the Glans is softened with Honey: It deterges the Eyes, and, when used, either by way of an Ointment, or a Gargarism, it cures Quinseys, and Inflammations of the Throat and Tonsils: It provokes Urine, allays Coughs, and is highly beneficial to those who have been bit by Serpents, or here taken too large Quantities of the Juice of Poppy, if exhibited warm, with Oil of Roses. Honey, also, when used either as a Linctus, or a Draught, is good against the poisonous Qualities of Funguses, and the Bites of mad Dogs: But, when used crude, it inflates the Abdomen, and excites a Cough; for which Reason it is not to be used till it is sufficiently despumated. Honey produced in the Spring is best; next to which is that obtained in the Summer; but that with which the Winter furnishes us is esteemed the worst of all, because it is coarse, and produces Eruptions on the Skin.

The Honey produced in *Sardinia* is bitter, because, in that Country, the Bees principally feed on Wormwood: This Species of Honey is, however, an excellent Ointment, not only for Freckles, but, also, for other Spots of the Face. *Dioscorides, Lib.* 2. *Cap.* 10. and 11. See ÆGOLETHRON.

Honey is thought to be heating, drying, nutritive, abstergent, aperient, friendly to the Lungs, diuretic, and proper for curing Coughs, and resisting the bad Effects of Poison: When used externally, it removes Dimness of Sight, and relieves other Disorders of the Eyes.

Among the Learned it is not perfectly agreed upon, what Honey is; for some assert it to be only a sweet nectareous Juice, discharged from certain Flowers by way of Sweat. This was the Opinion of *Cardus*, who informs us, that it is well known to Country-people, who, from their Infancy to an extreme old Age, have made it their Business to investigate the Nature of Bees, that these Animals, when intending to make Honey, only deposite the Liquor collected from Flowers in their Combs; but that they by no means convey the Honey-like Dew, when it falls, to their Combs; which, says he, I myself have found to be true. Hence, though, when this Honey-like Dew falls, the Bees flock in great Numbers to it; yet this is not with a View to convey it to their Hives, but only to use it as Food, with which they often so glut themselves, as not only to become languid and inactive, but, also, to such an Excess, as to fall the Victims of their Gluttony: Hence the Country-people assert, that these Honey-like Dews are excellent Food for those Animals, but contribute nothing to the Production of Honey. But, says Mr. *Ray*, I am of a contrary Opinion; and not only I, but all those Virtuosi, who have carefully observed the Nature, Action, and whole Oeconomy of Bees, and who are more to be trusted than ordinary Country-people, who, without any Examination, generally embrace and obstinately adhere to the Opinions and Traditions of their Forefathers: For, says that learned Gentleman, with whom I agree, I have observed, that after a Fall of these Honey-like Dews, almost the whole Swarms of the Hives, leaving the smallest at Home, fly abroad, and, with surprising Industry and Expedition, load themselves with Honey, which they convey to their

reſpective Hives; going and coming as often as they can, till the Heat of the Sun has diſſipated the Dew. *Pliny*, in *Hiſt. Natural. Lib.* 16. *Cap.* 8. informs us, that the Honey-like Dews, falling from Heaven, are found in greater Quantities on the Leaves of the Oak, than on thoſe of any other Tree. And Dr. *Butler*, in his Treatiſe *de Apibus*, *Cap.* 6. tells us, that we are more indebted to the Leaves of the Oak, than thoſe of any other Tree, for the Preſervation of the Honey-like Dew, or Liquor, which deſcends from the Air, and of which the Bees make Honey. And *Theophraſtus*, in his Book *de Melle*, affirms, that the Bees make Honey of the Honey-like Dew. *Dale*.

Without entering into any long Diſpute about the Origin of Honey, I ſhall only remark two Circumſtances; one is, that Honey will taſte of the Plants from whence it is collected, as *Dioſcorides* remarks, with reſpect to the *Sardinian* Honey; and, under the Article ÆGOLETHRON, we have ſhewn from unqueſtionable Authority, that the Flowers of this Plant communicate their poiſonous Quality to the Honey which the Bees collect from them: This ſeems to render it highly probable, that Honey is a vegetable Production.

The ſecond Circumſtance is, that Honey, diſſolved in Water, ferments, and hence a vinous Spirit is generated; and this ſeems to put it beyond Diſpute, that Honey is a vegetable Subſtance; for nothing in Nature yet diſcover'd will ferment, and yield a vinous Spirit, except vegetable Subſtances.

Lemery gives the following Account of Honey.

Honey is compoſed of the moſt eſſential Subſtance of various Flowers, which the Bees extract, and convey to their Hives, as proper Nouriſhment: Theſe ſagacious Animals, having, with exquiſite Contrivance, formed ſmall hexagonal Cellulæ, in Plates of Wax, fill them with Honey, which they intend for their Winter Store.

This ſweet Subſtance diſcovers itſelf in ſeveral Species of Flowers, ſuch as thoſe of common Trefoil, Roſes, and Gilly-flowers; for if we chew theſe, eſpecially their inferior Parts, called the *Ungues*, contained in the Calyx, we perceive a ſweet and agreeable Taſte: This Subſtance, in the Bee, and in the Hive, is ſo elaborated, as to render it perfect, and reduce it to Honey.

Four Circumſtances principally contribute to render Honey good: Firſt, The Warmth and Purity of the Air; for it is obſervable, that the Honey produced in hot Climates, ſuch as *Languedoc* and *Dauphiny*, is generally better than that furniſhed in colder Countries. It is, alſo, remarkable, that all the Places in the ſame Country are not productive of equally good Honey; ſince a Mountain, for Inſtance, on one of its Sides, or Declivities, furniſhes far better Honey, than can be found in any other Part of it. But this Difference is, probably, occaſioned by the different Situations, with reſpect to the Influence of the Sun.

Secondly, The Goodneſs of Honey depends upon the Bees, according as they are more or leſs tame, and of the domeſtic Kind; for ſometimes wild Bees take Poſſeſſion of Hives.

Thirdly, The Goodneſs of Honey depends upon the Paſturage of the Bees; for, according to the Nature and Efficacy of the Plants they ſuck, ſo they produce an Honey more or leſs good and fragrant. We, alſo, obſerve that the Places moſt proper for producing good Honey, are thoſe of the mountainous Kind, ſhelter'd from the North Wind, and expoſed to the Eaſt, or South, becauſe in ſuch Places the Bees find Plants of a more aromatic, ſtrong, and efficacious Nature than elſewhere. Beſides, in ſuch Retreats, theſe Animals live with more Tranquillity, than in the Plains.

The Flowers moſt proper for the Production of Honey, are thoſe of Roſemary, Thyme, Lavender, Primroſes, Violets, Marjoram, Baſilicon, Baum, Sage, Roſa-ſolis, Penny-royal, Betony, Gilly-flowers, Marigolds, Lily of the Valley, Roſes, and the *Egyptian* Thorn.

In the fourth Place, The Goodneſs of Honey depends on the Method of preparing it, after it is taken from the Hives; for ſometimes, according to the Management, the Honey produced in one and the ſame Stove is more or leſs beautiful and fine.

Honey may be taken from the Hive at two Seaſons of the Year, that is, the Spring and Autumn. But though Authors are of different Opinions with reſpect to the Choice of theſe different Seaſons, yet the Spring, to me, ſeems to be the moſt proper, for the following Reaſons; firſt, At this time the Bees are in their greateſt Vigour, ſince they then quit the Hive, take Flight, and form new Colonies. Secondly, In the Spring the Bees ſip the Dews, which fall copiouſly in the Month of *April* and *May*, and eſpecially in hot Climates, where, in ſoft and ſerene Weather, this Dew is condenſed, on the Leaves of the Trees, into Grains as large as Coriander-ſeeds, and which are of a ſweet and agreeable Taſte; this is what is commonly called the *Manna of Briançon*. Thirdly, The Spring is preferable, on account of the Goodneſs and Purity of the Juices of the Plants at the Renovation of the Heat.

There are two Kinds of Honey, one of a white, and another of a yellow Colour; the former is extracted without Fire, by laying the Plates of Wax, full of new-made Honey, upon Twigs of Ozier, or putting them into Table-cloths whoſe four Corners are tied to four Supporters, with proper Veſſels under them; by which means there flows from theſe Cakes, or Plates, of Wax, an excellent, white, and beautiful Honey, which coagulates, and is commonly called *Virgin Honey*.

This Species of Honey may, alſo, be obtained from the Cakes of Wax by Expreſſion; but, when procured in this manner, it is not ſo beautiful as the former.

The yellow Honey is extracted from all kinds of Combs found in the Hive, whether new or old, provided they are full of Honey. The Method of obtaining it, is, firſt, to ſqueeze the Combs, and warm them with Water. Then, wrapping them up in Bags of thin Linen, they are ſubjected to the Preſs, in order to have the Honey ſqueezed out; the Wax, in the mean time, remains in the Bags, though ſome ſmall Portions of it always paſs thro' them, as we afterwards find in diſtilling the Honey.

The yellow Honey is moſt common, and prepared moſt univerſally. It ought to be new, concreted, and of a pretty thick Conſiſtence, of a yellowiſh Gold-colour, and of an agreeable Smell. In this Species of Honey the Alchymiſts ſearch for Gold, on account of its Colour, which, in ſome meaſure, reſembles that of this Metal. They, alſo, ſuppoſe, that in this Species of Honey they muſt neceſſarily find a large Quantity of Univerſal Spirit, becauſe it is drawn from Flowers, in which, they imagine, this Spirit is more copiouſly concentrated than any-where elſe.

The White or Virgin Honey is pectoral, excites Expectoration, aſſiſts Tranſpiration, reſtores and confirms the Strength, and renders the Body ſoluble.

The yellow Honey is of a detergent, laxative, digeſtive, attenuating, and reſolvent Quality.

PROCESSES UPON HONEY, FROM *LEMERY*.

Diſtillation of Honey.

Put four Pounds of good Honey into a large Earthen Cucurbit; diſtil the Moiſture from it by a moderate Sand-heat, till acid Drops begin to be diſcharged. Then remove the Fire, and preſerve this Water in a Bottle.

It will amount to twenty-five Ounces, be of a yellowiſh Colour, of a pretty agreeable Smell reſembling that of Honey, and of a ſomewhat acid Taſte. It is cordial, pectoral, aperient, and makes Nurſes loſe their Milk, if they drink two Ounces of it twice or thrice a Day: It is, alſo, good for making the Hairs grow, if the Combs uſed are moiſtened with it every Day, or a ſmall Quantity of it be put about the Roots of the Hairs, by means of a Piece of Sponge.

Take the Matter remaining in the Cucurbit, and put it in an Earthen or Glaſs Retort luted, and of which two Thirds remain empty. Then place your Retort in a reverberatory Furnace; adapt to it a large Receiver, and lute the Junctures carefully. Begin the Diſtillation by a gentle Fire, for three Hours, in order to warm the Retort; augment the Fire by little and little, and the Spirit of Honey, together with a ſmall Quantity of black Oil, will come over, in the Form of Clouds, which fill the Receiver. Continue the Fire till nothing more is yielded. Take off the Luting of the Veſſels, and, by means of a Funnel lined with filtrating Paper, ſeparate the Spirit from the black and fetid Oil, of which there will be only a ſmall Quantity. Preſerve both the Spirit and Oil in Phials.

You will have twelve Ounces of a dark-red-coloured Spirit, which deeply tinges the Fingers with an Orange-colour, not to be effaced ſooner than eight or nine Days, and of an highly empyreumatic Smell, tho' not very diſagreeable, and of an acid, ſharp, and pungent Taſte.

This Spirit is an excellent Aperient, and may be put into Julaps, in ſo large a Quantity, as to render them very acid.

The Spirit may be rectified, by diſtilling it with a Sand-heat from a Glaſs Cucurbit, and by keeping that which aſcends laſt, by itſelf, as the moſt ſtrong and efficacious. It is uſed to cleanſe old Ulcers, and conſume fungous and luxuriant Fleſh.

The Oil is accounted good for a Caries of the Bones.

There will remain in the Retort twenty-ſix Ounces of a Matter, which is black, highly ſpongious, and inflammable in conſequence of the fuliginous Subſtance remaining in it. If this Matter is ſubjected to Calcination in an Earthen Veſſel over a brisk Fire, it is, at firſt, kindled, like an ordinary Coal; but is not, like that, reduced to Aſhes; for it will preſerve both its Form and Colour, and only loſe five or ſix Ounces by a Calcination protracted for ten Hours. This Matter, when calcined, acquires a ſomewhat ſaline Taſte; and, if Water is poured upon it, it ferments almoſt like Quick-lime. It is manifeſtly of an alcaline Quality, ſince it produces an Effervescence with Acids.

From this calcined Caput Mortuum of Honey, we may, by Lixivaition and Evaporation, obtain a Dram and an half of a fixed, alcaline, acrid, and penetrating Salt, which is of an aperient Quality, and proper for reſolving and attenuating viſcid Humours. The Doſe of it is from half a Scruple to two Scruples. *Boerhaave*,

Boerhaave, however, ſeems to ſay, that a fixed Salt cannot be obtain'd from the Caput Mortuum of Honey.

Very large Veſſels are neceſſary for the Diſtillation of Honey, becauſe it requires a great deal of empty Space for its Rarefaction.

The Water firſt obtained is call'd Dew of Honey, and is generally diſtilled by means of a Vapour-bath. It is clear like common Water, ſmells like Honey, and is inſipid to the Taſte, though, at the ſame time, it contains an Acid, for it renders Turnſole red. It is highly eſteemed, and much uſed by Chymiſts, becauſe they imagine it full of an univerſal Spirit, capable of contributing to the Generation of Gold. I could never diſcover any other Virtues in it than thoſe of the common Water of Honey, than which it, alſo, operates more weakly.

The Water of Honey makes the Hairs grow, becauſe it opens the Pores: For this Purpoſe, ſome mix the Juice of an Onion with it, and diſſolve in it a little of the Dung of Mice, in order to render it more efficacious.

Sometimes we find in the Receiver a ſmall Quantity of Wax, ſeparated from the Honey, with the Spirit, in Diſtillation. But if the Honey uſed is pure, no Wax will be found.

Honey contains a great deal more Oil than is ſeparated from it by Diſtillation, ſince a Portion of the Oil always remains intimately mixed with the Water and the Spirit; for if theſe two diſtil'd Liquors are ſuffered to remain in a State of Reſt for ſome Months, a ſmall Quantity of Oil is precipitated to the Bottom, and ſome Portion, alſo, adheres to the Sides of the Veſſel; for the Oil which ſubſides is rendered heavy by the Salts with which the Fire mixes it; and that which adheres to the Sides of the Veſſel grea ly reſembles Tartar, not only in the Figure and Diſpoſition of its Parts, but, alſo, in its acid Taſte.

The Spirit of Honey, when rectified, is entirely clear, but ſomewhat yellow; its Smell is empyreumatic, and diſagreeable; its Taſte loſes ſomewhat of its Acrimony. And this is what we call the Spirit, or Acid, of rectified Honey.

We find in the Bottom of the Cucurbit uſed in rectifying the Spirit of Honey, a tartarous Matter, of a black Colour, an empyreumatic Smell, and of an acid penetrating Taſte. This Matter is good againſt Aphthæ, or ſmall Ulcers, formed in the Mouth. It is, alſo, proper for deterging Wounds, and reſiſting a Gangrene; and is, properly ſpeaking, a Tartar of the Spirit of Honey already mentioned. If the rectified Spirit of Honey is put in Digeſtion with Leaf-gold, it diſſolves a ſmall Portion of that Metal, but wi hout producing any ſenſible Effervеſcence. It, alſo, diſſolves Iron, Lead, and Silver.

The Coal, or black Matter, taken from the Retort after the laſt Diſtillation of Honey, is almoſt inſipid; but, when chew'd, gives ſome faint Indications of Salt, perceptible to the Taſte. If, after the firſt Calcination, and a Separation of the Salt by Lixiviation, we dry it, and repeat the Calcination, it takes Fire as before, and is not reduced to Aſhes, but is no more alcaline, but inſipid, and yields no more Salt.

If we lay upon a Paper a ſmall Quantity of this Coal, reduced to a groſs Powder, and either hold a Knife, touch'd with a Load-ſtone, ſufficiently near it, or gently move the Powder with the Knife, we forthwith perceive a great many Particles of the Coal attracted by the Knife, and adhering to it, in the ſame manner as Filings of Iron do to a Load-ſtone. This Experiment ſhews, that the Coal of Honey contains a certain Portion of Iron, ſince we have not hitherto diſcovered any Matter capable of being attracted by the Load-ſtone, beſides Iron. See the *Memoires de l'Acad. Royale des Sciences*, for the Year 1706.

Though Honey, in its natural State, is poſſeſs'd of an highly ſweet Taſte, yet none of its Principles, when ſeparated, retain that Reliſh of it; on the contrary, we find only theſe Principles to be acid, acrid, or ſaline, whilſt the other Parts are inſipid, and the natural Taſte of the Honey loſt. It is, alſo, impoſſible ſo to remix theſe Principles, as again to produce a ſweet Taſte; for, in order to this, there muſt be a very exact Mixture of the Acid with the Oil, or the Sulphur. The Oil alone is vapid, and paſſes over the Nerves of the Tongue, without making any Impreſſion upon them. The Acid, on the contrary, in ſome meaſure, ſtimulates and irritates theſe Nerves, ſubſervient to Taſte. But, when theſe two Subſtances are united and combined, the Particles of the Oil ſo embrace the acid Particles, as, in ſome meaſure, to abſorb them, and prevent their exciting the ſame Irritation; however, they ſtill irritate enough to give a gently penetrating Quality to the Oil, which is their Vehicle, and produce upon the Nerves ſubſervient to Taſte, the agreeable Senſation we call Sweetneſs. This Reaſoning is agreeable to what is obſerv'd in a great many Experiments; for from all ſweet Subſtances we obtain, by Diſtillation, an Acid, and an Oil; and thoſe Principles being diſunited and ſeparated, there no longer remains any Sweetneſs. Sweetneſs is, alſo, produced by exactly mixing an acid with a ſulphureous Matter; for, if we diſſolve Lead in Vinegar, the Solution will be ſweet. But it does not, from this, follow, that every time we mix acid Liquors with oleous or ſulphureous Subſtances, the Mixture will be ſweet, ſince daily Experience convinces us of the contrary; for, in order to produce Sweetneſs, the Acid muſt be intimately incorporated with the Oil, which is frequently done by Nature, but rarely by Art; ſince, for that Purpoſe, a certain Combination of Principles, not eaſily hit upon, is abſolutely neceſſary. *Lemery Cours de Chymie.*

Processes upon Honey, from *Boerhaave*.

Honey, diſſolved by Water, affords, by Diſtillation, a Water impregnated only with the Smell of Honey.

Take one Part of pure and perfect native Honey, and ſix Parts of pure Rain-water: Mix them well together, and diſtil them in a Glaſs Veſſel, with a moderate Fire. The riſing Vapour collects in watery Drops ſcattered upon the Inſide of the Alembic-head, without running down in Rivulets, though two Thirds of the Water be thus drawn off: Nor has this Water any vinous Odour, but only that of Honey, which often retains the Fragrance of the Flowers whence the Bees collect it. All the Water, which thus comes over, quenches Fire; and, upon drinking, proves very inſipid, without heating, or inebriating.

Remarks.

Hence we learn, that the moſt elaborate Juices of Plants, produced and perfected in the Cells of Flowers, and thence collected by the Bees, contain nothing at all of that Spirit which they afterwards yield by Fermentation: Whence we clearly ſee, that the Action of the Sun upon the Juices of Plants, ſo long as they remain therein, can never produce the requiſite Effect of a true Fermentation; and, conſequently, that pure Honey has not any heating, drying, or conſtringing Virtue, but one which is attenuating, deterging, relaxing, ſtimulating, and ſaponaceous; whence it has excellent Effects both in chirurgical and internal Caſes. For this Reaſon, ſcarce any thing was more celebrated by the antient Phyſicians than Hydromel, or a Mixture of Honey and Water, as being attenuating, aperitive, purgative, and ſtimulating, yet without Heat. Our Honey-water, however, diſtil'd in a Balneum Mariæ, receives a certain Virtue from the Spirits of the Flowers lodged in the Honey; and thence is accounted extremely uſeful in the way of Collyrium, and Fomentation, applied in Inflammations or Obſtructions of the Eyes, as being, in ſome meaſure, the Waters of the Flowers which afforded the Honey. Our preſent Proceſs, likewiſe, holds in certain freſh-expreſſed and inſpiſſated Juices of Plants, as of Manna, the Pulp of Caſſia, Sugar, and Tamarinds; which, alſo, when mix'd with Water, and treated in the ſame manner, afford no vinous Spirit. The ſame holds of other thinner Juices, as thoſe of Berries, Summer-fruits, the Birch, the Vine, and the like; which, alſo, upon Diſtillation, afford no inflammable Spirit; ſo that the Proceſs is univerſal.

Honey diluted with Water, and fermented.

Dilute Honey with ſuch a Proportion of Rain-water, that the Solution may ſupport a new-laid Egg on its Surface; this is called Hydromel. Fill an upright Cask with it, ſo as to leave the Tap-hole, which is now at the Top, open: Place the Cask ſo as to keep it conſtantly heated to ſeventy Degrees. The Liquor will ſoon begin to ferment, with all the Signs of Fermentation: Let it continue thus, till the Operation be entirely over, when the Liquor will have a ſweet ſpirituous Taſte, and is to be kept in a cloſe Veſſel, under the Title of *Mead*, or *Metheglin*.

Mead, prepared by Fermentation, according to the laſt Proceſs, affords an inflammable Spirit, and a Vinegar, by Diſtillation.

Pour a Pint of boiling Water into the Still; light up the Fire, that the Water may continue ſtrongly boiling; then pour in Mead that has been long kept in a cloſe Veſſel, leaving a third Part of the Still empty; the Fire is now to be increas'd, and the Matter kept frequently ſtirring with a Stick, to continue the Maſs well mixed. When almoſt ready to boil, clap on the Still-head, and carefully regulate the Fire ſo that the Head may grow thoroughly hot, and the Spirit may diſtil ſufficiently quick through the Worm. Thus an excellent vinous Spirit will come over, not to be diſtinguiſhed from that of real Wine; and the Time it continues to run muſt be obſerved, that this Spirit be kept ſepatate. When it is all come off, if the Receiver be changed, another watry, white, ungrateful, Liquor will follow.

Remarks.

This Proceſs affords an Example of the Diſtillation of Spirits from a fermented Liquor, together with the proper Caution required. The Remainder of the Mead, after the Spirit is drawn off, ſtill contains ſomething nutrimental; and the Caſe is the ſame in Beer. But if this Matter be artificially treated according to the Proceſs of Fermentation, (ſee Alcohol.)

it

ſt cannot be made to ferment again, but it will grow ſour and vapid, without turning vinous, ſo as to afford freſh Spirits; and thus it gradually corrupts more and more.

Processes on Honey, from *WILSON*.

Tincture of Honey.

Take a Pound of pure Virgin-honey; deſpume it in a clean Earthen Pan, and put to it three Ounces of pure Salt of Tartar (or any other fixed Salt), finely pulveriz'd: Stir them well together, and an Ebullition will ariſe; ſtay till it is over, and take of the Scum, and put the Mixture into a Cucurbit uncut, and pour upon it one Pound and an half of tartarized Spirit of Wine: Cloſe the Mouth, and ſet it in a Heat of Digeſtion forty-eight Hours. Agitate the Matter three or four times a Day, and in that time the Spirit of Wine will have charged itſelf with the pureſt Part of the Honey. Decant it from the Fæces into a new Cucurbit, lute on the Head and Receiver, and draw off one half of the Spirit of Wine in a gentle Heat. That which remains, will be a ſweet thick Tincture, being an excellent pectoral Medicine.

Its Doſe is from forty Drops, to two Drams.

Sweet Honey Water.

Take of good *French* Brandy, one Gallon; the beſt Virgin Honey, and Coriander-ſeeds, each one Pound; Cloves, one Ounce and an half; Nutmegs, one Ounce; Benjamin and Storax, each an Ounce; Benilloes, Number four; the yellow Rind of three large Lemons. Bruiſe the Cloves, Nutmegs, Coriander-ſeeds, and Benjamin; cut the Benilloes in ſmall Pieces: Put all into a Cucurbit, and pour the Brandy to them; and after they have digeſted forty-eight Hours, diſtil off the Spirit *in Balneo Mariæ*.

To one Gallon of this Water add, of Damask-roſe, and Orange Flower-water, each one Pound and an half; of *China* Musk and Ambergriſe, each five Grains: Firſt grind well the Musk and Ambergriſe, with ſome of the Water, and afterwards put all together into a large Matraſs; ſhake them well, and let them circulate three Days and Nights in a gentle Heat. Then let all cool; filtre, and keep the Water in a Phial well ſtopt for Uſe.

This Water I often made for King *James* II. It is an Antiparalytic, ſmooths the Skin, and gives one of the moſt agreeable Scents that can be ſmelt. Forty or fifty Drops, put into a Pint of clean Water, are enough to waſh the Hands or Face with; and the ſame Proportion to Punch, or any Cordial Water, gives a moſt pleaſant Flavour. *Wilſon.*

It is remarkable, that Honey was uſed by the Antients, in the Compoſition of their Antidotes and Theriacas, as in Mithridate, the *Theriaca* of *Andromachus*, commonly call'd *Venice Treacle*; and *Fracaſtorius* has follow'd their Example, in the Compoſition of his Confection, call'd *Diaſcordium*. Now, Honey I apprehend to be a very proper Ingredient in ſuch Compoſitions: For it opens the other Ingredients by fermenting; extracts, and, in ſome degree, alters their Virtues, and unites them in one common Efficacy. Beſides, Opium, and other Narcotics, which are frequently directed in the Antidotes of the Antients, are corrected by Honey; agreeable to which, is the Remark of *Dioſcorides*, that Honey relieves the Diſorders excited by taking the Juice of the Poppy. When, therefore, we make any of theſe Antidotes with *Diacodium*, a Medicine reſults from the Compoſition, of Virtues very different from thoſe of one which is made with Honey. And this deſerves the ſerious Conſideration of Phyſicians who preſcribe *Diaſcordium*, or any of the other Antidotes made with *Diacodium*.

With reſpect to Honey, one farther Remark is to be made, which is, that there is a Peculiarity in ſome Conſtitutions, which renders them incapable of bearing the leaſt Quantity of Honey, without exceſſive Gripes, Vomitings, and Uneaſineſs. And in others, it operates as a Poiſon; an Inſtance of which we find in the *Philoſophical Tranſactions*, as follows.

One Mr. *Morley*, of *Bury St. Edmunds*, in an aſthmatic Diſtemper, was adviſed by ſome to take a Spoonful of good *Engliſh* Honey; which being done, the Patient fell into an univerſal Swelling, as if he had ſwallowed the worſt of Poiſons. Mr. *Goodrick* (who is my Author) preſcribed a common Sudorific, which, in competent time, relieved him; and that they might be aſſured there was nothing amiſs in the Honey, they afterwards got the like Quantity at another Place, which was given with the very ſame frightful Event, and the Party was cured with the ſame kind of Sweat.

The like Example has been more than once related to me by a noble Lady in *Ireland*, who having received a ſmall Hurt on her Leg, and the Surgeon (unknown to her) mingling, in the Application to be made to it, a little Honey, (for which ſhe had an utter Averſion) the Place affected ſoon after rankled and grew ſo bad, that the Lady was conſtrained to ſend for him, who had apply'd it, who, being acquainted with her Antipathy to Honey, immediately removed that Plaiſter, and apply'd another with good Succeſs. *Philoſ. Tranſ.*

I don't know, that Phyſicians have ever directed any Remedy for Diſorders excited by Honey; but I muſt relate what has more than once happen'd to myſelf, when I was rendered very uneaſy, and affected with ſevere Gripes, and a Diarrhœa, by too plentiful an Uſe of Honey. On theſe Occaſions I was very much inclin'd by my Appetite to eat Salt-meats, and indulged myſelf with lean Bacon broiled, from which I found conſiderable Relief. What renders this Obſervation, which has a very trifling Air, of more Importance, is, that I find *Dioſcorides*, *Aetius*, *Oribaſius*, *Paulus Ægineta*, and *Actuarius*, all recommend ſalt Aliments (ταριχη) as a Cure for Diſorders excited by the Uſe of the poiſonous Heracleotic Honey mentioned under the Article Ægolethron. I ſhould imagine, alſo, that copious Draughts of Chicken-water, made ſo as only juſt to taſte of the Chicken, as directed by *Sydenham* for the Cure of a *Colera*, would have a very good Effect in Gripes ariſing from the Uſe of Honey, eſpecially if, at the ſame time, Clyſters of the ſame were injected.

I ſhall end this Diſſertation on Honey, with the Character *Quincy* gives of it as a Medicine; firſt remarking, that it is a popular Remedy for the Stone and Gravel, and that not a bad one.

The medicinal Virtues of Honey, ſays *Quincy*, are many and great, inſomuch that there is no Author, from the moſt ancient Times, but makes mention of them, eſpecially from the divine *Hippocrates*, down to this Age. It is very penetrating and deterging, and is, therefore, good in all Obſtructions, eſpecially from viſcid and tough Humours. In Infarctions and Stuffing of the Breaſt, it is of great Efficacy, and wonderfully promotes Expectoration. In ſhort, there is no Diſorder from Phlegm, or any thing which is the Produce of a cold Conſtitution, in which it is not ſerviceable. But in thin and hot Habits, it is not good. It was antiently uſed as Sugar is now; and great Pity it is, that it is not at preſent more uſed. It does great Service to ſuch as are troubled in a Morning with thick tough Phlegm, with which they cannot be eaſy, until it is hawk'd up, though it gives much Difficulty and Straining to do it. For this Purpoſe, it is very conveniently eat over Night upon a Toaſt, or diſſolved in any warm Liquor. Some affirm, it will deſtroy Worms, drank in Milk. It has been much uſed in Surgery to cleanſe foul Ulcers, either by immediate Application, or waſhing them with Liquors, in which it had been diſſolved.

Mel Ægyptiacum. See Ægyptiacum Unguentum.

Mel Anthosatum. *Honey of Roſemary.*

Take of Roſemary-flowers freſh-gathered, a Pound; of clarified Honey, three Pounds: Mix them together in a Pot, and keep for Uſe.

Mel Elatines. *Honey of Paul's Betony.*

Take of the clarified Juice of Paul's Betony, and of clarified Honey, each four Pounds; and boil to a due Conſiſtence.

This was never directed before the laſt College Diſpenſatory, either by the College, or in any other Diſpenſatories, that I have met with.

Mel Helleboratum. *Honey of white Hellebore.*

Take of the Roots of white Hellebore, dry'd, and cut into Slices, one Pound; of common clear Water, fourteen Pounds: Let them infuſe together for the Space of three Days; and then leiſurely evaporate to the Conſumption of half the Quantity of Liquor; and boil up, when ſtrained, by ſtrong Expreſſion, to the Conſiſtence of Honey, with three Pounds of the fineſt white Honey.

Mel Mercuriale. See Bonus Henricus.

Mel Mororum. *Honey of Mulberries.*

Take of the Juice of Mulberries, both of the Tree and Shrub, gathered unripe, and before Sun-riſe, and depurated by ſettling, each one Pound and an half; Honey, ſtrained and deſpumated, two Pounds: Let them ſimmer together in a gentle Heat, to a due Conſiſtence.

Mel Rosatum. *Honey of Roſes.*

This is made from one Pound of the Juice or Infuſion of red Roſes, and two Pounds and an half of Honey, boiled together into a Conſiſtence.

Mel Saponis. *Honey of Soap.*

Take of common Soap and Honey, each four Ounces; Salt of Tartar, half an Ounce; Furmitory-water, two Drams: Mix them together.

This ſtands recommended as a good thing to ſcour and whiten the Skin; but it may, alſo, be put to a much more important Uſe, and will frequently do great Service in the Gout, and rheumatic Pains,

Pains, if it be well rubbed into the Part affected; but it is ſo penetrating, as ſometimes to raiſe a Biiſter, and at firſt may enrage the Pain.

For theſe Purpoſes, great Improvements may be made, with the Addition of due Quantities of Camphire and Opium.

MEL VIOLACEUM, *Honey of Violets*,

Is made altogether as the Honey of Roſes; but it is little uſed, and therefore ſeldom kept in Readineſs in the Shops. The Honey of Roſes is frequently preſcribed in Gargariſms, and, in many Intentions, as a cooling Detergent.

MELAMPODIUM. Black Hellebore, thus called from *Melampus*, the firſt Diſcoverer of its Virtues.

MELAMPYRUM.

The Characters are;

The Leaves are conjugated; the Flower is monopetalous, perſonated and bilabiated, the upper Lip being galeated, and the lower entire. The Fruit is round, bicapſular, and full of Seeds reſembling Grains of Wheat.

Boerhaave mentions two Sorts of this Plant; which are,

1. Melampyrum; comâ purpuraſcente. *C. B. P.* 234. *Raii Synop.* 3. 286. *Boerh Ind. A.* 236. *Tourn. Inſt.* 173. *Triticum vaccinum.* Offic. *Melampyrum multis, ſive Triticum vaccinum.* J. B. 3. 439. Raii Hiſt. 1. 774. *Melampyrum purpureum.* Ger. Emac. 96. *Cratæogonum flore vario.* Park. Theat. 1326. COW-WHEAT.

It is called Cow-wheat, becauſe it is grateful Fodder to Black Cattle; it is commonly found among the Corn in foreign Countries, but is not, as far as I can find, of *Engliſh* Growth. *Melampyrum*, ſays *J. Bauhine*, has hitherto been of no Uſe in Medicine, but has lain neglected. *Cluſius* writes that in thoſe Parts of *Weſt Frieſland* and *Flanders*, where it is very plentiful, it vitiates the Bread, and makes it black; and that thoſe who feed on it are moleſted with a Stuffing or Heavineſs of the Head, as if they had eaten Darnel. He has often, he ſays, obſerv'd Bread diſcolour'd with this Grain, but never found it ill-taſted, nor eſteemed the more unwholſome by the Country-people, who do not trouble themſelves to ſeparate it; and *Tabernæmontanus* aſſures us, that he often eat of this ſort of Bread, and that he found it very ſavoury, and not at all hurtful. *Raii Hiſt. Plant.*

2. Melampyrum; luteum; latifolium. *C. B. P.* 234. *Boerh. Ind. A.* 236. *Tourn. Inſt.* 173. *Cratæogonum.* Offic. *Cratæogonum album.* Ger. 84. Emac. 91. *Cratæogonum vulgare.* Park. Theat. 1326. *Melampyrum ſylvaticum flore luteo, ſive Satureia lutea ſylveſtris.* J. B. 3. 441. Raii Hiſt. 1. 775. Synop. 3. 286. WILD COW-WHEAT.

It grows in Woods, and Places adjacent, Thickets, Hedges, and ſhady Places, about the Roots of Oaks, and other old Trees, in almoſt every Country of *Europe*.

It flowers in *June* and *July*, and the Seed is in Uſe, which, as *Dioſcorides* ſays, ſtimulates to Venery.

The Name *Melampyrum* is compounded of μέλας, (*Melas*) black, and πυρὸς, (*Pyrus*) Wheat, becauſe it muſt reſemble Wheat, and is, alſo, an eſculent Grain: It is ſaid by many, that, if mixed with Wheat, it affects the Head; but this, again, is contradicted by many others. *Hiſt. Plant. aſcript. Boerhaav.*

MELANAGOGA, μελαναγωγα. Medicines which purge off black Bile.

MELANCHLOROS. μελάγχλωρος. An Epithet for certain Troches, deſcrib'd by *Paulus Ægineta*, *L.* 7. *C.* 12. And likewiſe of a Plaiſter deſcrib'd by the ſame Author, *L.* 7. *C.* 17.

MELANCHOLIA. See MANIA.

Erratic Melancholy is that Species of the Diſorder, which moſt generally ſeizes Patients in the Month of *February*. It is ſo called, becauſe thoſe who labour under it, cannot remain for an Hour in one Place, but continually wander about, without knowing where they go. It is by the *Arabians* call'd *Kutubuth*, from an Animal, which, as they inform us, perpetually moves up and down on the Surface of ſtagnant Waters.

Under erratic Melancholy, the Patients, as we have already obſerv'd, are in continual Motion, ſhun Company, love ſolitary Places, and know not whither they wander. The Colour of the Body is yellowiſh; the Tongue dry, like that of a Perſon ſcorch'd with Thirſt; the Eyes dry, hollow, and never diſcharging any Tears; the whole Body dry and parched; and the Countenance overcaſt with Gloom, Horror, and Sadneſs. Such melancholy Patients are more timorous than others; for which Reaſon they love Solitude, wander in the Night, and ſeek for Concealment about the Sepulchres of the Dead, and other ſolitary Places. They endeavour not to meet human Creatures, and, if they ſhould unexpectedly do ſo, they do not look at them, nor ſee them; which is undoubtedly owing to their unaccountable Dread and Fear, in conſequence of which they ſuſpect and ſhun every thing; or becauſe they do not advert to external Objects, ſince their Fancies are always employ'd, and their Thoughts continually dwelling on the Repreſentations of their Fancies. They ſeek after ſolitary Places, that they may not be diſturb'd in thoſe Speculations, on which their exorbitant Fancies brood; juſt as the Studious in their Senſes ſhun Company, and all thoſe other Objects, which are capable of drawing their Minds off their favourite Subject. Their Legs are generally full of Ulcers, which cannot be conſolidated, ſince by the continual Motion the peccant Humour is ſolicited to the Legs.

The Cure is almoſt the ſame with that of common Melancholy, ſince it proceeds from the ſame Cauſe, and only differs in Degree, and the Commixture of the Humours. For this Reaſon, the melancholic Humour, which affects the Spirits in the Head, and diſpoſes the Brain to the Generation of the like Spirits, is to be corrected and evacuated. Then the Head is to be corroborated, and its Intemperature reduc'd to a due State, by moiſtening and moderately heating, or rather temperate Cephalics. In this Diſeaſe copious Veneſection is uſeful, either at one Time, or repeated Intervals, as the Condition of the Patient requires. But, above all Things, Sleep is to be carefully procur'd, ſince nothing contributes more to the Removal of this Diſorder. Purgative Medicines are; alſo, to be frequently repeated. Some Phyſicians, when other Meaſures prove ineffectual, order the Patients to be laſh'd, till they forſake their wild Fancies, reſume their Reaſon, and become obedient. But I doubt whether this Practice is ſafe, ſince the Dread with which this Species of Melancholy is attended, may by this means be increas'd, and the Patient more expoſed to Danger.

The oppoſite of this erratic Melancholy is the apoplectic Melancholy; for as in the former the Patients are reſtleſs and wander about from one Place to another, ſo in the latter every Circumſtance is revers'd; for the Patients appear ſtupid, and, being apparently deſtitute of a Locomotive Faculty, ſeem to be fix'd to a particular Place. When they lie, they care not for erecting themſelves; when they ſit, they care not for riſing; and when they ſtand, they will not walk, except forc'd to it by their Friends, or the By-ſtanders. They do not ſhun Men; but, tho' they ſeem attentive to what is ſaid to them, yet they make no Anſwer to it; and, being penſive, and wrapt up in the Contemplation of other Things, they do not attend to the Objects of Sight and Touch. They ſleep and watch by Intervals, eat their Aliments when held to their Mouths, drink like other People, and in theſe and the like Things are pretty tractable, and eaſily manag'd.

Tho' this Diſorder is pretty rare, yet *Jacobus Janus* furniſhes us with a remarkable Inſtance of it in a Clergyman of about thirty Years of Age, who, having a larger Fund of Superſtition than Senſe, falſly imagined that Almighty God could never be reconcil'd to him, on account of the trifling Miſcarriages of his Youth; for which Reaſon, he thought himſelf unworthy of the Sacred Function he bore. In conſequence of this fooliſh Notion he labour'd ſo much under the fatal Influences of Deſpair for a whole Spring and Summer, that he frequently attempted to lay violent Hands, both on himſelf, and on his Wife, at which times he ſeemed to act in conſequence of a certain Paroxyſm. But in the Autumn, the Violence of his Diſorder being allay'd, he remain'd preternaturally melancholy, and could not be induc'd to ſpeak, tho' he utter'd frequent and deep Sighs. Tho' he ſeem'd chearfully to liſten to the conſolatory Diſcourſes of his Friends and Acquaintances, endeavouring to remove his Grief, and ſooth his anxious Thoughts; yet he could never be prevail'd upon to make any Anſwers to their Queſtions; tho' he was frequently heard to invoke God in a manner which teſtified Deſpair and Horror. For ſome Weeks after not a Word could be extorted from him; tho' he was often ſolicited to ſpeak. He ſlept well in the Night; and in the Morning, when he wak'd, appear'd penſive, and, as it were, immoveable in his Bed. When rais'd out of Bed, and his Clothes put on, he ſtood like a Statue, only with this Difference, that he put his Hand to his Head and Temples ſpontaneouſly. He fetch'd deep Sighs, as melancholy People do; when puſh'd forwards, and led by the Hand, he walk'd; when brought to a Chair, or Seat, he ſat down; when forc'd to ſit at Table, he took the Aliments given him by his Wife, and drank as other Perſons do, when adviſ'd to it. His Diſorder laſted during the whole Autumn, but began to be diminiſh'd about the middle of the Winter; ſo that at laſt he became capable of exerciſing his Function; tho' he remain'd dejected for a long time, becauſe he was naturally of a melancholic Habit.

The diagnoſtic Signs of this Diſorder are ſufficiently obvious from what has been ſaid. There is a great Difference between a Catoche, and apoplectic Melancholy; ſince the former generally ſeizes the Patient ſuddenly, whilſt the latter invades ſlowly. In the former, the Patient is depriv'd of Senſation and Motion; whereas, in apoplectic Melancholy, both theſe are retain'd, tho' the Patient cannot uſe his Senſes ſo quickly as ſound Perſons do; becauſe their Fancy, being employ'd on certain Objects, cannot advert to others. In a Catoche, the Patients ſometimes neither ſee, hear, nor feel; whereas in apoplectic Melancholy they do all theſe, tho' they do not teſtify in Words, that they do ſo. In a Catoche, the Patients generally have their Members retain'd in the State and Poſition they are plac'd by the By-ſtanders; whereas, in apoplectic Melancholy, the Patient is capable of moving his Members. Thoſe, alſo, who labour under a Catoche,

have their Eyes open, and cannot ſpeak, which Symptom is not obſerv'd in apoplectic Melancholy. *Sennert. Oper. Lib.* 1. *Part* 2. *Cap.* 14.

MELANDERINOS, μελανδέρινος. The Name of a Sea Fiſh, like the MELANURUS.

MELANDRYUM. A Name for the *Lychnis*; *Sylveſtris*; *quæ Been Album, vulgo*. See BEHEN.

MELANORRIZON. *Brunfelſius* is guilty of an Error, in ſaying that *Dioſcorides* calls by this Name the black Hellebore; I ſuppoſe he means *Polyrrhizon*, for *Melanorrhizon*, μελανόρριζον, which is one of the Names of black Hellebore, in *Dioſcorides*, *L.* 4. *C.* 151. *Gorræus*, and from him *Caſtellus*, have both run into the ſame Miſtake, probably after the Example of *Brunfelſius*. *Galen*, in his *Exegeſis*, explains μέλαινα ῥίζα, the Root of the aromatic *Aſpalathus*.

MELANPSITHIA, μελαμψίθια. Certain black Wines are thus call'd by *Dioſcorides*, *L.* 5. *C.* 9. It is deriv'd from μέλας, black, and ψιὰ, Joy, Pleaſure, or Exhilaration.

MELANTERIA, μελαντηρία. See CHALCITIS.

MELANTHELÆUM, μελανθέλαιον. Oil of *Melanthium*, mention'd by *Dioſcorides*, *L.* 1. *C.* 46.

MELANTHIUM. See NIGELLA.

MELANURUS. Offic. Aldrov. de Piſc. 62. Rondel. 1. 126. Raii Ichth. 310. Ejuſd. Synop. Piſc. 131. Bellon. de Aquat. 269. Geſn. de Aquat. 542. Salv. de Aquat. 181. Charlt. Piſſ. 15. Jonſ. de Piſc. 31. THE BLACK-TAIL.

It is a Fiſh taken in the *Mediterranean* Sea. Being eaten broil'd, it ſharpens the Sight, and the Broth thereof cures the Colic, as we are aſſur'd by *Kyranides*. *Dale*.

MELANZANA. A Name for the *Melongena*; *fructu oblongo violaceo*.

MELAONES, or MELONES. Black Worms found in Meadows in the Month of *May*, which, when bruis'd, emit an agreeable Smell. Certain yellow Beetles are, alſo, thus call'd.

MELAPHRODITOS *Herba*. *Aetius*, *Tetrabib.* 4. *Serm.* 1. *C.* 21. recommends this as effectual in curing the Bite of a Viper; but I cannot find what Plant he means, neither do I know, that it is mention'd by any Botanic Author.

MELAS, μέλας, black, is an Epithet apply'd by antient Authors in Medicine in a peculiar Senſe to the Colour, or Skin, and, alſo, to ſome particular Remedies. In Conformity hereto, in the firſt Place, a Perſon who has a black or ſable Colour preternaturally diffuſed over his Skin, as in the black Jaundice, is call'd

MELANCHRUS, μελάγχρους, or MELANCHROS, μελαγχρὼς, (from μέλας, black, and χρῶς, the Skin) 6 *Epid. Sect.* 2. *Apb.* 27. In this Paſſage ſome Copies for μελάγχρως read μελάγχλωρος, (*melanchlorus*) which is Black inclining to Green, yelloviſh, or a pale-dark Colour [ſee CHLOROS]; and is the Word uſed by *Aretæus*, in his Deſcription of Melancholy, or black Bile.

MELAINA, μέλαινα, is ſometimes uſed by *Hippocrates* ſimply to ſignify the ſame as μέλαινα χόλη, (*melaina chole*) black Bile; particularly *Lib. de Nat. Hom.* and in the Paſſage, *Lib.* 29. *de Morbis*, μέλαιναν ἐμέσει δίον τρύσα, "He vomits black Bile, re-"ſembling Fæces." To this Paſſage *Galen* ſeems to have an Eye in his *Exegeſis*, where he ſays, μέλαινα, λέγεσθαί τε καὶ ἡ νόσος ἀπὸ μελαίνης χολῆς συνισαμένη. "*Melaina* the Diſeaſe, the "Matter of which conſiſts of black Bile, is ſo called."

MELAINA NUSOS, μέλαινα νῦσος, the black Diſeaſe. There are two Diſeaſes to which *Hippocrates* applies the Epithet μέλαινα, black, by way of Diſtinction; and both are deſcribed by him at the End of his ſecond Book of Diſeaſes.

In the firſt the Patient, he ſays, vomits black Bile, like Fæces, ſometimes bloody, and ſometimes reſembling ſecondary Wine, at other times like the Ink, or black Juice, of the Polypus, or Cuttleſiſh, and ſometimes ſour as Vinegar; ſometimes he throws up a thin ſort of Phlegm and Saliva, and ſometimes a greeniſh kind of Bile [χολὴν χλαρὴν]. When the Matter ejected by Vomit is like black Blood, it ſeems to ſmell of the Slaughter-houſe; the Mouth and Fauces are inflamed with Vomiting, the Teeth are ſet on Edge, and what is vomited ferments on the Ground. After Vomiting, the Patient finds himſelf ſomewhat relieved; he can neither bear Faſting, nor dares to eat freely; for, in the firſt Caſe, he is moleſted with a Rumbling of the Viſcera, and a Sourneſs of the Saliva; and, after Eating, he feels a Weight and Oppreſſion on the Viſcera, with a pungent Pain of the Breaſt and Back, as if inflicted by Pins thruſt therein; there is, alſo, a Pain in the Side, with a ſlow Fever, Head-ach, a Dimneſs of Sight, an Heavineſs of the Legs, and a Blackneſs of the Skin.

The ſecond black Diſeaſe (μέλαινα νῦσος) is attended with the following Symptoms: The Patient is extenuated, and becomes of a dark-red Colour, [ὑπόπυρος] and his Eyes of a paliſh Green [ὑπόχλωρος]; his Skin is thin, and his Body weak, and the longer the Diſeaſe continues, the more formidable it grows: He vomits at all Seaſons, diſcharging a thin Matter, as it were by Diſtillation, to the Quantity, perhaps, of two Brochthi. [See BROCHTHUS]. He frequently vomits up his Food, together with Bile and Phlegm; after which a Pain extends itſelf over all his Body; and ſometimes, before he vomits, he is moleſted with a ſlight Shivering, and a Fever; and he is moſt ſubject to vomit, after taking ſweet and oily Things. See MORBUS NIGER.

MELAN PHARMACON, μέλαν φάρμακον, the black Medicine, ſeems to be Ink; or to ſignify what in *Hippocrates* is, alſo, called μέλαν γραφικὸν, *Atramentum Scriptorium*, Ink to write with; for ſo *Celſus* and *Paulus* ſeem to have underſtood it. The Place where the Words occur, in *Lib. de Cap. Vuln.* where, in exploring the Fiſſure of the Cranium, he ſays, δεῖ δὲ ἐπὶ τὸ ὀστέον τὸν μελάγματος, δεύσας τε τῷ μέλανι φαρμάκῳ τῷ τριπλείῳ· "We ought to pour over the Bone ſome very black Subſtance, "macerated in a Solution of the black Medicine." The Senſe of this Place ſeems to be expreſſed by *Celſus*, *Lib.* 4. *Cap.* 8. in the following Words, *At ſi neutrum quidem prima manifeſta eſt, inducendum ſuper os atramentum ſcriptorium eſt, deinde ſcalpro id radendum*: "If neither then the Fiſſure appears, you are to co-"ver the Bone with Ink, and then apply the Lenticular." And *Paulus*, *Lib.* 6. *Cap.* 90. ſays, we are to pour on the Bone ſome liquid black Medicine, or Ink which we write with. But whether it be writing Ink, or ſome other black Medicine, which *Hippocrates*, in the Place before quoted, directs to be poured upon the Bone, it is certain, that *Galen* had an Eye to that Paſſage in his *Exegeſis*, when he expounds μέλανι φαρμάκῳ by theſe Words, τοῦτο πῶς παρασκευάζεται, ἐν τῷ περὶ ἑλκῶν αὐτὸς ἐδίδαξεν· "How this (black Drug or Medicine) is prepared, he himſelf "has taught us in his Book of Ulcers." Hence we may infer, that by theſe Words is meant ſome Medicine, whoſe Compoſition is uncertain, ſince we meet with nothing explicitly relating thereto in that Treatiſe; and, therefore, either this Book *Of Ulcers* is imperfect, or we take this black Medicine for ſome other Compoſition among thoſe there deſcribed, and not for *Atramentum Scriptorium*, which is no-where mentioned in that Book. The fore-mentioned Paſſage, *Lib. de Cap. Vuln.* is indeed ſufficiently corrupt; we may, however, collect from it, that by μέλαν φάρμακον, *Hippocrates* means ſome black liquid Medicine, which is to be poured upon the Bone, in order to find out how deep the Fiſſure had penetrated; and whether this be Caricon, deſcribed in the Book *Of Ulcers*, or ſome other Compoſition there deſcribed, or writing Ink, it is a Matter of ſmall Importance. In the ſpurious Additions to the firſt Book of *Hippocrates*, *de Morb. Mulier.* there is a black Medicine, μέλαν φάρμακον, directed to be prepar'd of the *Squama*, and *Flos Æris*, firſt pounded ſeparately, and afterwards mixed.

MELASMA, μέλασμα. A Sugillation, or Bruiſe, which turns black, is thus called.

MELCA, μέλκα, according to *Galen*, is a *Roman* Word, and ſignified a laudable ſort of Food, of a refrigerating and moiſtening Quality, in Uſe among the *Romans*: It ſeems to be a ſort of Oxygala, as we may infer from *Galen*, *Lib.* 7. *M. M.* and *Paulus*, *Lib.* 1. *Cap.* 37. where he directs thoſe who, from an hot Diſtemperature, labour under an Averſion to Food, to uſe a refrigerating Diet; and, among other Aliments of that Quality, he adviſes eating of Melca, which, he ſays, is prepared of Milk. This is confirmed by *Conſtantine*, *Lib.* 18. *de Agricultura*, who aſſures us, that Melca was nothing but Milk repoſited in a new earthen Pot, firſt well ſeaſon'd with boiling-hot Vinegar, by which means there was a Secretion of the thicker Subſtance of the Milk from the Whey; From whence it appears, as we ſaid before, to be a kind of *Oxygala*. *Gorræus*.

MELE, μήλη. A Probe.

MELEAGRIS. Offic. Bellon. des Oyſe. 249. *Gallo-pavo*. Aldrov. Ornith. 2. 35. Geſn. de Avib. 426. Charlt. Exer. 81. Jonſ. de Avib. 39. Mer. Pin. 172. Schw. A. 279. *Gallo-pavo ſive Meleagris & Numidica avis*. Raii Ornith. 169. Ejuſd. Synop. A. 51. Will. Ornith. 113. *Gallus Indicus quibuſdam*. THE TURKEY.

The Fleſh is eſteemed analeptic, or reſtorative, and ſtimulative to Venery. The Food of Turkeys is principally of Vegetable Subſtances, and the habitual Exerciſe not very great; hence their Salts are not very much exalted: They are eſteemed to be of eaſy Digeſtion, eſpecially when young.

MELECH. Salt. *Rulandus*.

MELEGUETTA. A Name for the greater Cardamoms. See CARDAMOMUM MAXIMUM. *Cluſius* mentions a ſpurious Sort of Meleguetta.

MELEIOS, μήλειος. An Epithet for that Species of Alum, which is produced in the Iſland *Melos*.

MELEUKEN. The Name of an *Indian* Fruit, like the Pine-nut. *Raii Hiſt. Plant.*

MELI, μέλι. Honey. See MEL.

MELIA TERRA. See CRETA.

MELIANTHUS.

The Characters are;

Its Root is perennial, and it has the Appearance of a Shrub; the Leaves are like thoſe of Burnet, and the Calyx multifid: The Flower is tetrapetalous and anomalous; ſome of the Petals reſembling a Fan, and others a Cone: The Fruit is like a Bladder, tetragonal, or four-corner'd, quadricapſular, and full of roundiſh Seeds.

Boerhaave mentions two Species of this Plant; which are,

1. Melianthus; Africanus. *H. L.* 414. *Pimpinella, ſpicata, maxima, Africana.* Act. Hafn. 2. 58.

2. Melianthus; Africanus; minor; fœtidus. *Commelin. Rar.* 4. *Boerh. Ind. alt. Plant.*

It is called *Melianthum*, or *Melianthus*, from μέλι, Honey, and ἄνθος, a Flower, that is to ſay, Honey-flower; becauſe in *Africa* its Flower tranſudes Honey.

The Inhabitants of *Africa*, when exhauſted with Heat and Thirſt, crop the Flowers, and ſup the Liquor: This Liquor is much in Uſe among the *Hottentots*, to ſtrengthen and refreſh the Spirits; for which Purpoſe it is very effectual. *Hiſt. Plant. adſcript. Boerhaav.*

MELIAS. The ſame as MELEROS.

MELICA. A Name for the *Milium*; *Arundinaceum*; *ſubrotundo ſemine*; *Sorgho nominatum.*

MELICERIA, μελιννεία. The ſame as HYDARTHROS.

MELICERIOLA. A ſmall Meliceris.

MELICERIS, μελικηρὶς. An encyſted Tumor, thus called, becauſe it contains a Subſtance like Honey. See TUMOR.

Sometimes Meliceris imports the ſame as CERION, or TRAVUS.

MELICHROOS, μελίχροος. Of the Colour of Honey.

MELICHROS, μελιχρὸς. Sweet like Honey.

MELICRATON, μελίκρατον, from μέλι, Honey, and κεράννυμι, to mix. Hydromel; Water in which Honey is diſſolv'd.

MELIEDES, μελιηδὴς. An Epithet of Wine, importing a Sweetneſs and Flavour reſembling thoſe of Honey.

MELIGEION. *Blancard* explains this, a fetid oleous Humour, of the Conſiſtence of Honey, diſcharged from Ulcers, complicated with a Caries of the ſubjacent Bone.

MELILOTUS.

The Characters are;

The Ovary is a naked Capſule, (not hidden within the Calyx, as in Trefoil) pregnant with one or two roundiſh Seeds; the Flowers grow in Spikes.

Boerhaave mentions twelve Species of this Plant; which are,

1. Melilotus; fruticoſa; lutea; vulgaris; vel Officinarum. *Boerh. Ind. A.* 2. 29. *Melilotus.* Offic. *Melilotus vulgaris.* Park. Theat. 719. Raii Hiſt. 1. 951. Synop. 3. 331. *Melilotus Germanica.* Ger. 1034. Emac. 1205. *Melilotus Officinarum Germaniæ.* C. B. P. 331. Tourn. Inſt. 407. *Trifolium odoratum ſive Melilotus vulgaris, flore luteo.* J. B. 370. MELILOT.

The ordinary Melilot has a large, woody, ſpreading, white Root, from which ſpring many ſlender-chanel'd ſmooth Stalks, two or three Feet high, having at every Joint three oblong, round-pointed, green Leaves, ſet together upon one Foot-ſtalk, ſerrated about the Edges, and frequently gnaw'd by Inſects. The Flowers grow on long Spikes, being yellow, in Shape of Tare or Pea-bloſſoms, but much leſs; to each of which ſucceeds a ſmall, rough, round Pod. The whole Plant, but eſpecially the Flowers, has a ſtrong pleaſant Smell. It grows frequently among the Corn, and in Hedges; and flowers in *June*. The Leaves and Flowers are uſed.

They are accounted mollifying, diſcuſſing, diſſolving, and eaſing Pain; and therefore are frequently ordered in Stuphs and Cataplaſms againſt Inflammations, hard Tumors, and any kind of Swellings. The Melilot-plaiſter made of this Herb, boiled in Mutton-ſuet, Roſin, and Wax, is drawing, and good for green Wounds, but is chiefly uſed in dreſſing of Bliſters.

The only officinal Preparation is the *Emplaſtrum Meliloti, ſimplex. Miller's Bot. Off.* See EMPLASTRUM.

This Plant gives hardly any Tincture of Red to blue Paper; it is acrid, bitter, ſtyptic, odoriferous, and gives a ſlight Nauſea, when chewed; by which, it ſeems, its Salt very much reſembles the natural Salt in the Earth, united with a great deal of eſſential Oil, and terreſtrial Parts.

For, by the chymical Analyſis, the Melilot, beſide a great deal of acid Phlegm, yields, alſo, a good Quantity of Oil of Earth, together with an urinous Spirit, volatile, concrete, and fixed Salt very lixivial.

Therefore this Plant is aperitive, reſolvent, and lenifying. The Ptiſan made of the Tops of it, and Chamomile, is excellent for the Inflammations of the lower Belly, for the Colic, Retention of Urine, Rheumatiſm, and generally in all Caſes where it is neceſſary to facilitate the Courſe of the Humours by lenifying. The diſtilled Water of the Flowers of Melilot has a Smell agreeable enough; but *Cæſalpinus* obſerves, that it increaſes and retains that of other aromatic Waters, with which it is mixed; for which Reaſon it is uſed in the *Eau de Cordue*. The Melilot is uſed in the carminative Clyſters, lenifying and reſolvent Cataplaſms. For the Clyſters they boil the Flowers of Melilot and Chamomile in Tripe-broth, and add ſome Drops of Oil of Anis to the Decoction, ſtrained through a Cloth. For the Cataplaſms boil two Roots of Lilies, with an Handful of Hemlock and Henbane-leaves, and three Pugils of Melilot-tops: Strain all through a Sieve, and mix with it ſome Drops of fetid Oil of Tartar. The Juice of Melilot-flowers, or their Infuſion, in boiling Water, very much aſſwages the Inflammation of the Eyes, eſpecially if, after having taken it from the Fire, there be added a little camphorated Spirit of Wine, ſtrained through a Linen Cloth, to ſeparate the ſuperfluous Camphire. *Martyn's Tourn.*

For mitigating a Pleuriſy, the following Fomentation is approved by Experience:

> Take the Herb Melilot, and true Pellitory of the Wall, of each two Handfuls; of Betony, one Handful: Mix them, and boil them in Water, and therewith frequently foment the Breaſt. *Simon Paulli.*

The Emplaſtrum de Meliloto, of *Meſue*, is an excellent Anodyne, and diſcuſſive not only of Flatulencies, but of cold and groſs Matter, in external Tumors, even thoſe of the Liver and Spleen.

Whereas *Dioſcorides* ſays, that Melilot is ſweet-ſcented, he is to be underſtood of the dry'd Herb, becauſe, when green, it has hardly any Smell at all, but, when dry, is very fragrant, as is obſerved, alſo, by *Theophraſtus, Lib. 6. de Cauſ. Plant.*

Melilot is called by *Camerarius*, and the *Italians, Trifolium Caballinum*, Horſe-trefoil, becauſe Horſes are very greedy of it; and in *England* it is ſometimes ſown for the ſake of providing Fodder for Horſes and Cattle. *Raii H. P.*

It takes the Name *Melilot* from μέλι, Honey, and λωτὸς, *Lotus*, a celebrated Plant among the Antients, not from its ſweet Taſte, for the Leaves, Flowers, and Fruit, are bitter, but becauſe there is no Plant from which the Bees gather ſweeter Honey, or more in Quantity.

The Leaves, beſides their emollient Quality, are endued with a Virtue of heating in a very gentle manner, by their aromatic Quality; the Flowers are, alſo, aromatic and emollient, and, therefore, reckoned among internal Pectorals; but they are more uſed outwardly, as emollient, diſcutient, and anodyne; on which accounts they are ſerviceable in all ſorts of Inflammations, particularly of the *Uterus*, *Teſtes*, and *Anus*, as well as in nephritic and arthritic Pains. The Seeds are diſcutient, aperient, aromatic, and reſolvent. Of the Flowers immers'd in Oil is expreſſed an Oil, to which new Flowers are added, and the ſame ſtill repeated, till it becomes a Balſam of Melilot, which is an excellent Medicine; for it preſerves from Putrefaction, and conſolidates in an extraordinary Degree. The Seeds, reduced to a Flower, compoſe a Plaiſter, which is highly emollient and reſolvent. The Decoction of the Leaves and Flowers taken inwardly is very good to cleanſe the Paſſages obſtructed by Cold. A Decoction of the Tops of the Plant is good for Inflammations of the Inteſtines, the Colic, Retention of Urine, and the Rheumatiſm; they are preſcribed, in Conjunction with Chamomile-flowers, in Cataplaſms, Plaiſters, and Fomentations. *Hiſt. Plant. Boerh. adſcript.*

2. Melilotus; fruticoſa; candida; major. *M. H.* 2. 161. *Trifolium odoratum, ſive Melilotus vulgaris, flore candido.* J. B. 2. 370.

3. Melilotus; lutea; minor; floribus & ſiliculis, minoribus, ſpicatim, & denſe diſpoſitis. *M. H.* 2. 161.

4. Melilotus; lutea; ſeminis pericarpio, magno, rugoſo, rotundo, albo. *M. H.* 2. 161. *Boerh. Ind. A.* 2. 29. *Melilotus vera.* Offic. *Melilotus Italica.* Park. Theat. 719. *Melilotus Italica ſive Patavina.* Ger. 1033. Emac. 1204. *Melilotus Italica folliculis rotundis.* C. B. P. 331. Tourn. Inſt. 407. *Melilotus magno ſemine rotundo, rugoſo.* J. B. 2. 317. Raii Hiſt. 1. 951. ITALIAN MELILOT.

It is a Native of *Italy*, but cultivated with us in Gardens, and flowers in *July*. The Herb and Flowers are uſed, and agree in Virtues with thoſe of the common Melilot. *Dale.*

5. Melilotus; minima; recta; lutea; ſiliquis craſſis, curtis, in capitulum congeſtis; ſemine Fœnigreci. *M. H.* 2. 162.

6. Melilotus; capſulis Reni ſimilibus, in capitulum congeſtis. *T.* 407. *Trifolium pratenſe, luteum, capitulo breviori.* C. B. P. 328. *Trifolium pratenſe, luteum, mas, flore minore, ſemine multo.* J. B. 2. 380.

7. Melilotus; major; odorata; violacea. *Tourn. Inſt.* 407. *Boerh. Ind. A.* 2. 30. *Lotus urbana, Trifolium odoratum.* Offic. *Lotus hortenſis odora.* C. B. P. 331. *Lotus ſativa odorata annua.* J. B. 2. 368. *Trifolium odoratum.* Ger. 1025. Emac. 1195. Park. Theat. 715. Raii Hiſt. 1. 950. SWEET TREFOIL.

This Trefoil has large, hollow, chanel'd Stalks, divided into many Branches full of Leaves, three growing together on long Foot-ſtalks, which are longer and broader than Melilot, indented a little about the Edges. The Flowers grow in ſhort round Spikes, ſet on very long Stalks, of a pale-blue Colour, being ſmall and papilionaceous, ſet each in a particular Calyx, and ſucceeded by ſhort Pods, containing two or three ſmall yellow Seed. The Root is woody and fibrous, periſhing after Seed-time. The whole Plant has a very ſtrong Smell, like Fenugreek-ſeed. It grows with us in Gardens only, and flowers in *June*. The Herb and Seed are uſed.

This is, by many, accounted a good vulnerary Plant, and preferred to Melilot, to keep down Inflammations in Wounds, to cleanſe foul ſordid Ulcers, and to diſſolve hard Swellings; an Ointment or Plaiſter being made therewith, as with Melilot. The Seed is diuretic, and reckoned, by *Galen*, to be an Alexipharmic; but it is rarely uſed. *Miller's Bot. Off.*

This Species is what is meant in the Shops by the Name of *Lotus*, and *Trifolium odoratum*, without the Addition to this laſt of *Bituminoſum*. Its Virtues are moſt conſpicuous in the Oil, the ſame Virtues with that of the common Melilot, but in a more celebrated Degree, as it excels the other in Fragrance. *Dale* ſays, it is alexipharmic, anodyne, diuretic, and vulnerary. *Hiſt. Plant. Boerh. adſcript.*

8. Melilotus; fructu plano, orbiculari, maximo. *Trifolium, peltatum, Creticum.* C. B. P. 329. Prodr. 142. J. B. 2. 381.

9. Melilotus; Ægyptia; minima; foliis eleganter inciſis.

10. Melilotus; Orientalis; folliculis rugoſis.

11. Melilotus; ſupinus; Creticus; luteus.

12. Melilotus; Cretica; humillima; humifuſa; flore albo, magno. *T. C.* 28. *Spica trifolia.* Proſp. Alp. Exot. 168. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 29.

Proſper Alpinus, in his Treatiſe *de Plantis Exoticis*, *Cap.* 75. gives a Deſcription and Figure of this Plant, and informs us, it grows in *Crete*; but ſays, that he does not know of any medicinal Virtues it is poſſeſs'd of.

MELILOTUS, QUINTA, TRAGI. A Name for the *Coronilla*; *herbacea*; *flore vario.*

Beſides the foregoing Species of Melilot, *Dale* mentions the following;

MELILOTUS ALTISSIMUS. Offic. *Melilotus vulgaris altiſſima fruteſcens, flore luteo.* Ind. Med. 75. Tourn. Inſt. 407. Herb. Par. 289. WOODY MELILOT.

This Species of Melilot muſt not be confounded with the common Melilot; for, being cultivated in the *French* King's Royal Garden, it never becomes ſo tall, nor ſo ligneous. The Stalks of this are four or five Feet high, firm, hard, chanel'd, branched, ſet with Leaves an Inch and an half long, ſeven or eight Lines broad, obtuſe and notched; thoſe towards the Top are much narrower, and a great deal more pointed; they are ſuſtained by Threes, by a Pedicle an Inch and an half long. The Flowers are yellow, diſpoſed in a Spike; their Standard is three Lines long; the Wings ſhorter and narrower, as is, alſo, the Keel. The Empalement is ſhort, ſmooth, and divided into five Points; out of its Bottom ariſes a Pointal, which becomes a little Cod, a Line and an half or two Lines long, almoſt round, wrinkled, opening into two Parts; containing rediſh Seed, almoſt round, and a little flatiſh. This Plant has leſs Smell than the common Melilot; it flowers in *July* and *Auguſt*; its Seed is ripe in *September*. *Martyn's Tournefort.*

MELIMELUM, μελίμηλον. A ſort of ſweet Apple, mentioned by *Dioſcorides*, *L.* 1. 161.

MELINUM, μήλινον. A compound aromatic Ointment, impregnated with Quinces, the Preparation of which is deſcrib'd by *Dioſcorides*, *L.* 1. *C.* 55. *Paulus Ægineta* directs another Method of preparing this Oil, *L.* 7. *C.* 20.

MELINUM EMPLASTRUM. *Galen*, in his Treatiſe *de Comp. Medic. per Genera*, *L.* 2. *C.* 6. 7. 8. 9. 10. and 11. deſcribes ſeveral Plaiſters under this Title, which are ſo called on account of their Colour. Thus he takes notice of one aſcrib'd to *Andromachus*; another to *Menœtus*; another to *Serapion*; and another to *Hera.*

MELIPHYLLON. Baum.

MELES, MELIS, MELUS, MELO, or MELOTUS, are different Names for the Badger. See TAXUS.

MELISSA.

The Characters are;

The Calyx is long, tubulous, and quinquefid, the Segments being diſpoſed in ſuch a manner as to make it appear bilabiated. The *Galea* is erect, roundiſh, and bifid; the Beard tripartite. The Flowers, which are produced from the Wings of the Leaves, are not whorled quite round the Stalk; they are generally ſix in Number, three on each Side.

Boerhaave mentions ſeven Species of this Plant; which are,

1. Meliſſa; hortenſis. *C. B. P.* 229. *Tourn. Inſt.* 193. *Boerh. Ind. A.* 167. *Meliſſa.* Offic. Ger. 558. Raii Hiſt. 1. 570. *Meliſſa vulgaris.* Park. Theat. 40. *Meliſſa vulgaris odore Citri.* J. B. 3. 232. *Meliſſa, Apiaſtrum.* Chab. 417. BAUM, BAULM, or BALM.

The Roots of Baum are long, ſlender, and creeping, ſhooting out, in the Spring, many ſquare Stalks, two or three Feet high, having at every Joint two roundiſh Leaves, broad at Bottom, and growing narrow towards the End, indented about the Edges, and beſet with ſhort ſmall Hairs of a pleaſant Lemonſcent. It is but thinly ſet with Flowers, which grow at the Joints with the Leaves, ſeveral ſet together on each Side the Stalks, being of a white Colour, galeated and labiated, ſet in large Calyces; by the Side of each Cluſter of Flowers are ſet two very ſmall green Leaves. It grows only in Gardens, and flowers in *July*. The whole Herb is uſed.

Baum is cordial, cephalic, and good for all Diſorders of the Head and Nerves; chears the Heart, and cures the Palpitation thereof; prevents Fainting, Melancholy, hypochondriac and hyſteric Diſorders; reſiſts Putrefaction, and is of Uſe in malignant and contagious Diſtempers: Outwardly applied, it helps the Stinging of Bees and Waſps.

The only officinal Preparation of Baum is the Simple-water; for the Virtues of which, ſee AQUA.

Baum is reckoned among Cardiacs, and is much extolled by *Foreſtus* for the Syncope and Palpitation of the Heart. It is commended by *Rondeletius* for the Palſy, Vertigo, and other cold Affections of the Brain, being boiled or macerated in Wine, and drank. And *Gratarolus* commends it for ſtrengthening the Memory, and ſharpening the Wit, in whatever manner it be taken. It is of great Service, alſo, in a Retention of the Menſes, or Lochia, and in hyſteric Diſorders; and corrects a fetid Breath.

The good Women in *France* bruiſe the young Shoots, and make them up with Eggs, Sugar, and Roſe-water, into Cakes, which they bake, and give to Women in Labour, or newly delivered, under a great Loſs of Strength, or not well cleanſed from the Secundines. Outwardly, it is of Uſe in Baths for the Uterus, and in Cataplaſms for the poiſonous Stings of Bees, Waſps, and other Inſects. *C. Hoffman* adviſes to gather it for officinal Preparations in the Spring, before the Flowers appear, becauſe, in time of flowering, it ſmells of Bugs.

For the Mania,

> Take of Leaves of Baum, one Handful; cut them, and infuſe them in four Ounces of Spirit of Wine: To which add half a Dram of Pearls prepared. The Doſe is two Spoonfuls.

This Preſcription was a Secret, in the Poſſeſſion of a certain Family of *Montpelier*. *Riverius.* If you deſire, ſays *Simon Paulus*, a Remedy againſt Melancholy, I preſent you with what follows:

> Take of Conſerve of Baum, one Ounce; of Borrage, and Bugloſs, each half an Ounce; Confection of Alkermes, one Dram; with Syrup of the Five opening Roots.

By conſtant taking of this, after the previous Uſe of Univerſals, I remember, he ſays, a Virgin, who was freed from an obſtinate Melancholy, attended with a Chloroſis, and reſtored to her former Health.

It is uſual with our Country-women, ſays the ſame Author, to provoke the Menſes with a Decoction of Baum; and I know, ſays he, one or two, who ſucceſsfully try the Experiment upon themſelves, by only wearing freſh Baum in their Stockings, or Shoes. Many, afflicted with a Trembling of the Heart, and given over by Phyſicians, have been cured only by Water of Baum, mixed with Manus Chriſti to a proper Conſiſtence, and exhibited in pretty large Doſes, in the Time of the Paroxyſm. *Raii Hiſt. Plant.*

It is called *Meliſſa*, from μέλι, Honey; becauſe the Bees are very much employ'd in gathering Honey from this Herb. It is, alſo, called *Meliſſophyllum*, from μέλι, Honey, and φύλλον, a Leaf: And *Apiaſtrum*, from *Apes*, a Bee, becauſe the Bees are much delighted with it: And *Citrago*, from *Citrum*, a Citron; becauſe it has the Smell of a Citron.

This Plant is endowed with extraordinary Virtues; for Pleaſantneſs of Taſte and Smell no Herb exceeds it. The Leaves, infuſed in Wine, impregnate the ſame with its grateful Scent, and render it an highly uſeful and comfortable Medicine in all melancholy Affections; for it mightily exhilarates, being very cordial. The expreſſed Juice has, alſo, an Aſtringency, and is good for thoſe who are ſubject to Melancholy, and hypochondriacal Flatulences; and, in ſuch Caſes, it is always proper to be exhibited, though attendant on hot Diſorders. The Herb, freſh-gathered, and infuſed in half Wine and half Simple-water, cold, or drank after the manner of Tea, affords great Relief to melancholic Patients. If it is infuſed in *Rheniſh* Wine, with an Addition of Honey, it is an excellent Cordial, as I myſelf have found from Experience. From this Circumſtance, Naturaliſts, in their Reſearches after the Nature of Plants, as, alſo, *Crollius* and *Paracelſus*, have affirmed, that the Leaf of Baum reſembled an human Heart. This Herb is an excellent Remedy for hyſteric Women, ſince it wonderfully exhilarates the Spirits. Women ſubject to Rumblings of the Inteſtines, Eructations, and Syncopes, are greatly relieved by Baum-leaves, bruiſed, and held to the Noſe, in the Paroxyſms of theſe Diſorders. A medicated Wine, prepared of this Herb, is highly beneficial in gouty Rheumatiſms, and arthritic Pains, provided it is daily uſed. By Diſtillation an Oil is obtained from this Plant, which ſmells like a Citron. A Decoction of the Leaves corroborates lax Gums. An Infuſion of it with Wine, Ale, or Water, contributes greatly to the Cure of that Species of Melancholy, which draws its Origin from a Defect of Spirits. It is commended againſt Epilepſies, Madneſs, Barrenneſs, Apoplexies, Palſies, Vertigos, and Faintings. It is beneficial in Crudities of the Stomach, Obſtructions of the Menſes, and a Retention of the Lochia. It removes the fetid Smell of the Breath, and is ſerviceable to thoſe who labour under a Retention of Urine. Externally, it is uſed in Cataplaſms, Baths for the Feet, poiſonous Stings of Waſps, and

and other Misfortunes of a like Nature. *Hist. Plant. adscript. Boerhaav.*

2. Melissa; minor; & humilior. *Flor.* 2. 76.

3. Melissa; Romana; molliter hirsuta; & graveolens.

4. Melissa; peregrina; caule brevi; plantaginis folio. *T.* 193. *Gallitrichum, folio rotundiore, flore magno, violaceo.* J. B. 3. 313.

Theat. 40. *Melissa Fuchsii.* Raii Synop. 3. 242. Ger. Emac. 690. *Melissa adulterina quorundam amplis foliis & floribus non grati odoris.* J. B. 3. 233. *Lamium montanum Melissæ folio.* C. B. P. 331. Raii Hist. 1. 561. BASTARD BAUM.

We must not confound this Plant with that which *Cæsalpinus* has called *Melissa altera*; which is the *Melissa Romana, hirsutior.* Mor. H. R. Blæs.

It grows in several Woods in the West of *England*, as about *Totness* in *Devonshire*, and *Haverfordwest* in *Pembrokeshire*. *R. Syn. Ed.* 3. 242.

The Crest of this Flower is sometimes entire, and sometimes cut like an Heart. It flowers in *May* and *June*. The Flowers are disposed in a simple Ring; they come but three at most, out of the Bosom of each Leaf, which makes the Number of six at each Ring. These Flowers have each of them a Pedicle, coming immediately out of the Stalk, which is not branched. Out of the Bosoms of the lower Leaves there usually comes but one Flower, out of the middle ones two, and out of the upper ones three. The Empalement consists of two Lips, the upper one of which is a little reflexed, and slightly divided into two little Points, the under one being usually cut into three Segments, and sometimes only into two.

It is excellent for a Suppression of Urine: Put two Pounds of it in an Alembic, with an equal Quantity of Herniaria; sprinkle them with Salt, add a little Water, and leave them in Digestion three Days; after which distil them in Balneo Mariæ: Cohobate the distilled Water three times upon fresh Herbs, bruised. Keep the last Water in a Bottle, well stopt. In a Suppression of Urine give, every four Hours, four Ounces, mix'd with as much White-wine; and anoint the lower Belly, the Perinæum, and Region of the Kidneys, with the following Oil; infuse in the Sun, for three Days, or boil gently in the same Oil, an Handful of Betles, ten Cantharides, and a Scruple of the Seed of Ammi. A Clyster may be given of the Decoction of Mallows, Melissa Tragi, Herniaria, and two Drams of Chips of nephritic Wood. *Martyn's Tournefort.*

6. Melissa; humilis; latifolia; maximo flore albo. *T.* 193.

7. Melissa; quæ Bugula Lusitanica; odorata. *Corn.* 4. *Bugula odorata, Lusitanica.* M. H. 3. 39. *Clinopodium, Lusitanicum, spicatum & verticillatum.* T. 195. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 167.

Melissa is, also, a Name for several Sorts of Moldavica; which see.

Melissa Fruticosa. A Name for the *Galeopsis; Hispanica; fruteſcens, Teucrii folio.*

Melissa Moluccana. A Name for the *Molucca*; and for the *Molucca spinosa.*

MELISSOCHORTON, μελισσόχορτον. In *English*, Bees-grass. The Word occurs in *N. Myrepsus, Sect.* 1. *Cap.* 74. and imports the same as Melissa, Baum.

MELISSOPHYLLON. A Name for the *Melissa*; *humilis*; *latifolia*; *maximo flore purpurascente.*

MELITÆA, or MELITEA TERRA. Earth of *Malta.* See Creta.

MELITERA, μελίτηρα. The Name of a Powder for external Use, described by *Paulus Ægineta, Lib.* 7. *Cap.* 13. and recommended by the same Author, *Lib.* 4. *Cap.* 40. as a good Application to hollow Ulcers.

MELITISMOS, μελίτισμός. A Linctus prepared with Honey.

MELITITES, μελίτιτης. This sometimes signifies Hydromel; but, more frequently, a Sort of Stone; which is the

Lapis Melitites. Offic. de Laet. 142. Calc. Mus. 276. Boet. 416. Matth. 1385. *Mellitites.* Aldrov. Mus. Metall. 668. *Melitites.* Agricol. 606. THE HONEY-STONE.

This Stone only differs in Colour and Sweetness from the Lapis Galactites; and the Effects produced by both are, according to *Dioscorides*, the same. But, according to *Galen*, it is somewhat more hot and abstergent than the Galactites. *Agricola*, in *Lib. de Nat. Fossil.* affirms, that the Galactites and Melitites are produced in the same Lime-stone Rock. *Wormius* distinguishes between the Moroethus, the Galactites, and the Melitites, in the following manner: The Moroethus yields a milky Juice, which is destitute of the Sweetness of Honey, and is neither of a white nor cineritious Colour; but the Galactites is of a white or cineritious Colour, and yields a milky Juice, without any Taste of Honey; whereas the Melitites is of various Colours, and yields a milky Juice, as sweet as Honey. But *Jo. de Laet*, in his Book *de Gemmis & Lapidibus*, distinguishes between these three Stones in the following manner: That which is of a cineritious or black Colour is the Galactites; that which is yellow, and in Colour resembling Honey, is justly called the Melitites; whereas that which is greenish is the Moroethus, which shines like a Gem more than any of the others. *Dale.*

MELITTOMA, μελίτωμα. A Confection, or Sweetmeat, prepared with Honey. Some Authors, by Mistake, write it *Melitema.*

MELITZANIUM. This Word occurs several times in *N. Myrepsus*; but his Commentators are not certain what he means. *Fuchsius* guesses it to be the *Melanthium sylvestre.*

MELLAGO. Any Medicine, which has the Consistence and Sweetness of Honey, is thus called.

MELLIFAVIUM. The same as Meliceris.

MELLISODIUM. Burnt Lead. *Rulandus.*

MELOSI. Earth-worms. *Johnson.*

MELO.

The Characters are;

All the Species produce an oval, smooth, chanel'd Fruit, divided into three Capsules, which are cut into two Parts, and full of oblong Seeds.

Boerhaave mentions seven Species of this Plant; which are,

1. Melo vulgaris. *C. B. P.* 310. *Tourn. Inst.* 104. *Boerh. Ind. A.* 2. 77. *Melo.* Offic. Ger. 771. Emac. 917. Raii Hist. 1. 644. Park. Parad. 525. *Melones.* J. B. 2. 242. MUSK-MELON.

The Vine, as it is usually called by Gardeners, which bears this Fruit, has long trailing Stalks, furnished with several Tendrils or Claspers, and is rough and hairy, as well as the Leaves, which are somewhat like Cucumber-leaves, but rounder. The Flowers are yellow, of the same Shape, but larger than those of the Cucumbers; and are succeeded by pretty large oval Fruit, sometimes, as it were, divided into several Parts by deep Furrows, running lengthways, and other times having the Outside covered with a raised Net-work. Its Inside is of a reddish Colour when ripe, of a very pleasant Scent, and of a sweeter Taste than the Cucumber, having a great Quantity of flat oblong Seed included in a moist watery Pulp. Melons are sown yearly in the Spring, and are ripe in *July* and *August.*

The Seed only is used in Physic, and is one of the Greater cold Seeds, and a common Ingredient in Emulsions, being cooling and useful in Fevers and other inflammatory Distempers. It helps the Stone, Strangury, and Heat of Urine. The Flesh of the Melon is pleasant and grateful to the Stomach, but must be eaten with Caution, being liable to surfeit, and bring on the Colic, and Cholera Morbus. *Miller's Bot. Off.*

There is a great Variety in this Fruit, not only with respect to the Colour of the Rind and Pulp, the Taste and Smell, but, also, in its oblong Figure, Sextile Disposition, and other Accidents; for *Bauhine* mentions a *Melo reticulatus*, that is, a Melon cover'd with a Rind like raised Network; a *Melo turbinatus*, a turbinated Melon; a *Melo magnus, cortice virente lævi, Semine parvo*, a large Melon, with a smooth green Rind, and a small Seed; and a *Melo longus*, a long Melon, four Spans in Length, and incurvated like a Cow's Horn.

Though Melons are in high Esteem among those of a delicate Taste; yet their Pulp is cold and humid, subject to putrefy in the Stomach, and tending to generate Fevers and Gripes. I can easily come into the Opinion of *Dodonæus*, says *Ray*, that Melons are more difficult of Concoction than Cucumbers, tho' *J. Bauhine* thinks the contrary, because of their sweet-scented Pulp, and for that he himself, who labour'd as he says, under a cold and phlegmatic Stomach, had found by Experience more than once, the Inconvenience of eating Cucumbers, that they were difficult of Concoction to the Stomach, and excited Eructations a long time after eating them, which savour'd of them; whereas he always eat Melons without any manifest Inconvenience. On the contrary, for my part, says *Ray*, I never receiv'd any Prejudice from eating Cucumbers, but have been very much disorder'd, and that more than once, by feeding on Melons; but perhaps, says he, these different Effects are to be attributed to an Idiosyncrasy. To prevent Melons from putrefying in the Stomach, it will be proper to eat them with Salt and Pepper, tho' some use only Sugar, and to drink plentifully of Wine afterwards.

The Milk of Melons is esteemed an excellent Remedy in burning Fevers. The Pulp of the Seeds, first bruised in Spring Water, or some other proper Liquor, is passed through a very fine Hair Sieve, or a Linen Strainer adapted to the Purpose. This Cremor of the Seed may be successfully exhibited in feverish Disorders, as we are assur'd by *Matthiolus*; it is also given in Coughs, Consumptions, and is very effectual in a burning Heat of Urine. *Raii H. P. p.* 644.

It is called *Melo* from the *Greek* Word μῆλον, *Malum vel Pomum*, an Apple, because its Fruit resembles, in great measure, an Apple.

The Pulp of a Melon is said to be cold, but Experience convinces me of the contrary; for its Taste and Smell indicate an aromatic Quality, and prove it an aromatic Plant; which is confirm'd by its Effects: For, if eaten to Excess, they excite bloody Urine; wherefore it is of an heating Quality, and there is scarce any thing in Nature more stimulative to Venery than this Fruit. The Pulp affords very good Nourishment, if us'd

with Moderation, but then it muſt be eaten upon an empty Stomach. The Seeds have a viſcous and farinaceous Quality; the Melon perfectly ripe affords an aqueous Juice, which is looſening to the Belly, as may be obſerv'd alſo of the Cucumber. *Hiſt. Plant. adſcript. Boerhaav.*

2. Melo; magnus; cortice virente; lævi; ſemine parvo. *J. B.* 2. 244.

3. Melo; Hiſpanicus. *J. B.* 2. 244.

4. Melo; turbinatus. *J. B.* 2. 244.

5. Melo; reticulatus. *J. B.* 2. 244.

6. Melo; pyriformis, moſchatus. *C. B. P.* 311.

7. Melo; rotundus; parvus. *C. B. P.* 311. *Melo, Moſchatellinus, parvus.* J. B. 2. 244. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 78.

MELOCACTUS.

The Characters are;

It has a ſingular Appearance, is ſucculent, echinated, and polygonal, or has many Angles. The Flower is monopetalous, Bell-ſhaped, tubulated, naked, multifid, ſeated in the Ovary, and furniſhed on the Inſide with a Multitude of Stamina. The Ovary becomes a pulpous, ſoft Fruit, full of numerous ſmall Seeds.

Boerhaave mentions two Species of this Plant; which are,

1. Melocactus; Americana; minor. *Echinomelocactus, minor, lacteſcens, abſque tomento, cylindris ſtrictioribus.* Par. Bat. 136. *Ficoides, vel Ficus Americana, Sphærica, tuberculata, lacteſcens, flore albo, fructu rubro pyramidali.* Cat. Hiſt. Beaum. H. A. 1. 105. *Melocarduus mammillaris, minimus, ſeſſilis, uberior, ſpinulis imbecilliſtoribus donatus.* M. H. 3. 171.

2. Melocactus; Indiæ Occidentalis. *C. B. P.* 384. *T.* 653. *Echinomelocactus.* J. B. 3. 93. *Pomum ſpinoſum Opuntiatum.* Munt. Pr. 420. *Melocarduus, ſulcis rectis, ſpinis ad angulos appoſitis major.* M. H. 3. 170. *Ficoides Occidentale ſpinoſum, Melonis facie, coſtis erectis.* H. L. 670. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 83.

It is called MELOCACTUS, from μῆλον, *Melo*, an Apple, and κάκτος, *Cactus*, a Thiſtle, becauſe it reſembles an Apple, and is furniſhed with Spines. It is alſo called *Echinomelocactus*; becauſe it is echinated, or furniſh'd with Spines, or Prickles, like the Echinus, or Hedghog.

The Fruit is eaten, tho' very full of ſandy Grains; and has an Acidity, which is very grateful to the Taſte, and extremely agreeable to the Inhabitants of thoſe hot Countries, whence it comes: But I find no medicinal Virtues aſcribed to it. *Hiſt. Plant. adſcript. Boerhaave. Miller's Dict.*

MELOCARDUUS, a Name for the MELOCACTUS; which ſee.

MELOCARPUS, according to *Blancard*, is the Fruit of the *Ariſtolochia*.

MELOCHIA. See CORCHORUS.

MELOCHITES. A Name for the ARMENUS LAPIS; which ſee.

MELOCORCOPALI Scaligero. *Corcopal Theveti.* Lugd. It is deſcrib'd as a Tree like the Quince-tree, bearing a Fruit ſhap'd like a Melon, of an agreeable Taſte, not unlike that of a Cherry, and ſomewhat cathartic. *Ray* ſuſpects it to be the ſame as the CARCAPULI.

MELOCOTONEA. A Species of Peach is thus call'd.

MELON, μῆλον, ſignifies an Apple; a Sheep; or the Cheek; τὰ μῆλα, are the Tonſils. *Melon*, or *Mylon*, is alſo, a Diſorder of the Eye, in which it ſwells, and protuberates out of the Orbit. See OCULUS.

MELOMELI, μελόμελι. Honey impregnated with Quinces. *Dioſcorides, L.* 5. *C.* 29.

MELONGENA.

The Characters are;

The Flowers are monopetalous, rotated, or Wheel-ſhaped, and multifid; the Fruit is fleſhy, and contains Kidney-ſhaped Seeds.

Boerhaave mentions two Species of this Plant; which are,

1. Melongena; fructu oblongo, violacea. *T.* 151. *Boerh. Ind. A.* 2. 70. *Mala inſana.* Offic. Ger. 274. Emac. 345. *Mala inſana Syriaca.* Park. Theat. 392. *Solanum pomiferum fructu oblongo.* C. B. P. 167. Raii Hiſt. 1. 673. MAD APPLES.

It is cultivated with us in Gardens, and flowers in Summer; the Fruit is uſed. *Dale.* We take this Plant, with *Marggrave*, to be the *Belingel* of the *Portugueſe*, the *Tongu* of *Angola*, and the *Macumba* of *Congo*.

The Apples, being much like thoſe of the Mandrake, have induced ſome Moderns to ſuſpect this Plant to be the male Mandrake of *Theophraſtus*, and, ſuppoſing them to be deadly, to call them *Mad Apples*; whereas, in reality, they excite no Symptoms of Madneſs, but are uſed by the *Italians* and *Spaniards*, in their Sauces and Sweetmeats. They have the Taſte of the Citron. *Margr. Raii H. P. p.* 673.

This Plant induces a Sopor and Madneſs, whence it takes its Name. *Hiſt. Plant. adſcript. Boerhaav.*

2. Melongena; fructu oblongo albo. *T.* 151. *Solanum, pomiferum, fructu inſtar Mali rotundo, albo.* C. B. P. 167. *Boerh. Ind. alt. Vol.* 2. *p.* 70.

This agrees in Virtues with the former.

MELOPEPO. The Squaſh.

The Characters are;

It agrees in all Things with the Pompion, except that its Fruit is roundiſh, ſtriated, angulous, cut into five Parts, and full of flat Seeds, which are affixed to a ſpongy Placenta.

Boerhaave mentions five Species of this Plant; which are,

1. Melopepo; compreſſus. *C. B. P.* 312.

2. Melopepo; fructu maximo; albo. *T.* 106. *Pepo compreſſus, major.* C. B. P. 311. *Pepo, Indicus, compreſſus, maximus.* M. H. 2. 25.

3. Melopepo; Clypeiformis. *T.* 106. *C. B. P.* 312.

4. Melopepo; verrucoſus. *T.* 106. *Cucurbita verrucoſa.* J. B. 2. 222. *Pepo minor verrucoſus.* M. H. 2. 26.

5. Melopepo; tuberoſus; & verrucoſus. *T.* 106. *Boerh. Ind. alt. Plant. Vol.* 2.

It has the Name *Melopepo*, becauſe its Fruit comes near in Size to a Melon, and partakes ſomewhat of the Nature of the *Pepo*, or Pompion.

It is of a moiſtening and refrigerating Quality, and is eſteemed pectoral; the Seeds are reckon'd among the Four cold Seeds. *Hiſt. Plant. adſcript. Boerh.*

MELOPLACUS, μηλοπλάκους, is a ſort of Cake made of Quinces boil'd in Wine, adding afterwards Honey, Pepper, and other Seaſoning, at the Diſcretion of the Cook. *Galen. de Aliment. Facult. L* 2. *C.* 27.

MELOSIS, μήλωσις. The probing a Wound or Ulcer.

MELOTIS, μηλωτὶς, or MELOTRIS, μηλωτρὶς. A ſmall Probe; properly one for the Ear.

MELUSI, Mercury. *Rulandus.*

MEMBRANA. A Membrane. By Membrane we underſtand a pliable Texture of Fibres, diſpoſed or interwoven together in the ſame Plane. They differ in Thickneſs according to the Smalneſs of their Fibres, or Number of their Planes. Theſe particular Planes are termed Laminæ, and diſtinguiſhed into external, internal, and middle.

The Difference of Membranes, in general, depends on that of the Fibres, of which they are compoſed. Small Portions of Membranes, eſpecially when they are very thin, are called Pellicles; and ſome membranous Laminæ are united together by the Intervention of a particular Subſtance, compoſed of this ſort of Pellicles, and called the cellular or ſpongy Subſtance. *Winſlow's Anatomy.*

MEMBRANOSUS MUSCULUS. The ſame as FASCIA LATA.

MEMBRUM. A Limb, or Member.

MEMYCYLON. A Name for the *Arbutus. Oribaſii Collect. Medic. L.* 15. *C.* 1.

MEMIGMENON, μεμιγμένον. The Name of a *Collyrium* deſcrib'd by *Celſus, L.* 6. *C.* 6.

MEMITHA. Some ſuppoſe the *Memitha* of the *Arabians* to be the *Cerinthe*; but *Cluſius* takes it to be the *Glaucium* of the *Greeks*.

MEMPHITES LAPIS. Offic. Matth. 1388. *Memphites* Aldrov. Muſ. Metall. 707. *Sardonyx Arabica, aliis Memphites.* Geoff. Prælect. 79. MEMPHIS-STONE. *Dale.*

It is a Stone of a pinguious Subſtance, parti-colour'd, of the Size of an ordinary Pebble, and found in *Egypt* near *Memphis*.

They ſay that this Stone, levigated, and rubbed on the Parts which are to ſuffer Cutting or Burning, renders them inſenſible without Danger. *Dioſcorides, Lib.* 5. *Cap.* 148.

What this Stone was, has been unknown ſince the Times of *Dioſcorides*. *Boetius*, in his Chapter of the *Onyx*, (which is parti-colour'd, and incircled with two diſtinct Zones, the white and the black) ſays, when the white Zone is ſcraped off, and diſcovers under it a black Zone, in Nature of a Stratum, the Stone is called by ſome *Memphites*, and by the modern Jewellers *Camehnia*, as if it were another Gem. And in another Place he quotes the following Paſſage from *Ludovicus Dulcis*: It is called *Memphites* from the City *Memphis*; being taken inwardly, or macerated in Vinegar, it induces a Stupor on the Members, ſo as that they may be amputated without Pain.

MENAGOGUS. The ſame as EMMENAGOGUS.

MENDESIUM, μενδήσιον. The Name of an aromatic Unguent, deſcribed by *Dioſcorides, Lib.* 1. *Cap.* 72.

MENDONI. A Name for the METHONICA, *Malabarorum.*

MENDOSA SUTURA. The ſquamous Suture in the Cranium.

MENDOSÆ COSTÆ. The ſpurious Ribs.

MENAGETÆ, in *N. Myrepſus, Sect.* 1. *Cap.* 22. ſignifies the greateſt Cardamoms, or *Grana Paradiſi*, in the Opinion of *Fuchſius*.

MENINGOPHYLAX, μηνιγγοφύλαξ. An Inſtrument deſcribed by *Celſus, Lib.* 8. *Cap.* 3. contrived for guarding the Membranes of the Brain, whilſt the Bone is raſped, or cut, after the Operation of the Trepan.

MENINX, *μήνιγξ*. A Membrane. But the Word in Anatomy is generally uſed to ſignify the Dura and Pia Mater. See CAPUT.

MENISPERMUM. A Name for the *Hedera*; *monophyllos*; *Convolvuli foliis*; *Virginiana*.

MENS. The Mind.

MENSES.

Among the natural Actions which prepare proper Juices, and Matter, for carrying on the vital Motions, we may, with the greateſt Juſtice, reckon the menſtrual Purgation of Women; ſince, by means thereof, the ſuperfluous and redundant Blood is evacuated, that what remains in the Veins may circulate with the greater Freedom, and be the more effectually depurated.

The monthly Evacuation of Blood from the Uterus, occaſioned by the Redundance of that Fluid in Women, and the peculiar Structure of the Uterus, as it is of great Importance to Health, ſo it is the means by which the Fœtus is nouriſhed.

The Quantity of Blood, thus monthly evacuated, cannot be exactly and accurately aſcertain'd; for it varies in Women of different Ages, Methods of Life, and Conſtitutions. About the firſt Eruption of the Menſes, the Quantity diſcharged is generally but ſmall; whereas it is conſiderably larger in Women arrived at the Years of Maturity. Lean Women, alſo, and thoſe who abound in Blood, evacuate more than ſuch as are fat, and of a cold Conſtitution; and thoſe who are addicted to Luxury and Idleneſs, a larger Quantity than thoſe who live upon low and ſlender Diet, or uſe much Exerciſe. *Hippocrates*, in his firſt Book *de Morbis Mulierum*, affirms, that two Heminæ are diſcharged; and other Authors, alſo, maintain that one Pint, or one Pint and an half, is evacuated.

The Cauſe of this Diſcharge is nothing but the Redundance of the Blood, the due Evacuation of which is wiſely appointed by Nature for the Preſervation of Health. Phyſicians have entertained various Opinions, with reſpect to the Cauſes of this Diſcharge, whilſt ſome aſcribe it to the Motion and Change of the Moon; others to a peculiar Ferment of the Uterus; others to the Archæus of *Helmont*, who is ſuppoſed to preſide over the human Body; and others to a ſecret and unknown, but wiſe and well-deſigned Law of Nature: But, rejecting theſe myſterious and abſtruſe Principles, which are but ill accommodated to the common Senſe of Mankind, we account for this Diſcharge from Plenitude, or a greater Quantity of Blood than is neceſſary.

The ſoft and lax Texture of the ſolid Parts, together with the Smalneſs of the Veſſels, is the Reaſon why Women abound more in Blood than Men; for the more ſolid the fibrous Parts are, the greater Strength and Reſiſtance they have to impel the Fluids; whereas the ſofter and laxer the Fibres are, the leſs Strength and Efficacy they have for this Purpoſe; and the Pulſation of the Heart and Arteries bears a Proportion to the Strength of the Fibres, and the Capacity of the Veſſels. In Men, the Parts of whoſe Bodies are firmer, and whoſe Veſſels are larger, the Pulſe is briſker, fuller, and quicker, than in Women, in whom, by reaſon of the Softneſs of the Fibres, and the Smalneſs of the Veſſels, it is more languid, ſoft, and ſmall: But ſuch as the Pulſe is, ſuch the Circulation of the Fluids muſt of courſe be; and ſuch as the Orifices of the ſecretory Veſſels are, ſuch is the Tranſpiration, and Conſumption of the Moiſture of the Body. Now, ſince in Women the Blood circulates more ſlowly, and the Veſſels are narrower, than in Men, ſo, in the former, there will be a ſmaller Secretion of the perſpirable Matter, and, conſequently, a greater Redundance of Blood and Humours in the Veſſels. Beſides, Women uſe leſs Exerciſe than Men: But, according to *Sanctorius*, in the ninth Aphoriſm of his fifth Section, human Bodies are always render'd lighter by Exerciſe; ſince it carries off a large Quantity of the Humours contained in them.

That a Plethora is the Cauſe of the menſtrual Diſcharge, may be, alſo, confirmed by ſeveral other additional Arguments; for thoſe Women who indulge themſelves in Luxury and Idleneſs, who are lean, and of a ſoft Habit of the Body, have, in conſequence of their greater Redundance of Blood, more copious Diſcharges; whereas fat Women, in whom the Blood is not ſo much collected in the Veſſels, as diffuſed through the whole Habit; Country-women; thoſe accuſtomed to hard Labour; thoſe juſt recover'd from chronical Diſeaſes; thoſe who in Child-bed, or by means of any other Evacuations, have loſt large Quantities of Blood; as, alſo, thoſe who give Suck, or are pregnant, have but very ſmall, or no menſtrual Diſcharges at all.

The beſt Blood, or that which is moſt richly impregnated with the nutritive Juices, and not that which is moſt peccant and corrupted, is diſcharged from the Uterus: For the Antients, not knowing the Circulation of the Blood, falſely imagined, that the menſtrual Blood was poiſonous and corrupted; becauſe a Suppreſſion of it proved ſo prejudicial to the Body: But the Blood diſcharged from the Uterus is fluid, and florid; in young Girls pretty thin, but in full-grown Women much thicker. But if it ſhould ſtagnate for a conſiderable time in the Veſſels, it may, by its Continuance there, be render'd grumous, black, and fetid.

The peculiar Structure of the Uterus is the Reaſon why this redundant Blood is evacuated from that Part, and not from other Parts; for ſuch is the Fabric of the Uterus, that its Fibres and Veſſels may not only be diſtended and dilated in an incredible manner, but they are, alſo, capable of contracting and reſtoring themſelves again to their former Condition; for which Reaſon the redundant Blood is more eaſily convey'd to the Uterus, and there collected: Beſides, both arterial and venous Veſſels, ariſing from the ſpermatic and hypogaſtric Trunks, ſend off an almoſt infinite Number of Ramifications to the Uterus and Vagina: And theſe Ramifications do not run in a direct Courſe; but are variouſly contorted, crooked, diſtributed, as it were, in a ſerpentine Form, and are very ſmall in Women who are not pregnant; but in pregnant Women they become large, and are ſtretched in proportion as the Uterus is augmented; for, without ſuch an Incurvation and Flexure of the Veſſels, the Uterus could not be diſtended by the Fœtus, without ſome Danger of a Rupture of its Veſſels. Beſides, the Membranes which cover both the internal and external Surface of the Uterus, and through which Veſſels are diſtributed, are covered with no Fat, in conſequence of which, the Veſſels are the more eaſily diſtended and opened: The deſcending Trunk, alſo, of the Aorta is obſerved to be larger in Women than in Men; becauſe in the former a more conſiderable Quantity of Blood is to be conveyed to the Uterus. Beſides, as the perpendicular Aſcent of all Fluids is performed with Difficulty; ſo we find, that the Motion of the Blood through the long and winding Progreſs of the ſpermatic Veins to the ſuperior Parts is perpendicular, and, conſequently, ſlow and languid. In a Word, as the Valves, with which the Veins in the other Parts of the Body are furniſhed, excellently aſſiſt the progreſſive Motion of the Blood, and prevent its Regurgitation, ſo in the Veins of the Uterus, which are deſtitute of Valves, the Blood circulates ſlowly, and, being collected in the larger Veſſels, regurgitates to thoſe of the ſmall and capillary Kind, whoſe tender Orifices it preternaturally diſtends and ſtretches. If, therefore, a larger Quantity of Blood is accumulated, than the Veſſels can either receive, or the Strength of the Heart and Solids can diſpoſe of in a due manner, it can make its Retreat ſo properly to no Part, as to the Uterus: For this Reaſon it is gradually accumulated in the Veſſels, and fills their Sinuſes, till their Extremities, which terminate obliquely in the Uterus, being too much diſtended, at laſt burſt, and diſcharge the Blood into it.

The Eruption of the Blood from the capillary Veſſels of the Uterus is not only produced by its Stagnation in the Veins, but, alſo, by a ſpaſmodic Conſtriction of the Parts; for it is a conſtant Obſervation in Practice, that, in all critical and copious Evacuations of Blood, there are always perceived a certain Coldneſs of the Extremities, a Pain of the Back, an Inflation of the Abdomen, and a Retention of the Fæces, accompanied with Languor, and a Senſation of Weight; for, according to *Hippocrates*, in *Aph.* 39. of *Sect.* 6. too great a Repletion of the Veſſels produces ſpaſmodic Strictures, by which the Circulation of the Blood through the capillary Veſſels is hinder'd: Hence it regurgitates to the larger Veſſels, and, when too copiouſly congeſted about the Heart, renders its Contraction both ſtronger and quicker, as is obvious from the hard and large Pulſe in every violent Eruption of Blood. The Blood, being, therefore, convey'd through the Arteries to the Veſſels of the Uterus, opens their Extremities; and this Effect is the more eaſily produced, becauſe the Veins of the Uterus, being already loaded with Blood, reſiſt the free Circulation of that Fluid.

The menſtrual Blood is evacuated from the minute Veſſels, both of the Uterus and Vagina. It is, however, a great Controverſy among Anatomiſts, whether this Blood is diſcharged from the Veins of the Uterus alone; or thoſe of the Vagina, excluſive of the Uterus: And both Opinions have their reſpective Patrons, who appeal to the Evidence of Senſe, for what they eſpouſe as Truth. I, on the contrary, affirm, that both Opinions may be true; but, becauſe more Veſſels are diſtributed to the Uterus, than to the Vagina, and becauſe the ſpermatic Veins, which are diſtributed through the Ovaria, are very winding, we may juſtly affirm, that large Effuſions of Blood, as in Abortion, proceed from the Veſſels of the Uterus; whereas the ordinary menſtrual Diſcharges proceed from the Veſſels of the Vagina. But whether the menſtrual Blood is diſcharged from Veins, or ſmall Arteries, cannot be accurately determined; but, becauſe it is evacuated Drop by Drop, I am inclined to think, that it rather proceeds from the former than from the latter, eſpecially becauſe, according to *Fantoni*, in his *Anatomia Corporis Humani*, Air blown into the Veins of the Uterus is readily convey'd to its Cavity, and to the Vagina; and becauſe the Coats of the Veins are more eaſily opened, than the Sides of the Arteries.

The Cauſes of this ſtated and periodical Diſcharge of Blood from the Uterus are purely mechanical: Many imagine the Moon to be the Cauſe of this ſurpriſing Phenomenon, becauſe it recurs at a certain State or Phaſis of that Planet: But, becauſe the ſame Effect recurs on a certain Month, Day, or Hour, we are not, for that Reaſon, to aſcribe this Effect to the Influence of the Stars; for, in conſequence of the ſlow Circulation of the

Blood,

Blood, and the languid Perſpiration in Women, it is neceſſary ſome Quantity of ſuperfluous Blood or Humours ſhould be accumulated in the Veſſels; by which means a Plethora is gradually induced. Let us ſuppoſe, then, that a certain determinate Quantity of Blood, a Pint and an half, for Inſtance, is neceſſary to produce this Eruption through the Veſſels of the Uterus; and that, in order to collect this Quantity, a certain Time, twenty-eight Days, for Inſtance, is requiſite; it will from this follow, not that this Time is the direct Cauſe of the menſtrual Diſcharge, but that a certain Time is requiſite to the Accumulation of ſuch a redundant Quantity of Blood, as is ſufficient to excite Spaſms, and produce a Rupture of the Extremities of thoſe Veſſels which terminate in the Uterus: From the particular Quantity, therefore, of menſtrual Blood diſcharged from each Woman, we may eaſily determine how much ſuperfluous Blood, and nutritious Juice, is each Day generated in every individual Woman; and, conſequently, what Quantity ought to be expelled and diſcharged.

Daily Experience proves, that this Diſcharge greatly contributes to the Preſervation of Health; for, when this Evacuation is carried on in a regular and natural manner, a perfect State of Health is enjoyed; but when it happens to be either defective, or exceſſive, it lays a Foundation for an incredible Number of Diſorders. This Doctrine is confirmed by *Hippocrates* in *Aph.* 57. of *Sect.* 5. And *Galen*, in his Treatiſe *de Venæ ſectione adverſus Eraſiſtratum*, uſes the following Expreſſions: "Does not uner-"ing Nature every Month evacuate the ſuperfluous Blood from "Women? For as the female Sex ſtay much at Home, are un-"accuſtomed to hard Labour, deprived of the Advantages of "the free and open Air, and accumulate large Quantities of "Humours, I am of Opinion, that the Evacuation of theſe ſu-"perfluous Humours is, as it were, the Remedy kindly ap-"pointed and ordained by Nature:" For, in order to the due, equable, and free Circulation of the Blood, which maintains the Soundneſs of all the Parts and Functions, a certain determinate Quantity of Blood is requiſite; and when this Quantity is either exceſſive, or defective, the due Circulation of the Blood, ſo conducive to Health, muſt neceſſarily be diſturbed.

An exceſſive Redundance of Blood, in conſequence of a Suppreſſion of the Menſes, retards the Circulation of the Blood, and impairs the Strength, Elaſticity, and Contraction of the Heart and Veſſels. Hence Stagnations and Congeſtions of Blood, together with Obſtructions of the Viſcera, prove highly injurious, and lay a Foundation for great Numbers of chronical Diſorders; for from a Diminution, or total Suppreſſion, of the Menſes, moſt of the Diſeaſes incident to Women proceed, which are widely different, according to the various Parts they affect: Thus, if Blood ſhould ſtagnate in the Head, it excites Melancholy, an heavy Pain of the Head, a Vertigo, a Dimneſs of Sight, and Dulneſs of Hearing, Paleneſs, Madneſs, and, ſometimes, Apoplexies. On the contrary, when Blood is congeſted in the Præcordia, it produces a Difficulty of Breathing, an Aſthma, a Cough, a Spitting of Blood, a Palpitation of the Heart, and Syncopes. If Blood becomes ſtagnant in the Stomach and Inteſtines, Inflations, Rumblings, Eructations, Uneaſineſs of the Præcordia, Vomitings of Blood, and Gripes, are produc'd. If the abdominal Viſcera are loaded with thick Blood, a Cachexy, an Heavineſs of the whole Body, a Scurvy, a Jaundice, hyſteric Diſorders, purple Fevers, Tumors of the Legs and Feet, and Varices of the Veins, are generated. If too large a Quantity of Blood is accumulated in the Uterus, a *Fluor albus*, Inflammations of the Part, Moles, and Abortions, are produced. But by reſtoring the menſtrual Diſcharge, all theſe Diſorders are either alleviated or remov'd; or they may be prevented by ſeaſonable Veneſection. The particular Method of treating all theſe Diſorders is deliver'd under the Article UTERUS; which ſee.

The Menſes generally make their firſt Eruption in Girls about fourteen Years of Age, and ceaſe between forty and fifty, at which times a large Number of Diſorders are generally produced. This Diſcharge generally begins in Girls about fourteen Years of Age; becauſe at that time a larger Quantity of Aliments is uſed and digeſted, and conſequently a greater Quantity of Blood generated, which in their younger Years was much more ſerous, though well enough calculated for the Nouriſhment of the Body. When this Evacuation begins, the Body is frequently freed from numberleſs Diſorders ariſing from the Redundance of Serum before generated. But this Diſcharge generally ceaſes in Women between forty and fifty Years of Age, becauſe, at that time, the Fibres become more rigid, the Mouths of the capillary Veſſels are block'd up, and the ſpaſmodic Motions which produce this Excretion begin to fail. Unleſs, therefore, we relieve Women at this Age by ſeaſonable Veneſection, or by increaſing the Evacuations by Urine or Tranſpiration, they are generally afflicted with various chronical Diſorders.

Not only Women, but, alſo, Men, who generate large Quantities of Blood, evacuate the ſuperfluous and redundant Part of it by the hæmorrhoidal Veins.

As Women, in conſequence of the Smalneſs of their Veſſels, and the ſoft and flexible Structure of their Fibres, become plethoric, and receive incredible Advantage from the Evacuation of the Menſes, ſo Men of ſimilar Habits and Conſtitutions, in conſequence of an increaſed Plethora, diſcharge the ſuperfluous and redundant Blood by the hæmorrhoidal Veins: The hæmorrhoidal Diſcharge in Men is more frequent than is generally imagined, as Phyſicians much converſant in Practice very well know. But ſuch Men as are full of Juices, of delicate Complexions, and whoſe Fleſh is lax and ſpongious, are moſt ſubject to this hæmorrhoidal Diſcharge; becauſe Perſons of ſuch Habits, in conſequence of their languid Pulſe, and the Narrowneſs of their ſecretory Veſſels, do not evacuate a Quantity of Juices proportion'd to that generated from the Aliments they uſe: Such Men are, in their younger Years, ſubject to Hæmorrhages from the Noſe, or a Spitting of Blood; but, when they are more advanced in Years, they become ſubject to the hæmorrhoidal Diſcharge, which is both more copious and frequent, the more Blood there is accumulated in the Veins.

The hæmorrhoidal Diſcharge is highly ſalutary, becauſe it frees the Body from a Plethora, and conſequently prevents the Diſorders which would, in Proceſs of Time, ariſe from it: For which Reaſon the Antients juſtly dignified this Evacuation by giving it the pompous Epithet of *Golden*; and others call it the bountiful Work of powerful and ſalutary Nature; becauſe it procures Health, and protracts Life to old Age. Nothing is, therefore, more prejudicial, than unſeaſonably to diminiſh, or ſuppreſs, this accuſtomed and ſalutary Evacuation, by improper Diet or ill-choſen Medicines; for by this means violent Obſtructions and Infarctions of the Viſcera, and, in conſequence of theſe, chronical Diſorders, ſuch as Cachexies, Dropſies, the Stone, ſpaſmodic Flatulences, Melancholy, convulſive Colics, and ſciatic Pains, are generated, all which are happily removed, by prudently and ſeaſonably reſtoring the hæmorrhoidal Diſcharge. But we muſt diſtinguiſh between that Species of Hæmorrhoids, which is critical, ſalutary, and evacuates the redundant Blood; and that leſs auſpicious Kind, which draws its Origin from a bad and preternatural Conſtitution of the abdominal Viſcera. In conſequence of this laſt-mentioned Misfortune, we often obſerve cachectic, hypochondriac, and dropſical Patients afflicted with the hæmorrhoidal Diſcharge, which ſometimes afford Relief, and ſometimes proves prejudicial, eſpecially when it is too copious.

The Preſervation of the human Body, which is highly ſubject to Corruption, depends upon the free Circulation of the Blood, which, again, depends on the due Ingeſtion, Retention, and Excretion of ſuch things as are moſt ſuitable to Nature; for the vital Functions conſiſt in the ſeveral Motions both of the ſolid and the fluid Parts. But theſe Motions can neither long ſubſiſt, nor have Matter to exerciſe themſelves upon, unleſs by means of the natural Actions ſubſervient to the due Ingeſtion, Secretion, and Excretion of proper Aliments. The Aliments, therefore, taken, and the Excretions made, are of the greateſt Importance, either to the Preſervation of Life and Health, or the Production of Diſeaſes; for which Reaſon the Phyſician ought always to have a due regard to them. See DIÆTA.

'Tis certain from Experience, that frequently, when by any Cauſe the Menſes are ſuppreſſed, the Blood which ought to have been diſcharg'd by the *Pudenda*, is conveyed to other Parts, and diſcharged in preternatural and uncommon Hæmorrhages. Thus *Horſtius*, in *Præfat. ad Part.* 2. *Obſ. Schenkii*, *Lib.* 4. informs us, that upon a Suppreſſion of the *Menſes*, the Blood regurgitated, and was diſcharged from the Ears. And *Hollerius* in *Comment. in Lib.* 2. *Sect.* 2. *Coac. Prænot.* as, alſo, *Johannes Rhodius*, *Cent.* 3. *Obſ.* 51. affirm, that they have known the menſtrual Blood critically diſcharged from the Gums, and the Sockets of the Teeth. But it is more frequently obſerv'd, that this Blood, which ought to be diſcharged from the *Uterus*, is thrown up by Vomit, in conſequence of a Rupture of the Veins of the Stomach; which is ſufficiently confirmed by *Hippocrates*, in *Lib.* 1. *de Morb. Foreſtus. Lib.* 16. *Obſ.* 25. *Panarolus Pentecoſt.* 1. *Obſ.* 6. *Rodericus a Caſtro*, *de Morb. Mulier. Lib.* 1. *Cap.* 3. *Hoechſtetterus*, *Obſ. Dec.* 2. *Caſ.* 7. *Stalpart vander Wiel*, *Cent.* 2. *Obſ.* 17. and ſeveral other Authors. It, alſo, ſometimes happens, that, when the Blood cannot be diſcharged through the Veſſels of the *Uterus*, it is, with a conſiderable Impetus, conveyed to the Lungs, where, burſting the Veſſels, it is diſcharged by Coughing. Inſtances of this are found in *Holler*, *de Morb. intern. Lib.* 1. *Cap.* 29. *Rhodius*, *Cent.* 3. *Obſ.* 30. and *Salmuthus*, *Cent.* 2. *Obſ* 18. In old Women, alſo, when the menſtrual Evacuation ceaſes, a Diſcharge of bloody Urine frequently enſues; ſo that there are Inſtances in which, at every ſtated Period of the *Menſes*, Blood, partly fluid, and partly grumous, has been diſcharged with the Urine.

But every judicious Phyſician muſt readily perceive, that ſuch an Evacuation of the menſtrual Blood from improper Places, muſt neceſſarily be very unſafe and dangerous. But the more noble and neceſſary to Life the injured Part is, the greater the Danger muſt, of courſe, be. Thus, if the Lungs, ſo neceſſary to the various Functions of Life, are affected and lacerated by ſtagnant Blood, an ulcerated and phthiſical State of that Organ is readily brought on. To this Purpoſe we find a memorable Paſſage in *Proſper Alpinus*, *Medic. Method.* which runs thus: "The "menſtrual Diſcharge is ſuppreſs'd by immoderate Evacuations

" of Blood, or long-protracted Diſeaſes; but if this Suppreſſion " continues for a conſiderable time, the Patients are ſubjected " to terrible Misfortunes, and ſome are ſeized with a Spitting of " Blood, after which they fall into a Phthiſis; an Accident of " which kind happen'd to one *Æmilia*, a young Lady of Diſtin- " ction, who, by continual Grief and Sorrow, having her Menſes " ſuppreſs'd, was ſeized with a Spitting of Blood, a continual " Cough, and a ſlight Fever, which, a few Months after, put an " End to her Life." *Hippocrates*, alſo, in his firſt Book *de Morb. Mulier.* informs us, "That in ſome Women the menſtrual Blood, " being retained in the Uterus for two Months, regurgitates to " the Lungs, and produces all the Symptoms of a Conſumption." But if this Blood ſhould be lodged between the highly ſenſible Membranes of the Stomach, and become corrupted or coagulated there, a dangerous Inflammation of the Stomach, or an hectic Fever, is produced; or, if it ſhould happen to make an Eruption, the Veſſels of the Stomach, before too much diſtended, are ſo dilacerated, eſpecially if the Spleen is previouſly diſordered, that they cannot be again conſolidated, but a copious Vomiting, frequently recurring, puts an End to the Patient's Life.

An Inſtance of an Epilepſy ariſing from a Retention of the Menſes is found in *Miſcel. Nat. Curioſ. Dec.* 1. *An.* 1. *Obſ.* 85. and another Inſtance of an obſtinate Loſs of Memory brought on by the ſame Cauſe is recorded in the *Acta Haffnienſia:* 'Tis, alſo, certain from Experience, that a Retention of the Menſes, throws the nervous Syſtem into ſuch Commotions, as to excite hyſteric Diſorders; which we find confirmed by *Hippocrates*, in his Treatiſe *de Morb. Mulier. In Miſcel. Nat. Curioſ. Dec.* 2. *An.* 1. *Obſ.* 79. we have an Inſtance of a Dropſy of the Uterus ariſing from a Suppreſſion of the Menſes; and we learn from Experience, that Exulcerations, violent, and even ſcirrhous Tumors of the Uterus are ſometimes produced by the ſame Cauſe. Neither do the external Parts of the Body eſcape the fatal Conſequences of a Suppreſſion of the Menſes, ſince we know from Experience, that by this means they are frequently affected with the Itch, the Elephantiaſis, Boils, eryſipelatous Diſorders, or ſcirrhous Tumors.

As all theſe Misfortunes are, in young Women, brought on by a Suppreſſion of the Menſes, ſo they often happen to thoſe in whom this Evacuation ceaſes, by reaſon of Age; for I have known from Experience, that Women, after fifty Years of Age, eſpecially thoſe of ſanguine Habits, who have formerly been accuſtomed to copious menſtrual Diſcharges, and who lead ſedentary, idle, and delicate Lives, whilſt, at the ſame time, they neglect Veneſection, have been afflicted with violent Cardialgias, accompanied with intenſe Heat and Pain about the Præcordia, the Back, and Scapulæ, eſpecially in the Night-time. I have ſeen others, from the ſame Cauſe, ſeized with intolerable Heat and Pain of the Joints, and eryſipelatous Fevers, whilſt others were afflicted with nephritic Diſorders, accompany'd with Pains of the Loins, and terminating in calculous Concretions. Some Women, after the ſixtieth Year of their Age, have diſcharged bloody Urine, or been ſeized with an immoderate Diſcharge of the Menſes, which has, at laſt, terminated in an Hectic. Some Women, eſpecially thoſe waſted by long Grief, have been afflicted with a Pain of the Left Hypochondrium, accompany'd with an Uneaſineſs and Heat of the Præcordia; and which, afterwards, terminated in a violent Vomiting of Blood, or the Morbus Niger of *Hippocrates*. In ſuch Patients, upon laying open the Body, the Spleen has been found preternaturally large and putrid, the Vaſa Brevia of the Stomach ruptured, and gaping, and the Blood diſcharged from theſe Veſſels into the Ileum. A Lady of uncommon Diſtinction, upon the Ceſſation of her Menſes, in the fifty-third Year of her Age, was ſeized with continual and tormenting Vomitings for half a Year; after which, a Swelling of her Hands and Feet appeared, which, however, was happily removed by Veneſection, and other proper Remedies. *Frederic Hoffman.*

With reſpect to the menſtrual Flux, I am of Opinion, that the Blood is diſcharged from the Extremities of the uterine Arteries, where they open into the Veins; and that this periodical Flux is not excited by the Force which the Contraction of the Heart impreſſes upon the circulating Blood, but by the ſubſequent Impulſe of the contracting Arteries, which forces the Blood out of the Arteries into the continuous Veins. Now, whenever, upon any Occaſion, the Strength and contractile Force of the Arteries is impaired to a certain Degree, the Menſes become deficient, as it happens in lax and cachectic Habits. Hence the Reaſons are obvious, why Aſtringents, as Bitters, the Bark, Steel, and all thoſe Medicines and Methods, which impart Strength to the Fibres, Veſſels, and Viſcera, and increaſe their Elaſticity, and contractile Force, if prudently managed, excite the menſtrual Flux, and cure Diſorders ariſing upon the Suppreſſion thereof. See the Articles CACHEXIA, CHLOROSIS, FIBRA, and UTERUS.

I muſt not finiſh this Article, without taking notice of ſome very idle Pieces of Superſtition, which do no great Honour to human Sagacity. One is, what *Columella* relates of *Democrates*, that, in his Book of Antipathy, he aſſures us, that all thoſe Caterpillers, and other Inſects, which deſtroy a Garden, fall off, and die, if a Woman, with her Menſes upon her, walks three times round each Quarter of it bare-foot, and with her Hair looſe. But, to do Juſtice to this great Man, I muſt remark, that the ſame *Columella* informs us, that the Books, in his Time aſcrib'd to *Democrates*, were really wrote by one *Delus*, or *Bolus*, an *Egyptian.*

It is much leſs ſurpriſing, that *Paracelſus* ſhould believe the menſtruous Blood to be the greateſt of Poiſons; that, with it, the Devil produced Spiders in the Air; and that Fleas, Beetles, Caterpillers, and other Inſects, were generated by it: For as this Enthuſiaſt, who did not want Imagination, was, when young, accidentally depriv'd of his Virility by a Sow, it is remarkable, that he miſſes no Opportunity of diſgracing a Sex, in which he had no Delight.

MENSIS *Philoſophicus*, A Philoſophical, or Chymical Month. This is a very undetermin'd Space of Time; for ſome make it only three Days and Nights, others ten, ſome thirty, but moſt, forty. See MENSTRUUM.

MENSTRUA. The ſame as Menſes.

MENSTRUATIO. Menſtruation.

MENSTRUUM.

This is a barbarous Term, and denotes a Body, which, when artificially apply'd to another, divides it ſubtily, ſo that the Particles of the Solvent remain thoroughly intermixed with thoſe of the Solvend. This Solvent was called a Menſtruum, becauſe the Chymiſts, in its Application to the Solvend, firſt uſed a moderate Fire, for a Philoſophical Month, or forty Days; and hence aroſe the Name of a menſtrual Solvent, at length, barely a Menſtruum.

It is the Property of a Menſtruum to be itſelf equally diſſolv'd, when it diſſolves the Solvend; but, when the Solution is perfected, it may ſometimes happen, that the Solvent and Solvend ſhall ſeparate. The divided Parts, therefore, of the Solvent, muſt inſinuate themſelves among the Parts of the Solvend, ſo as to divide and diſſolve the Body. Hence it appears, that the Action of Menſtruums differs from all mechanical Separations, where the Inſtrument, ſuch as a Knife, Sword, or Saw, while it divides, is not itſelf divided, but remains almoſt entire. But there is ſome Reaſon to ſuſpect, that the ſingle Particles of a Menſtruum act like mechanical Inſtruments, by the Properties of their own proper Size, Figure, Hardneſs, and Gravity. Every Menſtruum, while it diſſolves, is neceſſarily divided into inviſible Particles, and muſt, therefore, be fluid in the Action; and, when the Diſſolution is completed, the Solvent and Solvend muſt become one Fluid.

Cuſtom has given the Name of Menſtruums to many Bodies of a hard, conſiſtent Nature, though, in that State, they cannot act as Solvents; and hence the Chymiſts have divided Menſtruums into Solid and Fluid.

Dry or ſolid Menſtruums may be again divided into five Claſſes. 1. The ſix Metals, Gold, Lead, Silver, Copper, Iron, and Tin; which act upon one another after being fuſed in the Fire, and may be intimately mixed, ſo as to make an apparently homogeneous Maſs, every Particle of which holds the ſame Proportion of a different Metal, as the Whole. For, if ten Ounces of Silver be thus mixed with an Ounce of Gold, and a Grain of this Maſs be given to an Aſſay-maſter, he will diſcover, that it contains one eleventh Part Gold, and ten Parts Silver. The ſame would be the Caſe, if an hundred thouſand Parts of Silver were mixed with one of Gold. Thus the leaſt Particle of Gold may be extended through an immenſe Maſs of Silver, ſo that every the leaſt aſſignable Particle of Silver ſhall contain a proportionable Particle of Gold, while the Particle of Gold remains unchanged among the unaltered Parts of the Silver. 2. The Semi-metals, as Antimony, Biſmuth, Cinnabar, Marcaſites, and Zink, which, when melted, mix with one another, or with Metals; but the Metals, even to the moſt minute Particle, are no longer malleable, but eaſily reduced to Powder. 3 The dry Salts; as Alum, Borax, Nitre, Sal Ammoniac, Sea-ſalt, Vitriol, fixed Alcali, and Mercury ſublimate; which may be ſubtily divided by Fire, and intimately mix with one another, with Metals, Semi-metals, and other Things. 4. Hard, foſſil, ſulphureous Bodies; as Sulphur Vivum, common Brimſtone, Arſenic, Orpiment, and Cobalt. 5. Thoſe foſſile Bodies, called by the Refiners, Cements; which conſiſt of Salts, Sulphurs, and Brick, reduced to dry Powders, and ſtrow'd betwixt Plates of Metal, in order to raiſe their Colour, or ſeparate one Metal from another.

Some Menſtruums, being left to themſelves, after the Solution, concrete into an hard Maſs, which, tho' compounded, appears of a ſimple uniform Nature. In this manner, if melted Lead be mixed with melted Tin, they unite as Water with Water, or Mercury with Mercury. The Caſe is the ſame in all the Metals, and ſome of the Semi-metals. Thus, if a Scruple of Regulus of Antimony be added to a Pound of melted Tin, the Maſs, when cold, will appear uniform, but become entirely brittle. So fixed Alcali unites with Sand in the Fire; and Sulphur and Mercury, by being ground together, turn to a black and dry Powder, which, being ſublimed, produces an apparent ſimple Body called Cinnabar. Many fluid Solvents intimately diſſolve ſome ſolid Maſſes, and after the Solution become an hard, and ſometimes a dry Body. Thus almoſt all the Menſtruums of Metals unite with their reſpective Metals into ſolid Vitriols; and thus ſtrong diſtilled Vinegar, when it has diſſolved Shells, Chalk, and ſtony

Subſtances,

Subſtances, ſeparates from its Water, and, together with the Bodies it diſſolves, forms a dry hard Maſs.

Numerous Menſtruums have a liquid Form, before they act as Solvents; as Vinegar, Water, ſaline, acid, alcaline, and compound Spirits, alcaline Oils *per Deliquium*, *&c.*

Some Menſtruums become liquid after the Solution, and continue ſo with the Solvent. Thus, in the Diſſolution of five of the Metals with ſimple Mercury, a ſoft Paſte is produced, which may be diluted indefinitely by the Addition of more Mercury; but there is ſcarcely any known Method of reſtoring this Amalgama to its Solidity. All the liquid Acids, after having diſſolv'd Metals in a large Proportion, cannot eaſily be dried; whence many have imagined theſe Solutions to be fixed metallic Oils, and in vain ſought great Secrets in them, though it is no more than a Way of collecting acid Salts in a large Quantity about Metals.

It is now eaſy to obſerve, that many Menſtruums unite Bodies, as well as ſeparate them: For frequently after the Diſſolution the Particles of the Menſtruum preſently join with thoſe of the Solvent, and produce a new Compound, often very different from the Nature of the ſimple reſolved Body. The Parts, however, of the Solvent, after its Concretion, no longer touch one another, but are ſeparated by the Interpoſition of the Particles of the Matter diſſolv'd. And the Particles, which before conſtituted the Solvend, are ſeparated by the Interpoſition of the Particles of the Solvent.

Hence it is plain, that the Parts of the Menſtruums apply themſelves to the Parts of the Solvend; and a certain Cauſe is here required, to make the Particles of the Solvent fly from one another, and approach the Particles of the Solvend, rather than remain in their former Situation. The like Cauſe ſeems to be required, to make the Particles of the Solvend, now ſeparated, remain united with the Parts of the Menſtruum, rather than ſuffer the diſſolving and diſſolved Particles to unite, by their natural Affinity, into homogeneous Bodies.

This Cauſe muſt be ſought as well in the Solvend, as the Solvent; for the Action is reciprocal. Thus, while Aqua Regia diſſolves thrice its Weight of Gold into a yellow Liquor, the Particles of Gold are united with the Aqua Regia, and remain ſuſpended in it, though Gold be eighteen times heavier than Aqua Regia: Whence there muſt be a mutual correſponding Power between the Particles of the Gold and Aqua Regia, whereby they act upon, embrace, and detain each other; otherwiſe the Particles of Gold would fall to the Bottom, the ſaline Particles reſt upon them, and the Water float over both.

If we were to deduce the Cauſe from Similitude of Subſtance, the Action of Diſſolution ſeems to be performed by a certain Power of the Parts of the Menſtruum to attract the diſſolved Parts, rather than to repel them; and is not a mechanical Action, or unfriendly Commotion, but rather an Appetite of Union. Thus, in a violent Solution, the Agitation, Heat, Hiſſing, and Tumult, ceaſe, when all the Parts of the Solvend have united with thoſe of the Solvent; as appears on throwing a Piece of Iron into weak Aqua-fortis.

The whole Solvent never acts once on the whole Solvend. Only thoſe Particles of the Solvent, which touch other of the Solvend, firſt act; and theſe, being ſeparated, freſh Particles of the Menſtruum apply themſelves to others of the Solvend.

Therefore, Part of the Menſtruum acts upon that Part of the Body which it ſtrikes off, and ſeparates; but the Conflict made in this Separation excites a greater Motion in the Menſtruum, by which means other Parts of the Menſtruum are agitated, and applied to other Parts of the Solvend.

Fire certainly excites, promotes, and increaſes, the Action of Menſtruums; for in extreme Cold Solutions are either not made, or made but ſlowly; but they are ſoon performed by the Aſſiſtance of Heat.

Some Menſtruums require a ſtrong Heat, as Mercury, before it will diſſolve Metals: Some a ſmaller; thus Sal Ammoniac, Sea-ſalt, and Salt of Tartar, eaſily diſſolve in Water. Some Menſtruums act with a moderate, but loſe their diſſolving Power, or even acquire a Power of coagulating by a ſtronger. Thus warm Water diſſolves the White of Eggs, which boiling Water coagulates.

This Effect of Fire ſeems to be produced, 1. By impelling, moving, and agitating the Menſtruum, in the manner of a mere mechanical Motion. 2. By its general Power of expanding the Subſtance of all Bodies. 3. By ſeparating the Parts, ſo as to ſet them farther aſunder. In moſt Caſes the Heat is increaſed during the Solution; and even the Action of thoſe Menſtruums is augmented by Heat, which generate a great Degree of Cold in the Solution: Thus Sal Ammoniac diſſolves ſooneſt in warm Water.

Of the Action of Menſtruums.

The Changes wrought upon Bodies by the diſſolving Power of Menſtruums ſeem greatly to depend upon the minute Particles of the Menſtruum now ſtrongly cohering with the Particles of the Solvend; and can ſcarcely be attributed to an eſſential Alteration introduced by the Menſtruum into the diſſolv'd Particles. Though pure Metals, ſuch as Gold, Silver, and Mercury, diſſolv'd, ſeem entirely changed; yet they may be eaſily ſeparated from the Menſtruums in the Form of a Calx, which being fuſed in the Fire, the Metal is recover'd unchang'd. Hence it appears, that the Menſtruums have no other Effect, than barely adhering to the Surfaces of the metallic Particles, while divided: Many more Inſtances of this kind may be given.

But it may be objected, That Solution produces new Bodies; becauſe, if red Lead be diſſolved in diſtilled Vinegar, there ariſes Sugar of Lead, when the Acid of the Vinegar is attracted into the Particles of the Lead; and though this Salt of Vinegar be diſtilled in a Retort with a ſtrong Heat, the Spirit of Vinegar is not recovered, but a particular Liquor obtained, which will burn in the Fire. There are many more Inſtances of the like kind; but we muſt conſider, that the adhering Parts of the Menſtruum cannot always clearly extricate themſelves, but remain united. Hence ſome imagine, that the Nature of Bodies is deſtroyed, while there only happens ſuch a ſimple Conjunction of unchanged Particles, under a new Appearance.

Thus the Blade of a Lancet or Knife, when naked, has the Appearance of the Power of Cutting; but, when in the Sheath, it has not, then, the ſame Appearance; tho' in themſelves the Knife, or Lancet, is ſtill the ſame. The eaſier they are to be unſheath'd, the ſooner the Appearance of their cutting Power becomes manifeſt; but, if the Sheath was to be firmly connected with the Blade, we ſhould not ſcruple to ſay, that the Blade was changed. So if a little Cylinder of pure Silver be gilt, and ſo put into Aqua-fortis, the Silver will be perfectly diſſolved, and leave the hollow Covering of Gold entire, floating like a black Film in the Menſtruum. Whence the acid Parts of Vinegar may be ſo united to certain Parts of Lead, as not to ſeparate upon Diſtillation, but eaſily riſe together. It would, therefore, be wrong to aſſert, that the Acid of the Vinegar was thus converted into a new kind of inflammable Liquor by the Contact of Lead: It is highly probable, that this Difference much oftener happens from Combination, than from any Change of the Subſtance; and the like holds, alſo, in Separation. For the Subſtance diſſolved often conſiſts of very different Parts, ſome of which are perfectly taken up by the Menſtruum, while others are rejected, and left ſeparate: Whence, after the Menſtruum is abſtracted from the Solution, there remains a different Subſtance from what was employed as the Solvend. And hence, without Caution, one might be ready to infer, that the Subſtance thus procured was a new one, produced by the changing Power of the Solvent; whereas, in reality, it is only produced by a bare Separation.

Hence we may learn, that the Action of all known Menſtruums depends upon Motion: For, if a Menſtruum did not change the Motion of the Parts upon which it acts, thoſe Parts would remain as they were; in which Caſe the Menſtruum, contrary to Suppoſition, could have no Action at all. The Origin of this Motion we cannot fairly attribute to the common Cauſes of Motion, ſuch as Impulſe, Gravity, Elaſticity, Magnetiſm, and the like; but there is a particular Cauſe, not common to all Bodies, exerted between the Solvent and Solvend. An Inquiry ſhould be carefully made into this Subject, to which we are the more incited, as ſome great Philoſophers have conceiv'd, that all the Actions of Bodies muſt be accounted for mechanically.

When a Solvent divides its Solvend by a mere mechanical Motion, this Motion muſt be generated in the Particles of the Solvent by ſome Cauſe, and this Cauſe is generally Fire. The Particles of the Menſtruum, thus agitated, muſt ſtrike againſt the Surfaces of the united Particles of the Solvend, communicate to them their Motion, and looſen and ſeparate them from the Solid, whether this Action be exerted externally, on the Surface of the Solvend, or internally, by penetrating the Solvend. Though this mechanical manner of acting may have ſome Effect, it is, perhaps, leſs than is generally imagined: For Fluids can produce little Alteration in a Solid, by means of their Quantity, Hardneſs, Figure, and Weight; and the Force they receive from the Fire is but ſmall, and always as capable of acting upon themſelves: The Power of Solution, therefore, muſt depend upon ſome other Cauſe. Thus a Wedge could never cleave Wood by being barely applied to it, or kept floating about it; but muſt firſt be fixed into the Subſtance, and then driven farther by an external Force; an Action not to be expected from the Particles of a yielding Fluid.

Thoſe Menſtruums alone appear to act mechanically, which, by a bare mechanical Motion, ariſing from their Magnitude, Hardneſs, Figure, Weight, and Impulſe, firſt attenuate Bodies, then directly ſeparate from them again, according to their ſpecific Gravities; by which kind of Solution no great Change can ariſe. By this Mark we may diſtinguiſh Menſtruums which act mechanically, from others.

Repulſion, alſo, may cauſe Bodies to ſeparate, after having been mix'd together by Shaking; as in Oil and Water, or Alcohol and Oil of Tartar *per Deliquium*; where not only Gravity, but, alſo, Repulſion, occaſions a Separation, and ſuffers ſimilar things to unite with ſimilar.

When, after Solution, the diſſolv'd Particles remain equally mix'd with thoſe of the Solvent, though, at firſt, they differed remarkably

remarkably in their Weight, ſuch a Solution may partly be aſcribed to the general mechanical Power, which here almoſt univerſally occurs; but principally to another Action, ariſing from the peculiar Properties of the Solvent and Solvend with reſpect to each other: As by this Power the Particles of the one attract the Particles of the other, thus both are ſeparated from their former Concretions, and afterwards permix or unite with each other, ſo as to form numerous new Species of Bodies.

To illuſtrate this Doctrine by an Example: If a Ball of ſoft Clay be put into Water, and ſet over the Fire to boil, the Parts of the Water put in Motion by the Fire will divide the Clay into ſmall Particles, and permix them with the Body of the Water, while the Boiling continues; but when the external Force of the Fire ceaſes, and the Water comes to reſt, and grows cool, all the Clay falls to the Bottom: This I would call a mere mechanical Solution.

But if a Ball of Sal-gem be boiled in four times its Quantity of Water, all the Salt immediately diſſolves ſo perfectly as to remain totally imbibed, ſuſpended, and uniformly diffuſed in the Water, even after it grows cold, and is thoroughly at Reſt; altho' the Gravity of the Salt is much greater than that of Water. Whence it appears, that the Water has a Power, by which it unites to itſelf the Particles of the Salt, ſo that they cannot be ſeparated from it by their own Gravity, but remain ſuſpended. The cloſer or looſer Degrees of Adheſion of the Particles of different Menſtruums with the Particles of the Body diſſolv'd are almoſt infinite; and hence ariſe numerous Differences in the Corpuſcles produced by Menſtruums.

We may now divide all known Menſtruums into four Kinds: 1. Thoſe which act by a mere mechanical Power, which are few, and generally ſimple. 2. Thoſe which, while they in ſome meaſure act by a mechanical Motion, principally owe their Efficacy to a certain repelling Power. 3. Such as chiefly act by a mutual Attraction between the Parts of the Solvent and Solvend, which are very numerous. 4. Thoſe which act by the joint Concurrence of the ſeveral Properties above-mentioned, and theſe are the largeſt Number. If it were poſſible to claſs Menſtruums according to the Differences of their Actions, and thence to form lower Claſſes, Chymiſtry might be brought to Rule, and the Event of every Operation be determined *a priore*; and hence chymical Experiments might be advantageouſly extended to other Branches of natural Philoſophy.

We ſhall now give an Example of each Kind, with regard to mechanical Solution:

Take an Ounce of pure Silver; put it into a clean ſtrong Crucible, cover'd cloſe with a Tile; ſet it in a gentle Fire; and, when almoſt ignited, give a ſtrong Blaſt-heat, till the Silver runs as thin as Water: Take the Crucible out of the Fire, and, holding it high in the Air, pour the fluid Metal, by a little at a time, into cold Water, that riſes at leaſt a Foot in the containing Veſſel: Thus the Parts of the melted Silver will enter the Water with a gentle Hiſſing, and, upon the firſt Contact, ſeparate into ſmall Grains, and fall to the Bottom, without any further Change, either in the Silver, or in the Water: Thus the melted Silver divides the Water, and is divided by it, while neither are alter'd by the Diviſion, but range themſelves according to their reſpective ſpecific Gravities.

The like Experiment ſucceeds in Gold.

But, if made with Copper, the melted Metal no ſooner touches the Water, than it inſtantly recoils, and flies off, with an incredible Force, divided into ſuch ſubtile Particles as ſcarcely to be found again. Thus there may be Menſtruums, which ſurpriſingly diſſolve the Solvend by a repelling Power.

Take four Ounces of the Flower of Sulphur; put them into an unglazed earthen Pan, covered with a Tile, to prevent the Sulphur from catching Flame: Set it over a Fire, ſo gentle as barely to keep the Sulphur melted: Put ſix Ounces of pure Quickſilver into a ſtrong, clean, Linen Bag, and ſuſpend it over the melted Brimſtone; into which, being uncovered, gently ſqueeze a little of the Quickſilver, and ſtir them together with an heated Spatula, till, by degrees, all the Quickſilver be mixed in, and a black, brittle, ſtringy Maſs will be obtained; which, viewed through a Microſcope, ſhines, and appears metallic.

Here we ſee a dry fluid Solvent, and a dry hard Solvend, Subſtances very different in their Origin, Gravity, Kind, and Degree of Volatility, and little diſpoſed to unite, when entire, which, upon the Contact of their minute Particles, concrete together, by Attraction, ſo tenaciouſly, as not again to be ſeparated by Fire. The Cauſes of this Union are, 1. Fire, which melts the Sulphur, and divides it into its minute Particles. 2. The Diviſion of the Mercury, by paſſing through the Linen Bag, and falling by little at a time into the Sulphur. 3. The conſtant ſtirring of them together. But theſe three Cauſes only apply the Mercury to the Sulphur. 4. A Power in both, whereby, when touching in many Surfaces, they attract each other ſo ſtrongly, as to require a great Force, or a ſtronger Attractive of either, before they will ſeparate again; and thence mutual Attraction is the principal Cauſe of the Effect. Whence, 5. ariſes ſo ſtrong a Cohesion, that, though ſublimed, they do not ſeparate, but riſe in minute Particles of Cinnabar, the ſmalleſt of which conſiſt of Sulphur and Mercury united. For the Mercury returns from it unaltered, when another dry Menſtruum is added, which attracts the Sulphur ſtronger than the Sulphur attracts the Mercury. Thus,

If twelve Ounces of Cinnabar, made ever ſo fixed by repeated Sublimation, be ground to Powder, and well mixed with an equal Quantity of clean Iron Filings, then diſtilled in a ſtrong Fire, all the Mercury comes over, in its own native Form, leaving behind a fixed Maſs, made by the Union of the Sulphur and Iron, which always unite more eagerly than Sulphur and Mercury.

As an Inſtance of the attractive and repellent Kind;

Take a Pound of common Antimony, reduced to Powder: Melt it in a clean Crucible, cloſe covered, till it runs like Water, and diſcharges a copious white Fume; then take the Crucible out of the Fire, and let it reſt in a quiet Place till perfectly cold; when the Surface of the Antimony will appear rough, unequal, and full of Holes.

Upon breaking the Crucible, you will find the bottom Part of the Maſs ſolid, metallic, and ſhining; but the upper Part porous, white, yellowiſh, and Lead-coloured: Whence we ſee, that the Fire, by melting the Antimony, had diſſolved its metallic and ſulphureous Parts; which, being thus ſet free, range and aſſociate themſelves differently, the metallic with metallic, and the ſulphureous with ſulphureous, while the metallic and ſulphureous mutually repel each other; ſo that, in this Solution, Fuſion by Fire, Repulſion, Attraction, and Gravity, acted together. If this Experiment be ſuppoſed not to ſhew the Nature of a Menſtruum, yet many Particulars may hence be learned, which happen in the Actions of Menſtruums.

To ſhew how Menſtruums may act by different concurring Ways;

Take four Ounces of fine Antimony, reduced to a ſubtile Powder: Grind with it two Ounces of hot and dry Salt of Tartar, in an heated Mortar, and a warm and dry Air, the Peſtle, alſo, being made hot: Put the Mixture into a Crucible, and melt with a ſtrong Heat, that the Powder may run thin: Then pour the melted Matter into a melting Cone, and, when cold, knock it out.

Thus we ſhall have an uniform Maſs, perfectly mixed through its whole Subſtance, by flowing in the Fire like Water, and now reſembling Glaſs, being of an Aſh-colour, a cauſtic Taſte, and diſſolving in the Air into a purple Liquor. Hence the fixed Alcali, the Sulphur, and the metallic Part of the Antimony, are, by the Action of the Fire, firſt minutely divided, and then again united into one uniform Subſtance.

We may now have a Notion of the Solution of Bodies by Menſtruums, different from the Opinion of thoſe Chymiſts and Philoſophers, who have conceived, that a certain mechanical Acrimony, acting by an univerſal mechanical Power, was here the Cauſe of the Effect; who, when they found, that what diſſolved one Body, would not diſſolve a ſofter, have invented ſeveral Ways to remove the Difficulty, and apparent Contradictions. But we purpoſe to inquire into Nature by Experiments alone.

Firſt, we are to conſider the Nature of Fire; which we find to be an almoſt univerſal Solvent, as it liquifies almoſt all Bodies, if applied in a proper Proportion to them: For when we riſe gradually from the Heat of the Body in Health, to the utmoſt Violence of the Focus of a burning Concave, we ſhall find few Bodies which do not reſolve into their minuteſt Particles, with one or other of theſe Degrees: For though ſome Subſtances, as Brick, grow harder with a certain Degree of Heat, yet they vitrify with an intenſe Fire, as we ſee in melting Furnaces. And although a few Bodies do not melt in the ſtrongeſt Fire hitherto known, yet, who can ſay they would not melt in a ſtronger? We muſt, therefore, acknowledge that the Power of Heat is very extenſive in the Action of Menſtruums.

Again, we are to obſerve, whether any mechanical, ſtrong, or long-continued Attrition, be concerned in the Action of Menſtruums; as this may often ſupply the Want of Fire, by attenuating, dividing, and rubbing the Parts of Bodies together; whence their fine Particles may act upon each other, and, at length, intimately unite. Thus, by means of M. *Langelotte*'s Mill, Gold is ſaid to have been ground into a potable Liquor; and M. *Homberg* informs us, that all Metals, even Gold itſelf, have been perfectly diſſolved, and turned to Liquors, by long grinding them with pure Rain-water.

Next,

Next, we are to conſider, that Bodies may be diſſolved after undergoing the Operation of Fuſion, Trituration, or feeling the joint Efficacy of both. For, when thus the Bodies are divided into minute Particles, and intimately mixed, there hence frequently ariſes an Opportunity for them to exert a repelling Force, which, before, was latent: For Inſtance,

Melt pure Lead in an Iron Ladle; then add to it thrice its Weight of pure Quickſilver, and you will thus have a white Amalgama, ſhining like Silver, capable of being kept for Years unaltered. If this Amalgama be ground in a Glaſs Mortar, with a Glaſs Peſtle, the whole Maſs ſoon turns perfectly black; and if Water be added to it, and ground with it, then poured off, it takes away the Blackneſs, and leaves the Amalgama pure again, and capable of being kept as before; but, if ground again, it grows black, and this after numerous Repetitions, as I have tried.

Whence it is plain, that the Mercury, here mixed with the Lead, does not repel this black Matter, either from itſelf, or from the Lead, unleſs this mechanical Triture be uſed; whereby the Mixture is attenuated, its Parts cloſer applied, and more intimately conjoined; whence there ariſes a Power in the Mercury upon the Lead, and of the Lead upon the Mercury; by which the Matter, foreign to both, is repelled and ſeparated from them; which could ſcarce be done by another Operation. If the Amalgama, thus made, be ſeveral times diſtilled with Mercury, and cohobated; thus, alſo, the ſame black Matter may be obtained and waſhed from it, by Trituration with Water: Whence a repelling Force is thus again plainly introduced; by means of which the Separation is afterwards eaſily made.

The Parts both of the Solvent and Solvend, when fuſed or agitated by the Fire, or attenuated and mixed by Trituration, often manifeſt a new and wonderful Power of Attraction and Combination: Whence proceeds a great Variety of Bodies, which did not appear before; as we ſee in the preceding Inſtance of the Amalgamation of Lead; where, upon Triture, there ariſes a wonderful Union of the Mercurial metallic Particles, by this attractive Power, after the repelling had ſeparated the heterogenous Parts, which prevented the mutual Contact of the homogeneous Parts; by which means ſomething unexpected is produced.

If, after the Solution is completed, the Menſtruum be ſeparated from the diſſolved Body, the latter is generally changed into a Calx, or ſome new kind of Subſtance.

Hence almoſt all Menſtruums, even the ſolid Kind, are, at the time of Action, in a fluid Form, except in Trituration; and that muſt be ſo exquiſite as to render the Bodies nearly fluid.

In the following Experiment, all the above-mentioned Cauſes, Fire, Triture, repelling Power, attractive Power, and mechanical Force, concur at once in dry Menſtruums, ſo as to produce all the Effects, as Attenuation, Concretion, Separation, and Change.

Take ſixteen Ounces of Antimony, purified, as has been directed, by a ſimple Fuſion: Reduce it to fine Powder, which we know conſiſts of common Brimſtone, intimately intermixed with the Mercurial Part of the Antimony: Then take twelve Ounces of *Rheniſh* Tartar, and ſix Ounces of pure Nitre, both finely pulverized: Dry them all ſeparately to the higheſt Degree, and mix them thoroughly in an Iron Mortar, and reſerve this Powder for the following Uſe. Next take ſix Ounces of Tartar, and three of Nitre, both powder'd, and mix them well together. Put a clean Iron Ladle over a clear Fire, till it becomes almoſt ignited; then throw into it a ſmall Portion of the Powder of Tartar and Nitre; the Mixture will immediately ſwell, boil, throw out ſmall Sparks, and burn with a livid Flame, leaving behind a white and fixed alcaline Maſs, intermixed with Spots of Green; and, if a freſh Quantity of the ſame Powder be thrown in, it produces the ſame Appearances.

Such are the Effects of the Mixture of an acid, vegetable Salt, with a ſaline, terreſtrial one, upon touching the Fire. Fixed Alcali, well-mixed with Sulphur, inſtantly takes Flame in the Fire, and the Sulphur is immediately diſſolved into a new Subſtance. Hence it appears, that if Tartar, Nitre, and Sulphur, be mixed, and thrown, by little at a time, into an ignited Ladle, a fixed Alcali immediately ariſes, which embraces the Sulphur, diſſolves it, and converts it into a peculiar Subſtance. Hence we apprehend the Effect of applying the firſt-mentioned Mixture to the Fire in the following manner.

Set a large ſtrong Crucible in the Fire, to heat gradually, and equably, without cracking; let it be capable of containing at leaſt thrice the Quantity of Powder to be thrown in; cover it with a Tile; and, when thoroughly ignited, take off the Cover, and throw in two Drams of the Mixture; firſt well heated, with Care to prevent its taking Fire: Upon touching the Bottom of the Crucible, it will burſt into Flame, Smoke, and Sparks; but grow quiet, when ignited. Throw in the ſame Quantity after the ſame manner, and do this by degrees, till all the Powder is uſed; at each time covering the Crucible, after the Matter is thrown in, till the Struggle is over. When the Deflagration is finiſhed, raiſe the Fire till the Matter flow like Water, which may be tried by ſtirring it with a Tobacco-pipe; keep it a while in this Heat; then pour it into a dry Braſs Cone, firſt heated and greaſed on the Inſide with Tallow; a Flame like Lightning immediately ariſes, upon pouring in the melted Maſs, on account of the Tallow; and, by this Flame, the Matter is hindered from ſticking to the Metal. When all is grown cold, invert the Cone, and, by ſtriking it, bring out the Matter, which will appear divided in two Parts; the upper being brown, and weighing about fourteen Ounces, is named Scoriæ; which are brittle, of a fiery Taſte, and run in the Air to a red Liquor. Theſe Scoriæ conſiſt of the fixed Alcali, made by the Tartar and Nitre; and of the Sulphur of the Antimony, melted into one Maſs, by the Alcali in the Fire; and thus, being repelled from the metallic Part, it floats at the Top, while the Metal falls to the Bottom by its own Weight; which, therefore, conſtitutes the other Part, and is of a white, ſhining Colour, like Silver, being very ponderous, and on its upper Surface bearing the Figure of a Star: This Part would be truly metallic, but for its extreme Brittleneſs, which renders it pulverable.

This Experiment illuſtrates all that was above delivered, concerning the Action of dry Menſtruums. 1. Mechanical Trituration renders three Kinds of Matter intimately miſcible. 2. The Fire melts, moves, mixes, and unites them. 3. The Oil of the Tartar, and the Sulphur in the Antimony, taking Flame, fixed Alcali is immediately produced, and directly embraces the Sulphur of the Antimony; whence, by their attractive Force, the Alcali and the Sulphur unite into one Maſs, that eaſily runs in the Fire. 4. At the ſame time there ariſes a repelling Power, between the metallic Part of the Antimony, and the alcaline Salt; which two can never be united in the Fire, but always in Fuſion repel each other, and range themſelves into different Strata, according to their Gravity. 4. The whole heated Maſs increaſes the Strength of the Fire; whence the Motion and Concuſſion becomes the more violent, and throws off a copious Fume with Soot and Sparks, by which thirty-four Ounces of the Powder loſe about ſixteen Ounces in the Operation; the Regulus weighing only about two Ounces and three Quarters.

Let us now conſider the Actions of Solvents, ſo far as they are explicable upon pure mechanical Principles. There is no known Body, whoſe Parts are ſo tenaciouſly combin'd, as not to be ſeparated by a mere mechanical Force alone; and thus even the Diamond may be cut into any Shape, and exquiſitely poliſhed.

Water by continual falling upon Metal or Stones diſſolves them; ſoft Leather long rub'd on the hardeſt Gems, Metals, or Glaſs, gives them a Poliſh; and Wheels of Wood kept conſtantly turning will wear away any Body applied to their Surface. Thus, the ſofteſt Bodies will at length reſolve the moſt rigid into inviſible Particles.

The leaſt and ultimate Particles of any Menſtruum, to us inviſible, may poſſibly be hard, and almoſt unchangeable, tho' in any ſenſible Bulk they appear ever ſo ſoft to our Senſes. Thus, the component Particles of Fire exceed all others in Hardneſs, Smalneſs, Mobility, and Immutability. None have obſerved any Change in an ultimate Particle of true Air; tho' the Air by its Force produces many Changes upon other Bodies. Water and Earth conſiſt of ſuch hard Parts, as not to be changed by Weight, Concuſſion, or Preſſure. So Alcohol receives no Change in its Particles, after ever ſo many Digeſtions, Diſtillations, and Commixtures.

But in every mere mechanical Diſſolution there occurs this Difficulty, that the Particles of the Menſtruum, applied to the Surface of the Solvend, eaſily recoil, ſo as not to act powerfully. But we are to conſider, that the Weight of both the Bodies, and, alſo that of the Atmoſphere, may have a great Effect. Whence it is certain, that Menſtruums, which act ſimply by a bare mechanical Power, diſſolve but weakly, unleſs ſome other Power be added: On the other hand, we know, that a ſtrong external Compreſſure of a Fluid to a Solid greatly increaſes the diſſolving Power, *cæteris paribus*. Thus, Bones are little changed by long boiling with Water in an open Veſſel; but ſoon grow ſoft, and diſſolve, in *Papin*'s Digeſtor; whence the Parts of the Water are ſtrongly compreſſed, and driven or ground againſt the Subject. Thus, the firſt mechanical Manner of acting appears to be by the Attrition of one Body upon the external Surface of the other.

But when a Solvent alſo diſſolves the inner Subſtance by Attrition, its Particles ſeem to inſinuate themſelves into the Pores of the Solvend, and thus to act upon the internal Surface in the ſame manner, as we have explained of the external Surface. So that here the principal Difficulty is to underſtand, by what means the Solvent enters the Pores of the Solvend.

The firſt Condition requiſite to this Solution, is a proportional Magnitude between the ſmalleſt Pores of the Solvend, and the Particles of the Solvent. No Diſſolution enſues, when the

Parts of the Menſtruum form Concretions, incapable of entering the Pores of the Solvend; but, if theſe Concretions are diſſolved by Water into finer Particles, they may enter the Pores. Thus, put an Ounce of highly rectified Oil of Vitriol into a Glaſs Body; place the Glaſs in Water ſet over the Fire to boil; then put into the Oil of Vitriol five Drams of clean Iron Filings, and ſhake the Glaſs; upon which a great Rarefaction, without Fume or Ebullition, will inſtantly ariſe; the Matter in the mean time remaining ſwelled, but undiſſolved, and of a grey Colour. To another Ounce of Oil of Vitriol, heated in the ſame manner, pour three Ounces of boiling Water; throw into this diluted Oil of Vitriol, five Drams of Iron Filings; upon which a violent Ebullition, Efferveſcence, and Fume, will ariſe, with a Garlick-ſmell; and the whole Body of the Iron be preſently diſſolved into a green Liquor.

Farther; we ſhould conſider the Figure of the Particles of the Solvent; for mechanical Actions greatly depend upon the Figure of the acting Body. Thus any Body whatever, by the Variation of its Figure only, may acquire a Power for performing many things which it could not perform before: For inſtance, an Ounce of Steel may be formed into a Sphere, a Cube, a Knife, a File, a Saw, *&c.* all which anſwer different Purpoſes, on account of their Figure. In like manner, the ſame Body may act differently as a Solvent, according to the Figure of its Parts, provided the Pores of the Solvend are able to receive them. Hence it may happen, that the reciprocal Power between a Solvent, and a Solvend, ſhall be ſometimes aboliſhed, or perfectly changed, when the Figure of the Surface of either, or both, is changed. This muſt be the Caſe, unleſs we imagine the diſſolving Particles of Bodies to be immutable; which, however, is not probable, becauſe the ultimate Particles of Bodies ſeem not to be the ſame with their diſſolving Particles; and it muſt be allowed, that, in many Inſtances, the diſſolving Particles themſelves ſeem to be changed. But that an efficacious Fitneſs for Action may ariſe in Bodies on account of their Figure, has been elegantly illuſtrated by Mr. *Boyle*, from the Example of a Lock, and its Key. That extraordinary Effects may be aſcribed to the Form of a Body, we ſee in a Bell; which being ſtruck by the Clapper, all the circular Sections of the Bell are changed into innumerable Ellipſes, with a quick reciprocal Motion; thus occaſioning Undulations in the Air, to a great Diſtance, propagating tremulous Motions, Shudderings, and Sounds; hence producing Changes in the Bodies of Animals, Vegetables, and Foſſils; all which depend upon the bare Configuration of the Bell.

The following Experiment is ſuppoſed of that kind, wherein the Figure of the Solvent is changed. To an Ounce of well rectified Oil of Vitriol, add, drop by drop, ſix Ounces of pure Alcohol, made without Alcali; and ſhake the containing Veſſel every time; digeſt the Mixture for a conſiderable time, in a tall well-clos'd Glaſs; then carefully diſtil with Degrees of Fire, till the Matter begins to grow black; upon which change the Receiver, and continue a gentle Fire: Thus a ſulphureous ſuffocating Phlegm will come over, and, at the ſame time, a dulcified, volatile, ſweet-ſmelling Oil of Vitriol, about ſix Drams in Weight, to be kept in a ſtopt Glaſs. The Liquor, thus obtained, produces very different Effects upon Iron, from thoſe wrought upon it by common Oil of Vitriol. This Change may be aſcribed to the Combination of the Alcohol, to Diſtillation, or to both.

A third Cauſe of merely mechanical Solutions ariſes from conſidering, that the leaſt Corpuſcles of a Menſtruum, having the requiſite Inflexibility, may inſinuate themſelves partially into the Pores of the Solvend, which will be filled with Points ſticking out like Briſtles. When, therefore, the Particles of ſuch a Menſtruum are put in Motion, they will ſtrike with a different Direction on all Sides upon the ſticking Particles, which will therefore act as Wedges, to ſhake and ſplit the Solvend. This is the more probable, if we reflect, that, in ſuch Solutions, the uniformly ſmooth Surface of the Solvend is rendered rough and unequal. In mechanical Solutions this appears to be the principal Cauſe.

Laſtly, the fourth Cauſe of mechanical Solution is Fire, which principally ſhakes, agitates, applies, and re-applies, the Particles of every Solvent, having the three preceding Cauſes, which, without Fire, could act no more than a Wedge not driven by an external Force. Fire alſo excites a Motion, Concuſſion, and Attrition, in the Air here preſſed upon, and applied by the Weight of the Atmoſphere againſt the Surface of the Menſtruum. In every Solution, therefore, all theſe mechanical Powers may cooperate; but theſe, alone without the Intervention of other Cauſes, cannot perform the whole Buſineſs. We ſhall therefore proceed to conſider thoſe Solvents, which act by a particular Virtue, and not by any general Property of Body; which are ſo numerous, that we are obliged to reduce them into Claſſes, under general Titles.

Of Aqueous Menſtruums.

The firſt Claſs of fluid Menſtruums we make to conſiſt of Water, and aqueous Liquors. But Water, in the Form of Ice, is a Solid, which diſſolves into a Liquor, upon being mixed with dry or fluid Salts, of the fixed and volatile alcaline Kind, with fixed or volatile acid Salts, compound Salts, and the fermented Spirits of Vegetables; and this even in the higheſt Degree of Cold. As a fluid Menſtruum, it begins to act in the next Degree below that of Freezing, or in an Heat of thirty-two Degrees by *Fahrenheit*'s Thermometer. The Heat of Water unconfined may in our Climate be increaſed by Boiling from thirty-two Degrees to two hundred and fourteen; but, as it heats the more, by a greater Weight of the Atmoſphere, its Heat may be prodigiouſly increaſed in the Bowels of the Earth; ſo as at great Depths to have, perhaps, an higher diſſolving Power upon many Bodies, than any other known Menſtruum.

In many Solutions, where Water is the Menſtruum, the diſſolving Power increaſes and diminiſhes with the Degrees of Heat. Thus, Water of thirty-three degrees hot diſſolves a certain Proportion of Sea-ſalt, which prevents the Water from turning to Ice, by the ſame Degree of Cold, which would freeze cold Water; and this probably happens by the Interpoſition of the Salt, by which the Surfaces of the Particles of the Water are prevented from coming into mutual Contact. But, when the Cold is increaſed far above the Degree which freezes pure Water, then the ſalt Water begins to contract, and the Salt to collect at the Bottom of the Veſſel in little Cryſtals; and as the Cold gradually increaſes, this Water gradually depoſites more Salt, till at length the Water, nearly deprived of all its Salt, turns to Ice. During the whole Increaſe of the Cold, more and more Salt is continually ſeparated from the Water; and when the Ice is thaw'd, all the depoſited Salt will again be taken up by the Water. On the other hand, if Water, thirty-three Degrees hot, has diſſolved as much Salt as it could in that Degree, and be afterwards gradually heated further, to the Degree of Boiling; and, upon the Increaſe of every Degree, a little more Salt be added; this Salt will be diſſolved every time, till the Liquor boils, after which it will diſſolve no more, though boiled for a long time.

Hence we may draw the following Concluſions: 1. That the Parts of the Salt and Water are not here changed, but ſo conjoined, that the Water now touches the Parts of the Salt, as the Particles of the Salt or Water before touched one another. This Species of Solution is a mere Permixtion. 2. That the Increaſe of Heat increaſes the Power of Permixture, ſo long as the Water can receive an higher Degree of Heat. 3. That aqueous Menſtruums, ſaturated with Salt, grow turbid in the Cold, and depoſite ſaline Cryſtals; but, when heated, grow tranſparent again, and diſſolve the Salt they had depoſited. 4. Boiling Water, ſaturated with Salt, is heavier than Water; whence Brine, in a boiling State, proves hotter by the Thermometer, than pure boiling Water, and requires a greater Heat to boil. 5. The ſolvent Power of Water does not depend upon the Water alone, but requires the Aſſiſtance of Fire to render the Solution perfect. 6. Theſe Diſcoveries, applied to the animal Juices, eſpecially of Mankind, have an extraordinary Uſe, as Water is the principal and moſt copious of all the Liquors contained in the healthy human Body; ſo that in this the other Principles of all the animal Fluids are diſſolved, mix'd, combin'd, and kept fluid. As this Water, therefore, is ſo liable to change from Heat and Cold, it may wonderfully change the Juices. Thus, how greatly is Blood, drawn out of the Veins, changed by Cold from what it was in the Body! And the Urine of an healthy Perſon, in a cold Seaſon, ſoon depoſites a groſs Sediment; which may again be taken up, by warming the containing Veſſel. From the Premiſes one might be tempted to ſay, that the ſolvent Power of Water almoſt always increaſes in proportion to the Heat applied to the Degree of boiling.

But it is dangerous to pleaſe the Mind with general Truths in Phyſics, or to extend our Conſequences beyond Experiments: For in the preſent Caſe there are numerous Experiments, ſhewing that the ſolvent Power of Water decreaſes, as the Degrees of Heat increaſe. Thus Balls formed of Flour, mixed with Water, reſolve in cold or warm Water, but harden in boiling Water. So the White of Eggs mixes intimately with warm Water, but coagulates by boiling; and this Hardening begins with a certain Degree of Heat, and increaſes as the Fire ſtrengthens; though, till this certain Degree be arrived at, the increaſing Heat ſerves to dilute the Subject the better. Underſtand the ſame of Blood.

Hence we ſhould range into Claſſes thoſe Bodies which are always diſſolved by Water, in all the Degrees of Heat. 1. All the known neutral Salts. 2. All the known, pure, volatile, alcaline Salts, obtained from Animals or Vegetables by Putrefaction, or Diſtillation. 3. All the fixed alcaline Salts obtained from Vegetables by Calcination. 4. All Kinds of Acids naturally found in Vegetables, and in all the acid Salts; all Kinds of native, foſſil, acid Salts, with all the vegetable acid Juices, which afford a Spirit or Vinegar by Fermentation; the Acids obtained from Woods by Diſtillation, diſtilled Vinegar, Oil of Sulphur by the Bell, Oil of Vitriol, Spirit of Alum, Spirit of Nitre, Spirit of Sea-ſalt, *&c.* 5. Artificial compound Salts, by the Combination of Acids and Alcalies, ſo as to render them neutral; all which eaſily diſſolve in Water; but Tartar of Vitriol with the greateſt Difficulty. 6. Salts of the Borax kind, which are difficult

difficult to diſſolve. 7. The native Salts of Plants, which are artificially procured, which eaſily diſſolve, and run ſpontaneouſly in the Air. 8. The vegetable Salts, called Tartar, will not diſſolve in Wine, and require twenty times their own Quantity of Water to diſſolve them by boiling. It is difficult to obtain pure Acids in a dry Form, and not without the higheſt Degree of Cold; but fixed Alcali, taken in a melted State from the Fire, preſently attracts the Moiſture of the Air. Hence it is plain, that theſe Salts have a latent Power of attracting Moiſture, and, conſequently, that Water exerts two diſtinct Actions, in diſſolving theſe Salts, the one attractive, and the other ſolutive; both which together conſtitute the Power of aqueous Menſtruums. We muſt alſo, obſerve, that there are ſome Salts highly attractive of Water, which, upon their Combination, turn into a third Subſtance not eaſily diſſolvable in Water. Thus, Oil of Vitriol attracts Water ſtrongly; and fixed Alcali, with Difficulty, lets go the Water it had attracted; but, if the Oil of Vitriol, and fixed Alcali, be mixed in ſuch a Proportion as to form a neutral Salt, this Salt will not eaſily diſſolve in Water. But, when Water is ſaturated with one Salt, it will ſtill diſſolve another, without increaſing the Degree of Heat: Thus, a ſaturated Solution of Nitre will diſſolve a conſiderable Proportion of Sea-ſalt; and the ſaturated Solution of theſe two will diſſolve a conſiderable Proportion of Sal Ammoniac.

Water, as a Menſtruum, diſſolves all thoſe Bodies which are called ſaline, and contain ſome of the above-mentioned Salts, as a principal Part in their Compoſition. Such are, 1. The native Soaps of Vegetables; as all the ripe Juices of Summer Fruits, being a Mixture of Water, Oil, Salt, and Spirit. 2. Certain concreted Juices perfected in a particular Part of the Plant, as the Pulp of Caſſia, Manna, Sugar, Gums, *&c.* which are Soaps containing a copious Oil, mixed with Salt. 3. The more fluid Juices of Vegetables, circulating thro' the Veſſels, and whole Structure, of the Plant; as the Liquors afforded by the Vine, the Walnut, and the Birch-tree, tapped in the Spring; which are all vegetable Soaps, diluted in a large Proportion of Water. 4. All the known animal Juices, except Fat, though none more eaſily than perfect Bile. 5. All the Soaps made of expreſſed vegetable Oils, and fixed vegetable Alcali, mixed, by means of boiling Water, with the fiery Part of Quick-lime, and brought, by boiling, into a hard Maſs. To theſe may be added all the Soaps prepared from diſtilled vegetable Oils, united with the ſharpeſt, drieſt, fiery Alcali, heated and ſtrengthened by Quick-lime, and thus prepared to receive the Oil by pouring it thereon, and expoſing the Whole to the open Air at ſome Depth under Ground. To theſe we add, thoſe Soaps obtained by mixing pure diſtilled Oils with a pure volatile alcaline Salt, without the Interpoſition of any foreign Water, but by a ſlow, careful, repeated Sublimation; whence admirable Remedies are procurable. But the moſt ſubtle Soaps are obtained by uniting the pureſt Alcohol with the pureſt volatile alcaline Salt, which produce a Subſtance in the Form of Snow. We may ſtill add another Soap, prepared by perfectly uniting Salt of Tartar with Alcohol, by a ſecret Treatment. It is here remarkable, that though Oils alone will not unite with Water; yet, when joined with Salts, they preſently diſſolve therein, whilſt the Salts alone are attractive both of Water and Oil. 6. Vitriols, eſpecially the acid Kind, alſo, diſſolve in Water, whilſt they retain their true tranſparent Form; but when the Water is exhaled by a gentle Heat, ſo as to render their Cryſtals opake, the metallic Parts are thereby leſs diſpoſed to diſſolve in Water; and, if highly dried, they will not diſſolve at all: Whence Water diſſolves Metals, only on account of the Acid adhering to the Surfaces of their Particles; and, therefore, quits the Metals ſo diſſolved, as ſoon as the Acid is removed. Thus, Metals diſſolved in Acids, then largely diluted with Water, become potable, ſo as to be received into the Body, mix with the Fluids, act upon the Solids, and produce conſiderable Effects; though this Power laſts no longer, than while they remain diſſolved; and, their Solution depending chiefly on the Acid, if that be remov'd, the Metal remains no longer potable, but turns to a Calx.

What is here ſaid of the Action of an Acid, with reſpect to Water, holds true, alſo, of thoſe Metals which are diſſolved by alcaline Salts. Thus, Copper diſſolved in ſtrong Spirit of Sal Ammoniac, ſo as to afford a fine blue Tincture, if this Tincture be deprived of its Salt, it is thereby greatly changed, and lets fall a dusky Powder. The ſame holds, alſo, of metallic Solutions made with compound Salts. Thus, Sal Ammoniac, or Sea-ſalt, may diſſolve Metals in a certain manner, ſo that they may be diluted with Water, and thus produce great Effects upon the Body; while their Action principally depends upon their being diſſolvable in Water. And yet this does not hold of all Metals; for though Butter of Antimony be highly acid; yet, inſtead of diluting with Water, it immediately, upon the Affuſion thereof, lets fall the Antimony in a white Calx; which, being fuſed by a ſtrong Fire, affords a fine Regulus of Antimony, incapable of being diſſolved in Water.

If pure earthy Bodies be firſt diſſolved in Acids, they may afterwards be perfectly diluted with Water, ſo as to eſcape the Cognizance of the Senſes, and leave the whole Body of the Liquor limpid. Hence we ſee how unſafe it is to infer, that a Liquor is free from Earth, becauſe it appears pellucid.

But Alcalies, when intimately united with Earth, as in Glaſs, cannot be afterwards diluted with Water; ſo great is the Difference between the Solution of the Earth by one kind of Salt and another. The ſubtile, volatile, alcaline Salts of Animals, intimately united with Earth, form a Maſs undiſſolvable in boiling Water; for the Stones generated in Animals I take to conſiſt of theſe Principles and Oil; and, in whatever Part they are generated, they have a Power of attracting to themſelves a ſimiliar Matter, from thoſe animal Juices which approach neareſt to Putrefaction, as the Bile and Urine: Theſe Juices containing Salts nearly alcaline, theſe Salts unite to themſelves the fine Earth, wore off from the Parts of the Body; thus laying the Foundation of new Stones, or enlarging the old, and producing terrible Diſorders.

Hence we may, perhaps, deduce the Reaſon, why the Author of Nature has made nearly all the Aliments of Animals incline to Acidity; for the acid Salts, on this account, predominating in the Stomach, eaſier diſpoſe ſuch Aliments to diſſolve, whoſe firmer Parts cohere principally by means of Earth; whence they would otherwiſe much more difficultly be diſſolved into fluid Chyle. But when afterwards a Matter is to be formed of this Chyle, fit to bind the Solids together, the Tendency to Acidity, which was neceſſary in the Chyle, is changed, and an alcaline Tendency of the Salts introduced; which, by binding the earthy Particles, forms a Structure indiſſoluble in Water. At leaſt we know, that Bones remain ſolid, if ſteeped in Alcalies; but grow ſoft and flexible, if detained in Acids. And, doubtleſs, when the Power of changing Aceſcents into Alcalies is wanting in the Body, the Bones, Cartilages, Teeth, and Ligaments, become ſoft, weak, looſe, and flexible, as we ſee in the Rickets. Hence Acids uſed in the way of Dentifrice, with Deſign to render the Teeth white and gloſſy, may ſoon render the Perſon melancholy, nervous, or paralytic. But if fixed Alcalies, or alcaline Solutions, well diluted with Water, be uſed for this Purpoſe, the earthy Part of the Teeth will remain unhurt.

Sulphurs do not of themſelves diſſolve in Water; but, when intimately mix'd with Alcalies, they readily unite with it; whence we may eaſily underſtand the medicinal Virtues of ſulphureous mineral Waters. Volatile alcaline Salts will, alſo, diſſolve Sulphurs, and render them miſcible with Water; ſo that we ſee, Water, by the Aſſiſtance of Alcalies, becomes an excellent Solvent of Sulphurs. And as this is applicable even to the Sulphurs concealed in Metals and Semimetals, hence we have a way of producing to View ſuch Sulphurs as before lay conceal'd; by which means ſlight Productions have been ſold at high Prices, as great Secrets, and even Princes themſelves have been impoſed upon. I have ſeen a Liquor prepared from Antimony, ſold under the ſpecious Title of a Panacea; a few Drops of which, taken in Wine, were ſaid to cure Diſeaſes ſpeedily, without any ſenſible Effect; and indeed they did Service in ſome Diſtempers. Upon Examination, I eaſily diſcovered this Liquor was prepared by taking levigated Antimony, and putting twice its Quantity of Oil of Tartar *per Deliquium* to it, and digeſting them in a Sand-heat together; whereby the liquid Alcali, diſſolving the Sulphur of the Antimony, thus extracts a red Tincture of a fiery Taſte, and an alcaline, heating, aperitive, diuretic, and diaphoretic Virtue. But as good a Medicine may preſently be procured, by boiling common Sulphur in an alcaline Lixivium; as the Sulphur of Antimony does not differ from common Brimſtone, and as the Alcali does not diſſolve the metallic Part of the Antimony. In like manner, by digeſting powdered Antimony with the alcaline Spirit of Sal Ammoniac, a golden ſulphureous Tincture may be obtained; and as good a one from common Sulphur, as Mr. *Boyle* has ſhewn.

Though Bodies of a glutinous, viſcous, or hard Subſtance remain untouched by Water, yet they may be render'd perfectly ſoluble in it, by firſt uniting them intimately with fixed or volatile Alcalies. Thus, we find putrefied Urine, Salt of Tartar, Soap, Gall, Honey, Sugar, Yolks of Eggs, and the like, being mixed with theſe tenacious Bodies, render them commodiouſly diſſolvable in Water, which hence generally acquires a deterging Power. Oils, Balſams, Roſins, Gums, and the like, by this Treatment, become miſcible with Water.

Having thus explained the diſſolving Power of Water, I ſhall only add a few remarkable Particulars: 1. Hail collected in the Summer-time, after Thunder, conſequent upon a Series of hot Weather, being kept in clean Veſſels, has a different Effect from all other Water; perhaps on account of being purer, carried higher into the Atmoſphere, and froze there before it fell lower. 2. Next to this in Purity, we reckon Snow-water, collected in a cold Winter, in a ſtill Air, and an high ſandy deſert Place, and from the upper Part of a deep Drift. 3. Dew, being a Mixture of aqueous, ſpirituous, ſaline, and unctuous Vapours, and of all ſorts of dry Exhalations, differs greatly from all other aqueous Menſtruums; ſo that the Effects of Dew can ſcarce be determined, or brought under one Claſs: Whence it is no Wonder, that many have thought the Matter of the univerſal Salt was contained therein; and that a ſaline Subſtance, which they call the congealed Spirit of the Univerſe, might be extracted

extracted from it. But it is time to proceed to the other kind of Menſtruums; only firſt obſerving, that Water, floating in the Air, may often act as a Menſtruum, and the Action be falſly aſcribed to the Power of the Air.

Of Oils, and Oily Menstruums.

Oil, conſidered as a Menſtruum, is a fluid Juice, (or capable of being rendered fluid, with a ſmall Degree of Heat) unctuous, burning in the Fire, and immiſcible with Water. Alcohol is excluded from the Claſs of Oils, by its being eaſily miſcible with Water, while in other Properties it has a perfect Reſemblance to them. All Oils are either native, or obtained by Art. Native Oils are every-where found in Foſſils, Vegetables and Animals; and theſe Oils are changed by Art, upon boiling unctuous Bodies in Water, ſo as to melt the Fat, and extract it from its Lodgment: Whence by its Lightneſs it floats upon the Surface of the Water, and may be skimmed off without much changing its Nature. It may, alſo, be obtained by Expreſſion; when, if too much Heat be not uſed in the preſſing, the Oil is but little changed. Sometimes a cloſe Fire is uſed for ſcorching the Subject, and melting away the Oil; as in the obtaining Pitch and Tar from Fir. Laſtly, Oils are obtained by Diſtillation either *per Aſcenſum*, or *per Deſcenſum*.

Scarce any of the diſtilled Oils loſe their Fluidity in the greateſt natural Cold; whereas moſt of the Oils by Expreſſion congeal with ſtrong Cold, as we ſee in Olive-oil and Rape-oil; while others, as Linſeed-oil, do not freeze in the keeneſt Froſt. I have never been able to diſcover, whereon this Difference in Oils depends. Their diſſolving Power is not exerted, unleſs they be in a fluid Form; and, as ſome of them freeze ſooner than Water, their diſſolving Power is leſs durable, with reſpect to Cold, than that of Water; but thoſe which remain fluid in all the Degrees of natural Cold, conſtantly retain their diſſolving Power: Whence it appears not eaſy to fix a common Point of Heat in Nature, at which the diſſolving Power of Oils begins, though it may be nearly limited in any one Species of Oil, after it has been once accurately obſerved. And here it may appear ſurpriſing, that though Linſeed-oil remains fluid in the ſevereſt Froſt, yet, upon Examination, it is then no hotter than Ice, or any other congealed Oil.

When Oil is gradually heated, it does not boil, like Water, with two hundred and twelve Degrees of Heat, but grows conſtantly hotter, without boiling, till the Heat riſes to ſix hundred Degrees: Whence we ſee, why boiling Oil is ſo much hotter, and more ſcalding, than boiling Water. But the higheſt and moſt ſubtile Oils boil the ſooneſt; whereas others receive more Fire before they will boil. Hence we ſee the Difficulty there is to determine the diſſolving Power of Oil; becauſe in Linſeed-oil, for Inſtance, this Power begins with the greateſt Degree of natural Cold, whence it increaſes to ſix hundred Degrees, and in each Degree of Increaſe conſtantly acquires a new Power of acting, whether it be upon the ſame Body in different Degrees of Heat, or upon different Bodies in the ſame or different Degrees: In both which reſpects the Scale is infinite.

It may be ſhewn by Experiments, that Alcohol, though it be an attenuated inflammable Oil, boils much ſooner than Water; and that Oil of Turpentine, tho' much lighter than Water, and conſiderably thin, and inflammable, does not boil when the Water does; any more than Oil-olive. Whence neither Inflammability, nor Levity, nor Volatility, is here the Cauſe; ſince Oil of Turpentine is ſo volatile, as to riſe with boiling Water on Diſtillation.

To diſcover the Degree of Heat in Oil of Turpentine before it boil, put ſome Linſeed-oil into a Copper Veſſel, and ſet it upon a naked Fire; place a Mercurial Thermometer therein, along with the Phial of Oil of Turpentine; which will be found to boil much ſooner than the Linſeed-oil; while the Thermometer ſhews the Degree of Heat. But as theſe Oils, by boiling, throw off their more volatile Parts, and leave the Remainder thicker, they now require more Heat, every Moment, to keep them boiling. Whence Phyſicians need not wonder, that theſe Oils, rendered thick by boiling, heat the Body ſo violently.

As Oil will receive almoſt thrice as much Fire as Water, we may hence eaſily underſtand, that the diſſolving Power of Oil, which Power in Menſtruums depends upon Fire, muſt be much greater in Oil than in Water: For, ſince many Oils remain fluid in the firſt Degree of the Thermometer, whereas Water freezes at about the thirty-third; and ſince the Scale of Heat in Water, while it remains fluid, is but 180 Degrees (its freezing Point being 33, and its boiling Heat 213); and ſince the Scale of Heat in Linſeed-oil is at leaſt up to 600; it follows, that the Power of Heat in this Oil is, to the Power of Heat in Water, as ten to three. And conſidering that many Oils, inſpiſſated by Boiling, may thus receive much more Fire, hence the Scale of the Power of Heat may be ſtill farther extended in ſuch Oils.

The Bodies of Animals, and of Vegetables, are entirely kept from diſſipating, fermenting, putrefying, and changing, by being carefully plunged in Oil; and this for ever ſo long a time, even in the hotteſt Climates. When Bodies are covered with Oil, Inſects alſo are prevented from preying upon and deſtroying them. And after theſe Bodies have remain'd cover'd with Oil, for a proper Seaſon, ſo as to be thoroughly impregnated therewith, they ſeem to become almoſt incorruptible; as appears from Carcaſes treated in this Manner; upon which Diſcovery the Art of Embalming principally depends.

If Bodies are ſuddenly plunged into boiling Oil, they preſently acquire an hard and almoſt ſtony Coat, of a yellow, red, or black Colour, like Bodies ſcorched by a naked Fire; while the inner Subſtance, being agitated by the great Heat of the boiling Oil, is wonderfully changed, digeſted, and ripened; till at length the Whole is conſolidated, and rendered durable, for great Lengths of Time. But when theſe Bodies abound with aqueous Juices, as in Fleſh or Fiſh dried only on the Surface, theſe Juices, contained within the external Cruſt, being thus more than boiled, become ſurpriſingly ſoft, roſcid, digeſtible, and nutrimental. Food, thus treated, may be long preſerved; as all the Principles of Bodies ſo prepared, being intimately united, perfect one another, and turn to a Subſtance, that is well defended from the Action of external Cauſes.

Hence we may draw ſome unexpected Conſequences: 1. The Degrees of Heat, received by Bodies from Fire, are not in proportion to the Denſities of the heated Bodies. 2. Yet in the ſame Bodies, gradually rendered more denſe, more Fire may be communicated in proportion to the Increaſe of their Denſity. 3. The Power of receiving a greater Degree of Heat does not depend upon the Bodies being combuſtible in the Fire. Thus, Alcohol, being brought to boil, does not receive more Fire or Heat, though nothing in Nature is more combuſtible; nor does any known Liquor receive leſs Fire: Whence we ſee, it is in vain to ſeek after general Properties in Chymiſtry; but we are to diſcover the particular Properties of Bodies by particular Experiments. 4. Some Metals may be intimately diſſolved in ſome Oils by boiling; ſo as thence to form a Mixture, not eaſily reſolved into its Principles; and by theſe means many noble Diſcoveries have been made for Mechanical and Medicinal Purpoſes.

Thus, put half an Ounce of red Lead into a long-neck'd Phial, and pour into it an Ounce and an half of Oil-olive, and ſhake them well together; heat the Glaſs carefully; then ſet it over the Fire, ſo as almoſt to touch the Coals, and bring the Oil to boil; upon which the red Lead will diſſolve, and mix and unite into a Maſs therewith, when the Oil has acquired a great Degree of Heat. Thus, a metallic Balſam, or an excellent Cement for Water-works, may be prepared. The ſame Experiment will ſucceed, if made with granulated Lead; the Lead firſt melting at the Bottom, even before the Oil begins to boil, or fume: Whence we ſee, that Lead is more eaſily melted than Glaſs; and that Oil cannot be made to diſſolve Glaſs, with any Degree of Heat the Oil will receive. Hence we ſee the Reaſon why melted Lead ſcalds leſs than boiling Oil, and may be nimbly handled, if the Skin be firſt rubbed over with dry Chalk. The ſame Experiment, alſo, ſucceeds with Tin, and a Mixture of Tin and Lead; the Solution of which together is quicker performed, than of either alone. Hence again we may draw further Conſequences; as, 1. That Oils receive, and long retain, much Fire, before they boil. 2. That no Fluid in Nature receives more Fire than Oil; for all Lixiviums, and Oil of Vitriol itſelf, boil ſooner, and prove leſs hot upon boiling; even Quickſilver itſelf boils rather ſooner, or nearly about the ſame time. 3. That a great Force of Fire muſt act upon Oils, before they riſe in Vapour. 4. That Oils communicate the ſame Force of Fire they receive, to the Veſſels in which they are boiled: Whence, though Water may be boiled in Veſſels of Tin or Lead, yet Oil cannot. 5. That the ſame Force of Fire received by the Oils is communicated to the Metals contained therein. 6. That we cannot eaſily find a Way of communicating more Fire to Oil, than by boiling it; for if one would endeavour to make Oil collect more Fire, we muſt find a Way of compreſſing the Oil in the containing Veſſel with a greater Weight, than that of the Atmoſphere, whereby Heat might be increaſed in Proportion: Whence it appears, that Oil, compreſſed by the increaſed Weight of the Atmoſphere at great Depths in the Earth, may acquire a moſt violent Heat, if it ſhould there meet with a ſtrong Fire; when, if Water ſhould happen to touch the Oil in this State, it might occaſion moſt terrible Earthquakes; which may poſſibly be one Phyſical Cauſe of Vulcanos. 7. Oils, when they remain fluid, will not permit more Heat to be communicated to the containing Veſſel, than to themſelves; and, therefore, prevent all Veſſels from melting, which will not fuſe with leſs than 600 Degrees of Heat. 8. Hence the Author of Nature has ſet a Limit to Fire; which Limit checks its Power upon the moſt inflammable Matter we know.

In order to explain the diſſolving Power of Oils, it muſt be remembered, every expreſſed, crude, vegetable Oil conſtantly contains Water, as may appear upon boiling expreſſed Oil of Almonds in chymical Glaſſes; whereby an aqueous Vapour is raiſed, and, condenſing in the Neck of the Veſſel, forms viſible

Drops, which, falling back upon the boiling Oil, occaſion great Commotion and Crackling, which may in ſome Degree affect the manner of Solution. Hence, after this Water is diſcharg'd by long boiling, the Property of Oil, as a Menſtruum, is changed.

Beſides this Water, Oils contain a certain ſubtile latent Salt, ſuppoſed to be very penetrating, which is generally acid and volatile, as in ſome of them is manifeſt by the Smell. Theſe Salts appear in the Form of acid Spirits, collecting themſelves like Water, and ſeparating from the Oil, ſo as not to be again eaſily mixed therewith; though it is not eaſy to free the Oil perfectly from its acid Spirit, which continues to riſe through the whole Diſtillation, but in the greateſt Quantity at firſt.

Chymiſts, therefore, ſhould carefully diſtinguiſh whether the diſſolving Power of Oils be not owing to the Water and Acid they contain; otherwiſe great Errors might ariſe: For we ſee in Painting, that Colours, diſſolved in Oil which has been boil'd, unite and ſink in better, dry quicker, and remain more beautiful, than when mixed up with crude Oil. Thus, alſo, the particular Power, which the ſofteſt Oils are ſuppoſed to have of diſſolving Metals in a gentle Heat, ſeems principally to proceed from the latent Acid, and not from the oily Part; it having been obſerved, that Oil-olive, when mixed with very fine Filings of Iron, Copper, or Lead, and long digeſted together, a Part of the Metal is thus taken up by the Oil, ſo as to give it a new Colour, and extraordinary Properties. Hence the Power of Oil, as a Solvent, has been extended too far; for this Power does not remain in Oils, after they have been long boiled, and are deprived of their latent Acid. Hence, the Poliſhers of Braſs and Copper have obſerved, that their Work cannot be well preſerved from Ruſt and Tarniſh, by rubbing it over with crude Oil; but much better by beſmearing it with boiled Oil, eſpecially if a little Ceruſs, or black Lead, be added in the boiling, ſo as perfectly to imbibe this Acid. Dr. *Hoffman* has ſhewn by Experiment, that even diſtilled Oils contain an Acid.

Thoſe Oils which are obtained by Diſtillation from alcaline or putrefied, vegetable or animal Subſtances, abound with volatile alcaline Salts; which may be copiouſly ſeparated from them, by a gentle Fire, in a white ſolid Form: Whenever, therefore, we would explain the Properties of Oils, we ſhould carefully ſeparate them from all foreign Salts, and examine them pure; otherwiſe we can never form a right Judgment of their Virtues.

Oils obtained by Diſtillation with or without Water by the Retort, conſtantly leave Earth behind them, upon being rediſtilled to Dineſs in cloſe Veſſels, and gradually become more ſubtile, leſs adheſive, more fluid and tranſparent; and, when rediſtilled fourteen times, or more, they each time become different Oils, and different Menſtruums; ſo as, at length, to become penetrating anodyne Medicines, excellent in many obſtinate Diſtempers. Whence the elder *Helmont* imagined, that the Oil of human Blood, thus diſtilled ſeveral times with Spirit of Salt, till no Fæces were left behind, would prove a diaphoretic Medicine, capable of diſſolving, like a Menſtruum, all preternatural and other mortal Obſtructions and Coagulations in the Body. The excellent Dr. *Hoffman* aſſures us, he has prepared Oils in this manner, and gives an high Commendation of their medicinal Virtue; and another leſs faithful Writer affirms, that the univerſal Remedy may be obtained by means of an Oil prepared in this manner. On this Subject, *Raymond Lully*, and *Iſaac Hollandus*, deſerve to be conſulted.

All kinds of Oils have a certain ſubtile, volatile Subſtance adhering to them, and ſeparable from them, called their preſiding Spirit; which is a moveable odorous high-taſted thing, produc'd by Fire, and the true Cauſe of very great Effects. This Spirit, being innate in Oils, detained and confined in them, communicates thereto a ſingular efficacious Virtue, no-where elſe to be found. This Spirit exhales from many Oils ſpontaneouſly with a gentle Heat; mixes with the Air; and, when it entirely quits them, leaves them inſipid and unactive, ſo as ſcarce to be diſtinguiſhable from one another. Their diſſolving Power ſeems principally to proceed from this Circumſtance, that Oils are diſpoſed to receive much Fire into themſelves, and apply it to other Bodies.

1. Moſt Oils mix with other Oils, though ſome of them not eaſily; as in the Diſtillation of Turpentine and Amber; where the Oils, raiſed by different Degrees of Fire, are different in Weight, Conſiſtence, Colour, and Situation, ſo as not readily to unite with each other. 2. True reſinous Bodies melt and diſſolve in Oils. 3. So do many of the Gums, ſuch as have a Mixture of Roſin. 4. So, likewiſe, do condenſed Oils or Balſams. 5. So do Sulphurs, both the natural and artificial, and both the liquid and ſolid; and this, tho' concealed in other Bodies. Thus, Antimony, finely powdered, or ſublimed into Flowers, being boiled with Oil, ſoon affords a thick red Balſam of Antimony, tho' it proceeds only from the Sulphur of the Antimony, diſſolved by the Oil, which leaves the metallic Part untouched; and the ſame holds, alſo, of the other Semimetals, abounding with Sulphur.

Of Alcohol, or Spirituous Menſtruums, properly ſo called.

Eminent Chymiſts have aſſerted, that Alcohols could not be united with a pure fixed Alcali; and this is no Wonder, as the Effect may be prevented by the leaſt aqueous Moiſture in either the Salt, or the Alcohol: But, if pure Alcohol be applied to perfectly dry Salt of Tartar, a rich Tincture is immediately extracted, and a true Combination made. Hence we cannot be too inquiſitive into the Nature of this Liquor, which, on account of its Excellence, we eſteem the firſt among ſpirituous Menſtruums.

Alcohol is prepared from Vegetables alone, by bare Fermentation, and repeated Diſtillation. It is beſt obtained from Wine, Mead, or Beer; for, though theſe Liquors may quench Fire, yet the Spirit obtained from them by Diſtillation is inflammable; and, when all Water is perfectly ſeparated from this Spirit, we obtain pure and perfect Alcohol. Oil, alſo, is called Alcohol, when it mixes with Water, and is totally inflammable. Animal and vegetable Subſtances, when perfectly putrefied, may have their Oils ſo ſubtilized and volatilized, as to be inflammable in the open Air; and, by repeated Diſtillation, ſuch Oils may be ſo attenuated, as almoſt to mix with Water. When, therefore, the diſſolving Power of theſe Spirits is to be determined, we muſt firſt regard what kind of Spirit it is; for common Brandy contains much Water, a liquid, acid, volatile Salt, a diſagreeable Oil, and Alcohol; rectified Spirit of Wine contains leſs Water, leſs of the nauſeous Oil, a volatile acid Spirit, as before, and mere Alcohol. Perfect Alcohol, prepared without Addition, contains neither Water, acid nor groſs Oil; and, if once gently drawn off from fixed Alcali by Diſtillation, it becomes highly purified; and, as there are theſe Differences in this Spirit, we are carefully to regard them.

1. Perfectly pure Alcohol diſſolves Water, and all aqueous Liquors. 2. Conſequently, Wines of all kinds. 3. It diſſolves all ſpirituous fermenting Acids, as the Tribe of Vinegars. 4. All pure Oils. 5. All true vegetable Roſins. 6. Moſt of the gummy Roſins. 7. Pure volatile alcaline Salts. 8. Perfectly dry and fix'd alcaline Salts. 9. Moſt of the Soaps. 10. Sulphurs firſt opened and diſſolved by Alcalies. But it does not touch compound or native Salts; as Sal Ammoniac, Sea-ſalt, and Nitre; nor pure Earth, pure Sulphur, Mercury, Metals, Semimetals, nor Stones, whether vulgar or precious. See Alcohol.

Of the alcaline and acid ſpirituous Menſtruums.

Moſt Chymiſts, under oily and ſpirituous Menſtruums, have ranged two Kinds, which might rather be termed Saline, or Compound. This happens, becauſe theſe Menſtruums uſually appear in an unctuous Form; and are generally not only volatile, but liquid and ſubtile: Whence ſome Acids, and ſome Alcalies, have been called by the Name of Spirits, on account of their ſubtile, volatile, and unctuous Appearance; though they differ greatly from each other, not only in Kind, or as to Acid and Alcali, but, alſo, acid from acid, and alcaline from alcaline Spirit. We, therefore, firſt divide the ſaline ſpirituous Menſtruums into the Acid and Alcaline Tribes; this Diſtinction being abſolutely neceſſary. Next, we divide the alcaline Spirits from one another; ſome of them being ſimple; and others compound. The ſimpleſt of theſe conſiſt of Water, and an extremely ſubtile, volatile, alcaline Salt, both together appearing in the Form of a thin, pellucid, and ſomewhat unctuous Liquor; as the pure alcaline Spirit of Sal Ammoniac: And to this Claſs belong the numerous alcaline Spirits obtained both from Animals and Vegetables, after being deprived of the Oil, that is ready to adhere thereto; as we daily ſee practis'd by the Chymiſts, who can thus produce them from the hot, antiſcorbutic Plants, putrefied Vegetables, and all animal Subſtances. The more compound Kind uſually conſiſt of Water, the volatile Salt juſt mentioned, and a fetid Oil, into which three Parts they may be ſeparated; and, therefore, are a kind of volatile alcaline Soap, diluted in a Proportion of Water barely ſufficient to diſſolve it. The acid and commonly volatile Liquors are alſo called Spirits, by the Chymiſts, for the Reaſon above aſſigned; but all theſe, when examined, prove to be acid Salts diſſolved in pure Water. Thus, Oil of Vitriol, and *Oleum Sulphuris per Campanam*, ſeveral times diſtilled with boiling Water, become in a great meaſure, volatile. Upon this Conſideration, therefore, I ſhall here drop the Name of Spirits, and for the future call them by the Name of Saline Menſtruums.

Of the ſimple ſaline Menſtruums.

It is a Saying of the Alchymiſts, That ſuch as do not underſtand Salts, can never arive at the grand Secrets: And no Wonder, as various Salts have great Energy in the diſſolving of Bodies.

I call Salt a Body which diſſolves in Water, and, if not volatile, fuſes in the Fire, having a ſapid Taſte. When a Salt is pure, or either naturally, or artificially, ſeparated from every thing elſe, it conſiſts of Particles too minute, to be diſtinctly and ſeparately viewed, even by the Help of the beſt Glaſſes; ſo that we can pronounce nothing as to the Figure of theſe Particles. And when ſaline Bodies are reſolved into the ultimate Particles, from whence they are formed, they thus ſeem to become perfectly volatile; ſo as, when ſeparated from each other, and from all foreign Subſtances, to fly off into the Air. Therefore, when theſe laſt Particles

ticles of pure Salt concrete into ſenſible Cluſters, they always are held together by ſome intermediate Particles; particularly thoſe of Water and Earth, which here ſerve for a Cement, and make the Aſſociation permanent. Hence we ſee, that, as the original Particles of Salt can ſcarce ever be confined in Veſſels, ſo we can ſay little of their chymical Actions; but, when they appear in a ſtable Form, we may have ſome Certainty of them in this compound State.

We muſt, next, conſider the principal Differences of Salt, ariſing chiefly from the different ſaline Principles, of which they are compoſed: And though theſe Principles are ſeparately known, yet, doubtleſs, they have a certain peculiar Property reſpectively. A ſecond Difference ariſes from the other Principle, which, uniting with the ſaline one, conſtitutes the Salt. We, therefore, divide all Kinds of Salts, into ſuch as differ, either in reſpect of their ſaline Principle, their connecting Principle, or both. And, with regard to the firſt Diviſion, I diſtinguiſh Salts, and ſaline Menſtruums, into the following Claſſes. 1. Fixed Alcalies. 2. Volatile Alcalies. 3. Native vegetable Acids. 4. Fermenting vegetable Acids. 5. Fermented vegetable Acids. 6. Vegetable Acids obtained upon Burning. 7. Vegetable Acids procured by Diſtillation. 8. Native foſſile Acids. 9. Foſſile Acids procured by Burning. 10. Foſſile Acids procured by Diſtillation. 11. Neutral Salts; as Borax, Nitre, Foſſile Salt, Sal-gem, Sea-ſal, and Sal Ammoniac. 12. Other Salts compoſed of theſe ſimple ones. Each of which Salts ſhould be examined, in order to find out their peculiar Properties, whereby we may come to a true Knowledge of them, ſo far as regards the diſſolving of Bodies.

Of fixed Alcali, as a Menstruum.

Having already given *Boerhaave*'s Account of the Phyſical Marks, the Nature, and Properties of Alcalies, under the Article Alcali, that illuſtrious Author, in conſidering fixed Alcali as a Menſtruum, proceeds to make the following Queries, as Particulars deſerving to be farther inquired into.

1. Whether all fixed Alcalies are generated by Fire alone? 2. Whether all volatile Alcalies are produced by a putrefactive Heat? 3. Can any fixed, or volatile Alcalies long retain their Nature in the open Air? 4. Whether their Nature will not be altered, or the Salts changed, ſo as to become neutral or ſaponaceous, by thus meeting with acid or oily Particles? 5. Will not the ſame happen in the Bodies of Plants and Animals? 6. Is not a large Quantity of compound Salts thus daily produced; eſpecially of ſuch Salts, whoſe component Acid is every-where common, and ready at hand? 7. As natural Acids, or thoſe produced by fermenting Vegetables, abound every-where, is there not, in Nature, a very common Salt, of the ſame Kind with regenerated Tartar, or the Spirit of *Mindererus*, made with a volatile alcaline Salt, and diſtil'd Vinegar, being a mild, penetrating, moveable Salt, of no great Taſte? But there is nothing of this Kind more deſerving to be known, than the Origin and Nature of the moſt common uſeful Salts, as Sea-ſalt, Sal-gem, and Nitre; which, whether they are made by a Combination of their own Acids, ſuch as we find by chymical Diſtillations, and a fixed vegetable Alcali, deſerves to be inquired; or whether, being produced ſimple by Nature, they are not rather changed, than ſeparated, by Fire. Many eminent Chymiſts maintain, that all theſe Salts are naturally produced from the Mixture of Acids with Alcalies. But it is highly probable, that Salt was contained in the Sea, before the acid Spirit of Salt was preſent therein, and before any fixed Alcali was made from Vegetables. On the other hand, no known Experiment hath hitherto produced the leaſt fixed Alcali from Sea-ſalt. Nor do I learn, that the acid Spirit of Sea-ſalt was ever hitherto found naturally, but always as produced by Art, or by Fire; and this rather by a Change, than a Separation, of Parts. It is true, theſe Acids, properly mixed with Alcalies, regenerate, in ſome ſort, the Salts which afforded the Acids, though always with ſome Difference between the native and artificial; which ſhews we cannot be ſo certain as to the Compoſition and Reſolution of theſe Salts, as ſome Authors pretend. We may hence learn what Caution is required in uſing Alcalies as Solvents, ſince a Change in any Circumſtance, or a ſlight Addition of a foreign Subſtance, may eaſily change an Alcali, and produce a Salt that ſhall not operate as a pure Alcali, but according to the Nature which is thus introduced.

If, to an hundred Weight of clean Sand, or Flint, reduced to a Calx, and ground to fine Powder, an hundred and fifteen Pounds of pure fixed Alcali be added, and thoroughly mixed therewith, and the Mixture be ſet in a Glaſs-houſe Furnace, with a moderate Fire, for an Hour, and kept ſtirring all the while, the Fire being afterwards increaſed for five Hours, while the Stirring is all along continued, a Maſs will thus be obtained, rightly diſpoſed for making the fineſt Glaſs. If this Maſs be put into dry Casks, and kept in a warm dry Place, for four or five Months, the Ingredients will thus be more intimately united. If now the Matter be put into Glaſs-houſe Pots, ſet in the hotteſt Part of the Furnace, it will thus melt into a kind of viſcous, thick, and apparently unctuous Fluid, caſting up a Froth to the Surface, as it boils; which Froth, riſing more and more, often amounts to a fourth Part of the whole Maſs. This frothy Matter being carefully ſcummed off, as it riſes, till no more appears, and the remaining purify'd Matter being kept in conſtant Fuſion for two or three Days, the Matter, thus remaining behind in the Pot, is what the Glaſs-men call their Metal; and, when cold, makes the beſt Sort of Glaſs. Now, unleſs this was proved by daily Experience, who would have ſuſpected, that fixed Alcali, which runs into a Liquor in a dry Air, ſhould thus, with Sand, melt into a Matter ſo like a Metal, except in Malleability?

This affords us an Inſtance how ſuch Menſtruums, as have a ſtrong diſſolving Power, may permanently concrete with the Bodies they perfectly diſſolve; the Concretion being the ſtronger, as the Solution was more perfect. Hence we learn, that Alcalies, when they diſſolve perfectly, may be ſo changed in the Action, as totally to loſe their ſaline Nature; for though Glaſs contains near a third Part of Alcali in its Subſtance, yet it retains not the leaſt Mark of an Alcali. It is extraordinary, that the Glaſs thus made melts into a tenacious, tough, ductile Maſs, ſo as to be formed into Veſſels of any Figure, and ſticking ſo ſtrongly to Iron, as to be thereby taken out of the Melting-pot. Another remarkable Particular is, that two opake Bodies ſhould thus concrete into a pellucid Solid, not to be diſſolved by any known Menſtruum; though itſelf, in part, conſiſts of the moſt ſoluble of all Salts.

As the Vegetables which afford fixed Alcali by burning, contain an Acid, which adheres more or leſs to the Alcali, the alcaline Salt muſt conſequently be of a different Nature, than if no Acid adhered to it: Underſtand the ſame of Oil and Earth adhering to the Salt. On theſe Accounts there will be a great Difference between fixed Alcalies, as they contain more or leſs of theſe Principles: Whence it is no Wonder, that certain Experiments with Alcali, as related by ſome Authors, do not ſucceed, when try'd with different Alcalies.

Alcalies, alſo, may receive great Alterations from being added to other Subſtances: Thus, being mixed with Quick-lime, a Salt may be obtained ſo ſtrong and corroſive, as to diſſolve and fuſe almoſt all the Solids of Animals and Vegetables by boiling: Whence we ſee a ſtrong alcaline Solvent may be prepared from the ſame Ingredients which make Glaſs. Again, fixed Alcali, rendered ſtronger by Quick-lime, and afterwards dried at the Fire, eaſily melts like Wax; and thus, by an extraordinary Virtue, lays hold of, and diſſolves, Bodies put into it. This, perhaps, is the incerated Salt of ſome antient Chymiſts.

There are, however, ſome Bodies, upon which fixed Alcali has no Effect, as a Menſtruum: Thus, it does not affect pure Quickſilver; and hence it exerts no diſſolving Power upon thoſe Metals, which, according to the Adepts, conſiſt of a pure Mercury, and a fiery, metallic, fixing, ſulphureous Spirit. Thus, Gold and Silver are not changed by it, that I know of, though it has ſome Action upon the other Metals; perhaps, becauſe to their Mercurial Parts they have another added, which approaches to the Nature of an unctuous and ſulphureous Subſtance. But as theſe external Sulphurs are not eaſily ſeparable from the metallic Matter with which they concrete, hence it often happens, that, when theſe alcaline Salts act upon ſuch Sulphurs, they may ſeem to change the Mercurial Parts of the Metals intimately united with the Sulphur, without being able to touch the Mercury in its own pure Nature. Here, therefore, the diſſolving Power of Alcalies, with reſpect to Metals, ſeems to be limited; for, when applied to calcined Metals, and aſſiſted by the Force of Fire, they ſeem not capable of diſſolving that Sulphur which fixes their Mercury, and gives them the metallic Form; no Method of applying fixed Alcalies having hitherto, that I know of, obtained the Mercuries of Metals: So that, if what Mr. *Boyle*, *Tachenius*, and M. *Homberg*, relate of recovering the Mercuries of Metals be true, ſome ſecret Proceſs is required, to make theſe regenerating Alcalies enter the fixing Sulphur of Metals.

Both the fixed and volatile Alcalies have a diſſolving Power, 1. Upon animal, vegetable, and mineral Subſtances; ſo far as theſe contain Oils, Balſams, Gums, Roſins, or gummy Roſins, or conſiſt of unctuous Matters; as, alſo, upon Sulphurs, whether pure, compounded, or joined with other Materials; all which theſe Alcalies excellently open, attenuate, reſolve, and diſpoſe to mix intimately with Water, Alcohol, and Oils. 2. Theſe Alcalies, alſo, act as a Solvent upon ſuch Bodies whoſe component Parts are held together by an acid Cement, which being thus attracted by the Alcali, the component Parts now ſeparate, or fall aſunder. 3. After certain Bodies have been once diſſolved by an acid Menſtruum, pure Alcalies often exert a new Power, ſo as to diſſolve ſuch Bodies better, than if applied to them before they were thus diſſolved by the Acid. Hence the Alchymiſts direct, in order to obtain the Mercuries of Metals, that the Metals be firſt calcined by Acids, and afterwards be treated with Alcalies.

Whether any volatile Alcali exiſts in Nature, without the Aſſiſtance of Putrefaction, or the Diſtillation of animal or vegetable Subſtances, is not eaſy to determine; unleſs we ſhould ſay, that the particular Salt, found in mineral Waters, is of this Kind, tho' ſuch Salt cannot be juſtly reduced to the Claſs of volatile Alcalies: However, Dr. *Hoffman* has ſhewn, that they rather belong thereto, than to the acid Tribe. On the other hand, all animal

and

and vegetable Subſtances are, by Putrefaction, brought to afford a perfect volatile alcaline Salt; the acrimonious pungent Vegetables, and all animal Subſtances, afford it upon bare Diſtillation; and ſuch animal Juices as are not alcaline, yet, upon being mixed with fixed Alcali, are ſo changed as immediately to yield alcaline Exhalations, and, by the Action of the Fire, afford a volatile Alcali, the other Parts being attracted into the fixed Alcali. Theſe Salts, however produced, may by chymical Treatment be render'd pure, of the ſame Virtues, and of the ſame Form; their Virtues being ſimilar to thoſe of fixed Alcalies, though with ſome Difference: Thus volatile Alcalies act, and are agitated ſpontaneouſly, or by a very ſmall Degree of Heat; whereas fixed Alcalies require a much ſtronger Aſſiſtance from Fire, in order to their acting; volatile Alcalies fly off the Inſtant they are heated, and, therefore, do not exert their diſſolving Power, when applied to heated Bodies; while fixed Alcalies ſooner enter the Bodies they diſſolve, when aſſiſted by Heat; and remain conſtantly applied to every fixed Subject they act upon. But, when volatile Alcalies are purpoſely kept cloſe to a Subſtance to be diſſolved, a moderate Heat then increaſes, and quickens their diſſolving Power; as we ſee upon applying the volatile Salt of Urine, for Inſtance, to the warm Skin, and covering the Salt with a ſticking Plaiſter; for thus there ſoon ariſes Heat, Pain, and Inflammation upon the Skin, followed by an Ulcer, and a black Eſchar. Allowing for theſe Differences, the Action of volatile Alcali may be underſtood from the Hiſtory given of fixed Alcali. See ALCALI.

ACID MENSTRUUMS are conſider'd under the Article ACIDA.

NEUTRAL SALTS, CONSIDER'D AS MENSTRUUMS.

By neutral Salts we here underſtand ſuch as are neither acid nor alcaline, but ſeem to be a ſaturated Mixture of the two. Let us firſt conſider Sal Ammoniac, which eaſily diſſolves in Water, and runs per Deliquium in a moiſt Air, ſo as thus to make an extremely pungent, penetrating Liquor, capable of diſſolving groſs, gelatinous, pituitous, and gummy Concretions in the Bodies of Animals, being not only admirably attenuating, reſolving, and inciding, but, alſo, ſudorific, diuretic, and ſtimulating, to the ſalival Glands, and, at the ſame time, greatly preventive of Putrefaction. This Solution of Sal Ammoniac, boiled or digeſted with gummy or reſinous Vegetables, reſolves them intimately, and this diſpoſes them to reſolve in aqueous or ſpirituous Menſtruums. Iron Filings, boiled in it, are excellently diſſolved and turned into an admirable, aperient, and invigorating Medicine. Being digeſted with Filings of Copper, it produces a beautiful blue Liquor; a few Drops of which, taken upon an empty Stomach, often prove good againſt Worms, and epileptic Fits.

The pure dry Salt, being ſublimed into Flowers, and then very well ground, and mixed with Foſſils, and ſublimed together with them in cloſe Veſſels, produces very extraordinary Effects as a Menſtruum; whence it has been called by the Alchymiſts the *White Eagle*, or the *Philoſophical Peſtle*. If ſulphureous Bodies, Metals, or Semimetals, be treated in this manner, they are thus attenuated, opened, volatilized, and perfectly changed: Whence moſt excellent Remedies are, in this manner, prepared, and ſcarce ſo well in any other; as we ſee in making the Flowers of Lapis Hæmatitis, Ens Veneris, Ens Martis, *&c.* The Changes of Colour produced in Antimony, by being ſublimed herewith, are very extraordinary. And many of the antient Chymiſts have called this Salt, the Key for unlocking the Secrets of Nature: It has this excellent Property, that it is ſcarce changed in Sublimation, except by the Bodies it is mixed with: When added to Aqua-fortis, or Spirit of Nitre, it preſently changes them into Aqua Regia. With fixed alcaline Salts it ſoon changes, partly into a pure volatile Alcali, which directly acts as ſuch, and partly into a new Salt, reſembling Sea-ſalt. A ſaturated Mixture of the Spirit of Sea-ſalt, and a pure, volatile, alcaline Spirit, immediately produces Sal Ammoniac; which may, alſo, be made by ſubliming a Mixture of Sea-ſalt, Urine, and Soot: Whence it ſeems to be a ſemivolatile Sea-ſalt; ſo that its Power, as a Menſtruum, chiefly reſembles that of Sea-ſalt. It cannot, therefore, be more improved, than by being ſeveral times ſublimed from pure, dry, decrepitated Sea-ſalt, in cloſe Veſſels; which is the beſt Method of obtaining the Flowers of Sal Ammoniac.

Though Sea-ſalt, Sal-gem, and Spring-ſalt, differ in their Origin, yet they are of the ſame Kind, and may all be conſider'd as Sea-ſalt; which by means of the Sea-ſalt Springs, and Salt Mines, is diſtributed over all Parts of the Earth, as the univerſal Preſervative againſt Putrefaction. This Salt eaſily diſſolves in Water, and runs per Deliquium in a moiſt Air, ſo as to make a Brine, or an excellent Menſtruum, producing nearly the ſame Effects as the Brine of Sal Ammoniac.

Sea-ſalt decrepitates over the Fire, and, being afterwards reduced to fine Powder in a warm dry Mortar, it may be melted in the Fire; where it readily paſſes through the Pores of the Crucible, and vaniſhes. If Semimetals, or metallic Foſſils, are mixed with this Salt in Fuſion, great and peculiar Changes are thus produced. I mixed eight Ounces, of moiſt, undecrepitated Sea-ſalt with two Ounces of powder'd Antimony; and, after long grinding them together, I put the Mixture into a Crucible; and, covering it with another Crucible, I faſtened them together with a ſtrong Luting; then ſetting them in a reverberating Furnace for twenty-four Hours, and increaſing the Fire at laſt, to make the Salt run, I found, upon opening the Veſſel, a dusky Maſs, with white Spicula riſing on the Top; then, reducing the Whole to Powder, I treated it as before, and obtained a ruddy Maſs, with the more metallic Part at the Bottom; and, upon repeating the Proceſs, and uſing a ſtrong Fire of Fuſion, almoſt all the Salt paſſed through the Pores of the Veſſel; leaving at the Bottom a ruddy Maſs of Antimony, ſurpriſingly changed; whence we ſee, by an Example, how this Salt may act as a dry Menſtruum, by means of Fire.

This Salt may be uſed, on many Occaſions, with a much greater Effect than any other Salt; and, therefore, is uſually applied, in a dry Form, mixed with Brick-duſt, in the Buſineſs of Cementations, in order to introduce extraordinary Changes as to the Exaltation, Separation, and Ripening of Metals. In this Operation we are to obſerve, that the dry Sea-ſalt, here mixed with the Brick-duſt, turns to a volatile acid Spirit, reſembling Aqua Regia, and acting like that upon Metals. When, by theſe means, the Sea-ſalt is turned to a Spirit, and ſeveral times returned back upon a pure decrepitated Salt, a ſurpriſing particular Solvent is thus obtained from the Sea-ſalt: To this Purpoſe, I ſhall here relate a laborious Experiment.

To two Pounds of Spirit of Salt, I added, by Degrees, as much pure, dry Sea-ſalt, in fine Powder, as the Spirit would take up; then, purifying the Liquor by Reſt, and ſtraining, I put it into a tall chymical Phial; and, inverting another of a ſmaller Kind thereon, I carefully cemented them together; then expoſed the Matter to the Heat of the Sun, from the tenth of *May* to the tenth of *July*. After this I diſtilled, in a Retort, with a gentle Fire, till a thick Liquor, appearing like Oil, and containing hard Cryſtals of Sea-ſalt, remained at the Bottom. What was diſtilled over, I now poured back, and drew off afreſh, repeating this Operation thrice; then found the Salt remaining at the Bottom was ſpongy, fat, and oily. After this I repeated the Operation twenty times, and again poured back the Liquor laſt diſtilled, and left them mixed together for five Months; then with a gentle Fire I drew off an almoſt inſipid Phlegm, till the acid Spirit began to riſe; when, changing the Receiver, and diſtilling with a ſtronger Fire, I obtained an extremely ſtrong, acid, ponderous Oil of Salt, which I kept ſeparate, and obſerved, that the Salt remaining at the Bottom of the Retort, after all theſe Diſtillations, was extremely acid, and conſiderably fixed. I put this Salt in a glaſs Diſh, and expoſed it to the Air of a Cellar, where it ran *per Deliquium* into a Liquor; which being purified by ſtraining, and united again to the Phlegm, Spirit, and Oil of Salt, before drawn over, I thus, at length, by a new Diſtillation, obtained a Menſtruum of ſuch Efficacy, as made me not repent of my Labour. Sea-ſalt, being diſſolved, purified, and cryſtallized, affords a ninth Part of a ſaline Subſtance, having a bitter auſtere Taſte, and not ſhooting into Cryſtals; and this Part being taken from it, the Salt becomes the purer.

The common Nitre, being produced from animal, alcaline, and calcarious Subſtances, is eaſily turned to fixed Alcali, and a volatile Acid. It, alſo, appears of a particular Nature, when applied to Bodies as a Menſtruum; and its Operations are here ſo intricate, as ſometimes ſcarcely to be explained. When expoſed to the Fire in a pure and dry State, it there ſoon flows with certain Bodies, like Water; and thence ſurpriſingly promotes their Melting, though otherwiſe of difficult Fuſion; and thus attenuates, divides, and intermixes their Parts, even while it acts upon them in no other reſpect. Whence it comes to be uſed in Metallurgy, as a Flux for Metals.

But if the Matter, thus mixed with the Nitre, contains any thing oily, unctuous, or ſulphureous, this ſuddenly deflagrates with the Nitre in the Fire, raiſes a violent Flame, and greatly increaſes the Heat: Whence the Application and Action of the Nitre being ſtronger, it greatly changes, divides, fuſes, and ſeparates the Bodies in a different manner than is otherwiſe known; the Nitre, at the ſame time, loſing its own Nature, or turning to a kind of Sal Polychreſtum, which has a different diſſolving Power from that of Nitre: Whence the Action of Nitre upon Bodies is of one ſort before it deflagrates with them, of another during the Deflagration, and of a third after the Deflagration is over.

When Nitre is melted along with a vegetable Coal, its Parts are ſtrongly agitated, ſo as in like manner to agitate the Bodies to be diſſolved; at the ſame time diſcharging particular active Fumes, capable of penetrating and diſſolving many Bodies in the Fire. But, when the Nitre is thus changed to fixed Alcali, it does not flow, unleſs the Fire be violent; and then, according to its penetrating and particular Nature, it begins to act as a fixed alcaline Menſtruum; and thus acquires and exerts a new diſſolving Power.

If the Bodies thus to be diſſolved by Fuſion with Nitre contain Earth, Stone, Alum, Vitriol, Bole, or the like, the Nitre is immediately changed into a ſtrong acid volatile Salt, or Spirit of Nitre, which, now agitated with ſo violent a Fire, penetrates, diſſolves,

diſſolves, and greatly changes the Subject, thus acting by one of its Parts like Aqua-fortis; while the other Part, remaining at the Bottom, acts by a very different diſſolving Power. Hence we may underſtand, what a great Effect this Salt may have, when uſed in the way of Cementation, along with metallic Matters; for thus it changes into a corroſive Spirit, capable of altering metallic Subſtances various Ways.

If pure Nitre be fuſed in a ſtrong Fire, along with Regulus of Antimony, it, at length, produces a kind of cauſtic Stone, which acts after a manner peculiar to itſelf, being a very fixed Salt of difficult Fuſion, and uncommon fiery Acrimony: Whence it appears, what a prodigious diſſolving Power this Salt may have, when mixed with Regulus of Antimony, and applied to Bodies in the Fire.

If Powder of Sal Ammoniac be thrown upon Nitre melted in a clean Crucible, a gentle Flaſh will be produced, as if a burning Coal was thrown upon the Nitre; while the Salt is thus every Moment changed in the Fire, till at length, being ſaturated with the Sal Ammoniac, it flaſhes no longer; but turns to a new Kind of rediſh Salt, of a very particular Nature, little known or conſidered by the Chymiſts; but while the Nitre, and Sal-ammoniac, are thus mixed with other Bodies in the Fire, different Kinds of Solutions will be made at different times; and, conſequently, different Effects produced at each time, while the Bodies remain together in the Fire. Theſe Particulars are ſeldom carefully regarded by the Operators; whence they frequently meet with unexpected Accidents, while they overlook ſuch things as may alter the Succeſs of their Experiments. If one Part of Sea-ſalt, and two of Spirit of Nitre, be diſtilled together, the Liquor that comes over from them, with a gentle Heat, will prove an *Aqua Regia*, and acts entirely as ſuch; while the Salt remaining behind will be Nitre, and, when thoroughly dried, will act as Nitre, though, at the Beginning of the Operation, it acted as *Aqua Regia*, in the Liquor diſtilled over. Whence we ſee, what a great Difference may be in the Action of a Menſtruum, at different times of the Operation. So, again, if one Part of pure Nitre, and three Parts of the Spirit of Sea-ſalt, be diſtilled together, they yield a ſtrong *Aqua Regia*; while the dry Salt, remaining in the Retort, is again left true Nitre. Which ſhews us how careful we ought to be in the Uſe of theſe Menſtruums, to prevent being impoſed upon. So, likewiſe, if the Spirit of Nitre, with a proper Proportion of any Alcali, be uſed as a Solvent, they ſoon turn to Nitre, and act as ſuch at the End of the Operation. If *Glauber* ſays true, that Nitre may be made from a Mixture of Sea-ſalt, fixed Alcali, and Quick-lime, burnt and ignited in the Fire, and afterwards expoſed to a moiſt Air; theſe three Subſtances, being uſed together in Cementation, muſt have a very different Effect from what one might otherwiſe imagine.

Native Borax, being diſſolved in Water, filtred and cryſtallized, has a ſomewhat ſweetiſh and bitteriſh Taſte; but is neither acid nor alcaline. By ſtrong Diſtillation it affords mere Water; while the Part that remains behind, turns to Glaſs, incapable of being diſſolved in Water. When mixed with Sand, and urged with a violent Fire, it affords no acid Spirit. It greatly promotes the Fuſion of Metals, and thus, alſo, has numerous other Effects, which could not otherwiſe be ſo eaſily obtained.

If what is above delivered of ſaline Menſtruums be well underſtood, it will not be difficult to conceive, that various Combinations of Salts ſhould produce many new Kinds of ſaline Menſtruums, having ſingular and uncommon diſſolving Powers. Theſe Combinations are ſometimes made by Art and Contrivance, and ſometimes accidentally, ſo as to ſurpriſe by their unexpected Effect, and thence come to be regiſtred in Books of Chymiſtry; and, from theſe two Origins proceeds that vaſt Stock of Menſtruums with which Chymiſtry abounds. Thus, when volatile Alcalies are mixed with the fixed Kind, the former are always rendered ſtronger, and more volatile, by the Action of the Fire; whilſt the latter, attracting the acid Particles, which perhaps remain'd in the volatile Alcalies, as alſo the Oils, but retaining the terreſtrial Particles, hence become different, or more compounded, and productive of other Effects. Fixed Alcalies, being united with native vegetable Acids, afford an extraordinary compound Salt, of a mild, aperient, and diuretic Nature; as we ſee upon mixing Salt of Wormwood with Juice of Lemons, and the like in a proper Proportion; whereby a Salt is procured of very different diſſolving Powers from the Parts it was compoſed of, or from any other Salts; and, when volatile Alcalies are mixed with theſe Acids, another Kind of compound Salt is produced, differing greatly from the former, made with fixed Alcali. When fixed Alcalies are properly united with pure, fermented, vegetable Acids, they, upon mixing, afford many extraordinary Phenomena, and produce a neutral, mild, volatile, penetrating, ſaponaceous Salt; the Effects whereof upon animal, vegetable, and foſſile Subſtances, have made me ſometimes ſuſpect it to be the volatile Salt of Tartar, ſo highly extolled by *Helmont*. Perhaps, of all the neutral Tribe of Menſtruums, there is not one that more deſerves to be conſidered, and made uſe of, than this; as might be ſhewn by numerous Examples, and as remarkably appears by its diſſolving the Body of Myrrh, which with Difficulty yields to Alcalies and Acids, ſo as to be rendered potable, and miſcible with the Blood; but, by being properly digeſted with this neutral Salt, it is intimately and inimitably diſſolved for the Purpoſe. The ſame Salt, if carefully made, intimately unites with Spirit of Wine, ſo as to afford an excellent Menſtruum. Hence we might eaſily confute the Error of the modern Chymiſts, who make Alcalies and Acids the Principles of all things, and aſſert, that their Virtues are deſtroyed by mixing them together. On the contrary, it is certain, that the pure Alcali of Tartar, properly mixed with the volatile Acid of Vinegar, makes a neutral Salt, of a much more noble Virtue than the ſeparate Acid or Alcali. When a pure volatile Alcali is exactly ſaturated with the ſtrong Spirit of Vinegar, we have thus a limpid, lightly ſaline, volatile, compound Liquor, able to paſs through almoſt all Kinds of Bodies, ſo as to diſſolve them, without any conſiderably viſible Conflict. Whence ſome have highly eſteemed this Liquor, in curing Diſorders of the Eyes and Ears, ariſing from Concretions. What has likewiſe been reckoned a great and ſucceſsful Secret for reſolving cold, glandulous Swellings is, to foment them with a Mixture of putrefied Urine and Vinegar, the Part being firſt rubbed, and the Liquor applied warm.

Hence we may underſtand, that the Conſequence of mixing fixed or volatile Alcalies with fermenting Acids will be, a Stoppage of the Fermentation, after the Production of a ſudden Effervеſcence, and the conſequent Production of neutral Salts. The like neutral Salts will, alſo, be produced, upon mixing the ſame Alcalies with the Acids obtained either by Diſtillation, or the burning of Woods in the Fire.

When theſe fixed Alcalies are united to a native foſſile Acid, new compound Salts, greatly differing from one another, are produced. Thus, if hot Oil of Tartar *per Deliquium* be gradually dropt upon a Solution of pure Alum in Water, till the Point of Saturation is obtained, an earthy Calx will be precipitated; and if the clear Liquor, floating above it, be filtred, the native Acid of the Alum, here attracted by the Alcali, will afford a Salt like vitriolated Tartar, but without any metallic Part, and of an excellent diſſolving Power, as a Menſtruum, and of conſiderable medicinal Virtue. So, if to a warm and clear Solution of white, green, or blue Vitriol, the ſame Solution of fixed Alcali be added, after the ſame manner, we obtain a compound Salt, conſiſting of the fixed Alcali, and the foſſile Acid, which had diſſolved the calcarious Matter, the Iron, or the Copper, naturally diſſolved in the Vitriols. Whence, again, a neutral vitriolated Tartar is produced, differing from the common, as its Acid had not felt the Force of ſo ſtrong a Fire, and, therefore, better preſerves its native Virtues; it alſo better depoſites its metallic Parts, except the Vitriol was from Copper, whoſe metallic Part, remaining in the Solution, tinges the Salt of a blue Colour.

When fixed Alcali is intimately mixed with Sulphur, the foſſile Acid of the Sulphur is attracted into the Alcali; and hence ariſes a Salt reſembling the former, though of a ſomewhat different Nature, as appears by the Figure of the Cryſtals it ſhoots into: This ſeems principally occaſioned by the unctuous Part, which being mixed in with the Sulphur, alſo, joins itſelf to the fixed Alcali, and fouls the Salt; thus making a more compound Salt of different Taſte, Odour, and Virtue.

Thus, upon mixing vitriolic or aluminous Waters, or their unctuous Sediments, with fixed Alcali, the metallic or terreſtrial Part, diſſolved in them, being now ſeparated, the acid Solvent will unite with the Alcali into a kind of vitriolated Tartar where the diſſolving Power is peculiar or different from that of other Salts; as appears by applying it to Metals, Semimetals, Sulphurs, and other foſſile Subſtances. This Salt uſually retains its diſſolving Power more permanently than any other compound Salt; its Acid, as well as its Alcali, being more fixed, and both thus united into a very fixed neutral Salt. Nor do we know any other Acid, which, when apply'd to this vitriolated Tartar, is able to ſeparate the Acid it contains; whereas the native Acid of Vitriol commonly expels the Acid from all other Salts.

When pure volatile alcaline Salts are mixed with theſe native foſſile Acids, a particular Kind of ammoniacal Salts are thus produced. Theſe may be called Semivolatile vitriolated Tartars, and highly deſerve to be regarded by Chymiſts, on account of their remarkable diſſolving Property; and by Phyſicians, on account of their conſiderable, aperitive, attenuating, reſolving, ſtimulating Virtues.

Hence may be underſtood, what will follow upon mixing common Sal Ammoniac with the Vitriols, and committing the Mixture to the Fire. Thus, the Acid of the Vitriols, being attracted into the alcaline Part of the Sal Ammoniac, releaſes the acid Spirit of the Sea-ſalt, which makes the other Part of the Sal Ammoniac; this Spirit, being volatile, is thus ſeparated, whilſt, by the Union of the vitriolic Acid with the alcaline Part of the Sal Ammoniac, a ſemivolatile vitriolated Tartar is produced; the remaining Part being a metallic Maſs, before contained in the Vitriol, but now precipitated in the Form of Fæces; or elſe, being again diſſolved by the Spirit of Salt, affords a new Kind of metallic Solution. Hence we have a juſt Foundation for judging of the Event of combining fixed, or volatile Alcalies with all the

native foſſile Acids, however they may lie concealed in Metals, Earth, Oils, or other Salts.

Let us next conſider thoſe Menſtruums which ariſe from the Combination of fixed Alcalies with a foſſile Acid obtained by Fire. When pure fixed Alcali is perfectly ſaturated with the acid Spirit of Sea-ſalt, Sea-ſalt ſeems to be regenerated. When ſaturated with the Acid of Nitre, it re-produces Nitre; and with the Acid of Alum, of Sulphur, or Vitriol, it conſtantly makes the Tartarum vitriolatum. In the ſame manner, when pure volatile Alcali is united with Spirit of Sea-ſalt, there ariſes a true Sal Ammoniac; and when mixed with Spirit of Nitre, or Aqua-fortis, a ſemivolatile Nitre is produced. If the ſame volatile Alcali be united with Oil of Vitriol, with Oil of Sulphur by the Bell, or with the Acid diſtilled from Alum, it thus produces a ſemivolatile vitriolated Tartar. Hence it appears how many and what ſurpriſing Actions of Menſtruums ariſe from the mixing of certain Bodies together, and applying them to the Fire. And, without an exact Knowledge of ſuch a Variety of Particulars, we can never have an adequate Knowledge of the chymical Hiſtory of Menſtruums.

We now proceed to conſider the Action of Menſtruums made by uniting pure ſimple Salts with other Salts. Thus, if pure Alcali be added to the Brine of Sea-ſalt, an earthy Matter is precipitated; and the Salt now obtained by Cryſtallization from the clear Liquor will be a purer Sea-ſalt. The ſame fixed Alcali, being added to a Brine of Nitre, changes the Liquor thick and milky, and precipitates an earthy Matter, whereby the Nitre obtained from this Solution becomes extremely pure. When fixed Alcali is added to the Brine of Sal Ammoniac, it ſeizes the Acid of that Salt, ſets the volatile Alcali free, or ſuffers it to fly off, leaving a pure, fixed Sea-ſalt at the Bottom of the Veſſel. If a pure volatile Alcali be added to the Brine of Sea-ſalt, it makes the Liquor thick, then purifies it, and flies off: It does the ſame, when added to a Solution of Nitre, or to a Solution of Sal Ammoniac. Vegetable Acids, fermented or not, produce but little Alteration, by being mixed with Sea-ſalt, Nitre, and Sal Ammoniac. Of the Menſtruums ariſing from the Mixture of foſſile Acids with theſe Salts, we have already produced Examples; and ſhall only add, that if Quickſilver be incorporated with calcined Vitriol by long grinding them together, and decrepitated Sea-ſalt be added therero, and the Mixture be put to ſublime in a glaſs Veſſel, with Degrees of Heat, in a Sand-furnace, the Acid of the Vitriol thus turns the Acid of the Sea-ſalt into a Spirit, which now diſſolves the Mercury, and makes it riſe to the Top of the Veſſel in the Form of pure Mercury Sublimate, which is no more than the Spirit of the Sea-ſalt attracted into the Quick-ſilver, and thus united therewith, into an uniform, vitriolic, mercurial Maſs, ſoluble in Water. There are numerous ſurpriſing Inſtances of this kind, in the Hiſtory of Menſtruums, which may be all underſtood by the Principles here laid down. Let it only be remembered, that in what way ſoever Salts are united with Salts, new ſaline Productions, and new Menſtruums, will ariſe; whence the Art of Chymiſtry may be perpetually improv'd, and new Phenomena produced, not only affording Pleaſure to the Mind, but increaſing our Knowledge of the native Properties of Bodies, and often leading to great and unexpected Diſcoveries for the Accommodation of Life.

New Menſtruums of particular Virtues may be infinitely made, by variouſly combining different Menſtruums together, by reducing every Menſtruum to its utmoſt Degree of Purity, and by reducing ſome of them into their minuteſt Particles; for, upon theſe three Particulars, the extraordinary Skill of the principal Chymiſts ſeems chiefly to depend. It would be endleſs to give all the Inſtances that might be produced to this Purpoſe; we ſhall, therefore, content ourſelves with the following: Suppoſe an extremely pure, ſtrong, and ſubtile, fermented, vegetable Acid was wanting: Take fine Verdegriſe, prepared from Copper, corroded by the ſubtile Vapour of a fermenting Acid: Add to it twenty times its own Weight of the ſtrongeſt diſtil'd Vinegar that can be made; digeſt them together, till the Verdegriſe is diſſolved into a deep-green Liquor, which being thoroughly purified by Filtration, and inſpiſſated over a gentle Fire, to a Pellicle, ſet it in a quiet Place, where it will ſhoot into Cryſtals, of the Colour of an Emerald, conſiſting of the Acid of the Vinegar, and the diſſolved Copper; pour off the Liquor, collect the Cryſtals, and repeat the Proceſs, till no more Cryſtals can thus be obtained. If, now, the Verdegriſe, ſaturated with the Acid, be dry'd in a warm Air, then diſtil'd in a Glaſs Retort, with Degrees of Fire, you may obtain a moſt pure, and perfectly ſtrong, vegetable Acid, no way participating of the Copper. But the ſame Experiment does not ſucceed with Lead, Tin, or Iron; whereas Copper thus attracts the Acid ſeparately from the aqueous Part, and without changing its Nature, while other Subſtances would alſo attract and ſeparate it, but, at the ſame time, render it impure. A Vinegar, for this Purpoſe, may be made from Beer, Cyder, Perry, Honey, Sugar, Manna, and the like.

To ſhew that, by compounding one Menſtruum with another, new and excellent Salts may be procured, let it be recollected, that regenerated Tartar, properly prepared, may be intimately united with pure Alcohol, and thus produce a vegetable Menſtruum, compoſed by the cloſe Union of the moſt ſubtile vegetable Particles, Alcali, Acid, and Sulphur: Whence the Effect of ſuch a Liquor is extremely great, both as a Menſtruum, and a Medicine.

We ſhall now proceed to make the following Inferences:

1. It is not certain, whether any Menſtruum has a Power of diſſolving any Subject, without the Aſſiſtance of Fire; as no Experiment could ever be made in a Place deſtitute of all Fire, and, as moſt of the known Menſtruums act the better, when aſſiſted by a certain Degree of Fire.

2. Menſtruums can ſcarce act as ſuch, unleſs reduced to a fluid Form, or at leaſt, approach thereto; as they chiefly do, by the means of Fire, Air, Water, and Triture; which four Cauſes uſually excite the latent Powers of Menſtruums.

3. Certain Menſtruums contain a Cauſe within themſelves, apparently capable of exciting Motion; though in Reality it depends upon the near Approach of another Body. Thus, if a good Load-ſtone be ſuſpended by a Thread, and hangs at Reſt in a great Degree of Cold, it will ſeem to have no active Virtue; but, if Iron comes near it, a Motion is produced in both theſe Bodies, till they come together, and remain in Contact; and this kind of Power generates Motion ſpontaneouſly, without the Aſſiſtance of any Fire ſenſible to us; and is not excited by Motion. So likewiſe, ſtrong Spirit of Nitre, confined in a cloſe Veſſel, yields an acid Fume, conſtantly playing about the Surface of the Liquor, and iſſuing out whenever the Veſſel is unſtopped. The ſame Appearances has the Fume of the alcaline Spirit of Sal Ammoniac; and the Spirit of Sal Ammoniac, made with Quick-lime, affords a Fume much more volatile and moveable. This kind of Bodies, therefore, ſtrangely retain, and ſtrangely excite Motion; and poſſibly there are ſuch continually floating about in ſubterraneous Places, till they reſt in ſome one Body, where they unite, fix, and thus produce numerous compound Subſtances; but we are always to remember, that Air, even in the utmoſt Cold, has a conſtant vibratory Motion, and therefore may often excite the Motions we here ſpeak of; as, on the other hand, Solutions are often immediately performed, by means of the Motion peculiar to the Menſtruum ariſing from it; whilſt a conſiderable Motion of another kind, and proceeding from a different Cauſe, would not produce the Effect. Thus, if a Piece of fine *Engliſh* Chalk be calcined in a ſtrong Fire, or even in the Focus of a burning Concave, it will ſcarce be changed by this violent Motion; nor, again, by being expoſed to a hot and cold Air, either at Reſt, or agitated by ſtrong Winds; and though it be long boiled in Water, or a Brine of Salt of Tartar, it will not diſſolve; but it immediately melts and diſappears in cold Vinegar: Whence we ſee there is a very great Difference between the Motion excited by the reciprocal Force of the Solvent and Solvend, and the Motion excited by Fire, Air, Water, and Impulſe.

4. The Acrimony of a Menſtruum, which excites Pain, corrodes, or conſumes the Parts of the human Body, is no Sign, that ſuch a Menſtruum is ſuited to diſſolve other Bodies. Thus, Oil of Vitriol, Spirit of Nitre, Spirit of Salt, and *Aqua Regia*, though they readily conſume the Fleſh, do not diſſolve Wax and Sulphur; though theſe two may eaſily be diſſolved in the human Body.

5. Many Bodies, incapable of diſſolving in certain Menſtruums, may be fitted for diſſolving therein, by being previouſly diſſolved in another Menſtruum. Thus, if common Sulphur be boil'd ever ſo long in Alcohol, it diſſolves no more than a Stone in Water; but, if the Sulphur be firſt melted with Salt of Tartar into a dusky Maſs, cold Alcohol will ſoon diſſolve the Sulphur intimately. Some eminent Chymiſts have conceived ſo highly of this regular and ſucceſſive Application of different Menſtruums, particularly Mr. *Boyle*, and Mr. *Homberg*, that they ſay even Metals may, by theſe means, be reſolved into their component running Mercury, and fixing Sulphur. But, after many Experiments, I have not found, that Metals could be thus turned into Mercury.

6. Certain Menſtruums diſſolve ſuch Bodies, as before Trial might be judged little ſuited thereto: And this holds both on the Side of the Solvent, and Solvend. Thus, the viſcid and tenacious Body of native Turpentine is ſo penetrating in the Body, as very ſoon to give a Violet-ſmell to the Urine, change its Colour, and warm the Perſon who takes it; it diſſolves Oils and Roſins with a gentle Heat, and even the gummy Roſins, which can ſcarce otherwiſe be diſſolved. The Yolk of an Egg would ſcarce be ſuſpected of any ſolvent Power from its obvious Properties; yet, by being ground with any of the Gums, Oils, Roſins, or Balſams, it diſſolves them better than any other Menſtruum, deſtroys their Tenacity, renders them miſcible with aqueous and ſpirituous Liquors, and fit to enter the circulating Fluids of Animals. The White of an Egg, when boiled to Hardneſs, and diſtilled *in Balneo Mariæ*, affords a limpid aqueous Liquor, of no conſiderable Smell or Taſte, and of no ſaline, acid, or alcaline Nature; yet what a particular Power it may have, even upon Metals, appears from *Paraceſſus*, and *Helmont*, who judg'd it the propereſt Thing in preparing their medicated Mercury. And if the White of an Egg, after Boiling, be ſuffered

fered to run *per Deliquium* in a Cellar, it turns to a kind of pure Water, which diſſolves the hard tough Subſtance of Myrrh, better than any other Menſtruum.

7. Hence therefore Acidity, Acrimony, or a ſaline Property, diſcovered in any Menſtruum, can never aſſure us, that ſuch a Menſtruum will diſſolve a given Subſtance, till we find by particular Experience, that a Solution enſues, upon putting the Bodies together. Thus, if any known Acid, whether ſtrong, or ſmall, be put to common Sulphur, and aſſiſted by Heat, it will not diſſolve the Sulphur. So Spirit of Nitre, which diſſolves other Metals, will not touch Gold: Whence we cannot ſay in general, that Acids diſſolve Metals; but, properly, that certain Acids diſſolve theſe or thoſe particular Metals. A Perſon who had often experienced the corroſive Virtue of ſtrong, fixed Alcali in numerous Subſtances, might perhaps expect it would diſſolve all Bodies; but he would ſoon be undeceived, upon finding it does not affect Quickſilver, Silver, or Gold; and the ſame holds alſo of Salts. Hence we cannot ſay, that Acids, Alcalies, or Salts, are Solvents univerſally; but only with reſpect to their determinate, definite Subjects, whereto Nature has fitted and limited them.

8. So again, univerſally, a cautious Chymiſt, finding a Body diſſolved, will not infer, that an Acid, an Alcali, or a neutral Salt, was the Cauſe of the Solution, unleſs other Circumſtances determined this to be the Caſe; yet the modern Chymiſts have often deviated from this Rule, through a Fondneſs for general Concluſions. Suppoſe a Perſon ſure, that Gold was diſſolved into its leaſt Particles, and that there was no other known Salt which would diſſolve Gold, beſides Sea-ſalt, or Preparations thereof; yet he could not hence juſtly infer, that Sea-ſalt was here the Solvent: For pure Quickſilver will alſo diſſolve Gold; though Quickſilver be as far from an acid, alcaline, or acrimonious ſaline Nature, as any known Subſtance in the World.

9. We may add, that there is no general or abſolute corroſive or diſſolving Acrimony, this being always relative, and holding only true of the Solvent, and Solvend, and not of the Solvent, in reſpect to all other Bodies. Thus, if upon ſeeing the corroſive Virtue of *Aqua-fortis*, in a thouſand Inſtances, upon animal, vegetable, and mineral Subſtances, we ſhould hence conclude it would corrode all other ſoft and tender Subſtances, we might ſoon correct ourſelves by obſerving, that it will not diſſolve ſoft Wax, or brittle Sulphur.

10. On the other hand, it is no ſafe Concluſion, that becauſe a Menſtruum proves mild and innocent to the human Body, it will not therefore diſſolve other Bodies: For Oil-olive may be ſafely received in a large Quantity into the Stomach and Inteſtines; though it readily diſſolves Sulphur and Wax, which Acids will not touch. Melted Wax, though ſo mild a Subſtance, is ſaid to extract the red Colour of Coral, which long ſuſtains a violent Fire without changing, and even reſiſts the Force of Alcalies. Hence the hardeſt Bodies, with regard to our Senſes, and found to be ſuch by their reſiſting of Fire, do not require, in order to their Solution, Solvents apparently corroſive.

Upon the Strength of the Doctrine here delivered, it cannot appear impoſſible to diſcover, in Art or Nature, a peculiar Menſtruum, capable of diſſolving ſome one thing inſoluble by almoſt all others; whilſt, at the ſame time, this Solvent ſhall not diſſolve other Subſtances of a much weaker and ſofter Texture. The way of diſcovering ſuch a Menſtruum is by ſucceſſively applying all ſorts of Menſtruums to the Body, whoſe Solution is required; and, here, what might be judged the leaſt proper for the Purpoſe, may ſometimes beſt anſwer the End. Thus, though Cancers, and the Stone in the Bladder, have hitherto proved incurable, yet we ought, on no Account, to deſpair of diſcovering Remedies for them, and particularly of finding a Method of diſſolving the Stone, without injuring the Bladder; ſince it is by no means a Conſequence, that the Bladder ſhould be corroded by the ſame Remedy which diſſolves the Stone.

The Spirit of Rye-bread has a ſurpriſing Power to diſſolve certain Stones; yet does not corrode any Part of the human Body: And the Water which boiled Whites of Eggs ſpontaneouſly runs into, diſſolves many Subſtances; yet may be poured into the Eye with Safety.

11. Moſt Menſtruums, at the time they diſſolve and change the Subject, are alſo changed by it, the Action being reciprocal; and though Water, Alcohol, and Mercury, hence receive but little Alterations, yet they are gradually changed by the Operation.

12. It is a great Error to ſuppoſe, that the purer any Menſtruums are made, the more powerfully, or the more perfectly, they always diſſolve; becauſe their diſſolving Power is often diminiſhed, in proportion to their Purification. Thus, Lead is always more difficultly diſſolved in *Aqua-fortis*, the ſtronger the *Aqua-fortis* is made; and more eaſily, when the Menſtruum is diluted with a proper Proportion of Water; and ſeveral Examples may be brought to the ſame Purpoſe. On the other hand, the utmoſt Purity is often required in a Menſtruum, to make it a proper Solvent: Thus, diſtilled Oils require perfect Alcohol to diſſolve them totally into an uniform Liquor; the Interpoſition of Water preventing the Effect. Hence we cannot abſolutely pronounce of Menſtruums, whether they ſhould be weak or ſtrong, in order to diſſolve certain Subjects; but the Matter muſt be determin'd by Experiments.

13. There is nothing more remarkable in this Doctrine of Menſtruums, than the Production of new Powers by their Action; which Powers, before, exiſted neither in the Solvent, nor Solvend; but depend entirely upon the Union of both, after the Solution is performed. Thus, an Infant might ſafely ſwallow a few Grains of Quickſilver, or a very few Drops of Spirit of Salt; but, if theſe two Bodies are united, ſo as to make corroſive Sublimate, three or four Grains thereof would prove a violent Poiſon. Chymiſts, being thus admoniſhed, will, it is hoped, not always expect, that the Productions of their Solutions muſt be either innocent or medicinal, only becauſe the Simples employ'd in them were ſo. Whoever has regard to Truth and Virtue, will think, that if any new Production be thought deſerving of a Trial as a Medicine, it ſhould be done ſlowly and carefully; beginning with a moderate Doſe, and having the Mind intent upon the Event and Circumſtances. Thus, our Chymical Doctrine of Menſtruums may lead us to underſtand all the beſt and greateſt Diſcoveries which the Art is able to make. *Boerhaave's Chymiſtry.*

MENSURA. A Meaſure See PONDUS; under which Article there i a Table of Meaſures and Weights.

MENTAGRA. This was a kind of obſtinate Tetter, which *Pliny*, *Lib.* 26. *Cap.* 1. informs us, firſt appeared in *Italy* in the Reign of *Claudius Cæſar*. It began upon the Chin, and extended itſelf over the reſt of the Face, even to the Eyes; and deſcended to the Neck, the Breaſt and Hands. It did not endanger Life; neither was it painful; but was extremely frightful to look at. Neither the Women, nor the ordinary People, nor the Slaves, were affected with it; but People of the firſt Condition only. They brought Phyſicians from *Egypt*, in order to cure it, which is a Country fruitful in ſuch kind of Diſtempers. The Method of Cure was to cauterize, in ſome Parts even to the Bone, otherwiſe it would return. And the Cauteries left Scars more unſeemly than the Diſtemper.

It is remarkable, that in the Pontificate of Pope *Pelagius*, the Summer after an Inundation of the *Tiber*, abundance of People were affected with an epidemical Eruption of Puſtules, which were very malignant, and which the Phyſicians had never before ſeen, nor did they know how to cure. This made ſome think, that the Lues Venerea ow'd its Origin to an extraordinary Overflowing of the *Tiber*, which happen'd in the Pontificate of *Alexander* the Sixth, at the time that *Charles* of *France* invaded *Italy*.

This epidemical Diſorder might poſſibly be the ſame as the *Mentagra*; and this laſt, in the Reign of *Claudius*, might happen after ſome great Inundation: What makes this the more likely is, that they were oblig'd to ſend to *Egypt* for Phyſicians, where this Malady was epidemical, probably from frequent Inundations.

MENTHA.

The Characters are;

It has a creeping Root; the Flower is quadrifid, and, tho' without Apperrance of a Galea, or Beard, has its Lip in a manner divided into two Parts; the Whorles of the Flowers are cloſely diſpoſed. The Plant has a pleaſant, balſamic, and aromatic Smell.

Boerhaave mentions thirteen Species of this Plant; which are,

1. Mentha; rotundifolia; criſpa ſpicata. *C. B. P.* 227. *J. B.* 3. 2. 218.

2. Mentha; criſpa; Danica; aut Germanica; ſpecioſa. *Park. Theat.* 32.

S. Paullus tells us, that he had obſerved the circular Motion of the Blood ſuppreſs'd by a ſimple Decoction of the *Mentha criſpa* [it is uncertain whether he means this Sort, or the *Mentha criſpa verticillata*, C. B. or the *Mentha ſpicata rotundifolia criſpa*, J. B.] to ſuch a Degree, that not a Drop could be evacuated from the Foot, tho' attempted by a very dextrous Surgeon with a myrtiform Lancet, which he enter'd three or four times, to a good Depth, into the moſt conſpicuous Veſſels of that Part. The Maid had firſt prepared a Bath for the Feet, into which ſhe had put ſome Bundles of Mint; this Bath her Miſtreſs made uſe of. Perhaps, ſays *Ray*, *S. Paullus* took that for the true Cauſe, which had no Influence at all in the Caſe; for to me it does not ſeem probable, that Mint ſhould produce any ſuch Effect. *Raii H. P.*

3. Mentha; rotundifolia; ſpicata; rubra. *C. B. P.* 227. *Menthaſtrum ſpicatum, cultum, folio rotundiore, rugoſo.* J. B. 2. 318. *Siſymbria, Mentha, agreſtis, ſativæ Menthæ Cruciatæ congener aut eadem.* Lob. Obſ. 272.

4. Mentha; criſpa; verticillata. *H. Eyſt.* 0. 7. *F.* 5. *F.* 1 *Mentha rotundiore folio glabro, Pulegii flore.* M. H. 3. 369. *Mentha.* 1 *Dod. p.* 95.

5. Mentha; criſpa; verticillata. *C. B. P.* 227. *Mentha* 1 *Dod. p.* 95. *Mentha, criſpa, verticillata.* H. Eyſt. Æſt. 0. 7. F. 5. Fig. 1. *Mentha vulgata, ſerpens, rotundiore folio, Pulegii flore coronato.* Lob. Obſ. 271.

Boerhaave ſeems to make theſe two diſtinct Species, but *Dale* thinks them the ſame, and tells us, that they grow in watery

Places

Places, and flower in the Month of *Auguſt*. The whole Herb is uſed. The Powder of it, daily uſed, is, by *Stockerus*, recommended againſt a Weakneſs of the Stomach: And *Etmuller* commends it againſt Vomiting.

6. Mentha; anguſtifolia; ſpicata. *C. B. P.* 226. *Raii Hiſt.* 1. 532. *Tourn. Inſt.* 189. *Boerh. Ind. alt.* 185. *Mentha.* Offic. *Mentha Romana.* Ger. Emac. 680. *Mentha Romana anguſtifolia ſive Cardiaca.* Park. Theat. 31. SPEAR-MINT.

Spear-mint has many ſquare Stalks, which, in good Ground will grow to be two or three Feet high, having two long ſharp-pointed Leaves, ſet oppoſite at a Joint, without Foot-ſtalks, high-vein'd underneath, thinly ſerrated about the Edges. The Flowers grow in long Spikes, on the Tops of the Stalks, ſet on Whorles, being ſmall and purpliſh, having a Galea and Labella ſo ſmall, that they are hardly perceivable; a white long Pointal ſtanding out of their Mouths. The Root creeps and ſpreads much in the Earth, being long and ſlender. The Leaves, Stalks, and Flowers, have a pleaſant agreeable Smell: It is planted in Gardens; and flowers in *July*; dying every Year. The whole Herb is uſed.

Mint is an Herb of great Uſe in all Diſorders of the Stomach, as Weakneſs, Squeamiſhneſs, Loſs of Appetite, Pain, Hiccough, and Vomiting: It is, likewiſe, accounted good to ſtop a Gonorrhœa, the Fluor Albus, and the immoderate Flux of the Menſes. A Cataplaſm of the green Leaves, applied to the Stomach, ſtays Vomiting; and, to Womens Breaſts, prevents the Hardneſs and Curdling of the Milk. *Parkinſon* commends a Decoction of Mint, to waſh the Hands of Children, who are broken out with Scabs and Botches.

Officinal Preparations of Mint are a ſimple Water and Spirit, a compound Syrup, and a diſtilled Oil. *Miller's Bot. Off.*

The Leaves of Mint put into Milk prevent its Coagulation, ſo that no Cheeſe can be prepared of it; they will not even ſuffer Milk to coagulate in the Stomach: For, which Reaſon, ſays *C. Hoffman*, it ought to be in frequent Uſe with thoſe who feed much on Milk, or have no other Food. Here *Ray* takes Occaſion to make the following Reflection: "Milk, *ſays he*, received "into the Stomach, if that be rightly diſpoſed, muſt, according "to the Order of Nature, coagulate; and, therefore, where the "Stomach is ſound, and in due Order, there is no Neceſſity of "ſearching out Remedies for preventing Coagulation, but, only, "for the due Regulation of it, where the Stomach is infirm, or "abounds too much with an Acid; for though Milk, at its firſt "Reception into the Stomach, be coagulated, yet this Coagulum "is again diſſolved before it deſcends into the Inteſtines, which "is not ſo eaſily effected, if the Subſtance be hard and denſe be-"yond a due Degree."

The Juice of this Herb, and its diſtilled Water, are frequently uſed, in order to ſtop Vomitings: Thus, according to *Hartman*, two Ounces of this Water, drank once or twice, ſtop the moſt violent Vomitings.

This ſame diſtilled Water is much uſed by Nurſes, in order to remove thoſe Gripes with which Infants are ſo frequently ſeized. According to *Turner*, the Smell of Mint corroborates the Brain, and not only preſerves, but, alſo, increaſes, the Memory.

Authors ſeem to contradict each other, with reſpect to the Virtues of this Plant; ſince ſome affirm, that it proves a Stimulus to Venery; whilſt others maintain, that it prevents Venereal Dreams, and nocturnal Pollutions.

In *England* it is cuſtomary to boil Mint with Beans and Peas, in order to correct their flatulent Quality.

Of dry Mint, with an Addition of an equal Quantity of Rue, and a ſmall Portion of Canary-ſeeds, duly boiled in Vinegar of Ale, is prepared a Cataplaſm, which, firſt, ſurpriſingly reſolves Milk coagulated in the Breaſts, and, then, totally prevents the Generation of any for the future. This Cataplaſm is ſucceſsfully and promiſcuouſly uſed by Women in Child-bed.

Want of Appetite is excellently removed by an Elixir of Mint, prepared by Infuſion with ſome proper Spirit, and the Addition of a ſmall Quantity of Sugar. *D. Hulſe*, from *Etmuller. Raii Hiſt. Plant.*

Mint abounds in a ſubtle and ſedative comforting Oil, which is highly friendly to the Nerves. But its Power of corroborating the Tone of the Stomach and Inteſtines is not only owing to this Oil, but, alſo, to a ſubaſtringent earthly Principle: For which Reaſon this Herb, either in Subſtance, or infuſed in Water, Wine, or Brandy, is highly beneficial, whether uſed internally, or externally, in ſtopping Hiccoughs, Vomitings, immoderate Fluxes, and Colics. I cannot forbear recommending Mint-water, whether prepared with Wine or Water, to the Uſe of all Families. After the previous Uſe of Purgatives, I have known inveterate Gonorrhœas, and a Fluor albus, happily removed, only by means of ſpirituous Mint-water, exhibited in due Quantities. *F. Hoffman de Præſt. Remed. Domeſt.*

7. Mentha; anguſtifolia; ſpicata; magis ſerrata. *Mentha quarta.* Dod. p. 95.

8. Mentha; latifolia; ſpicata; magis ſerrata.

9. Mentha; arvenſis; verticillata hirſuta. See CALAMINTHA PALUSTRIS.

10. Mentha; arvenſis; verticillata; folio rotundiore; odore aromatico. *D. Vernon. Raii Syn.* 123.

11. Mentha; hortenſis; verticillata; Ocymi odore. *C. B. P.* 227. *Boerh. Ind. alt.* 185. *Mentha fuſca.* Offic. *Mentha fuſca ſive vulgaris.* Park. Theat. 31. Raii Synop. 3. 232. *Mentha Cardiaca.* Ger. 553. Emac. 680. *Mentha verticillata minor acuta, non criſpa, odore Ocymi.* J. B. 3. 216. RED MINT.

This Plant is produced in Gardens, and watery Places; and agrees in Virtues with the other Species of Mint. *Dale.*

12. Mentha; rotundifolia; paluſtris; ſeu aquatica major. *C. B. P.* 227. *Tourn. Inſt.* 189. *Boerh. Ind. alt.* 185. *Mentha aquatica, Siſymbrium.* Offic. *Mentha aquatica rubra.* Park. Theat. 1243. *Mentha aquatica ſive Siſymbrium.* J. B. 3. 223. Ger. Emac. 684. Raii Hiſt. 1. 533. Synop. 3. 233. *Mentha aquatica.* Ger. 555. WATER-MINT.

This Mint has ſquare, hairy, brown Stalks, about a Foot high, or more, with two pretty large Leaves at a Joint, ſet on ſhort Foot-ſtalks, broad at the Baſis, and narrower toward the End; ſerrated about the Edges; of a very ſtrong Smell, ſomewhat like Penny-royal: The Flowers grow on the Tops of the Stalks, in round Spikes, with one or two of the ſame, a little lower, on the Stalks, at the Setting on of the upper Leaves: They are ſomewhat larger than common Mint, of a pale-purple Colour: The Root is ſtringy and fibrous. It grows in Ditches, and watery Places; and flowers in *July*.

Water-mint is rather hotter than Garden-mint, being carminative, expelling Wind out of the Stomach, and helping the Colic, opening Obſtructions of the Womb, and procuring the Catamenia. The Juice, dropped into the Ears, is good to eaſe their Pain, and help Deafneſs; but it is not much uſed. *Miller's Bot. Off.*

The Leaves of this Plant are acrid, bitter, aromatic, and make but a ſlight Impreſſion upon blue Paper: It has a very aromatic, volatile, oily Salt, is very ſtomachic and diuretic, and may be uſed as Tea. *Martyn's Tournefort.*

This Plant is produced in moiſt Soils, and flowers in the Month of *July*. The Whole of it is uſed; and in Virtues agrees with the other Species of Mint.

This Plant, as we are told by Mr. *Dale*, was, by an illiterate *London* Quack, eſteemed ſo powerful a Specific againſt the Stone, that, when he had Occaſion to exhibit it for that Purpoſe, he retired to his Cloſet, and cut it ſo ſmall, that it was no eaſy Matter to diſcover what Plant it was. At laſt a ſmall Quantity of this Arcanum coming into the Hands of one Dr. *Watſon*, he ſowed it in his Garden, and the Produce revealed the Secret.

This Mint is juſtly commended againſt Pains of the Stomach: For which Reaſon the Water diſtilled from it is by ſome called Colic-water. *Dale.*

13. Menthaſtrum; Chalepenſe; anguſtifolium; rarò florens. *Boerh. Ind. alt. Plant.*

The two firſt Species are eſteemed the moſt beautiful of all the others, and have both the Taſte and Smell of Penny-royal; for which Reaſon they may be uſed as a Succedaneum to it. The twelfth Species is commended for its acrid, balſamic, and aromatic Quality; is of an heating Nature, and highly extolled for the happy Effects it produces on the Stomach. *Sydenham* informs us, that he cured Hiccoughs and Vomitings by giving every Hour an Ounce of Mint-water, cold: It is beneficial to Patients afflicted with atrabiliarons and hyſteric Diſorders. In bloody Dyſenteries, the Herb bruiſed, and applied to the Abdomen, is a ſovereign Remedy; but is ſaid to deſtroy that Power to which we give the Name of Virility: But I know not why Authors have aſſerted this; ſince I am rather of the contrary Opinion. It is carminative, and excites copious Eructations, as *Martial* tells us,

Nec deeſt ructatrix Mentha, nec Herba ſalax.

It cures all Diſorders of the Stomach, and Iliac Pains, when proceeding from a cold Cauſe. It is beneficial in the Scurvy; provokes Urine, and the Menſes. The Herb boiled with Whey, and applied externally to the Face, ſolicits eryſipelatous Swellings, and Inflammations of the Fauces, to the Surface; and, by that means, relieves the internal Parts. A few Drops of the Spirit of Mint, exhibited in *Spaniſh* Wine, prove an excellent Medicine againſt Diſorders of the Stomach. Externally, the Leaves, or the Spirit mixed with *Rheniſh* Wine, are applied to the Abdomen, in order to ſtop Vomiting. Of the tender Tops an excellent Conſerve is prepared; as, alſo, a Spirit, which exceeds all other Carminatives, and is an excellent Cordial; and an Oil, of which an Elæoſaccharum and Balſam are made, which are highly beneficial againſt Convulſions proceeding from a cold Cauſe; and are excellent for the Cure of Contuſions and Wounds. This Plant, alſo, kills Worms. *Hiſt. Plant. Boerh. adſcript.*

Beſides the foregoing Species of Mentha, *Dale* mentions the four following; which are,

1. MENTASTRUM. Offic. Ger. Emac. 684. *Mentaſtrum ſpicatum folio longiore tendicante.* J. B. 3. 221. Raii Hiſt. 1. 532. Synop. 3. 234. *Mentha ſylveſtris folio longiore.* C. B. P. 227. Tourn. Inſt. 189. HORSE-MINT.

This wild Mint grows not ſo tall as the garden Mint, nor ſo much branched, having ſquare, hoary Stalks, with two long ſharp-pointed Leaves, hoary likewiſe, eſpecially underneath, and ſerrated about the Edges, without any Foot-ſtalks. The Flowers grow at the Ends of the Stalks, in long, narrow Spikes, being ſmall and purple. The whole Plant has a ſtrong, but not unpleaſant Smell.

Horſe-mint is much of the Nature of Water-mint beforementioned, and is good for the Wind and Colic of the Stomach, to procure the Menſes, and expel the Birth and Secundines, being an Ingredient in the Troches of Myrrh, much uſed in theſe Caſes. *Miller's Bot. Off.*

2. MENTHA SYLVESTRIS. Offic. *Mentha ſylveſtris rotundiore folio.* C. B. P. 227. Tourn. Inſt. 189. *Mentaſtrum.* Ger. Emac. 683. *Mentaſtrum folio rugoſo rotundiore, ſpontaneum flore ſpicato, odore gravi.* J. B. 3. 219. Raii Hiſt. 1. 532. Synop. 3. 234. ROUND-LEAVED HORSE-MINT.

This Species is produced in watery Soils. The Whole of it is uſed, and, according to *Chomel*, is good againſt Diſorders of the Stomach, and thoſe of the hyſteric Kind. *Dale.*

3. MENTHA PIPERIS SAPORE. Offic. *Mentha ſpicis brevibus & habitioribus, foliis Menthæ fuſcæ ſapore fervido Piperis.* Raii Synop. 3. 134. *Mentha Paluſtris ſpicis brevioribus & habitioribus, foliis oblongis, ſapore Piperis.* Raii Hiſt. 3. 284. PEPPER-MINT.

The Leaves of this Mint are broader, and ſomething ſhorter, than thoſe of Spear-mint, growing on Foot-ſtalks half an Inch long, ſharply ſerrated about the Edges. The Stalks are ſquare, about two Feet high. The Flowers are numerous, and grow in looſe oblong Spikes on the Tops of the Branches; they are bigger than thoſe of Spear-mint, but of the ſame Colour, and more thickly ſet. Both Leaves and Flowers have a pleaſing Scent, and an hot biting Taſte, like Pepper. The Root is ſlender and creeping; it grows in ſeveral Places, both in *Eſſex* and *Hertfordſhire.*

This Mint is eſteemed, by ſome, to be an excellent Remedy againſt the Stone and Gravel; which ſeems to be very probable, for, beſides its hot and biting, it has, alſo, a very diſcernible nitrous Taſte. *Miller's Bot. Off.*

4. AURICULARIA. Offic. *Auricularia Indorum ad ſurditatem efficax,* EARWORT, *vulgo* MARLOW *Mentaſtrum minus.* Ger. Emac. 685. *Mentaſtrum hirſutum.* Park. Theat. 34. *Mentaſtri aquatici genus hirſutum ſpica latiore.* J. B. 3. 222. Raii Hiſt. 1. 533. Synop. 3. 234. *Mentha paluſtris folio oblongo.* C. B. P. Tourn. Inſt. 189. CYLONIAN PLANT.

Doctor *Marlow*, in his Obſervations, mentions a Plant under the Name of *Planta Zeylanica*, without any other Deſcription or Characteriſtic, whereby it may be known, and its Uſes derived down to Poſterity. Hence 'tis diſputed, among Botaniſts, what Species of Plant this may poſſibly be; and though the whole of them agree, that it is a Species of Mint, yet what that particular Species is, remains ſtill dubious. Doctor *Pluckenet* is of Opinion, that it is a kind of Mint, growing in *Maryland*, which he takes notice of in his *Mantiſſa*. But Dr. *Sloane* is of Opinion, that it is a certain Species of Water-mint. Nor is this Conjecture improbable, becauſe in ſome ſmall Portions of this Plant, ſhewn me by Mr. *Finch*, an Apothecary, in *London*, and Succeſſor to Dr. *Marlow*, I perceived an exquiſite Smell of Water-mint; and Mr. *Finch* affirmed to me, that this Plant was produced in *England*, notwithſtanding the exotic Name given it by Dr. *Marlow*. *Dale. Pharmac.*

MENTHA AQUATICA. A Name for ſeveral Sorts of PULEGIUM; which ſee.

MENTHA CATARIA. A Name for ſeveral Sorts of CATARIA; which ſee.

MENTHA CORYMBIFERA. See BALSAMITA.

MENTHA FELINA. A Name for the Cataria; major; vulgaris.

MENTHASTRUM. See MENTHA.

MENTULAGRA. A Diſorder of the *Penis*, induced by a Contraction or Convulſion of the *Erectores Muſculi*, and inducing Impotence. *Caſtellus.*

MENTUM. The Chin.

MENYANTHES.

The Characters are;

The Root is perennial, and creeping; the Leaves reſemble thoſe of the Bean in Form and Size, three of them growing upon one Pedicle; the End of the Pedicle becomes a monopetalous, quinquefid, and expanded Calyx; the Flower is Funnel-ſhap'd, and deeply cut into Segments; the Inſides of which are elegantly fimbriated with white Cirrhi, and they are collected into a *Thyrſus:* The Fruit is oblong, bivalvular, unicapſular, furniſhed with a long Tube, and rough Apex, and full of round Seeds lying in the Bottom of the Calyx.

Boerhaave mentions two Species of this Plant; which are,

1. Menyanthes; paluſtre; latifolium, triphyllon. *Tourn. Inſt.* 117. *Boerh. Ind. A.* 205. *Raii Synop.* 3. 285. *Trifolium paluſtre, paludoſum.* Offic. *Trifolium paluſtre.* J. B. 2. 389. C. B. P. 327. Raii Hiſt. 2. 1099. *Trifolium paludoſum.* Ger. 1024. Emac. 1194. Park. Theat. 1212. *Trifolium fibrinum.* Offic. *Acopa Dioſcoridis.* Hiſt. Oxon. 3. 604. BUCK-BEAN, or MARSH-TREFOIL.

Marſh-trefoil has ſmooth round Stalks, three or four Inches long, on which grow three longiſh, round Leaves, ſomewhat reſembling the Leaves of Beans; among theſe ariſe Stalks about two Feet high, bare of Leaves, and bearing on the Top a Spike of whitiſh-purple Flowers, of one Leaf divided into five Segments, whoſe Inſide is covered with a curled Downineſs, having five whitiſh Chives in the Middle, all ſet in five-cornered Calyces. The Seed is ſmall and brown, growing in roundiſh Seed-veſſels; the Root is long and jointed, with many whitiſh Fibres at each Joint. It grows in marſhy, boggy Grounds, and flowers in *May* and *June*. The Leaves are uſed.

This is reckoned a great Antiſcorbutic, and very ſerviceable for the Gout, Rheumatiſm, and Dropſy, and is much uſed in Diet-drinks for thoſe Diſtempers. It is likewiſe a good Stomachic, and is made uſe of againſt intermitting Fevers. *Miller's Bot. Off.*

Being analyſed, beſide ſome acid Liquors, it yields ſome concreted, volatile Salt, and a good deal of Earth and Oil. It contains ſome Sal Ammoniac, wrapped up in Sulphur, and terreſtrial Parts; ſo that it is good for the Scurvy, Gout, Cachexy, and Dropſy. In a Fit of the Gout, give the Patient, every four Hours, a Glaſs of the Decoction of this Plant. *Martyn's Tourn.*

Simon Paulli commends it greatly in ſcorbutic Caſes, and ſays 'tis more ſubtle and penetrating than the *Naſturtium. Bartholine*, alſo, juſt mentions it. It ſeems, at this time, to be coming into great Repute in many chronical Diſtempers. Many uſe it in their Families in the Form of Tea; and experience its conſtant Uſe to be very effectual againſt Scrophulas, the King's-evil, and all obſtinate ſcorbutic Diſtempers. Its Taſte, at firſt Uſe, is not very grateful, being ſomewhat of a nauſeous Bitter; but Time wears off that Diſlike.

2. Menyanthes; paluſtre; anguſtifolium; triphyllon. *T.* 117. *Trifolium, paluſtre, minus, acutiori folio.* C. B. P. 327. *Boerh. Ind. alt. Plant.*

MENTZELIA.

The Characters are;

It hath a Roſe-ſhaped Flower, conſiſting of ſeveral Leaves, which are placed in a circular Order, and reſt on the Flower-cup, which afterwards becomes a membranaceous tubulous Fruit, containing many ſmall Seeds.

Miller mentions but one Sort of this Plant; which is,

Mentzelia foliis & fructibus aſperis. *Plum. Nov. Gen.*

The Name was given to this Plant by Father *Plumier*, who diſcovered it in the *French* Settlements, in Honour to Dr. *Mentzelius*, who was Phyſician to the Elector of *Brandenburgh*, and who publiſhed an Index of Plants in *Latin*, *Greek*, and *High Dutch.*

This Plant grows plentifully in the Iſland of *Jamaica*, but I know of no medicinal Virtue aſcribed to it.

MEPHITIS. A poiſonous Exhalation; or what the Miners call a Damp. Dr. *Mead*, ſpeaking of Mephitical Exhalations, ſays, that it is notorious, that People may be poiſoned by venommous Steams, and Exhalations, or a poiſonous Air, taken into the Body by the Breath.

And Authors, upon many Occaſions, make mention of it; but, when they come to explain the particular Manner how this kills, they moſt commonly reduce it to ſome of the Poiſons which prove deſtructive, by being admitted into the Stomach, alleging, that malignant Fumes and Airs are, therefore, fatal, becauſe impregnated with Arſenical, Mercurial, and the like deleterious *μιάσματα*, or Particles, that convey theſe into the Blood; which, being of a very corroſive Nature, muſt neceſſarily do Hurt both to the fluid and ſolid Parts.

And indeed, that the Fumes of theſe ſame Minerals are very pernicious, and Air filled with their Atoms very unfit for Reſpiration, is moſt certain: But to argue from hence, that all deadly Vapours, and malignant Airs, owe their Miſchief to theſe only, is too fond and ill-grounded a Conceit; ſince, upon a due Inquiry, it will appear, that there may be, and are, mortiferous Exhalations from the Earth, infecting the Air, of a Nature ſo different from any of thoſe Poiſons, that the very Subſtance, from which they ariſe, may not be at all hurtful, though taken into the Stomach itſelf.

Venomous Steams and Damps from the Earth, the *Latins*, in one Word, called *Mephitis.*

This, as many other *Tuſcan* Words, comes from a *Syriac* Theme, which ſignifies to blow or breathe.

And in antient Times ſeveral Places were notorious for them: So the *Mephitis* of *Hierapolis* was very famous, of which *Cicero*, *Galen*, but more particularly, and from his own Sight and Knowledge, *Strabo* makes mention.

Such another was the *Specus Corycius* in *Cilicia*, which upon the Account of its ſtinking deadly Air, ſuch as is thought to proceed from the Mouth of Dragons, which the Poets give to *Typhon*, was called *Cubile Typhonis.* This *Pomponius Mela* deſcribes, and it is, indeed, as antient as *Homer*; for *Arima*, in which he places it, was, as *Euſtathius* ſays, a Mountain of *Cilicia.*

Neither

Neither are ſuch Fumes as theſe infrequent now-a-days; and though moſtly taken notice of in Mines, Pits, and other ſubterraneous Places, yet they are ſometimes met with on the Surface of the Earth too, eſpecially in Countries fruitful of Minerals, or impregnated with imbowelled Fires: Such are *Hungary* and *Italy*, which latter, as *Seneca* obſerves, has always been, more than any, remarkable for them.

I ſhall therefore, having had the Opportunity of making ſome Remarks upon one of the moſt famous in all theſe Parts, give as good an Account as I can of that, and its manner of killing; which though I dare not affirm to be univerſally applicable to any *Mephitis* whatſoever, yet ſeems plainly to be the Caſe of moſt of them; and where it is not, this ſimple Miſchief will only be found to be complicated with another; and then ſome extraordinary Symptoms or Appearances in the Animals killed will eaſily make a Diſcovery of the additional Venom and Malignity.

This celebrated *Mofeta*, taken notice of, or at leaſt ſome other hereabouts, even in the Time of *Pliny*, is about two Miles diſtant from *Naples*, juſt by the *Lago d'Agnano*, in the Way to *Pozzoli* or *Puteoli*; and is commonly called *La Grotta de Cani*, becauſe the Experiment of its deadly Nature is frequently made upon Dogs; though it be as certainly fatal to any other Animal, if it come within the Reach of its Vapour; for *Charles* the Eighth of *France* proved it ſo upon an Aſs; and two Slaves put into it, by Order of *D. Pietro di Toledo*, Viceroy of *Naples*, with their Heads held down to the Earth, were both killed.

'Tis a ſmall Grotta, at the Foot of a little Hill, about eight Feet high, twelve long, and ſix broad; from the Ground ariſes a thin, ſubtle, warm Fume, viſible enough to a diſcerning Eye, which does not ſpring up in little Parcels here-and-there, but is one continued Steam, covering the whole Surface of the Bottom of the Cave; and has this remarkable Difference from common Vapours, that it does not, like Smoke, diſperſe itſelf into the Air, but quickly after its Riſe falls back again, and returns to the Earth; the Colour of the Sides of the Grotta being the Meaſure of its Aſcent; for, ſo far, it is of a darkiſh-green; but, higher, only common Earth, and this is above ten Inches. And, therefore, as myſelf found no Inconvenience by ſtanding in it, ſo no Animal, if its Head be kept above this Mark, is in the leaſt injured: But when (as the manner is) a Dog, or any other Creature, is forcibly held below it, or by reaſon of its Smalneſs can't hold his Head above it, it preſently, like one ſtunn'd, loſes all Motion, falls down as dead, or in a Swoon, the Limbs convulſed, and trembling, till, at laſt, no more Sign of Life appears than a very weak, and almoſt inſenſible Beating of the Heart and Arteries, which, if the Animal be left there a little longer, quickly ceaſes too, and then the Caſe is irrecoverable; but if ſnatched out, and laid in the open Air, ſoon comes to Life again; and ſooner, if thrown into the adjacent Lake.

In this ſhort, but accurate Hiſtory of the *Grotta de Cani*, I have ſet down thoſe Particulars, which do not only diſtinguiſh Mephitical Exhalations from common and innocent Fumes, but, alſo, give Hints ſufficient, I think, mechanically to determine the Reaſon and Manner of their ſurpriſing Effects.

And, not to ſpend Time in refuting the Opinions of others, I ſhall only take notice, that here can be no Suſpicion of any true Venom, or real Poiſon: If there was, it were impoſſible, that Animals taken out of the Grotta, ſhould ſo immediately recover the Effects of it, without any remaining Appearance of Faintneſs and Sickneſs, or ſuch-like Symptoms as thoſe ſuffer, who have been breathing in an Air impregnated with malignant corroſive Effluvia; beſides that the venomous Corpuſcles would certainly, in ſome degree, at leaſt, infect the Air in the upper Part of the Cave, which continues pure, and fit for Reſpiration. Neither, indeed, after what manner ſoever this Poiſon be imagined to act, whether by diſſolving or coagulating the Blood, could its Efficacy be ſo ſudden and momentaneous, without ſome Marks of it in the Creatures kill'd, when opened, which yet diſcover nothing of this Nature extraordinary, neither in theſe, nor in the ſolid Parts.

In order, therefore, to underſtand wherein this deadly Quality conſiſts; I ſay, in the firſt Place, that Life, ſo far as it reſpects the Body, is, in one Word, the Circulation of the Blood; that is, its Motion in conical, diſtractile Veſſels, from the Heart to the extreme Parts, and its Return to the Heart again, by the ſame Canals inverted; for 'tis upon this that all animal Functions, all Senſe and Motion, voluntary and involuntary, depend; ſo that the Regularity of this Courſe is the Meaſure of Health, or the moſt perfect Life, as its various Irregularities are the Occaſions of Sickneſs and Diſeaſes, or a beginning Death.

Now all the animal Operations and Offices which proceed from this Circulation, are the Effects of ſeveral Secretions of Liquors of very different Natures, out of the ſame fluid Maſs: It was, therefore, abſolutely neceſſary, that the Blood, before it be diſtributed to the Organs, ſhould be ſo comminuted and broken, as that no Coheſion of its Parts ſhould hinder the Separation of the Juices from it, when it arrives with a determinate Force at the Orifices of the ſecretory Veſſels.

This Work is done in its Paſſage through the Lungs, by the repeated Compreſſion of the Air in thoſe Bladders upon the Arteries with wonderful Contrivance diſperſed among them. Herein lies the Uſe and Neceſſity of Reſpiration; and the ſudden Miſchief of ſtopping it, in that the whole Maſs of Blood being to paſs this Way, upon a Check here, there preſently enſues a Stagnation, that is, a Ceſſation of all animal Functions, or Death; which will be more ſpeedy, if not only no Air is inſpired, but a Fluid of a quite different Nature from it ſucceeds in its Place.

Wherefore it muſt be obſerved, that this good Effect of the Air is performed by its Elaſticity; and that no Fluid whatſoever, that we know beſides, is elaſtic, at leaſt to any conſiderable Degree, that is, has a Faculty of expanding and dilating itſelf when compreſſed; no, not Water, as near as that is thought to approach to Air in its Nature.

And, as to the preſent Caſe, I took notice before, that this Vapour is one continued and uninterrupted Steam; and that, quickly after its Riſe, it falls down again; that is, that it has little or no Mixture of Air with it, or no Elaſticity; and is, on the other hand, very heavy, when forſaken by the Force of Heat, that drove it upwards.

So that I make no Queſtion, but that Animals in this Place, inſtead of Air, inſpire mineral Fumes, that is, a thin watery Vapour, impregnated with ſuch Particles as do, when united together, compoſe ſolid and heavy Maſſes; which is ſo far from helping the Courſe of the Blood through the Lungs, that it rather expels the Air out of the Veſiculæ, and ſtraightens the Paſſage of the Blood-veſſels, by its too great Gravity; whereupon the Bladders are relaxed, and ſubſide, and the Circulation is immediately interrupted. But if the Animal be, in time, removed out of this Steam, that ſmall Portion of Air, which does, after every Expiration, remain in the Veſicle, may be powerful enough to drive out this noxious Fluid; eſpecially if the Head of the Creature be held downwards, that ſo its Gravity may forward its Expulſion; or it be thrown into Water, which by aſſiſting, upon the Account of its Coldneſs, the Contraction o the Fibres, promotes the retarded Circulation of the Blood; as we every Day experience in a *Deliquium Animi*, or ſwooning Fit.

Though, if this Stagnation continue too long, no Art can renew Life, no more than in one perfectly ſtrangled, nor will the Lake of *Agnano* itſelf be of any Service; which ſhews that there is no ſingular Virtue in that Water beyond any other; nor is it, as ſome have fondly imagined, a peculiar Antidote to the Poiſon of the *Grotta*.

The bad Effects of ſuch Fumes as this will be the more certain, becauſe the inſpired mineral Particles twitch and irritate the Membranes, which are hereupon contracted to that Degree, as not to be able to recover their Tone; and ſo the Force and Action of the Lungs is quite loſt.

It appears from all this not to be at all neceſſary to make any farther Inquiry into the particular Nature of theſe mineral Particles, ſince they do, in this Caſe, act chiefly by their Gravity, which is common to them all: Though, indeed, the greeniſh Colour of the Earth, together with its ſubacid Taſte, very much (as *L. di Capoa* obſerves) like to that of the Phlegm of Vitriol, ſeem to declare them, if not altogether, yet principally, at leaſt, to be vitriolic.

To conclude this Part of our Diſcourſe; I think it a ſufficient Confirmation of this Reaſoning, that in Frogs, killed in this Grotta, the Bladders of the Lungs (more viſible in theſe Creatures than in moſt others) were found ſubſided, and quite empty of Air. But, if any one deſires a further Proof, he may, according to theſe Principles, make (as *Lionardo di Capoa* did) an artificial *Mephitis*; for if Antimony, Biſmuth, or any other ſuch Mineral, be finely powdered, and moiſtened with Aqua-fortis, or Spirit of Nitre, there will ariſe a great Heat, and a thick, dark Smoke, in which, as in the *Grotta di Cani*, Torches are extinguiſhed, and Animals, though but ſlowly, ſtifled and killed. And this Effect will be more ſenſible, and equal to the moſt violent Mephites, if the Antimony or Marcaſite be mixed with Bitumen, and the Spirit of Nitre, or Aqua-fortis, intirely depurated from all its Phlegm.

Thus I have ſhewn how Death may enter at the Noſtrils, though nothing properly venomous be inſpired. It were, perhaps, no difficult Matter, to make it appear, how a leſſer Degree of this Miſchief may produce Effects, though ſeemingly different from theſe now mentioned, yet in Reality of the ſame pernicious Nature; I mean, how ſuch an Alteration of the common Air, as renders it in a manner mephitical, that is, increaſes its Gravity, and leſſens its Elaſticity, (which is done by too much Heat, and at the ſame time too great a Proportion of watery and other groſſer Particles mixed with it) may be the Cauſe of epidemic Diſeaſes, and, it may be, more eſpecially of thoſe, which, by reaſon of their untoward Symptoms, are uſually called malignant.

For it is very remarkable, that *Hippocrates* obſerved the Conſtitution of the Air, which preceded peſtilential Fevers, to be great Heats, attended with much Rain, and Southern Winds;

and *Galen* takes notice, that no other than a moiſt and hot Temperament of the Air brings the Plague itſelf; and the Duration of this Conſtitution is the Meaſure of the Violence of the Peſtilence. *Lucretius* is of the ſame Mind; for, in his admirable Deſcription of the Plague of *Athens*, *Theſe Diſeaſes*, ſays he, *either come from the Air, or ariſe from the Earth.*

——Ubi *Putrorem humida* nacta eſt
Intempeſtivis *Pluviiſque*, & *Solibus* icta.

In ſhort, the general Hiſtories of epidemic Diſtempers almoſt conſtantly confirm thus much, and would have done it more, if the vain Notion of occult Venoms had not prepoſſeſſed the Minds of Authors, and made them regardleſs of the manifeſt Cauſes.

This is notorious enough in thoſe Countries where malignant Diſeaſes are moſt rife: Thus it is a very common Obſervation in the *Eaſt Indies*, that during the dry Heats the Seaſon is healthful; but, when the Rains fall, immediately upon the hot Weather, then untoward Fevers begin to threaten.

The ſame is obſerved in *Africa*; for, (as *Joan. Leo* relates) if Showers fall there during the ſultry Heats of *July* and *Auguſt*, the Plague and peſtilential Fevers enſue thereupon, with which whoſoever is infected hardly eſcapes.

And here I might, by reflecting on the Uſe and Neceſſity of Reſpiration, and the particular Manner of performing it, (of which I have hinted ſomething already) and conſidering withal the true Nature of Fevers, eaſily ſhew how ſuch a Conſtitution of the Air, as this is, muſt neceſſarily produce ſuch Effects; might run over the Propoſitions of *Bellini*, which, as they plainly evince malignant and peſtilential Fevers to be owing to a viſcid and tenacious Lentor, or Slime, which firſt obſtructs the capillary Arteries, and, afterwards, being diſſolved by Heat, ferments with the Blood, and changes it into a Maſs unequally fluid and glutinous, and, therefore, unfit for all the Operations of the animal Oeconomy; ſo it would be no uneaſy Task to prove, that Air, at the ſame time hot and moiſt, being leſs able to comminute and break the arterial Fluid in the Lungs, than is neceſſary, in order to prepare it for Secretions; it is no Wonder, if, when the Blood, paſſing through the capillary Veſſels, arrives at the ſecretory Organs, the Coheſion of its Parts not being ſufficiently removed, inſtead of deriving ſeveral Juices out of it into the Glands, it leaves its moſt glutinous and viſcid Parts ſticking about the Orifices of theſe Veſſels; which, though they may, at firſt be waſhed away by the repeated Impulſes of the ſucceeding Blood, yet, the Cauſe continuing, and theſe Strokes growing ſtill weaker and weaker, (from a leſſer Quantity of Spirits being ſeparated, and hence a more languid Contraction of the Heart) theſe Obſtructions are increaſed to that Degree as not to be removed, till, by the violent Agitation of a greater Heat, this ſlimy Mucus is thrown into the Blood again; and there, in the Nature of a Ferment, ſo diſturbs its Mixture, and changes its Compages, as to make it a Fluid of quite different Properties, that is, altogether unfit for the ſame Functions or Offices.

This Effect will be the more certain, becauſe a damp Air upon the Surface of the Body checks inſenſible Perſpiration, ſo that a great Quantity of this being detained, the Obſtructions are ſtill greater in the ſmall Tubes; whereas, indeed, upon the account of a more than ordinary Heat, this Diſcharge ought to be in an increaſed Proportion.

Such a Diſpoſition of the Blood as this the Antients called putrid; and, to ſpeak plainly, it is a beginning Stagnation, with a ſucceeding Heat and Fermentation.

Nor would it be amiſs here to take notice, how unjuſtly ſome Authors have quitted the Conſideration of plain Cauſes, for occult Venoms, and *Deleterium quid*; have brought in the θεῖον τὶ (*ſomething divine*) of *Hippocrates*, to favour their fond Hypotheſis; though his beſt Interpreter, *Galen*, underſtood by this Expreſſion no ſuch thing as they mean; but, on the other hand, only the manifeſt Conſtitution of the ambient Air, ſuch as himſelf has deſcribed in his Aphoriſms, and which is exactly the ſame with what we have been diſcourſing of.

And, therefore, not only does *Minodorus* rightly remark, that, in his whole *Epidemics*, *Hippocrates* never once mentions any Venom or Poiſon as the Cauſe of malignant Diſeaſes, but the divine old Man himſelf, in another Treatiſe, expreſly teaches us, that all Maladies equally, or one as much as another, proceed from the Gods, there being nothing more divine in this than in that, each acknowledging its own natural and manifeſt Cauſe.

But I willingly wave inſiſting upon theſe Heads, as well as the Hints which might be taken from this Theory, of ſome Uſe, perhaps, in the Cure of theſe Diſtempers; and leave to our Phyſicians to judge upon how good Grounds they do, in Caſes of this Nature, under the Notion of Alexipharmics, give ſuch Medicines as raiſe a great Heat, both in the Stomach and Blood; only praying them to take care, leſt, while they are engaging the animal Spirits in War with Malignities, they ſend treacherous Anxiliaries to the ſuppoſed weak Party; that is, that they either raiſe new Tumults and Diſorders, of worſe Conſequence than the original Miſchief; or, at leaſt, by clogging the Wheels, and throwing Duſt upon the Springs, of the firſt Machine in the Creation, check and interrupt the Action of Nature, when it is employed about the moſt nice and critical Work.

Neither can I, though an Occaſion be fairly offer'd, by any means be induced to intermeddle in the Controverſy of thoſe Gentlemen, who, by the Help of two Words, are made Maſters both of Philoſophy and Phyſic; I mean the violent Aſſertors of *Acid* and *Alcali*: Theſe ſcanty Principles fall infinitely ſhort of that vaſt Variety there is in the Works of Nature; however, for their ſakes who are as yet advanced no farther, I will adviſe the contending Parties (becauſe little Good is got by quarrelling) to think of an Union; and, if they can find no Remedies but out of theſe two Tribes, to make uſe of ſuch as reſult from a prudent Mixture of each; if this Project does not take, to reſolve, however, on both Sides, to diſtinguiſh the different Times of the ſame Diſeaſe, and know, that as, on the one hand, acid Medicines are often as certainly hurtful in the latter End, as they do Service in the Beginning, of the Fever; ſo, on the other, thoſe which are alcalious muſt neceſſarily, for the ſame Reaſon, do Miſchief in the firſt Periods, for which they are profitable, in the laſt Days of the Diſtemper.

By what Mechaniſm this comes to paſs, they will eaſily underſtand, when they have learned what Alteration ſuch things as theſe are, make in the human Body; nor will it then be a difficult matter to convince them, that he is equally a fond Slave to an Hypotheſis, who, becauſe Acids are ſometimes of great Service in Fevers, concludes, that their Origin is alcalious, as he, who, knowing that ſtagnating and fermenting Juices do eaſily turn to Acidity, from thence argues, that Alcalies are the only Cure of this Stagnation and Ferment.

But Dr. *Pitcairn* has abundantly demonſtrated the Weakneſs of theſe Mens Reaſonings, and the Vanity of ſuch immechanical Theories.

And here I would put a Period to this Part of the Diſcourſe, were it not that theſe Diſtempers being ſometimes contagious, and Contagion being juſtly reputed a real Poiſon, it may be worth while to examine what this is, and wherein it conſiſts; more eſpecially, becauſe ſome may, perhaps, be ready to think this to be an Argument of an occult Venom being the firſt and original Cauſe.

We are, therefore, to take notice, that when a Fever is communicated by way of Infection from one already diſeaſed, this moſt commonly happens in the latter End of the Diſtemper, that is, when the fermenting Blood is throwing off great Quantities of its active fermentative Particles upon the Glands of the moſt conſtant and eaſy Secretion; ſuch are thoſe in the Surface of the Body, and the Mouth and Stomach: By theſe means, therefore, the Liquid of inſenſible Perſpiration, and the Swear, is impregnated with theſe μιάσματα; and thus the ambient Air becomes filled with them; ſo that not only (as *Bellini* argues) may ſome of theſe Effluvia inſinuate themſelves into the Blood of a ſound Perſon through the Pores of the outward Skin, but, alſo, in Inſpiration through the Membranes of the Lungs; for he has, in another Place, demonſtrated how the Air, or ſomething from it, may this way come to be mixed with the arterial Fluid; and thus the like Ferment will be raiſed here, as was in the originally diſtempered Subject.

This may be one, but there is, perhaps, another yet more dangerous manner of Infection, and that is, by the Breath of the Diſeaſed taken in by a By-ſtander, eſpecially in the laſt Moments, ſeizing the Stomach, and fixing a Malignity there. For it is upon this ſcore, that thoſe who are infected do preſently complain of an extreme Pain and Nauſea in the upper Orifice of the Stomach, that all Authors agree in the admirable Uſe of Vomits, timely given, in this Caſe; theſe, by their ſtimulating Force, removing the very Minera of the Diſeaſe; and, likewiſe, that often in peſtilential Illneſſes, the Stomach, when opened, has been found gangrened and mortified: This made *Van Helmont*, who had obſerved this Part in one killed by a Plague-Infection, perforated and eroded in ſeveral Places, no otherwiſe than he had ſeen in one poiſoned by Arſenic, conclude, that the Plague, for the moſt part, begins in the Stomach, from a coagulated Tartar there.

Herein lies the Difference of Contagion, from the firſt Invaſion of malignant Diſtempers: The Effects of the one are the Cauſe and Beginning of the other; and, therefore, it is no Wonder, if, though the Symptoms in the former are, by a gradual Increaſe, wrought up to their Height, they do, however, in the latter, even at the very firſt, diſcover their ill Nature and Violence, and, like a re-inforced Enemy, by ſurer Strokes, make quicker Diſpatch. And this, alſo, is the Reaſon of the great Increaſe of Funerals in Plague-time, in that one Death is thus added to another.

If it be difficult to explain the particular Manner how the Stomach comes to be thus affected, we muſt not, therefore, deny matter of Fact; and may, however, probably conjecture, that the laſt Breath of one dying of a malignant Diſtemper proves thus pernicious, in that thoſe fermenting active Particles, which, as we juſt now obſerved, the Blood diſcharges upon the Glands of the Mouth, Stomach, Lungs, *&c.* impregnating the Air in

its

its Paſſage through theſe; when the ſame happens to be immediately inſpired by a ſound Perſon, it may eaſily taint the ſalival Juices in the Mouth, which are very glutinous, and of a fermenting Nature, and, therefore, ſuſceptible enough of contagious Effluvia, but, eſpecially, of ſuch as proceed from the ſame Liquor infected in the ſick Party. Now the Spittle is continually ſwallowed down into the Stomach, and ſo will quickly impreſs its Labes, or ill Quality, on ſo tender and ſenſible a Part; that is, will lodge theſe corroſive Salts (for ſuch we may ſuppoſe the Particles of Infection) in the ſecretory Ducts: Whereupon the Glands being obſtructed, little Tumors are, by the Afflux of their Fluid, raiſed here-and-there, which, breaking, become ſmall Ulcers, and produce that diſmal Train of Symptoms, which we have already related.

And here it may not be amiſs to take notice, that all Authors agree one great Cauſe of peſtilential Diſtempers, eſpecially in Armies and Camps, to be, dead Bodies lying expoſed and rotting in the open Air; the Reaſon of which is plain, from what we have been advancing: For Battles being generally fought in the Summer-time, it is no Wonder if the Heat acting upon the unburied Carcaſes, and fermenting the Juices, draws forth thoſe active Particles, which in great Quantities filling the Atmoſphere, when they are inſpired, and let into the Stomach, do affect it after the manner already deſcribed.

To illuſtrate this Matter, I ſhall relate a remarkable Story, told me by the late Dr. *Baynard*. The Body of a Malefactor was hung up in Chains in the Country. After a few Months, in very hot Weather, it was Sport and Paſtime to ſome Boys, playing thereabouts, to ſwing the Carcaſe up and down: One, more bold than the reſt, ſtruck it with his Fiſt upon the naked Belly, which, being outwardly parched and dry, and, from the Falling down of the Humours, ſwelled and tenſe, was eaſily burſt by the Blow: Out guſhed a Water ſo corroſive and fiery, that, running down the poor Lad's Arm, it cauſed a violent Excoriation, and a very hard matter it was to preſerve it from being truly mortified. What this Serum could do upon the outward Skin, the more volatile Parts of it would, without all doubt, effect upon the more tender and ſenſible Membranes of the Stomach, if a conſiderable Number were fixed there; the Fluids of human Bodies being ranker, and more abounding in active Salts, than thoſe of other Creatures, which are not continually repaired and nouriſhed by the Juices of Animals.

The Way by which bad Food, unripe Fruits of the Earth, *&c.* produce malignant and peſtilential Diſeaſes, is not very different from that by which we have obſerved unwholſome Airs to be the Cauſe of the like Effects. For the Juices with which thoſe ſupply the Blood, being corrupted, neceſſarily make a Fluid of quite other Properties than what the animal Oeconomy requires; that is, neither fit for Nutrition, nor for the Secretion of thoſe Liquors which in the ſeveral Organs are to be derived from it; whereupon the ſmall Tubes are obſtructed by an unequally glutinous Slime: And it is, therefore, no Wonder, if, beſides the other Symptoms enſuing, ſore Puſtules, Inflammations, Ulcers, *&c.* (more common in Fevers from this Cauſe than from any other) are raiſed on the Surface of the Body.

This is the Ground of the common Obſervation, that a Famine is very often ſucceeded by a Peſtilence. And this Calamity generally begins among the poorer Sort of People, whoſe Diet, to be ſure, is the worſt.

The chief City of *Surat*, in the *Eaſt Indies*, is ſeldom or never free from the Plague; and yet it is obſerved, that the *Engliſh*, who trade there, are in no Danger of being infected by it. Now the chief of the Natives in this Place are *Banians*, who neither eat Fleſh, nor drink Wine, but live very poorly upon Herbs, Rice, Water, *&c.* and moſt of the Inhabitants do the like, except Foreigners. This poor Fare, together with the Heat of the Climate, makes them ſo liable to malignant Diſtempers; from the Attacks of which thoſe who feed well are more ſafe and ſecure.

Thus much concerning poiſonous Exhalations and Airs, ſo far as the Conſideration of the *Grotta de Cani* has led us on to inquire into their Effects; for though there may be other Alterations of this ſame Element, differing in their Nature from this we have inſiſted on, and yet equally pernicious and hurtful, yet we take no notice of any of them, in regard that thoſe which are from arſenical, mercurial, and the like Fumes, are reducible to another Species; and thoſe which proceed from a Change of the known Properties of the Air, may be eaſily explained by what has been already delivered about this. I ſhall, therefore, rather chuſe to make ſome Remarks on the Miſchief of another Fluid, which, as it is the next in Uſe to this we have been treating of, ſo the bad Qualities of it, when it comes to be alter'd, muſt neceſſarily be almoſt equally fatal and dangerous.

I mean Water, which is of ſo conſtant Service, not only for our Drinks, but, alſo, in preparing of our Fleſh and Bread, that it may juſtly be ſaid to be the Vehicle of all our Nouriſhment; ſo that whenever this happens to put on other Properties than are neceſſary to fit it for this Purpoſe, it is no Wonder if, in its Paſſage through the Body, theſe make ſuitable Impreſſions there.

Thus, at *Paris*, where the River *Seine* is ſo full of ſtony Corpuſcles, that even the Pipes, through which it is carried, are incruſted and ſtopped by them, the Inhabitants are more ſubject to the Stone in the Bladder, than in moſt other Cities. The ſame I have obſerved in the Baths of *Abano*, a few Miles from *Padua*, to that Degree, that it is neceſſary very frequently to clear the Wheel of a Mill, driven by the Current of theſe Springs, from the great Quantity of petrified Matter with which it is from time to time incumbered.

In like manner, let the groſs Particles, with which the Water is ſaturated, be of any other Nature, metallic, ſalt, *&c.* theſe, according to their various Gravity, the Capacity of the Canals, and ſuch-like Circumſtance, will, when they come to circulate in the animal Body, be, by the Laws of Motion, depoſited on one Part or other. So thoſe mineral Bodies, and nitrous Salts, which abound in the ſnowy Waters of the *Alps*, ſo certainly ſtuff and enlarge the Glands of the Throat in thoſe who drink them, that ſcarce any who live there are exempted from this Inconvenience.

For this Reaſon, the Choice of Water, for Drink, among the Antients, was by Weight; the lighteſt being preferred, as moſt free from all heterogeneous Bodies.

The Cauſe, therefore, of poiſonous Springs, is their having corroſive Corpuſcles mixed with their Water; which cannot fail, when forſaken, in the Canals of the Body, of their Vehicle, to do the ſame Miſchief as they would if taken by themſelves undiluted, only with this Difference, that they may in this Form be carried ſometimes farther into the animal Oeconomy, and ſo, having paſſed the Primæ Viæ, diſcover their Malignity in ſome of the inmoſt Receſſes. Thus the *Fons Ruber* in *Ethiopia*, mentioned by *Pliny*, about which abundance of native Minium, or Cinnabar, was found, ſhewed its ill Effects chiefly on the Brain; and therefore *Ovid* ſays of it,

> ——— *Si quivis Faucibus hauſit,*
> *Aut furit, aut patitur mirum Gravitate Soporem.*

We ſhall not need to enlarge on this Matter, ſince any of the before-mentioned mineral Poiſons may thus impart their deadly Quality to Waters; and accordingly there are Inſtances of arſenical, mercurial, *&c.* Fountains, of which the Hiſtories may be ſeen in the Collections of the learned *Baccius*, and one very remarkable in the *Philoſophical Tranſactions*, N°. 8.

But, as we before took notice concerning Airs, ſo it may be worth the while to obſerve of Waters, that there are ſome Alterations of them, which, though not properly poiſonous, yet are of ſo great Conſequence in their Effects, that they may very well deſerve to be regarded.

This I ſhall do with reſpect to a great Abuſe committed in this Kind, about the City; and that is, in the chuſing of ſtagnating impure Well-water for the Brewing of Beer, and making other Drinks. Such a Fluid, indeed, has oftentimes a greater Force and Aptneſs to extract the Tincture of Malt, than is to be had in the more innocent and ſoft Liquor of Rivers; but for this very Reaſon it ought not, unleſs upon mere Neceſſity, to be made uſe of. This Quality becomes owing to the mineral Particles, and aluminous Salts, with which it is impregnated.

A late Author, by ſearching into the firſt Accounts of the Diſtemper we call the *Scurvy*, deſcribed by *Pliny* and *Strabo*, under the promiſcuous Names of *Stomacace* and *Scelotyrbe*, and examining the authentic Hiſtories of it in later Years, made by the moſt obſerving Phyſicians in thoſe Countries where it was unhappily revived, as *Olaus Magnus*, *Balduinus*, *Ronſeus*, *J. Wierus*, *Solomon Albertus*, and others, finds that the Origin of it was in all Times and Places charged upon the Uſe of unwholſome ſtagnating Waters. Then, by comparing together the clayey Strata of the Earth about the Cities of *London*, *Paris*, and *Amſterdam*, he ſhews that where the Water is worſt, there the Malady is moſt rife: So that he has put it out of all doubt, that moſt of the perplexed and complicated Symptoms, which are ranged under this one general Name, if they do not entirely owe their Birth to the Malignity of this Element, do, however, acknowledge it to be their main and principal Cauſe.

And, indeed, *Hippocrates* himſelf, as he has very plainly decyphered this Diſeaſe, by the Title of Σπλῆνες μέγαλοι, or *Great Spleens*; ſo he does very particularly, in another Treatiſe, take notice, that drinking of ſtagnating Well-waters muſt neceſſarily induce an ill Diſpoſition both of the Spleen and Belly.

If we inquire into the Reaſon of ſuch ill Effects, we muſt conſider, that Clay is a mineral Glebe; and that the groſs Particles, and metallic Salts, with which Waters paſſing through ſuch a Bottom do abound, are, as Dr. *Liſter* obſerves, not to be maſtered; that is, indigeſtible in the human Body. Not only, therefore, will theſe cauſe, as he very well argues, calculous Concretions in the Kidneys, Bladder, and Joints, and, as *Hippocrates* experienced, hard Swellings in the Spleen; but they muſt neceſſarily, oftentimes, by their corroſive Quality, twitch and irritate the ſenſible Membranes of the Stomach and Bowels, and thus hinder and interrupt the Digeſtion of our Food. Nay, beſides all this, when they come into the Blood, it is no Wonder, if the ſmall Canals of inſenſible Perſpiration are frequently ſtopt and

obſtructed by them; for it is upon this ſcore that *Sanctorius* teaches us, that heavy Water converts the Matter of Tranſpiration into an Ichor, which, being retained, induces a Cachexy.

What Miſchiefs will enſue hereupon, every one ſees; not only Pains in the Limbs, livid Spots in the Surface of the Body, Ulcers, *&c.* from the Acrimony of the undiſcharged Moiſture; but many beſides of thoſe perplexing Symptoms which go by the Names of *hyſterical* and *hypochondriacal*, may take their Riſe from the ſame Source; for the before-cited *Sanctorius* has remarked, that the Flatus, or Wind, ſo inſeparable from thoſe Caſes, is no other than the Fluid of Perſpiration rude and unfiniſhed.

If theſe Inconveniences are oftentimes not felt, at leaſt not till towards the declining Age, in ſtrong and active Habits of Body; yet I am, from very good Experience, aſſured, that they deſerve Conſideration in weaker Conſtitutions, and a ſedentary Life, eſpecially of the more tender Sex.

I have the Honour to be nearly related to a worthy Perſon, who led formerly an afflicted Life from the frequent Returns of violent colic Pains, till ſhe was, with happy Succeſs, adviſed by the noble *Van Helmont* not to drink (as ſhe then did) Beer brewed with Well-water; and her Health is even now ſo far owing to this Management, that an Error in it is unavoidably followed with the wonted Complaints.

For theſe Reaſons *Pliny* tells us, that thoſe Waters are condemned in the firſt Place, which, when boiled, incruſtate the Sides of the Veſſels; and that our Well-waters do this, nobody, who looks into the Tea-kettles of our Gentlewomen, can be ignorant.

And, indeed, in antient Times, when Phyſic was more a Science, which is now more a Trade, as that Part of it which relates to Diet was more carefully ſtudied than it is now-a-days; ſo this Point particularly, of which we are treating, was of ſo great Moment, that *Hippocrates*, who wrote the beſt Book on the Subject that ever was publiſhed, has, in a great meaſure, accounted not only for the Diſeaſes, but even for the Temper and Diſpoſition of the People of ſeveral Countries, from the Waters with which Nature has ſupplied them. *Mead on Poiſons.*

MERCURIALIS, Mercurial. An Epithet of all Preparations of Mercury. But the *Atra Bilis* is, alſo, call'd the Mercurial Humour; and the Diſeaſes thence generated are nam'd Mercurial Diſeaſes.

MERCURIALIS.

The Characters are;

The Leaves are crenated, and grow by Pairs oppoſite. The Cup of the Flower conſiſts of one Leaf, which expands, and is cut into three Segments; theſe are male and female in different Plants: The Flowers of the male grow in long Spikes, and conſiſt of many Stamina and Apices, which are loaded with Farina: The Ovary of the female Plant becomes a teſticulated Fruit, having a ſingle round Seed in each Cell.

The Species of *Mercury* principally us'd in Medicine are the following;

Mercurialis; teſticulata; ſive mas Dioſcoridis & Plinii. *C. B. P.* 121. *Tourn. Inſt.* 534. *Boerh. Ind. A.* 2. 106. *Mercurialis.* Offic. *Mercurialis mas & fœmina.* Ger. 262. Emac. 332. Park. 295. J. B. 2. 977. Raii Hiſt. 163. *Mercurialis annua glabra vulgaris.* Raii Synop. 54. FRENCH MERCURY.

French Mercury grows about a Foot high, full of ſmooth angular Stalks, beſet with narrow Leaves, about an Inch and half long, broadeſt in the Middle, and ſharper at both Ends, indented about the Edges, of a pale-yellow, green Colour. The Flowers are ſmall and ſtamineous, of a greeniſh Colour, growing in Spikes, which ariſe from the Boſom of the Leaves: Thoſe of the female fall off without any Seed. The male has a couple of teſticulated Seeds at the End of the Spike. The Root is fibrous, and periſhes after it has flower'd, and given Seed; it grows frequently in Gardens, and in waſte Places, and among Rubbiſh.

The Leaves and Stalks are uſed, and are aperient and mollifying; the Decoction thereof purges choleric and ſerous Humours; it is moſtly uſed in Clyſters. *Matthiolus* commends a Decoction of the Seeds with Wormwood, for the yellow Jaundice. The Juice takes away Warts. *Miller's Bot. Offic.*

Pena, *Lobel*, and *J. Bauhine*, found ſomething nitrous in this Plant; it is of an herby Taſte, a little ſaltiſh, and gives no Tincture of red to blue Paper. I believe the great Quantity of Sulphur, with which it abounds, hinders the Sal Ammoniac from manifeſting itſelf; for, by the Chymical Analyſis, it yields a great deal of volatile concrete Salt, Oil, and Earth. *Hippocrates*, *Dioſcorides*, and *Galen*, agree that this Mercury is purgative; the Syrup made with its Juice is laxative and aperitive. The Water, in which it has been macerated cold for twenty-four Hours, is given for the Dropſy, Cachexy, Vapours, and Greenſickneſs: This Plant is uſed in Semicupiums for the Suppreſſion of the Terms; for it is very emollient alſo; and they make thoſe Perſons who are believed to be barren, take three Ounces of its Juice depurated, and mix'd with two Drams of Tincture of Steel. This Mercury is employ'd in the *Syrop de longue Vie.* This is the manner of making it:

Take twelve Pounds of *Narbonne* Honey, eight Pounds of the Juice of Mercury, and two Pounds of that of Borrage in a Kettle; ſet it upon the Fire, and mix the Juice, and the Honey, with a wooden Spatula, and ſtrain them without letting them boil; then add three Pints of white Wine, in which four Ounces of Gentian-root have been infuſed for twenty-four Hours. Then ſet the Kettle again upon the Fire, and mix the Juices with the Wine, and Pieces of Gentian; ſtrain thro' the ſame Bag without letting it boil; after this boil the ſtrained Liquor to the Conſiſtence of a Syrup.

Take a Spoonful of it in the Morning faſting, and eat nothing for two Hours after; it keeps the Belly open, purifies the Blood, and keeps away the Gout, Sciatica, and ſuch-like Diſeaſes. This Plant is an Ingredient in the lenitive Electuary, in the *Catholicum* of the Deſcription of *Du Verney*, and in the ordinary Decoction for laxative Clyſters. *Martyn's Tournefort.*

Mercurialis; montana; teſticulata; & ſpicata. *C. B. P. Tourn. Inſt.* 534. *Boerh. Ind. a.* 2. 106. *Cynocrambe.* Offic. Ger. 263. Emac. 333. *Cynocrambe mas & fœmina, ſive Mercurialis repens.* J. B. 2. 979. *Cynocrambe mas & fœmina.* Raii Hiſt. 163. *Mercurialis perennis repens Cynocrambe dicta.* Synop. 53. *Mercurialis ſylveſtris Cynocrambe dicta vulgaris.* Park. 295. DOGS MERCURY.

This Plant grows in Woods and Hedges, and flowers in the Spring. The Whole of it is us'd; and tho' *Prevotius*, *Moreton*, and others, affirm it to be poſſeſs'd of the ſame Virtues with the former, yet the Effects it produc'd on ſome Perſons near *Shropſhire* ſufficiently prove it to be of a ſoporiferous and malignant Quality. It is a poiſonous Plant; for which Reaſon it is very injudiciouſly ſaid to be the Mercury of the Shops, by *Rhaſeld* in his *Hodegus Botanicus Buxb.*

What Species of Plant the *Cynia* or *Cynocrambe* of *Dioſcorides* may be, is not yet determin'd among Botaniſts. *Cæſalpinus* affirms, that it is a Species of *Atriplex*; and *Caſpar Bauhine* will have it to be a Species of *Parietaria*. *Lonicerus* refers it to the *Apocynum*, and *Matthiolus* makes it ſome Species of Mercury, all of which, eſpecially the female Mercury, agree with the Deſcription given of the *Cynocrambe* by *Hippocrates*. *Dale.*

Mercurialis; fruticoſa; incana; teſticulata. *Tourn. Inſt.* 534. *Boerh. Ind. A.* 2. 106. *Phyllon.* Offic. *Phyllon Arrhenogonon & Thelygonon folio incano Monſpeſſulana.* J. B. 2. 981. *Phyllon Thelygonon.* Ger. 263. *Phyllon Arrhenogonon ſive Mariſcum & Thelygonon ſive feminiſicum.* Ger. Emac. 333. *Phyllon mariſcum & feminiſicum.* Park. 296. Raii Hiſt. 1. 164. *Phyllon teſticulatum & ſpicatum.* C. B. P. 122. CHILDRENS MERCURY.

This Species, in *England*, is found only in the Gardens of the Curious, and flowers in the Summer. The whole Herb is uſed, and, according to *Cluſius*, much eſteemed in *Barbary*, againſt thoſe Diſeaſes which are in a peculiar manner incident to Women. Some recommend a Decoction of it for thoſe who have been bit by a mad Dog. *Magnol.*

MERCURIUS. Mercury, or Quickſilver.

Quickſilver, called *Hydrargyrus, ſive Argentum vivum*, Offic. *Hydrargyrus*, Græcor. *Mercurius Chemicorum, Argentum fuſum Theophraſti, Argentum Mobile Ariſtotelis, Vomica Liquoris Æterni Plinii*, and *Zaiba*, or *Zaback*, of the *Arabians*, is a fluid metallic Subſtance, cold to the Touch, of a ſhining ſilver Colour, very heavy, volatile, and which will unite with moſt Metals, eſpecially Gold; to which it joins itſelf very cloſely.

Quickſilver is found ſometimes in its fluid Form in the Bowels of the Earth; and, in that Caſe, it is firſt well waſhed with Water, to clear it from Earth; then ſometimes with Vinegar and Salt, to carry off all other metallic Parts; and laſtly, it is paſſed through Cotton, or dreſſed Leather, and then has the Name of Virgin Mercury.

It is likewiſe found in Glebes, or in form of a red ſulphureous Mercurial Mineral, called *Cinnabar*, or of a ſtony Glebe, ſometimes red, ſometimes yellow, ſometimes dark, and ſometimes of a Lead-colour.

From theſe Glebes Quickſilver is extracted by ſimple Diſtillation, ſometimes *per Aſcenſum*, the Mineral being put in Retorts, and ſet in a ſtrong Degree of Fire, by which the Quickſilver is raiſed in Fumes, Part of which, ſticking againſt the Neck of the Retort, are there collected, and run down into the Receiver; and the reſt are condenſed directly in the Receiver, which, for this Purpoſe, is half filled with Water.

The other way of Diſtillation is *per Deſcenſum*, which is performed in this Manner, and is the moſt expeditious, where the Mineral is rich. The Mineral, being beat ſmall, is put into earthen Veſſels, with very narrow Mouths, which are ſtopped with Moſs freſh-gathered from Trees. Other earthen Veſſels, like the former, but with wider Mouths, are buried in the Ground; and upon theſe the other full ones are inverted, their Mouths being let into thoſe of the lower ones. In this Poſition their

Necks are firmly cemented together with a proper Lute, the lower Veſſels being wholly under Ground, the upper wholly above Ground. An Area of a ſufficient Extent being thus filled, a Fire is lighted round the Veſſels, by the Heat of which the Quickſilver drains through the Moſs, out of the upper Veſſels into the lower. At a proper time they dig theſe up, and pour the Quickſilver into Bottles.

The Quickſilver Mines in *Hungary*, *Carinthia*, and *Friuli*, are very rich; there are, alſo, ſome ſuch Mines in *France*, eſpecially about *Montpelier*, and ſome Places of *Normandy*.

When the Mineral contains a great Portion of Sulphur, the Quickſilver cannot be extracted without adding ſomething to abſorb the Sulphur, and ſet the Quickſilver at Liberty, and render it fluid. Such Additions conſiſt in Wood-aſhes, Pot-aſh, Quick-lime, Filings of Iron, and the like, with which the Mineral is to be diſtilled.

Quickſilver is the heavieſt of any known Metal, except Gold, which is to Mercury nearly as four to three, and, therefore, ſinks in it, whilſt all other Metals ſwim. Quickſilver may likewiſe be mixed, or amalgamated, as it is called, with all other Metals, and metallic Subſtances, but moſt difficultly with Antimony, Iron, or Copper. It penetrates Metals, diſſolves and makes them brittle; whence it is by ſome reckoned the firſt Matter of all Metals, but without any ſufficient Foundation. It is, therefore, to be reckoned a metallic Subſtance *ſui Generis*, fluid, heavy, diviſible into very ſmall Parts, and extremely volatile. Fire ſeparates it into a very ſubtle Vapour, and in that Form diſſipates it entirely; whence Alchymiſts have given it the Name of the *Run-away Slave*. It is, likewiſe, eaſily diſguiſed many ways, and may again be reſtored to its priſtine Form; whence it has got the Name of *Proteus*.

It readily unites with Sea-ſalt, and, thus joined, a very gentle Heat ſublimes them in form of a white ſaline, cryſtalline Maſs, known by the Name of corroſive Sublimate. It does not ſo eaſily join with Nitre or Vitriol. It is more eaſily diſſolved by the Acid of Nitre, but very difficultly by Oil of Vitriol. Alcaline Salts work no Change in it; but it is in ſome meaſure fixed and extinguiſhed by ſulphureous Salts. By long Trituration with Sulphur, it is changed into a very black Maſs, which, being ſublimed by the Force of Fire, becomes an intenſely red, ſhining, radiated Maſs. When Quickſilver has been diſſolved by Spirit of Nitre, and that Spirit again evaporated by Fire, it remains in Form of a red Powder; but, if the ſame Solution be precipitated with Salt of Tartar, it appears a Saffron-colour'd Powder at the Bottom. With Sea-ſalt it gives white Precipitate; and with Lime-water, a yellow.

It is very difficult to analyſe Quickſilver, becauſe, as ſoon as any Degree of Fire is applied to it, it flies off, and thus baffles the Pains and Induſtry of the Artiſt. However, by being long expoſed to a very gentle Fire, in a glaſs Veſſel, with a very long Stem, it begins, by degrees, to be turned into a greyiſh Powder, which, by a long Digeſtion, becomes yelloviſh, and at length red.

Thus reduced to a Calx, it is heavier than when fluid, and, alſo, a little more fixed in the Fire; but if it be urged with a conſiderable Fire, it evaporates, leaving only a little fixed Earth behind. If this Calx be burnt gently with Charcoal-duſt, it turns immediately to running Mercury. By long Trituration it may, likewiſe, be reduced to a greyiſh Powder, ſome Particles detached from the Body, with which it is rubbed, hindering the immediate Contact of its Particles. When expoſed to the Focus of a great Burning-glaſs, it preſently evaporates in Fumes, without leaving any Remainder; but, if the Calx of Mercury calcined *per ſe* be thus expoſed on a Tile, it firſt melts into a Subſtance like Glaſs, then evaporates ſpeedily, leaving a ſmall Quantity of a browniſh Powder behind, which afterwards vitrifies. But if the ſame Calx be laid in the Focus of ſuch a Glaſs, on a Piece of Charcoal, it melts into a Glaſs in the ſame manner; then runs on the Coal, and becomes again pure Quickſilver before it evaporates. Hence it ſeems evident, that Quickſilver conſiſts of a volatile, vitrifiable Earth and Sulphur, to which it owes its metalline Splendor and Fluidity; but, if theſe Particles of Sulphur be again reſtored to it, it recovers both again. Quickſilver was by the Antients ranked among Poiſons. *Dioſcorides* aſcribes pernicious Effects to it; and from his Authority, doubtleſs, it was, that *Galen* reckoned it highly corroſive; for he owns he never made any Trial of it himſelf. The Name of it is not found in *Hippocrates*; whence it is probable, that it was not in Uſe in his Time. But before *Avicenna* it was uſed externally, though ſeldom internally, being ſtill reckoned a Poiſon by moſt Phyſicians. *Actuarius* ranks it, however, among Medicines; but *Meſue* applied it only for curing cutaneous Diſeaſes, though *Avicenna* obſerves, that many had drank it without any bad Effect, and that it paſſed through the Anus unchanged. About two hundred Years ago, though it was ſtill believed by ſome to be poiſonous, it began by many to be uſed inwardly; they having obſerved, as *Fallopius* relates, that it was given in that manner by Shepherds to their Cattle to kill Worms, without any bad Effect; whence they concluded, that it might be ſafely given to Men likewiſe, and that, therefore, crude Mercury was not to be reckoned a Poiſon.

Thus *Braſſavolus* and *Carolus Muſitanus* tell us, they gave it to Children troubled with Worms, from two to twenty Grains, and always with ſome Succeſs; and that ſeveral Midwives gave it to Women in difficult Labours, though, perhaps, not always with any viſible good Effects. *Matthiolus* relates, that ſome Women with Child drank each a Pound of Quickſilver to procure Abortion without any bad Sequel; and it is commonly known, that the Workers in Quickſilver take this Method to cheat their Maſters of conſiderable Quantities, by firſt ſwallowing it, and then voiding it with their Fæces, from which it is eaſily cleanſed by ſimple Waſhing. It muſt, nevertheleſs, be owned, that the Uſe of it, whether outwardly or inwardly, can never be long continued without Miſchief; for the Miners, and others employed about it, though of the ſtrongeſt Conſtitutions imaginable, ſeldom remain four Years in that State, but are ſeiz'd with Tremblings, and Palſies, and all die miſerable. By an injudicious Uſe of it, whether outwardly apply'd, or inwardly taken, the Nerves are, likewiſe, affected, weakened, corrupted, and contracted; whence Tremblings, Spaſms, Palſies, and too great an Attenuation of the Fluids, which often brings on a fatal Salivation, Ulcers in the Mouth and Throat, and incurable Looſeneſſes.

Quickſilver judiciouſly adminiſtered is, however, undoubtedly a moſt excellent Medicine; it opens the Pores, ſmall Veſſels, and Ducts of the Glands; reſolves obſtructed Humours, attenuates thoſe which are too thick and viſcid, eſpecially the Lympha; and diſſipates Concretions, even in the remoteſt Parts of the Body. On all theſe Accounts it is found to be of ſingular Service in Tumors, ſwelled Glands, ſcirrhous Spleen, Meſentery, or Liver, Ganglions, Strumæ, and other ſuch Diſeaſes. It likewiſe blunts the Acrimony of the Fluids, and hence performs Wonders in Venereal Tumors, Buboes, and Ulcers, in cutaneous Puſtules, Scabs, and other Affections of the Skin; univerſal Remedies of the preparatory, and eſpecially of the evacuating Kind, having not only gone before the Uſe of Mercury, but being continued along with it. For as all theſe Diſeaſes ariſe from a viſcid Serum, become cauſtic by a long Stagnation, if it be divided and reduced to a fluid State by Quickſilver, before a Paſſage is prepared for it out of the Body, it muſt either exert its Efficacy on the Part, where it was firſt lodged, or, by removing to other more noble Parts of the Body, bring on Symptoms more dangerous than the firſt. Therefore, before the Patient begins to take Mercury in any Form, his Body ought to be cautiouſly prepared by Bleeding, to leſſen the Plenitude of the Veſſels; by warm Bathing, and the Uſe of diluting Medicines, that the Humours may become more fluid, and the ſolid Fibres ſofter; as, alſo, by Purging, that a Way may be opened for the Paſſage of the diſſolved Humours out of the Body. Theſe Paſſages are, likewiſe, to be kept open during the Time that Quickſilver is taken, leſt the Humours be intercepted in their Courſe, and be turned a more dangerous Way; and the Patient ought to be kept warm, leſt Cold ſtop or diminiſh inſenſible Perſpiration, which ought likewiſe to be encouraged by gentle Exerciſe.

Quickſilver, not only taken inwardly, but, alſo, by Unction, evacuates the Humours by Stool, Sweat, and inſenſible Perſpiration; but the moſt common Method of its Operation is by the Evacuation of a mucous Saliva, whence it is termed a Salivation. This Way of Purging was entirely unknown to the Antients, and is thought the moſt effectual Remedy for Venereal Diſeaſes; for the Cure of which it was firſt uſed by *Jacobus Carpenſis*, a Phyſician of *Bologna*.

From whatever Country Quickſilver is brought, that is thought the beſt, which, is moſt pure, of the moſt ſhining white Colour, moſt fluid, and which being evaporated, leaves no Remainder behind it. That is to be rejected, which is of a livid or pale Colour, which does not run into Globules exactly ſpherical, but oblong, reſembling little Worms or Tears, which are ſure Signs, that it is adulterated with Lead, Biſmuth, or ſome other Metal.

Native or Virgin Mercury ought always to be purified before it is uſed inwardly; becauſe it is poſſible it may be ſtill mixed with ſome metallic, ſulphureous, or arſenical Particles. The moſt ſimple Way of purifying Quickſilver is, by paſſing it through dreſſed Leather, by which it is purged from the more groſs Parts, that may be mixed with it. Some waſh it with Vinegar and Salt: But it is much ſafer to diſtil in a Retort with Quick-lime, Pot-aſh, or Filings of Steel, by which Method Mercury is obtained more pure than by any other.

Mercury is uſed in Phyſic, either crude, that is, being only firſt purified; or differently prepared. Crude Mercury is given, in Subſtance, to kill Worms, from a Scruple to three Drams; being firſt well rubbed with Sugar in a glaſs Mortar, till it is diſſolved into inviſible Parts, adding a Drop or two of Oil of ſweet Almonds, to keep it from returning to its native Form. Decoctions of Quickſilver are likewiſe much uſed, being made by boiling a Pound of Mercury in ſix Pints of Water for an Hour: The clear Liquor is given both to Children and Adults for their common Drink. Quickſilver is a great Enemy to all Sorts of Vermin, as well as to Worms; and it ſuddenly kills or baniſhes them, being applied in an Ointment to any Parts of the Body where they are found.

Crude

Crude Mercury is likewiſe given in very large Quantities in the Iliac Paſſion, even two or three Pounds; and it often ſucceeds in removing the Obſtruction: But, if the Obſtruction be very great, ſo that the Mercury remains a great while in the Inteſtines, it may do them an Injury, merely by its great Weight. To cure the Itch, Quickſilver Girdles are uſed with very good Succeſs, when the Precautions above-mentioned are duly obſerved. The Quickſilver is to be beat up with the White of an Egg, till both are turned to a thick Froth, which is rubbed on a Cotton Girdle, and, when dry, is wore round the Loins.

Mercurial Ointments cure the Itch, and all Diſeaſes of the Skin. It is uſed in the *Emplaſtrum de Ranis cum Mercurio* of *Vigo*, in the *Unguentum Neapolitanum*, and in Mercurial Pills, of which the beſt Form, in my Opinion, is this:

Take of good Rhubarb, Trochiſci Alhandal and Agaric, each a Dram; Scammony, and waſhed Aloes, each a Dram and an half; of Quickſilver, killed in Turpentine, half an Ounce; Syrup of Peach-flowers, a ſufficient Quantity to make a Maſs of Pills. The Doſe is from a Scruple to a Dram and an half, in Venereal Complaints, Rheumatiſms, and Obſtructions of the Meſentery and Viſcera. In the Pox theſe Pills are taken by ſome every Day, or every other Day.

No Subſtance has been treated in ſo many different Manners by Chymiſts as Mercury, both for Medicinal and Alchemical Uſes; for, ſince they believed it to be the firſt Matter of all Metals, they have left nothing untried to fix it. But, though, after all their Labours, they have not been able to gain their propoſed End, they have, however, enriched the Materia Medica with many excellent Remedies. It is here to be obſerved, that ſome Chymiſts call the Preparations of Mercury either by the Names of Oils, or Salts, which are not to be looked upon as Principles or Subſtances extracted from that Metal, but as ſaline or oily Bodies mixed with it: For hitherto no Art has been able to reduce Mercury to its firſt Principles; for, being extremely volatile, it flies off, before any thing of its Texture can be diſcovered. *Geoffroy.*

Boerhaave gives us the following Proceſſes upon Quickſilver.

The Purification of Quicksilver.

1. Take Mercury bought of the Company of *Amſterdam*; put it into a Piece of Leather, cut round, and formed into a little Bag; tie this Bag cloſe at the Top with a ſtrong Packthread, and ſqueeze it ſtrongly over a large glazed Diſh; the Mercury will be thus ſtrained pure, through the Pores of the Leather; laſtly, ſqueeze the Bag tight, that the Whole may come through. I have not found this Mercury to leave any Foulneſs behind.

2. I have diſtilled Two Pounds of this Mercury in a clean glaſs Retort, with a Sand-heat, into a glaſs Veſſel fitted to the Receiver, and open at both Ends, ſo as to have its lower Part plunged under Water; the whole Body of the Mercury thus comes over without leaving any Fæces, even tho' the Diſtillation were thrice repeated in the ſame Retort: For ſtill I had two Pounds of Mercury, a very ſmall Quantity of a thin, fine, red Powder, of ſcarce any Weight, remaining in the Retort, but no Feculency; ſo that the Mercury, even by this Trial, was pure; which is a principal Recommendation of this Commodity.

3. Take a Pound of this Mercury; put it into a Retort, and add to it two Pounds of clean Lime, ſlaked in the Air; diſtil in a Retort, with a Sand-heat; and a Pound of Mercury will be obtained again; ſo that even thus no Feculence is found, which, if there was any, would certainly appear in this Method.

REMARKS.

Theſe are the common Ways of purifying Mercury, and fitting it for the following Operations; and this is the Method I always uſe. Hence we ſee the Volatility of Mercury; the Degree thereof; and the Purity of the Company's Mercury at *Amſterdam*.

Quicksilver dissolved in Aqua-Fortis.

Take four Ounces of pure Mercury, and ſix Ounces of Aqua-fortis; put them into a clean Urinal, ſurrounded with a ſmall Fire, that the Whole may grow warm: The Maſs of Quickſilver will begin to bubble at the Bottom, and conſume, whilſt red Fumes, and an Heat, are produced. When the Mercury is diſſolved, add a little more, ſo that ſome Part may remain undiſſolved, even in the Heat: Pour off the Liquor, when cold, into another Glaſs; the Quickſilver will be diſſolved into a pellucid, uniform Liquor, even tho' examined by the Microſcope: It is of an auſtere Taſte, ſmells like Spirit of Nitre, or Aqua-fortis, and is as colourleſs as Water.

REMARKS.

Hence we ſee, that the very opake Body of Quickſilver becomes pellucid by Aqua-fortis, or Spirit of Nitre; and, though ſo many times heavier than the Menſtruum, hangs ſuſpended in a Liquor fourteen times lighter than itſelf; ſtill remaining Quickſilver, and unchanged, only ſurrounded with the Acid, as will appear hereafter. It is here ſo equably diſtributed in the Fluid, that, if a ſingle Drop thereof be artificially examined, it will appear to contain a proportional Part of Mercury, in reſpect of the whole Liquor from whence it was taken; which is a Particular that deſerves the Conſideration of Chymiſts, and thoſe who underſtand Hydroſtatics: Whence we ſee, that the Mercury here is very finely divided; that the Acid is uniformly united with each Particle of the Mercury; and that this Acid, equably united with the Mercury, is intimately diſtributed therewith, amongſt its watery Parts. This Solution is violently cauſtic, ſo that it can ſcarce be touched, as burning all the Parts of the Body with violent Pain and Heat: Whence it becomes effectual in extirpating Warts. If a ſmall Part of a Drop touches the Skin, it preſently turns it purple. Neither Aqua Regia, nor Spirit of Salt, eaſily diſſolve Mercury; yet corroſive Mercury Sublimate is a true Salt of Mercury, diſſolved by the Spirit of Sea-ſalt, or Aqua Regia; for it produces all the true Effects thereof: And, if put to Salt of Tartar, regenerates Sea-ſalt. If firſt precipitated, it may be diſſolved in Aqua Regia; but it can alone be ſublimed into a Mercurial Salt, along with Sea-ſalt.

The Vitriol of Quicksilver.

1. If ſo rich a Solution be made of Quickſilver in Aqua-fortis, or Spirit of Nitre, as that no more will diſſolve therein by Heat, and the Solution be poured into a cold Glaſs, there ſpontaneouſly ſhoots to the Bottom, a ſaline, white, tranſparent Matter, from whence the Liquor being poured, this Matter remains ſharp, moiſt, ſaline, ſoluble in Water, and not ſafe to be touched.

2. If the remaining Liquor be inſpiſſated to half, and ſet in a cold Place, Cryſtals, like the former, will ſhoot.

3. But if one Part of Quickſilver, along with two of pure decrepitated Sea-ſalt, reduced to Powder, be diſtilled in a Glaſs Body, with a ſtrong Fire, for five or ſix Hours, and, when cold, the Glaſs be broke, there will be found a ſolid dry Mercury, ſublimed in the Form of Vitriol; and the common Mercury Sublimate is a true Vitriol of Mercury, tho' ſemivolatile.

REMARKS.

Quickſilver, therefore, is reduced to an imperfect Vitriol, with Spirit of Nitre, and to one that is perfect, with Spirit of Salt; but with Spirit of Nitre it is fixed; and with Spirit of Salt, volatile. The Vitriol is ſharpeſt that is made with Spirit of Salt.

The white Precipitate of Mercury.

Take a Solution of Mercury, made ſo ſtrong, that Aqua-fortis, or the Spirit of Nitre, can diſſolve no more; whence there remains no more Acid, than what is requiſite to diſſolve that Proportion of Mercury; add twice the Quantity of pure Water; then have at hand a ſtrong and hot Solution of Sea-ſalt; let this fall, by a Drop at a time, into the Solution of Mercury; upon which the Liquor will immediately become white, opake, and turbid, where the Solution of Sea-ſalt fell: After ſhaking the Veſſel, a white Precipitate will fall to the Bottom, and a limpid Liquor float above. After the Solution of Sea-ſalt no longer makes the Liquor turbid, let the Veſſel reſt for ſome time, till all the white Powder is fallen; then gently pour off the limpid Liquor, till all this white Powder be ſeparated. Shake the Remainder along with the white Powder, and put into a Paper Filtre, ſet in a Glaſs Funnel; a limpid Liquor will come away, which may be added to the former; and a white Powder will remain on the Paper: To this pour ſeveral hot Waters, till what comes through be as inſipid as it was poured on. After which the white Powder will remain almoſt taſteleſs in the Filtre; dry the Paper with its Powder, by a gentle Fire; and afterwards keep it ſeparate, under the Title of the *White Precipitate of Mercury*.

REMARKS.

The acid Spirit of Nitre, here attracted into the Mercury, and now diſſolved in the Water, becomes an Aqua Regia, as ſoon

as it is mixed with the Sea-ſalt; but Aqua Regia does not diſſolve Mercury like Spirit of Nitre; therefore the Mercury is let go by the former Solvent, and falls in a Precipitate to the Bottom. The Water waſhes the Aqua Regia from the Powder that externally adhered to it; yet in this Powder ſome of the Acid ſtill adheres to the Body of the Mercury; whence it has a particular Virtue, as may be ſhewn by many Experiments. The Powder, thus prepared, is, perhaps, the beſt Remedy hitherto afforded by Mercury, for internal Uſe: It operates effectually, and with conſiderable Safety. If ground with thrice its Weight of Loaf-ſugar, it makes what may more properly be called a Mercurial Panacea, than, perhaps, other laborious Preparations of Mercury; for, however Mercury may be treated, its medicinal Virtue principally depends upon a certain Quantity of Acid adhering to its metallic Part: This acid Virtue, if it abound, and appear externally, in the Mercury, acts with more Violence, but with leſs Safety: If more ſparingly added, and more united to the Mercury, it acts more ſlow, more mild, and ſafe; and this is the Caſe with our preſent Precipitate. If the ſaccharine Powder above-mentioned be given in the Quantity of nine Grains to a Perſon faſting, it purges, vomits gently, kills Worms, opens and cleanſes the Veſſels concerned in preparing the Chyle, reſolves Phlegm, and thus cures many Diſtempers, ſuch as the Gonorrhœa, Itch, and Venereal Ulcers. If this Doſe be ſeveral times repeated daily, it raiſes a kindly Salivation. If a Dram of this white Precipitate be well mixed with an Ounce of Pomatum, or the Ointment of Roſes, it makes an excellent and ſafe Unguent in cutaneous Diſorders, and proper for curing the Itch, Breakings out in the Face, and inveterate Ulcers. It is, therefore, no Wonder, if it ſhould be ſubſtituted in the room of the boaſted Panaceas. If this Powder be put into a Glaſs, ſet over the Fire, and kept conſtantly ſtirring with a Glaſs Rod, and thus be long and gently calcined, it becomes ſo mild as ſcarcely to purge, vomit, or ſalivate; and, therefore, acts very gently when taken internally; and, in this Form, the Chymiſts commend it as a Diaphoretic and Corrective; but, thus treated, it is ſo mild as to have little curative Virtue. If a little of this Powder be rubbed upon a warm and poliſhed Copper-plate, it preſently gives it the Appearance of Silver; but this ſoon goes off again in the Fire.

Red Precipitate of Mercury.

1. Take a Pound and an half of the liquid Solution of Mercury, made according to the ſecond Proceſs; put it into a Glaſs Retort, that will hold twice the Quantity; apply a Receiver, and diſtil with ſo ſmall a Fire as not to make the Matter boil, yet bring it almoſt to Drineſs; there will remain a ſolid, white, ponderous Maſs at Bottom, which is extremely corroſive and fiery, ſo that it cannot be handled. There ſticks up and down to the Sides of the Glaſs, ſomewhat of a red, yellow, or white Matter; the Mercury then beginning to dry, in a manner that is pleaſant to behold. The Liquor driven over is a weak and conſiderably pure Spirit of Nitre, fit for the cleanſing of Glaſſes, and other Uſes. This Operation, therefore, is a kind of coagulating Mercury into Vitriol.

2. Put the Retort into a Sand-furnace, and lute on a large Receiver; diſtil with a gentle Fire, ſo that the Drops may follow each other, at the Diſtance of four or five Seconds. Continue thus, till red Fumes begin to riſe; then immediately apply another large and clean Receiver; the Liquor that comes over is a ſtronger and purer Spirit of Nitre, to be kept for its particular Uſes. Urge the Remainder with Degrees of Fire, and Fumes will continue, and at length very red ones will fill the Receiver: Then keep up the Fire to the utmoſt, for two or three Hours; there will be found in the Receiver a yellow and exceedingly ſtrong Spirit of Nitre, which will afford yellow Fumes for Years, if confined in a clean Glaſs: And, by theſe means, an exceedingly ſtrong Spirit of Nitre may be procured, as being, in ſome meaſure, rectified; though it thus, in ſome reſpects, changes its Nature, as it will not ſo well take Flame with diſtilled Oils. All being now cool, there will remain, at the Bottom of the Retort, a ſolid Maſs, of a ſhining-red Colour; between which and the Neck, as, alſo, in the Neck itſelf, will be found a Matter of very various and beautiful Colours; as white, yelloviſh, yellow, greeniſh, rediſh, and highly red. Break the Retort carefully; take out the red Matter in the Belly of the Glaſs, and ſeparate it carefully from that which appears leſs red on the Surface; for this latter is very corroſive: Keep the red Part by itſelf, under the Title of the *Red Precipitate of Mercury*.

3. The Chymiſts, admiring this ſhining Mercury, and the remarkable Fixedneſs thereof, which was before volatile, imagined, that, by repeating the Operation, they might convert it into a fixed Gold: They, therefore, poured freſh Spirit of Nitre to it, drew it off again, and, by often repeating the Operation, thought to obtain Gold; which *Sylvius*, in his poſthumous Works, aſſerts to have been thus done: But this is incredible to the cooler Chymiſts. *Paracelſus*, in the Preparation of his Precipitate, directs the Spirit of Nitre to be often drawn off from the Mercury.

REMARKS.

Hence we learn the changeable Nature of Mercury, from fluid to ſolid; from volatile to fixed; from mild to corroſive; and from white into almoſt all kinds of Colours. But, however it is prepared with the Acid of Nitre, yet it may be recovered, in its native Form, and original Weight, unchanged, if it be diſtilled in the Retort along with fixed Alcali, Quick lime, or Iron Filings. This Precipitate, which is called *Vigo's* Precipitate, is ſharp and corroſive, occaſioning Pain, and producing an Eſchar, when externally applied; and hence, afterwards, it always occaſions a thick white Pus, and thus cleanſes the Lips and Bottoms of Ulcers, and diſpoſes them to heal. It is dangerous to give internally, as inflaming the Viſcera by its cauſtic Virtue, and occaſioning Anxiety, Pain, Vomiting, Purging, Griping, and operating, alſo, by Urine and Sweat. If given in too large a Doſe, which ſhould never exceed three Grains, or if too often repeated, it occaſions a Salivation, with all its Symptoms; and thus cures many Diſtempers, which are not eaſily curable any other Way: It is more violent and dangerous than the white Precipitate. *Paracelſus* and *Helmont* ſhew how to mitigate it, by ſeveral times diſtilling Alcohol upon it; and thus indeed it becomes milder, by loſing much of its Acid; but, at the ſame time, it requires to be given in a larger Doſe. They, alſo, corrected it with the ſame Succeſs, by diſtilling from it the Water of the White of Eggs. Others diſſolve it in ſtrong diſtilled Vinegar, by Boiling; then ſtrain and purify, and, by ſeveral times diſtilling the Vinegar off, render the Powder more mild. But there ſeems to be little gained by all this, white Precipitate being already the Thing here required. In ſhort, the acrimonious Acid, adhering to the Mercury, cauſes it to operate in a very ſmall Doſe; and the more this Acid is in it, and the more external to the Mercury, the more violently it acts, and *vice verſa*. If this Precipitate be put into a thin, hollow, glaſs Diſh, ſet over the Fire, and continually ſtirred with a Tobacco-pipe, it will change of a deep Colour; and, if long continued thus, it becomes ſo much the milder, ſo as, at length, ſcarcely to act at all.

Mercury ſublimate.

Diſſolve half a Pound of Mercury in a ſufficient Quantity of Aqua-fortis, according to the ſecond Proceſs; carefully inſpiſſate it to a white dry Maſs, according to the firſt Direction in the third Proceſs: Take, alſo, ten Ounces of decrepitated Salt, and as much common Vitriol calcined to Whiteneſs. Grind theſe two Salts for a long time ſeparate, in a glaſs Mortar, with a glaſs Peſtle, in a dry and warm Place; then mix them together, and carefully mix in the Mercury among them. Put the Powder into a Bolt-head, of which it may fill only a third Part; cut off the Neck of the Glaſs, ſo as to leave only about ſeven Inches thereof above the Body: Set it in a Sand-furnace, ſo as that the Bottom of it may touch the Iron Pot; and let the Sand riſe exactly to the Surface of the contained Matter. Apply a very gentle Fire, and increaſe it by very ſmall Degrees, till a Vapour exhales out of the Mouth, which Vapour is to be avoided as highly pernicious to the Lungs. When all the Moiſture is perfectly evaporated, ſtop the Mouth of the Glaſs with Paper, and increaſe the Fire till the Pot be red; a corroſive Mercury Sublimate will riſe to the Sides of the Glaſs in white tranſparent Cryſtals: Let the Glaſs cool, and break it, and ſeparate the Sublimate carefully from the Fæces, and ſoft Powder on the top, and keep it in a dry Glaſs. For the Method uſed at *Venice*, conſult *Tachenius*, in his *Hippocrates Chymicus*.

REMARKS.

The white Mercury, here employ'd, contains Aqua-fortis mixed in among it; the white Calx of Vitriol, mixed with Sea-ſalt, enters this Salt, and drives out the Spirit; and, whilſt theſe two act upon the Mercury by the means of Fire, there is made an Aqua Regia by the Spirit of Nitre contained in the Mercury, and the Spirit of Sea-ſalt ſet free by the Acid of Vitriol. The Phlegm is firſt diſcharged by a gentle Fire; the ſtrong acid Part of the Aqua Regia unites with the Mercury, and corrodes it; but this Aqua Regia is of the Nature of Sea-ſalt. The Spirit of Sea-ſalt fixes the Quickſilver not like the Spirit of Nitre, but rather makes it ſemivolatile: And hence the Mercury is ſublimed, and is a true ſolid dry Vitriol of Quickſilver, that remains conſiſtent in the Air. The Baſis of this Vitriol is pure Quickſilver, and the other Part, the ſtrongeſt Spirit of Sea-ſalt, that can any way be obtained; ſo as here to appear in a ſolid Form. With reſpect to this acid Spirit of Sea-ſalt,

Sea-ſalt, the Preparation is a Lapis infernalis of Mercury, and a moſt violent Corroſive, preſently converting all the Parts of the Body it touches, into an Eſchar, that ſoon falls off; whence it conſumes obſtinate Calloſities in Ulcers, as, alſo, Warts, and indurated Glands. That eminent Surgeon, *Johannes a Vigo*, was acquainted with it; and hence compoſed his Troches of Minium, which are an incomparable Remedy for conſuming ſcrophulous Tumors, and eradicating them by Suppuration. The Taſte of this Vitriol is abominably auſtere. A Grain of it, diſſolved in an Ounce of Water, affords an excellent Coſmetic, if cautiouſly uſed. It proves poiſonous to all cutaneous Inſects, by bare Lotion. If a Dram of this Solution be ſoftened with Syrup of Violets, and drank twice a Day, it performs Wonders in many reputed incurable Diſeaſes; but it requires to be cautiouſly uſed by a prudent Phyſician, and ſhould not be ventured upon, unleſs the Method of managing it be known. This Mercury, when mixed with Metals and Semimetals, has very excellent and inimitable Effects, even ſuch as would ſurpriſe a Chymiſt. It wonderfully changes Silver itſelf. Certainly, this Mercury Sublimate is a Key that ſerves to open numberleſs chymical Secrets. By means of it, perhaps, ſome Proportion of Silver may be converted into Gold, that could not before be found therein. Hence, alſo, is obtained the acute Menſtruum of Mr. *Boyle*, and other Things. No Chymiſt will repent of the Labour he employs upon this Sublimate. We ſee, that Aqua Regia will diſſolve Mercury better than any Aqua-fortis, provided it be firſt diſſolved in the latter; and the Spirit of Salt will ſublime it, tho' before fixed with Spirit of Nitre. If, according to the Direction of Mr. *Boyle*, this Mercury be ſublimed with an equal Weight of Sal Ammoniac, it will afford a wonderful Salt.

Geoffroy's Directions for making the Mercury Sublimate are theſe.

Take any Quantity of pure Quickſilver, diſſolve it in Aqua-fortis, and diſtil the Solution to Drineſs. With the remaining ſaline Maſs, mix four Parts of decrepitated Sea-ſalt, and ſublime in a glaſs Matraſs with a ſhort Neck. What riſes, is a white ſaline cryſtalline Body, called corroſive Sublimate, or the poiſonous Dragon.

When taken inwardly, it proves a corroſive Poiſon, of the ſame Nature with Arſenic; but the Symptoms it cauſes, are quicker, and more terrible. It is uſed externally to conſume proud Fleſh, and to deterge old Ulcers. The Phagedenic Water is made of it, by diſſolving half a Dram in a Pint of Lime-water. The Solution is yelloviſh.

The Cure for thoſe Perſons who have unfortunately taken Mercury Sublimate, is performed by drinking large Quantities of Milk, Oil, or fat Broths, while the Poiſon remains in the Primæ Viæ; but, after it has got into the Blood, alexiterial Medicines are to be uſed, ſuch as *Venice* Treacle, Mithridate, Bezoar, Powder of Vipers, Contrayerva-root, and ſuch-like, and afterwards a Milk-diet.

Relative to this Poiſon, *Sydenham* gives the following very remarkable Caſe.

About two Months ſince, a Perſon in my Neighbourhood deſired me to viſit his Servant, who had taken a large Quantity of *Mercury Sublimate*, being melancholy mad for Love, as I afterwards heard. The Poiſon had been ſwallowed near an Hour, when I came, and his Mouth and Lips much ſwelled; he was extremely ſick, had a burning Pain in the Stomach, and was almoſt killed with Heat. I ordered him to drink three Gallons of warm Water, as quick as poſſible, and to take a large Draught of the ſame, after each time of Vomiting; and as ſoon as it appeared, from the Gripings, that the Poiſon was going downwards, I alſo directed warm Water alone to be plentifully thrown up by way of Clyſter, in order to waſh his Bowels. The Wretch comply'd, being now very deſirous to live, and drank ſeveral Pints of Water more than I had directed. He told his Friends that were by, that the Water, which firſt came up, was very acrid, by reaſon of its being ſaturated with the poiſonous Salt; but that it was leſs acrid after every Vomiting, till at length it became inſipid, and the Gripes that ſucceeded were remedy'd by injecting Water alone Clyſterwiſe. By this ſimple Method, the Patient was recovered in a few Hours; only the Swelling of his Lips did not immediately fall, and his Mouth remained ulcerated; occaſioned by the Particles of the Poiſon, which came up with the Water by Vomiting; but theſe Symptoms yielded in four Days to a Milk-diet. I preferred Water to Oil, (which is generally uſed by the leſs knowing without Succeſs) and all other Liquors, becauſe, being very thin, it ſeemed fitter to abſorb the Particles of this poiſonous Salt, than any other Liquor that was thicker, or already impregnated with the Particles of ſome other Body.

Of this corroſive Sublimate is made Mercurius dulcis, called *dulcified Sublimate*, *Aquila alba*, the *Dragon tamed*, and *Calomel*, in the following manner.

Take of corroſive Sublimate, ſixteen Ounces; grind it thoroughly in a Marble Mortar, pouring in, by ſlow Degrees, twelve Ounces of crude Quickſilver, well purify'd. Continue to grind them, till the whole Quickſilver diſappears, and then the Powder will be of a leaden Colour. This Powder, put into proper Glaſſes, to the Height of an Inch or two, is ſublimed by a ſlow gradual Fire, into a white Maſs; which, being ſeparated from the Fæces, and powdered, is, again, ſublimed.

This Preparation purges gently, divides all viſcid pituitous Humours, kills Worms, and is reckoned a ſovereign Medicine in Venereal Diſeaſes. The Doſe is from ſix to thirty Grains in Pills, or a Bolus; and, if the Uſe of it be continued for ſeveral Days, it will raiſe a Salivation. It is moſt commonly mixed with other purging Medicines; and ſome chuſe to give it in this manner, every other Day, in order to cure the Pox without Spitting.

Turbith of Mercury.

1. Put four Ounces of pure Quickſilver into an urinal Glaſs; pour thereon eight Ounces of rectified Oil of Vitriol; heat them gently and ſlowly; then put the Glaſs upon burning Coals, that the Matter may boil gently, with Care to avoid the Fumes; to which Purpoſe, the Operation ſhould be performed under a Chimney, that the Vapour may go off without coming at the Lungs. The Quickſilver, running at the Bottom of the Oil of Vitriol, will thus begin to diſſolve. Continue the ſame Degree of Heat, till all the Mercury be diſſolved; the Maſs will be white like Snow; calcine it with the ſame Degree of Heat, to Drineſs, or till it fumes no longer; it will be an exceeding white and ſnowy Powder, but intolerably ſharp, ſo as not to be touched: It is called the white Calx of Mercury, made with Oil of Vitriol. The Operation ſucceeds in this manner, but ſcarcely in thoſe commonly directed.

2. Grind the dry and hot Maſs in a dry Mortar, to fine Powder; have at hand a Glaſs full of clean hot Water, at leaſt twenty times the Weight of the Mercury; throw the Calx into it; at that very Inſtant, the white Powder falls thro' the Water to the Bottom, and acquires a beautiful Lemon-colour. Shake the Veſſel for ſome time, that the Powder may be well mixed with the Water; then let all ſettle; decant the Liquor into another Glaſs; waſh the remaining yellow Powder with ſeveral hot Waters, till it becomes perfectly inſipid; then dry it thoroughly with a gentle Fire: This beautiful yellow Powder is called Turbith Mineral.

3. Let the firſt Liquor, poured off, ſtand for ſome time; then ſtrain and inſpiſſate it to a third Part; it will be a Mercurial Water; for, if a little Oil of Tartar be dropt in it, a rediſh Precipitate will fall to the Bottom; and the Liquor may be kept under that Title.

REMARKS.

Thus the ſtrongeſt Oil of Vitriol, united to Mercury, makes a white fixed Powder, that will endure a very ſtrong Fire, as being much more fixed than one would imagine. We ſee there are different Effects of different Acids, with regard to the Colour. The white Colour here is not changed with the moſt violent Fire, though it was eaſily with the Spirit of Nitre. This white Powder, however, being calcined, becomes exceedingly corroſive, and thence poiſonous. Here we ſee a new Colour immediately ariſe, in a particular Manner, upon the bare Contact of Water; for if this white Powder be properly prepared, and laid in the open Air, it ſoon grows yellow on its Surface, by attracting the Moiſture of the Air. This ſeems to be the Powder, with which, when rightly prepared, *Paracelſus* performed Wonders, as appears from his Hoſpital Surgeon; and this is ſufficiently atteſted by *Oporinus*, who declares he has frequently been employed in making it. It may be rendered milder, by burning Spirit of Wine upon it, after the Manner of the antient Chymiſts, who, by theſe means, took away from their metalline Calces the Salts, that, externally adhering thereto, rendered them too ſharp, ſo that only the Salts intimately united might remain behind. The prudent *Sydenham*, who is a cautious and ſparing Commender of the Chymiſts, gratefully acknowledges, that, by means of this Medicine, Diſeaſes, otherwiſe incurable, might be cured. Mr. *Boyle* relates, that by a ſmall Doſe hereof, uſed as a Sternutatory, the whole Body has been changed, and even Cataracts cured. A Woman at *Paris* is, alſo, ſaid to have herewith cured Perſons given over. Hence it ſeems an extraordinary Medicine, in ſtubborn and obſtinate Caſes; but it requires a skilful Phyſician, and ſhould not be uſed, when ſafer Remedies may ſuffice. It is ſerviceable in the Dropſy, as well as in the Venereal Diſeaſe; and, alſo, in the moſt obſtinate Diſeaſes of the Glands. *Helmont* ſays, that Oil of Vitriol is here converted into Alum, barely by the Contact of Mercury; but this is either ſpeaking improperly, or not juſtly; but when that excellent Author directs the Fire

Fire of the Vitriol of Copper to be poured upon *Vigo*'s Powder, and thence diſtilled, for preparing the ſecret Cathartic of *Paracelſus*, if I underſtand him right, it makes this Medicine: For if the Fire of the Vitriol of Copper be the ſtrongeſt Oil of Vitriol, as ſoon as this is poured upon red Precipitate, it immediately renders the Spirit of Nitre volatile, cauſes it to fly off from the fixed Mercury, and ſoon after, ſupplying its Place, produces the Calx of Mercury as above. If the Water of Whites of Eggs be ſeveral times diſtilled from it, this takes away the Acid externally adhering thereto, and renders the Powder milder, though it will ſtill operate ſufficiently, which is an Effect ſeldom procurable any other Way. But if, by Fire, any thing elſe be here underſtood of a more ſubtile Nature, I can fix no other Meaning to it; but by comparing *Helmont* with *Paracelſus*, I ſuſpect it is no more than what I have ſaid. Metals alone have little Effect upon the Body, except by their Bulk, Figure, and Weight; but by Addition of Salts, eſpecially the acid Kind, they acquire new Properties, and thoſe often ſurpriſing, and very different, according as the Acids are more fixed therein, or adhere more externally. In the Form of Vitriol they act very violently; but, if calcined in this Form, the Calx grows gradually milder; and by a long-continued ſtrong Calcination, which drives out the Acids, they become mild, though before exceedingly ſharp, as we ſee happens in *Turbith*; and thus their Operation becomes milder, and, at the ſame time, proportionably leſs effectual. Thoſe Chymiſts and Phyſicians, therefore, are miſtaken, who, having found that this *Turbith* performed extraordinary Things, but operated violently, endeavoured to mitigate its Virulence, which indeed may be eaſily done, but not ſo as to have the ſame Effects when mitigated, as before. The Ways of mitigating the Acrimony, are by taking away the Acid, by waſhing the Preparation with Water, by frequently diſtilling pure upon it to Drineſs; by pouring Alcohol upon it; by diſtilling ſeveral Parcels of Alcohol upon it to Drineſs; by grinding it along with more metallic Matter, as in the Preparation of *Mercurius dulcis*, by the Addition of alcaline Salts, which abſorb the Acids; by grinding the Matter with Chalk, Crabs-eyes, teſtaceous Powders, or the like Abſorbers of Acids; by a long-continued Calcination; and, laſtly, by Fixation with a Fire gradually increaſed from a moderate Heat to the higheſt that Glaſs will bear.

The fiery Oil of Mercury.

Take Mercury, calcined with Oil of Vitriol, to a dry ſnowy Calx, as in the preceding Proceſs; ſuffer it to cool; put it into an Urinal Glaſs, and pour thereon an equal Quantity of Oil of Vitriol; boil, as before, almoſt to Drineſs, with great Care to avoid the Fumes; it now dries with much more Difficulty, and requires a longer Time, and a much ſtronger Fire. When the Powder is dry, put the ſame Quantity of Oil of Vitriol to it, and proceed as before; at length it will ſcarcely dry by a long-continued and ſtrong Fire, but begin to ceaſe flowing, and to grow rigid like fixed Oil; being highly ſharp, cauſtic, and not to be touched, like the *Ignis Gehennæ* of *Paracelſus*: By this means the Mercury is ſo fixed with the Oil of Vitriol, as not to go off with the violent Action of the Fire.

REMARKS.

This Experiment ſerves to ſhew the Method of impregnating, ſaturating, and incerating Metals by Acids, to any Degree; and, alſo, of fixing volatile Mercury by them, ſo far as is poſſible: But no Metal is hence to be expected; for, in whatever manner Mercury is fixed with Acids, yet it is again recoverable in its priſtine State, by grinding it with twice its Weight of Iron Filings, and diſtilling it in a glaſs Retort, with the higheſt Degree of a Sand-heat.

Other Preparations of Mercury.

The *Mercurius Præcipitatus per ſe* is thus prepared:

The Mercury firſt well purified, put it into a flat-bottomed Glaſs, called *Vas Infernale*, which being ſet in a Sand-heat, the Fire is gradually increaſed, and the Metal turns firſt to an Aſh-coloured Powder, and, at length, becomes very red. It cauſes Vomiting, purges downward, and provokes Sweat, being given from two to ſix Grains. *Geoffroy.*

Mercurius præcipitatus Solaris per se, according to the *Pharmacop. Batean.* is made of an Amalgama prepared of four Ounces of Mercury, with half an Ounce of Gold fuſed with Antimony, and placed in the *Vas Infernale*, taking the Matter often out, and triturating it according to Art.

The *Green Precipitate* is thus prepared:

Take of pure Mercury, four Ounces; of thin Copper-plates, an Ounce: Diſſolve them ſeparately in Spirit of Nitre, then mix the Solutions, and evaporate to Drineſs. The remaining Maſs, being reduced to Powder, is digeſted, with diſtilled Vinegar poured on it, to the Height of ſix Fingers-breadth above it. When the Vinegar is tinctured green or bluiſh, it is poured off, and more put in its Place, as long as the Maſs can communicate any Tincture: then all theſe Tinctures, being mixed together, are evaporated to the Conſiſtence of Honey; and this Subſtance, when cool, grows hard; and, being reduced to Powder, is kept for Uſe.

It purges both upward and downward, and is reckoned by ſome a Specific in a virulent Gonorrhœa. The Doſe is from two to eight Grains, to be repeated every Day, or every other Day, till the Running ceaſes. Others reckon it an unſafe Medicine, becauſe of the poiſonous Quality of the Copper.

The *Violet*, or *Black Precipitate*, called by ſome Diaphoretic Mercury, or the Mercurial Panacea, is uſually made in this manner:

Take of pure Sulphur, four Ounces, and melt it in an earthen Veſſel over a Charcoal-fire: Into the melted Sulphur throw, with great Care, ſix Ounces of very clean Quickſilver, ſtirring it conſtantly with an Iron Rod; and, when they are perfectly incorporated, add four Ounces of Sal Ammoniac. Let this Maſs be ſublimed in a glaſs Veſſel; and, mixing the Sublimate with the Fæces, let them be again ſublimed; and repeat this Operation four times; then ſeparate the heavy, blackiſh or bluiſh Maſs, at the Bottom of the Veſſel, from the other light, rare, yellowiſh Subſtance, which is of no Uſe.

The laſt Preparation of Quickſilver in *Geoffroy* is the *Mercurial Panacea*, ſo called from its extraordinary Qualities; and which, ſays he, may be juſtly named *Panacea Ludoviciana*, becauſe the Secret was bought, and made public, by *Lewis* XIV. It is made in the following manner:

The crude Quickſilver is purified by being firſt made into Cinnabar, and then extracted from thence. Of this Mercury revivified from Cinnabar, is made corroſive Sublimate, which muſt be thrice ſublimed; twice with Sea-ſalt, and once without any Addition. Part of this Sublimate is again reduced to running Mercury, and the remaining corroſive Sublimate is made *Mercurius dulcis*, by nine Sublimations. Laſtly, this *Mercurius dulcis* is put in Digeſtion for three Weeks, with any aromatized Spirit of Wine; and afterwards ſeparated from the Liquor, and dried for Uſe.

This is undoubtedly an excellent Medicine in all Venereal Affections; and is recommended, alſo, in Rheumatiſms, Obſtructions of the Meſentery and Glands, King's Evil, the Itch, Tetters, and Worms. Some uſe it, alſo, for the Scurvy; but, in my Opinion, no Preparation of Quickſilver can be proper in that Diſtemper. The Panacea more readily ſalivates than *Mercurius dulcis*, becauſe this latter often paſſes off by Stool. *Geoffroy.*

Mercurius Resuscitatus.

Mercury revived from Cinnabar.

Take Cinnabar, one Pound; calcined Tartar, or Pot-aſhes, one Pound; Calx viva, two Pounds; grind theſe well together, and put them into a Retort, leaving, at leaſt, one Part in three empty; place it in a Reverberatory Furnace, and ſet to it a Receiver; let it ſtand twelve Hours, and then kindle a Fire, increaſing it gradually to the fourth Degree; keep it ſo till the Mercury is all come over into the Receiver, which will be in ſeven or eight Hours time; then waſh away the Filth, and ſtrain the clean Mercury through a clean Napkin, into an earthen Diſh.

Pulvis Principis: *Prince's Powder.*

Take of the red corroſive Precipitate of Mercury, half a Pound; grind it very well upon a Marble or Porphyry-ſtone; put it into a Cucurbit with two Quarts of Water; Place it in a Sand-furnace, and give it a Fire to make it ſcalding hot; let it ſtand ſo twelve Hours, ſtirring it about once in two Hours; then let it cool, and decant the Water. Put this Precipitate into Water a ſecond time, and a third, repeating the Operation as before. Then dry the Precipitate, and grind it with double the Weight of the Salt, extracted from the Reſiduum of the Tinctura Metallorum: Put them into a Cucurbit with Water; proceeding in all things as above, till the Precipitate remain inſipid; then

dry it, and boil it in Spirit of Wine: Decant the Spirit when cool, and dry the Precipitate.

This is emetic and cathartic, and is preſcribed in Venereal and Chronic Caſes. The Doſe is from three Grains to half a Scruple. The ſeveral Ablutions ſerve only to leſſen the Quantity and Pungency of the Salts, which the Precipitate received in Making from the Aqua-fortis, and ſo to render it milder in the Operation.

MERCURIUS VITÆ. See ANTIMONIUM.

For the *Arcanum Corallinum*, ſee ARCANUM.

HERCULES BOVII.

The moſt proper Method of preparing this Medicine, is the following, directed by *Thomaſus Bovius*.

Take of calcined Vitriol, and Nitre, each one Pound; diſtil in a Reverberatory Furnace; pour the diſtilled Liquor upon one Pound of calcined Sea-ſalt in a glaſs Retort, draw it off by a gentle Sand-heat; for it eaſily aſcends: The Mercury is to be diſſolved with one Portion of this Liquor, and the Gold by another; then both Solutions, when joined, are to be drawn off; and, after frequent Cohobations, adding at each time, about a third Part of the ſame Menſtruum, let the Diſtillation be repeated till the Matter is ſufficiently fixed; which when duly edulcorated, is to be kept for Uſe. The Doſe is from three to five or ſix Grains: Or,

Take of purified Mercury, four Ounces; of the Filings of Gold, half an Ounce; make an Amalgama, to which, when waſhed, and put into a Retort, pour the aforeſaid Menſtruum of *Bovius*; draw off in a Sand-furnace; and, after frequent Cohobations, adding at each time about a third Part of the ſame Menſtruum, let the Diſtillation be repeated till the Matter is ſufficiently fixed. Then let the Matter be calcined on a red-hot Plate of Iron, and edulcorated by frequent Waſhings, and burning Spirit of Wine upon it. The Doſe is from three to ſix Grains: It operates gently by Vomit; and often affords ſingular Relief in very terrible Diſorders, becauſe, getting beyond the Primæ Viæ, it operates immediately on the Maſs of Blood. *Willis*.

As the Aurum Vitæ is a celebrated Mercurial Preparation, we ſhall, under this Article, give Dr. *Bates*'s Directions for its Compoſition. This Medicine therefore is prepared in the following Manner:

Take of Gold, two Drams; of purified Mercury, two Ounces, ſeparately diſſolved in their proper Menſtruums, duly mixed, and in a Retort diſtilled to Drineſs. Calcine the remaining Calx, edulcorate by waſhing with Water, and an artificial Kindling of Spirit of Wine.

This Medicine is ſaid to ſurpaſs all other Cathartics, to remove Worms, cure the Lues Venerea, Petechial Diſorders, the Plague, and Quartan Fevers. The Doſe is from three to ſix or eight Grains, with Sugar of Roſes, in an Egg or Broth, or in Pills, eſpecially when joined with Scammony, and moiſtened with Aqua-vitæ burned upon it.

The Curious may find many more Mercurial Preparations in the *Collectanea Chymica Leydenſia*.

FREDERIC HOFFMAN'S DISSERTATION ON MERCURY.

Mercury is ſometimes ſo adulterated, as to produce very terrible and uncommon Symptoms: Thus, Mercury is commonly adulterated with Lead; but this Fraud is, I think, adverted to by none except *Quercetan*, in his *Conſilium de Lue Venerea*; for by the Intervention of *Biſmuth*, Lead, if its Quantity is not too large, may be forced through Leather, and rendered ſo fluid and moveable, as to prevent all Suſpicion of Fraud. Hence 'tis obvious, how inſufficient and ſuperficial the Depuration of Mercury muſt be by ſuch an Expreſſion alone. But what terrible Effects are produced by Lead internally taken, is ſufficiently obvious to any one, who is but a little converſant in the Writings of practical Authors; and a ſmall Quantity of it is abſolutely deleterious, when treated in a manner not unlike that uſed when Mercury is adulterated with it. But what ſome aſſert, which is, that Quickſilver attracts and aſſociates with itſelf metallic Impurities from Mines of Lead, Antimony, and Arſenic, ſeems to be entirely groundleſs; for, in thoſe Parts where Quickſilver is copiouſly obtained, Mines of this Kind are not contiguous to thoſe of the Mercury: Beſides, Quickſilver, which is eaſily mixed with ſome metallic Subſtances, nevertheleſs, when inherent in the Ore, and coagulated with the Vapour of the Sulphur, admits no intimate Mixture of Metals, or other contaminated Bodies. But, notwithſtanding theſe Circumſtances, it happens from other Cauſes, that all the Species of Mercury have not an equal Purity, and Subtilty of Parts. Hence one Species is often found far more valuable than another. That Mercury, however, is ſufficiently good, and fit for moſt Purpoſes, which, when expoſed to the Fire, is quickly and totally exhaled, ſo that no Part of it is left. That, alſo, is good, which, by Digeſtion, neither throws a foul Sordes up on its Surface, which is generally produced by the Biſmuth, nor contracts a Pellicle on its Surface, but quickly acts upon Metals, and ſpeedily deſtroys their Cohеſion. 'Tis a common, tho' falſe Opinion, that good and genuine Mercury, after Depuration in a ſilver Veſſel, leaves a yellow Spot behind it; which however is never readily obſerved, unleſs the Mercury has been frequently amalgamated with Gold, and afterwards ſeparated from it, or depurated, and revived after the Method of *Philaletha*, which we ſhall in the Sequel deſcribe.

We now come to conſider the Elements or Principles, of which Mercury conſiſts. But this Subject is ſo involved in Perplexities, and ſo incumbered with the ſubtile Hypotheſes of the Atomiſts, as to furniſh the Mind with nothing but vague and general Speculations. From rational and conſiſtent Principles of Chymiſtry, more probable and uſeful Truths might be diſcovered; but, even by theſe, this obſcure Subject has not been fully explained. 'Tis, however, certain, from the Experiments of various Authors, and eſpecially of *Becher*, that all Metals are compos'd of a certain ſolid and compact Earth, which conſtitutes their Baſes and Body. But ſince there are only two principal Kinds of Earths; the one comprehending the fuſible Earths, which are fit for being colliquated into vitreous Subſtances, and, therefore, called vitreſcent; the other containing the calcareous, that is, ſuch Earths as cannot be colliquated by the ſtrongeſt Fire, but are, by its means, burn'd to a Calx, or a light and porous Subſtance; hence it follows, that ſince the former Species of Earths are furniſhed with theſe Properties of Metals, Weightineſs, Fuſibility, and Malleability, Metals muſt enter their Compoſition. Such a ſolid Earth, therefore, of a fuſible and vitreſcent Nature, intimately, and in its minuteſt Particles, mix'd with an unctuous Matter more or leſs acid in ſubterraneous Cavities, by means of the Ether, conſtitutes the Matter of metallic Subſtances, the Variety of which depends only on the different Purity and Proportion of this Earth, with reſpect to the unctuous Matter, and the different Mixtures of theſe with each other. This is ſo effectually confirmed by the Experiments of *Becher*, in his *Phyſica Subterranea*, and of ſome others, that there is not the leaſt Poſſibility of entertaining a Doubt about it. We may, therefore, affirm, that Mercury, tho' differing from other Metals, with reſpect to its Fluidity, has yet the ſame common Origin with them; and that its conſtituent Matter, and conſiderable Weight, are owing to this ſolid and compact Earth; but that it contains a ſmall Quantity of the unctuous Subſtance, for which Reaſon it is not compacted into a ſolid Conſiſtence, like other Metals, but more eaſily yields to the brisk Undulations of the Ether, from which it derives its Fluidity. And, if we carefully advert to the Matter, it will be ſufficiently obvious, that, ſince this ſolid Earth, which conſtitutes the Baſis of Mercury, is, by the highly-accelerated and internal Motion of the Ether, continually circumagitated, all its moſt minute Particles muſt, by this rapid Agitation round their Axis, aſſume a round Figure, and become highly ſmooth and poliſh'd Globules of a ſurpriſing and indefinite Smalneſs. From this Smalneſs, and Mobility of the globous Particles of Mercury, ariſe not only its Properties, but, alſo, the Effects it produces on other metallic, as well as animal and organic Bodies.

Thus, therefore, we firſt account for that Fluidity in Mercury, which is ſo ſurpriſing, that nothing in Nature comes up to it; for it is entirely deſtitute of Humidity. Hence Mercury is by the Chymiſts called *a dry Fluid, which does not moiſten the Hands*. This Circumſtance ſeemed ſo ſurpriſing to *Fallopius*, that he call'd Mercury the *Miracle of Nature*. But the principal Cauſe of this Fluidity is the ſubtile Ether* copiouſly intermixed with the minute Globules of the Mercury. By the brisk and continual Agitation of this Ether the Particles of Mercury have their Situations ſo changed, and are ſo disjoined, that they eaſily yield to the Contact or Action of other Bodies, in which it is univerſally agreed that the very Eſſence of Fluidity conſiſts. But this Fluidity is not accompanied with Moiſture, becauſe the Particles, of which Mercury is compounded, are poliſhed, and highly ſmall; in conſequence of which they can neither be eaſily ſtopt in their Motion, nor readily adhere to other Bodies; which happens when Fluids are compoſed of branchy, viſcid, or more flexible Parts, ſuch as Oil, Water, and a great many others. But that this ethereal Subſtance is the Cauſe of Fluidity in Mercury, beſides the various Hypotheſes of Philoſophers, may, alſo, be proved by this, that, by means of Efferveſcence and Ebullition performed with various Salts, skilful Chymiſts can from Lead, or Regulus of Antimony, obtain a ſufficiently fluid Mercury; which happens partly becauſe the Salts, uſed for this Purpoſe, deſtroy the Cohеſion of theſe Metals, and render them fluid; and partly becauſe by the Conflict, and mutual Re-action of theſe Salts, a large

* *Hoffman*, inſtead of ſuppoſing this Ether to exiſt, and its Action, ſhould either have proved it, or ſaid nothing of it; for Hypotheſes of this kind are far from conveying Knowledge, and improving the Underſtanding.

Quantity of the ethereal Fluid is either produced, or collected, and put into a more rapid Motion, by which the yielding, and before highly moveable Particles of Metals are continually carried round their Axis, and by this means aſſume the Nature and Properties of Mercury. Beſides, upon this brisk and lively Action of the Ether on the minute Particles of the Mercury, depends its Volatility, which is ſo great, that upon the Acceſs of a gentle Heat it diffuſes a large Quantity of Effluvia, as is ſufficiently known from its Effects, when uſed as an Amulet, if we may believe the Accounts taken from *Hercules Saxonia*, by *Wedelius*, in *Tract. de Medendorum Facultat.* But if, by an intenſe external Heat, that of Fire, for Inſtance, the Elaſticity and Expanſion of the Ether in the Mercury are augmented, the Particles of the Mercury are gradually elevated, and exhaled in the Form of an almoſt inſenſible Vapour.

Beſides the Volatility and Fluidity of Mercury, it is, alſo, ſo heavy, as in Weight to exceed all other Metals, except Gold. The Matter of this Gravity is, without doubt, ſupplied by that ſolid Earth, from which Mercury has its Conſiſtence. All the Particles of this Earth, though highly ſmall, are yet ſo denſe, and lie ſo cloſe to each other, that they form Interſtices ſo ſmall as only to admit the Ether, and exclude the groſſer Air, as is certain from various Barometers, but eſpecially that of *Torricelli*. Hence, notwithſtanding the brisk inteſtine Agitation of all the Parts of Mercury, for the Continuation of which the ſubtile Ether is abundantly ſufficient, yet Mercury, of itſelf a denſe Subſtance, is ſo compreſſed by the circumambient Atmoſphere, as neceſſarily to conſtitute a Body of remarkable Weight. But though Fluidity and Mobility may at firſt ſeem rather to diminiſh than augment the Gravity of Bodies, yet the contrary may be proved from the moſt common Experiments; for we obſerve, that melted Metals are ſpecifically heavier, than ſuch as are ſolid: Thus, for Inſtance, if ſolid Silver is thrown into a Quantity of the ſame Metal fuſed, the former ſwims upon the latter. The ſame holds true in Ice, which is ſpecifically lighter, and takes up a proportionably larger Space, than fluid Water.

From the principal Properties of Mercury, already enumerated, we may, as it were, from ſimple and demonſtrative Principles, account for its Effects on other Bodies. That Solution, then, of Metals produced by Mercury, in what we call Amalgamation, is only to be aſcribed to the minute Globules of Mercury, which, being ſtrongly exagitated, eſpecially by external Heat, quickly enter the Pores of all Metals, except thoſe of Iron; and, by their deſtructive Motion, ſo disjoin and ſeparate the Coheſion of all the Parts, that, in minute Bulks, they ſwim in the Globules of Mercury, and reſemble a Subſtance of the ſame Ductility with Wax. Beſides, Mercury produces more powerful Effects on the human Body, than any other Medicines: For, if Quickſilver, properly ſubdued with Lard, is applied externally, by way of Ointment, to the Body, and even its tendinous Parts, or if repeated Doſes of the *Mercurius præcipitatus dulcis* are exhibited internally, the minute Particles of the Mercury, put in Action by the Heat of the Body, not only in conſequence of their globular Figures, and ſmooth Surfaces, but, alſo, by means of their ſpecific Gravities, quickly continue the Motion: For which Reaſon they eaſily enter the moſt remote and narrow Receſſes of the Body, break through the viſcid and impervious Humours lodged in them, and, by their Gravity, ſtimulating the moving Fibres, rouſe them to more frequent Contractions, and, by that means, accelerate the Circulation of the Humours through all the Veſſels; and all theſe Effects are produced without any Violence. But, if there is a large Quantity of acrid Salts in the Humours, and if theſe Salts ſhould approach to, and be united with, the Globules of Mercury, theſe Salts, before of a mild Quality, aſſume a pernicious and corroſive Nature: For which Reaſon, being forcibly applied to the moving and nervous Fibres, they not only throw them into violent Commotions, but, alſo, ſtimulate them to greater Contractions. Hence the interſpers'd Blood-veſſels are compreſſed, and the free and natural Circulation of the Blood through them intercepted: By this means an unequal Diſtribution of the Humours is made, and a too copious Congeſtion of them to the laxer Parts, and ſuch as are leſs ſubject to Conſtriction, is produced. But there are many lax lymphatic Glands, falſly taken for thoſe of the conglomerate Kind, ſince they rather conſiſt of a Compages of Veſicles and Cellulæ looſely cohering with each other, which are more lax than the other Parts; and of this Sort, in particular, are the ſpongious and glandular Coat of the Fauces, and the Tonſils, together with the other ſalival Glands, to which when the Mucus and Saliva are copiouſly congeſted, and, as it were, derived from other Parts, theſe Glands become ſo remarkably turgid, as, if a Swelling of the Tongue happens at the ſame time, which it frequently does, to bring on a conſiderable Danger of Suffocation. When this Tumor is broken, either by the Weight of the Mercury, or by means of the ſmall Ulcers, which are ſufficiently manifeſt from the fetid Smell, and produced by the Mercury aſſuming a corroſive Quality by the Acceſs of the acrid Salts of the Humours, there is produced a liberal Diſcharge of the Saliva, which, if a due Regimen is uſed, is protracted for ſome Weeks. But that, during this Salivation, there is a copious Congeſtion of Humours to the ſalival Veſſels from other Parts, is ſufficiently obvious from this, that, in ſuch a Courſe, the whole Habit of the Body is remarkably collapſed, or rather conſtricted, and the Veins, before conſpicuous and turgid, either plainly diſappear, or are very ſmall; ſo that Men, before ſufficiently full of Juices, appear waſted, decayed, and unſeemly; which is a manifeſt Sign, that the Skin, or tendinous and membranous Parts, together with the ſubjacent Veſſels, are remarkably conſtricted; and conſequently that the Acceſs of the Blood, and other Humours, to theſe Parts, is diminiſhed; which, in all Probability, happens, alſo, in the other membranous Parts, ſince their State and Condition is the ſame. Beſides, a Salivation, when immoderate, may be checked, or even ſtopt and diverted by the Exhibition of Sudorifics, with a warm Regimen, or by means of Purgatives; for, by the former, the equal Diſtribution of the Humours through the whole Body is reſtored, and by the latter a Congeſtion of them to other Parts, that is, the Inteſtines, is produced.

From what has been ſaid it is ſufficiently obvious, that the Action of Mercury on the human Body may be ſo heightened, that, becoming highly contrary and incongruous to the vital Motions, it aſſumes the Nature of a Poiſon: For ſince, as we have already obſerved, by the Agility and Gravity of the globular Particles of Mercury no very violent Commotions are excited, for this Reaſon, if any Diſadvantages attend the Gravity of crude Mercury, theſe muſt happen in ſuch Caſes as do not admit of violent and brisk Commotions. When, for Inſtance, there is a Redundance of thick Humours, theſe may, by the violent Commotion, be ſo impelled into the Subſtance of the Viſcera, and other Parts, that, not finding an eaſy Paſſage, violent Infarctions, and other Diſorders ariſing from them, are juſtly to be dreaded. But theſe Diſadvantages are rather to be aſcribed to the Ignorance and Raſhneſs of the Phyſician, than to any inherent Fault in Mercury. But if, by external Cauſes, the Operation of Mercury is heighten'd, violent and pernicious Commotions of the Humours are eaſily excited, as we principally obſerve in Mercurial Suffumigations, the Violence of which is ſometimes fatally experienced by Gilders, and confirmed by melancholy Inſtances given by various Authors. Beſides, if a ſtrong nitrous Acid, or that of common Salt, is intimately mixed with Mercury, a Concretion is produced, as is obvious from making Sublimate Mercury, a very ſmall Doſe of which proves an highly rank and virulent Poiſon; for tho' neither of theſe, ſeparately, is equally offenſive to the Body, yet, when theſe Salts are united with the Globules of Mercury, they, by the rigid Spiculæ with which they are furniſhed, ſo ruffle and diſcompoſe the ſmooth and poliſhed Surface of the Mercurial Globules, that they adhere more eaſily than they did before, to the Fibres of the Parts, and are, by the increaſed Motion of Gravity, more deeply imprinted in them; by which means they not only violently corrode them, but, alſo, induce inordinate and ſpaſmodic Motions of the nervous Syſtem, which never fail to prove fatal to the Patient: But, though the ſmooth Globules of Mercury may be render'd rough by the ſaline Sordes of the Humours, and tho', from this Circumſtance, principally, ariſe the prejudicial Commotions of the Humours, produced by the prepoſterous Uſe of crude Mercury, yet theſe Globules cannot, in like manner, aſſume a corroſive Quality, unleſs there is a violent Intemperature of the Humours, or unleſs, in thoſe Diſeaſes which proceed from ſuch a Peccancy of Humours, it is exhibited crude, or by a previous Correction not ſufficiently accommodated to them. Hence we may eaſily infer, that the cautious Uſe of Mercury, or even a Salivation excited by its means, are of themſelves by no means prejudicial to the Body, but are, rather, highly beneficial, in removing ſeveral obſtinate and chronical Diſorders, eſpecially thoſe ariſing from a conſiderable Lentor and Immobility of the Humours, or their too great Spiſſitude, and the Infarction of various Parts, eſpecially thoſe of the glandulous and excretory Kind, ariſing from this Circumſtance: For theſe Diſorders are generally ſo obſtinate, as by no means to yield to the milder Medicines obtained from the Animal and Vegetable Kingdoms; for theſe, whether of a reſinous, or of a ſalino-ſulphureous Nature, are eaſily ſo obtunded, and precipitated, by the Sordes of the Primæ Viæ, as only to tranſmit into the Blood a kind of Exhalation, which will ſoon be overpower'd by the large Quantity of that peccant Fluid. On the contrary, ſaline Medicines, tho' in other Caſes highly efficacious, are, nevertheleſs, inſufficient for conquering the Obſtinacy of chronical Diſorders; for thoſe of the volatile Kind, by exagitating the Blood too impetuouſly, excite preternatural Commotions, and, in a particular manner, throw the Humours, if they are not, before, ſufficiently moveable, into the excretory, or even the more noble Viſcera, from which they cannot be ſo eaſily expreſſed, ſince the Efficacy of the volatile Medicine is diſſipated: Hence it happens, that theſe Viſcera are violently infarcted, and a Foundation laid for far more terrible Diſorders: But if the Salts are of a fixed Nature, whether alcaline, alcalino-vitriolic, tartareous, or of any other Kind, they either do not extend their abſtergent Virtue beyond the Primæ Viæ; or, if any Part of them reaches the Maſs of Blood, it is carried off by the excretory Ducts, by Urine for Inſtance, before

fore it can produce an Effect of any Importance. Of greater Efficacy, therefore, than all theſe, or, perhaps, than all the other Metals, is Mercury, which, in the manner above-mentioned, rouſes the torpid and immoveable Humours; divides and attenuates thoſe which are viſcid; removes the Infarctions of the Glands, and other Parts; ſeparates and abſterges the ſalino-ſulphureous Particles of the Venereal Taint, and other polluted Matter, lodged in them, and adhering to the moſt remote Glands, and even in the Laminæ of the Bones, not without an uncommon Danger of Corruption; and afterwards, by a profuſe and liberal Diſcharge of Saliva, eliminates the Serum from the Body.

The many and great Encomiums, therefore, beſtowed upon a Salivation, in order to remove the Obſtinacy of the Lues Venerea, are by no means frivolous and ill-grounded, eſpecially ſince, by the uninterrupted and conſtant Experience of two Centuries, they are ſo confirmed, that no one has with Succeſs made an Attempt to depreciate and diſcredit the prudent Uſe of a Salivation. Beſides, there have been in former Ages, and ſtill are in our own Days, skilful and celebrated Authors, who have recommended this Method of Cure in other chronical Diſorders, and ſuch as would not yield to the Efficacy of milder Medicines: But, as this in general is ſufficiently obvious from their Writings, we ſhall only enumerate a few of the principal Caſes, in which they recommend a Salivation. For the Cure, then, of a violent Itch, or even of an Elephantiaſis, before the Appearance of the Lues Venerea, Quickſilver mixed with Ointments, and applied in that Form, was uſed by the *Arabians*, and principally recommended by *Meſue in Antidot.* and *Serapion*, as appears from *Sennertus*, who in his *Praxis*, *Lib.* 6. *Par.* 4. *& Cap.* 21. treats of this at greater Length. *Sylvius*, alſo, in his *Method. Medend.* warmly recommends the Uſe of a Salivation, for the Cure of an obſtinate Itch; and affirms, that this Method ought, alſo, to be uſed in other obſtinate Diſorders. Among others, the celebrated *Willis*, in his Treatiſe *de Scorbut. Cap. ult.* affirms, that in an inveterate, and what we call a cold Scurvy, a Salivation is ſo far from being uſeleſs, that, to ſome, it has been found to yield an immediate Relief. And *R. Lentilius*, treading in his Steps, in various Paſſages of his *Miſcel. Pract.* but eſpecially in the ſecond Part of that Work, gives us Inſtances of a ſcorbutic Atrophy perfectly cured by means of a Salivation, though not without conſiderable Uneaſineſs to the Patient. An Inſtance of a dropſical, ſcorbutic, and cachectic Habit, cured by a Salivation, is found in *Miſcel. Nat. curioſ. Decad.* 2. *An.* 3. *Obſ.* 173. *Ballonius*, in his *Epid. Lib.* 2. highly commends a Salivation for the Cure of a Quartan Fever: And *Willis*, in his Treatiſe *de Feb. Cap.* 4. gives us an Inſtance of a Woman happily cured of a Quartan Fever by Salivation. This Piece of Practice was, perhaps, firſt founded on an Obſervation of *Hippocrates*, who, in his *Epidem. Lib.* 1. *Sect.* 3. informs us, that obſtinate intermittent Fevers frequently terminate in a critical Salivation, the Truth of which, at preſent, quadrates with the Experience of judicious Phyſicians. *Sylvius*, *in Prax. Med. Append.* 8. thinks, that in arthritic Pains, when acid and viſcid Humours abound, a Salivation would be beneficial out of the Paroxyſm: That the Pains of the Gout were removed by a Salivation, but ſo as to return after three Years, we read in *Wedelius's Tr. de M. F.* In Madneſs and Melancholy it is extolled as a ſovereign Remedy, by *Rolfinckius*, *Epiſt. cognoſc. Part. aff. Lib.* 1. *Cap.* 12. as, alſo, by *Willis*, in *Path. Cerebr. Part.* 11. *Cap.* 12. who affirms, that he knew ſeveral mad Perſons cured by a copious Salivation long protracted. In obſtinate Head-achs, *Rolfinckius*, *in Meth. M. Sp. Lib.* 6. *Sect.* 3. *Cap.* 1. highly recommends a Salivation, where he, alſo, makes mention of an epileptic Patient infected with the Lues Venerea, cured of both his Diſorders, by means of a Salivation. And *Willis*, in the Part already quoted, *Cap.* 3. after in vain uſing Cathartics and Specifics in Epilepſies, orders a Salivation. In Cataracts, and perfect Blindneſs ariſing from them, *Riverius*, in *Prax. Lib.* 2. *Cap.* 5. and *Boyle*, *de Util. Phyſ. Experim.* highly commend a Salivation. *Rhodius*, alſo, *in Analect. ad Septal.* obſerves, that an Obſtruction of the Optic Nerve, and an Amauroſis ariſing from it, after in vain uſing Alterants, and other ophthalmic Medicines, was happily diſcuſſed by a Salivation. For the Cure of inveterate Ulcers, a Salivation is recommended by *Cardilucius*, *in Offic. Sanitat.* And *Morton*, who in *Phthiſiolog. Lib.* 1. *Cap.* 5. ſtyles it the laſt Aſylum of malignant Ulcers.

In conſequence of theſe Encomiums, the Efficacy of a Salivation is become ſo common a Topic of Converſation, that not only Phyſicians, but, alſo, Surgeons and Barbers, boaſt of great Feats they have performed by it. But it is neither proper, nor are the Obſervations of the moſt skilful Phyſicians ſo contrived, that any one may raſhly lay them down as the Model of his Practice; for, unleſs the Nature of the Diſeaſe is perfectly diſcover'd, and a due Regard had to the Diverſity of Circumſtances, it is not to be doubted, but a Salivation may be as quickly productive of bad, as ever it was obſerved to be of good Effects. But the Circumſtances which ought to be duly weighed before the Uſe of a Salivation, are often ſo latent and obſcure, that they cannot poſſibly be known: Hence it is, that Patients by this Method, which, in the ſame Diſorders, afforded immediate Relief to others, are either to no Purpoſe render'd highly uneaſy, or, which more frequently happens, are expoſed to imminent and irreparable Danger. For this Reaſon *Willis*, in *Pharmac. Rat. Cap.* 8. ingenuouſly confeſſes, that, by repeated Salivations, he removed the Impetigo of a young Woman, though not ſo effectually but it again returned with the ſame Virulence, notwithſtanding ſhe uſed a very exact Regimen. This Phyſician had not taken ſo precarious and uncertain Meaſures, if he had duly conſidered the various Circumſtances, by which the Obſtinacy of the Diſorder was ſupported and cheriſhed. For the like Reaſon a Quartan Fever, at other times happily cured by a Salivation, was unexpectedly excited by its means, as we are informed in *Act. Hafn. Vol.* 5. *Obſ.* 46. And *Wedelius*, in *Miſcell. Nat. curioſ. Decad.* 2. *An.* 4. *Obſ.* 120. gives us a fatal Inſtance of the bad Succeſs of Mercurial Unction, in arthritic Pains. In a Word, there are ſo many Inſtances of Salivations, which have produced bad Effects, that it would be both ſuperfluous and tedious to enumerate any more of them. And, if the genuine Worth of Salivation was to be diſcredited by contrary Obſervations, I believe as many Inſtances of its bad, as of its good Effects, might be given: But it is unfair to diſcredit a Method, ſupported by the juſteſt Obſervations of the greateſt Men, by ſuch means: But, from the many Inſtances of bad Effects, produced by Salivation, I think it plainly follows, that the Encomiums beſtowed on this Practice are too general; and that the Patients ought not to be expoſed to the Danger attending it, except abſolute Neceſſity requires it; when, according to the Maxim of *Celſus*, it is more expedient to uſe a dubious Remedy, than none at all; for precarious Hope is preferable to abſolute Deſpair. But Raſhneſs, and unreaſonably bold Attempts, ought never to ſtain that ſalutary Art, the principal End of which is the Health and Safety of Mankind.

Though we are not raſhly, and without juſt Grounds, to diſpute the Efficacy of a Salivation in a Lues Venerea, even of the moſt obſtinate and inveterate Kind, yet it muſt be owned, there are many Circumſtances, which either abſolutely do not admit of a Salivation in a Lues Venerea, or which, if neglected and overlooked, render it highly dangerous. But, ſince this is ſufficiently obvious to thoſe converſant in Practice, we ſhall only conſider the principal Diſadvantages ariſing from the prepoſterous Uſe of Salivations. Among the moſt frequent Symptoms of a Lues Venerea, of ſome ſtanding, we may juſtly reckon the various Diſorders incident to the Palate, to the Uvula, and the Tonſils; together with the Eroſions and Exulcerations of the Fauces, which, ſpreading deep into the ſubjacent Parts, often reſemble an eating Cancer, and cannot be totally cured and conſolidated, till the Diſorder which gives Birth to them is effectually ſubdued and removed. In this Caſe, therefore, if in any, we are to obſerve this Maxim, that the peccant Matter is neither to be convey'd to, nor evacuated by, the Part affected: Otherwiſe it muſt almoſt neceſſarily happen, that, by an Accumulation of the Saliva, which, to the Taſte of the Patient, is æruginous, virulent, and has its Qualities heighten'd by the Mercury, a Gangrene muſt be produced, and ſoon after ſucceeded by a fatal Sphacelus of theſe Parts: Of which, among others, *Hildanus* furniſhes us with ſome remarkable Inſtances, in *Cent.* 3. *Obſ.* 92. The Uſe of a Salivation is, alſo, diſcharged, in Caſes where, beſides a Redundance of thick and viſcid Humours, the Patients Strength is much impaired; and this is, indeed, a highly juſt and rational Maxim; for ſince, in conſequence of the Languor of the whole Body, and the Defect of a due Tone, and ſufficient moving Force, all the Parts, and even the more noble Viſcera, are preternaturally flaccid, hence it happens, that the viſcid Sordes of the Humours, being thrown into violent Commotions by the Efficacy of the Mercury, are eaſily, and in great Abundance, thrown into theſe Viſcera, but cannot, in conſequence of the Weakneſs of the moving Fibres, be afterwards ſo eaſily expelled from them: Hence theſe accummulated and peccant Humours become ſtagnant, and induce terrible Symptoms of various Kinds: For if theſe are copiouſly forced to the Glands of the Fauces, the Maxillæ, the Tonſils, or even the Tongue, theſe Parts become ſo tumid, that Deglutition and Reſpiration are entirely intercepted. With reſpect to theſe Misfortunes, the Reader may conſult *Sennert. Prax. Med. Part.* 4. *Lib.* 6. *Fallopius*, in his Treatiſe *de Lue Venerea*; and *Sylvius*, in his *Meth. Med. Lib.* 2. *Cap.* 11. But a more infallible and irreparable Misfortune is produced, when theſe Sordes are conveyed to the Brain, already weaken'd by previous Diſorders; for, by this means, Palſeys, Apoplexies, and other terrible lethargic Diſorders, muſt neceſſarily be ſoon produced. But ſince, in a Lues Venerea of ſome ſtanding, and deeply rooted in the Humours, there is generally a large Quantity of peccant Humours, and ſince the Strength of the Patient is, for the moſt part, much exhauſted, either by the Force of the Diſeaſe, previous Intemperance, Surfeits, or an Exceſs of Venery, hence it often happens, that, in thoſe Circumſtances, a Salivation, by ſome thought the only ſovereign Remedy for a Lues Venerea, is highly improper and abſurd. For this Reaſon a skilful Phyſician muſt bethink himſelf of ſome other equally efficacious Method, accommodated to ſuch Circumſtances, eſpecially ſince it is well known, that Decoctions of the Woods operate but in a very faint and languid manner, in a Lues Venerea of a conſiderable ſtanding.

A great many are indeed of Opinion, that, even in theſe Circumſtances, the Body may be render'd fit for bearing a Salivation; if, for Inſtance, before its Uſe, the Redundance of the peccant Humours is leſſened, and their Spiſſitude corrected by Veneſections, Purgatives, and the repeated Exhibition of Sudorifics. But I rather approve of the Opinion of *Sydenham*, who, in his Treatiſe *de Lue Vener.* informs us, that, by ſuch Meaſures, the Body is no more prepared for bearing a Salivation, than the Bodies of Soldiers would be prepared for Battle, by cutting their Nerves. Theſe are the principal Caſes in which a Salivation is improper in a Lues Venerea.

But if we make a general Eſtimate of the other Diſorders, for which we have above obſerved a Salivation was commended, we ſhall find their State and Condition to be of two Kinds: For they are either habitual, and ſupported by Cauſes deeply rooted in the Body; or they conſiſt in a Peccancy of the Humours, in their irregular Motion, for Inſtance, or their bad Qualities. If they are of the former Kind, that is, if they are hereditary, or ſupported by an Exulceration and Corruption of any of the Viſcera abſolutely neceſſary to the vital Motions, or by ſcirrhous Obſtructions, or tartareous Concretions copiouſly accumulated, and becoming ſolid, in any Parts of the Body, they cannot be perfectly ſubdued and removed either by a Salivation, or any other means whatever,

Afferat ipſe licet ſacras Epidaurius herbas.

It is, therefore, expedient, when Health cannot be reſtored, to attempt the Mitigation of the Symptoms of the Diſorder, that by this means the Patient may paſs the remaining Part of his Life with as much Eaſe as poſſible; for if a Patient, in this Condition, is ſubjected to a Salivation, he will, in vain, be rack'd with numberleſs Pains; or, what to me ſeems more probable, his Death will, by that means, be conſiderably accelerated; for this ſevere and exhauſting Method by Salivation, will either totally deſtroy the ſmall Degrees of Strength left by the Violence of the Diſeaſe, or, at leaſt, put the Patient into ſuch a deplorable Situation, that he cannot eaſily recover them; becauſe, when the Saliva, which is the principal Menſtruum of the human Body, is for ſome Weeks ſucceſſively exhauſted, or, by the Acceſs of the Mercury, contaminated, and ſpoiled by an æruginous Nidor, the Digeſtion of the Aliments, and Elaboration of the Chyle, on which the Preſervation of the Strength depends, muſt be greatly weakened. But if, without any conſiderable Diſorder of the Viſcera, theſe chronical Diſeaſes ſhould proceed from a Peccancy of the Humours, they both may be cured, and frequently are ſo, by other Medicines, which prove equally efficacious, without exciting theſe Commotions, and exhauſting Diſcharges of Saliva, which, for the moſt part, are more terrible than the Diſorder itſelf. Beſides, upon a mature Conſideration of all Circumſtances, I ſee no Neceſſity for ſo copious Diſcharges of Saliva in the Cure of moſt chronical Diſeaſes; for, when a Redundance of the Humours is to be removed, which, however, rarely happens in chronical Caſes, this End is more properly obtained by Evacuations, attended with leſs Trouble, and made from more convenient Parts, by Veneſection, for Inſtance, Purgatives, and Medicines of a diuretic Quality. If, on the contrary, the Quality of the Humours, whatever it is, is to be corrected; if, for Inſtance, their too great Lentor and Viſcidity, and various tartareous, ſalino-ſulphureous, acrid Subſtances, ſheathed up under theſe, are to be removed; the Intention is beſt anſwered without theſe exhauſting Salivations, or the Uſe of Evacuants; for Humours of this kind are moſt commodiouſly and properly corrected by ſuch Medicines as by a conſtant, but not too quick and impetuous an Action, excite ſtronger Commotions in the moving Fibres of the Parts, and produce more frequent and ſyſtaltic Motions in them; in conſequence of which repeated Concuſſions, and quicker Tranſpreſſions, the Humours are, in the porous and muſcular Subſtance of the Body, ſo divided and attenuated, that the ſaline Sordes, ſheathed up in them, are rendered fit for paſſing gradually and inſenſibly through proper Emunctories, provided theſe are, by a ſuitable Regimen, kept ſufficiently pervious and open.

Since, therefore, this Method of Cure is not only the moſt ſafe and pleaſant, but, alſo, ſufficiently efficacious, it ought juſtly to be ſubſtituted in the room of a tedious and troubleſome Salivation, eſpecially ſince in Circumſtances which do not admit of a Salivation, as we have above obſerved, ſuch Medicines are neceſſary, as are capable, without exciting any uneaſy and dangerous Commotions, of ſubduing chronical Diſeaſes, which prove too obſtinate for the milder Medicines obtained from the Vegetable and Animal Kingdoms. For this Purpoſe, the Chymiſts have judged Mercury the moſt proper of all other Subſtances; but, at the ſame time, it muſt be corrected in ſuch a manner, as that, being diveſted of its draſtic Qualities, it may, without exciting a Salivation, exert its Efficacy and Influence on the human Body. For this Reaſon various Authors have invented various Preparations of Mercury, moſt of which, not anſwering the Characters given of them, are juſtly exploded, as uſeleſs in the modern Practice. But the others, whoſe Uſe is confirmed by frequent and repeated Experiments, as they are not to be found in the Pharmacopeias, Diſpenſatories, and other Collections of Recipes, ſo they are uſed by few, and only known to thoſe who are converſant in Chymiſtry. Hence we ſee the Uſefulneſs of this Art, which is ſo neceſſary to a Phyſician, that, without an accurate Knowledge of it, *Sylvius* affirmed, he could neither acquire a Reputation at firſt, nor ſupport and maintain it afterwards. But, that we may have ſome certain Foundation for making an Eſtimate of the numberleſs Preparations of Mercury, we ſhall, from what has been ſaid, take a View of thoſe Properties, which produce, and give Birth to, the draſtic Quality of Mercury. Now theſe are, the Mobility of the Globules of which it is compoſed, and their Tendency to attract acrid Humours, from the Acceſs of which thoſe Commotions, produced by the Uſe of Preparations of crude Mercury, principally ariſe. Mercury is, therefore, moſt commodiouſly and efficaciouſly corrected by the Addition of ſuch a Subſtance, as, being itſelf free from a draſtic Quality, is capable of being ſo diſperſed and mixed with the Mercurial Globules, that by its Intervention the too ſtrong Adheſion of the acrid Salts may be prevented, and, at the ſame time, the too briſk Impetus of the Mercurial Globules checked, without totally deſtroying their Agility, and penetrating Force, but leaving them in ſuch a Condition, as that they are capable, by their conſtant, and, as yet, ſufficiently ſtrong Action, of exciting briſker Motions in the moving Fibres, without any violent or prejudicial Commotions.

It ſeems to have been the Opinion of many, that Mercury is very properly corrected by an Admixture and Sublimation with Sulphur. This gave Birth to the Production of Cinnabar, and its various Species, which really differ very little from each other; for it is ſufficiently known, that each of them is produced by a Mixture of Quickſilver with Sulphur. But whether the Sulphur is of the common foſſile Kind, and is united with the Mercury in the Mines, whether it is added artificially, or, laſtly, whether it is extracted from Antimony, after the Reguline Subſtance is diſſolved by the Salts of Mercury Sublimate, yet it is ſtill the ſame Sulphur, and, conſequently, muſt, in each Caſe, produce a Cinnabar of the ſame Nature and Qualities, the Efficacy of which, in removing obſtinate Diſorders, and eſpecially Epilepſies, is ſo highly extolled, that there is no Neceſſity for any additional Encomiums. And certainly this is a Remedy ſo highly ſafe and innocent, that it may confidently, and without any Fear of Danger, be exhibited to Patients of all Ages and Conſtitutions, in all Diſorders, whether chronical or acute; for the Sulphur, which is intimately mixed, and cloſely aſſociated, with the Mercury, by its unctuous Subſtance, not only bridles and ſtops the Motion of the Mercurial Globules, and checks their Impetus, but, alſo, hinders the external Salts from acting on the Mercury, and adhering to it. Hence it is that Cinnabar, by means of the moſt intenſely acid Liquors, is neither diſſolved, nor acquires a virulent Taſte; which, however, eaſily happens, when theſe acid Liquors are poured upon Quickſilver. In Cinnabar the Sulphur is ſo intimately mixed with the Mercury, that, though it is boiled in the ſtrongeſt Lixivium, it is not, as moſt People think, by that means diſſolved. Hence ſome are too much, though in vain, afraid of the Uſe of Cinnabar in thoſe Diſeaſes where there is a ſaline and acrid Intemperies, joined with a preternatural Thickneſs of the Humours, ſuch as a Scurvy, for Inſtance, ſince the Cinnabar can by no means be changed. The Opinion of thoſe is, alſo, falſe and groundleſs, who claſs Cinnabar among the anodyne, demulcent, and abſorbent Medicines; and, by that means, to no Purpoſe, augment the Number of theſe, which is already too large; for whatever Relief theſe Medicines afford in Diſorders of the Brain and Nerves, is principally produced by their gently diſcuſſing the extravaſated Blood and Lymph ſtagnating in theſe Parts.

But ſince in Cinnabar the Mercury is ſo much fixed, as to be in a great meaſure deprived of its natural Agility, when uſed in this manner, which is the common Cuſtom, it rarely or never produces any conſiderable Effect; for, if we form a Judgment from what has been ſaid, we muſt evidently perceive, that two or three Grains of Cinnabar, by which a large Quantity of abſorbent Powder is rather tinged than heightened in its Efficacy, can produce no Effect; and, if any happy and ſalutary Effect is produced by the Medicine thus faintly tinged, it is undoubtedly owing to the Efficacy of the other Ingredients, and not to the Cinnabar. But this Circumſtance by no means detracts from the Virtues of Cinnabar, which would be ſufficiently conſpicuous, if it was only duly prepared, and exhibited in a larger Doſe; for it is certain, from the Writings of Men equally famed for their Skill in Phyſic, and Veneration for Truth, that in former Times, when Cinnabar was frequently uſed by *Hartman* and *Michaeli*, it produced very conſiderable and ſalutary Effects: But we muſt obſerve, that they uſed Cinnabar not once or twice, as at preſent, but, at leaſt, ſix times ſublimed; and, in my Opinion, not without good Reaſon; for by the violent Motion of the Fire or Ether, which, in Sublimation, agitates the Cinnabar, the Mercurial Subſtance is divided, attenuated, and rendered more ſpirituous; by which means the Cinnabar is more exalted, and, as it were, refined. Beſides, it is abſolutely neceſſary, that the Cinnabar ſhould, by long Trituration, or rather an artificial

Elutriation, be reduced to Particles of the ſmalleſt Surfaces, or into a Powder far more fine and impalpable, than it is commonly to be had in Shops; for, unleſs it is thus fine, the groſs and weighty Molecules of the Cinnabar, which are not capable of being diſſolved by the Juices of the Body, will remain a dead and inactive Weight in the Primæ Viæ, but never convey their Influence to the Maſs of Blood and Humours. Beſides, we muſt carefully obſerve, that, if in the Cure of the more terrible Diſorders of the Lymph, and nervous Syſtem, any thing is to be attempted by means of Cinnabar, it is to be exhibited in far larger Doſes, than it generally is, from fifteen Grains, for Inſtance, or one Scruple, to half a Dram, or more, previouſly diluted in ſome aqueous Vehicle, and exhibited for one Doſe. And this Doſe, according to the Circumſtances of the Patient, is to be repeated twice or thrice a Day; which Method may, without any Danger, be continued for a conſiderable Number of Days, provided the Body is all the while ſufficiently ſoluble, and the Strength of the Primæ Viæ unimpair'd. *Stahl*, as is obvious from his Notes *ad Poterium*, frequently uſed this Method with Succeſs, tho' his Practice, in this reſpect, has not as yet been imitated. But that learned Phyſician confirmed me in the Juſtneſs of this Practice, by many Caſes, which he generouſly communicated to me. At *Clauſthal*, a Town near the *Black Foreſt*, and fam'd for metallic Mines, the Epilepſies and Convulſions of the Miners, produced by Falls, and Blows of the Head, were, by this Method of exhibiting Cinnabar, ſo ſpeedily and efficaciouſly cured, that ſome miraculous Effect was thought to have been produced. Cinnabar, exhibited in the above-mentioned Doſe and Manner, produced the like Effect at *Halberſtad*, in a Man of ſixty Years of Age, who, after a violent Contuſion of the Head, remained dumb for ten Days, was more than thirty times every Day ſeized with an epileptic Fit, and lay entirely deprived of the Exerciſe of his Reaſon. But by a Scruple of Cinnabar alone, exhibited thrice a Day, for ten Days ſucceſſively, he was, without any other Remedies, effectually reſtored to his former Health. I ſhall not, at greater Length, inſiſt upon the ſpeedy and ſurpriſing Relief, which, by this Method, has been afforded in epileptic Caſes, leſt I ſhould be ſuſpected to over-do my Encomiums on Cinnabar; which, when exhibited in proper Caſes, and in ſufficient Doſes, repeated according to the Circumſtances of the Patient, will always prove efficacious. But I muſt here obſerve, that, by the prepoſterous and ill-grounded Cowardice of many, eſpecially in determining the Doſes of Medicines, it happens, that the Obſtinacy of chronical Diſeaſes is ſo rarely ſubdued by the Efficacy of Medicines; which, conſidering the ſcanty Doſes in which they are exhibited, is almoſt none at all, but rather blunted, and wearied out by a tedious Expectation. But, at the ſame time, unleſs the Cauſe of the Diſorder is removed, the Patient can never, by theſe Means, be reſtored to Health.

But as Cinnabar only produces its due Effects, when exhibited in large Doſes often repeated, ſo it cannot be endur'd in ſo large Quantities, but by thoſe whoſe Primæ Viæ are ſufficiently ſtrong; for, if the Fibres of the Stomach and Inteſtines are flaccid, and deſtitute of their due Tone, and conſequently their periſtaltic Motion impair'd, the accumulated Cinnabar, which, by means of the Mucus, adheres to the Sides of theſe Parts, greatly oppreſſes them. Beſides, as the Mercury is ſo fixed by the Subſtance of the Sulphur, which, when throughly melted by the Force of Fire, is intimately mixed with its ſmalleſt Globules, Cinnabar is, for this Reaſon, ſomewhat ſlow and languid in removing obſtinate chronical Diſorders. For which Reaſon, in Caſes of this Nature, we juſtly prefer to Cinnabar an extemporaneous Mixture of Mercury and Sulphur, which, on account of its Colour, is called Æthiops Mineral; for the Sulphur, which, in ſuch a Mixture, is interſperſed and mixed with all the Globules of the Mercury, prevents the Acceſs of acrid Salts, and, at the ſame time, becauſe it is not ſo firmly mixed, and intimately colliquated with them, does not ſo powerfully bind up, and check their Mobility and penetrating Quality, as in the Cinnabar. Beſides, Æthiops Mineral is, by *Mayern* and *Harris*, extol'd not only for killing Worms, but, alſo, for removing Cachexies, Scurvies proceeding from a cold Cauſe, and even a Lues Venerea, or other Diſorders which require the reſolvent Efficacy of Mercury; in which Caſes, a ſmall Doſe of it produces happier Effects, than can be obtained by far larger Quantities of Cinnabar, eſpecially if, in preparing it, we uſe pure and native Sulphur dropping from ſubterraneous Caverns, previouſly deprived of its redundant Acid, and rendered more ſubtile by repeated Sublimations with Quick-lime. By which means it may be ſo corrected and exalted, as to prove a far more powerful Reſolvent, and Sudorific, than the common and more impure Species of Sulphur. When mixed, therefore with the Mercury duly depurated by boiling in Wax, and Sublimation, with a large Quantity of Quick-lime, it affords a Medicine at once highly ſafe and efficacious.

The other Preparations, Corrections, and Elaborations, of Mercury, which paſs under various pompous Names, and are promiſcuouſly recommended, are ſo incredibly numerous, that it would be too tedious to enumerate the various Species of precipitated Mercury alone. Beſides, ſo few of them anſwer the great Encomiums beſtow'd on them by their boaſting Authors, that, in many reſpects, crude Mercury, mix'd with Sugar for internal Purpoſes, or with proper Ointments for Unction, is poſſeſſed of a leſs draſtic Quality, and often produces more happy Effects. 'Tis, therefore, ſuperfluous to make a laborious Diſquiſition into the Natures of each of theſe Preparations, ſince, from what has been ſaid, we may eaſily form a Judgment of their reſpective Qualities. Moſt of the Compoſitions of Mercurial Medicines, deſtin'd for internal Uſe, which are at preſent known, agree in the moſt material and important Circumſtances; and the whole of the Affair conſiſts in this, that the Mercury, whether by itſelf, or previouſly amalgamated with other metallic Bodies, be diſſolved by acid and corroſive Menſtruums, and afterwards, by Precipitation with Salts of an oppoſite Nature, or by an Abſtraction of the acid Menſtruums, depriv'd of its Mobility, and reduced to a Powder. But, when treated in this manner, it anſwers neither of the Ends, which ought to be obtained by the Preparation; for the Spiculæ of the cauſtic Menſtruums are intimately mixed with the Globules of the Mercury, ſo that they cannot afterwards be ſeparated by any Elutriations, however frequent, or by Deflagrations with Spirit of Wine; and, conſequently, cannot be diveſted of that corroſive and draſtic Quality, which the Mercury, by that means, acquires. If the Mercury, rather contaminated than corrected in this manner, is taken internally, it generally excites a ſudden Salivation, violent Purgings, impetuous Vomitings, or Eroſions in the Primæ Viæ, and other Parts, not without a manifeſt Danger of future and greater Misfortunes. But moſt of the laborious Preparations of Mercury have a Tendency to excite theſe violent Commotions; and ſuch as are of an oppoſite Nature, as they are very few, ſo, if they produce any ſalutary Effects internally, theſe are not owing to the Efficacy of the Menſtruums, and cauſtic Salts, by which means a draſtic Quality muſt neceſſarily be excited; but as they are joined with ſuch Bodies, as, by interpoſing themſelves between the Globules of the Mercury, check their Impetus, hinder the Combination of the Salts, and by this means prevent Commotions in the Body, they act in a ſalutary Manner.

But the Bodies which produce this Effect, and are commodiouſly mixed with Mercury, are highly pure Metals, no-ways unfriendly to the Conſtitution, ſuch as pure Gold and Tin, which excellently check the Violence of Mercury, as is ſufficiently obvious from frequent Obſervation, and eſpecially from the Effects of the *Mercurius Diaphoreticus Jovialis*, which is moſt properly prepared thus: With Laminæ of pure *Britiſh* Tin, and Mercury well depurated, an Amalgama is made without Fire. From this Amalgama, placed in a glaſs Retort, a ſufficient Quantity of the Spirit of Nitre is drawn by means of a Sand-heat. The whitiſh Powder, remaining in the Bottom of the Retort after the Abſtraction of the Spirit, is to be edulcorated as well as poſſible with Rain-water; in order to obtain which End the more effectually, Spirit of Wine is to be frequently deflagrated upon the Powder, that by this means the Spiculæ of the Menſtruum, adhering to it, may be the better drawn out, and afterwards the more eaſily receiv'd into the warm Water. But that the Spiculæ of the corroſive Menſtruum which cannot be carry'd off by Elutriation, may be deſtroy'd, the Powder is for ſome Hours to be carefully triturated on a Marble, pouring on it, at proper Intervals, a ſufficient Quantity of the Liquor of fix'd Nitre. And this Trituration is to be repeated three times, the Powder being ſuffer'd to become dry before each time; and, laſtly, the dry'd Matter is to be put into warm Water, and the Powder which ſubſides, collected for Uſe. This Preparation rarely or never excites a Salivation, unleſs when it is exhibited in too large a Doſe, or its Uſe is too long perſiſted in; but, in a far ſmaller Doſe than Cinnabar, it generally exerts its Efficacy by ſomewhat increaſing inſenſible Perſpiration, or by exciting Sweats, if a proper Regimen is obſerved; for the Sulphur of the Tin, the Preſence of which is diſcovered by its kindling with Nitre, in the Subtilty of its Parts, far exceeds the common Sulphur, or the impure Sulphur of Antimony, uſed in the Preparation of Cinnabar; in conſequence of which, it not only checks the exceſſive Impetus of the Mercurial Globules, but alſo prevents the Acceſs of acrid Salts, whilſt, at the ſame time, it does not ſo effectually fix and obtund the penetrating Quality of the Mercurial Globules, as the coarſer Sulphur does in Cinnabar.

But, if in the room of Tin we ſubſtitute Gold, or at leaſt add a Portion of the latter to the former, and intimately mix them with the Mercury, a Medicine will be produced, in Efficacy far exceeding that laſt deſcrib'd; for, as the Gold, in conſequence of its being an homogeneous Subſtance, is eaſily and intimately mix'd with the Mercury, ſo, by the conſiderable Weight of its minute Parts, interſperſed with its Globules, it heightens its Virtues, and renders it more efficacious, whilſt it changes the too ſudden Impetus, which the Mercurial Globules would otherwiſe excite in the human Body, into a more conſtant, and, in conſequence of its Gravity, a more penetrating Action. Beſides, Gold is only capable of being acted upon, and diſſolved, by the moſt powerful Menſtruums, ſuch as Aqua Regia; in conſequence of which, when united with Mercury, it prevents that Acceſs of acrid Salts, which otherwiſe readily happens in the Juices of the human

human Body; by which means it excellently prevents the violent Commotions, which would otherwiſe be excited. Various Mixtures of Gold with Mercury are contrived, in order to reduce them to the Form of a Powder: But the leaſt expenſive Method is this; *Hungarian*, or any other Species of pure Gold, is to be diſſolved in Aqua Regia. Into this Solution a proper Quantity of duly depurated Mercury is to be gradually inſtill'd. Upon this, the Gold, together with a Portion of the Mercury, is forthwith precipitated to the Bottom in the Form of a Powder, which, when the Menſtruum is poured off, is to be gathered, corrected by the Addition of ſome alcaline Liquor, and carefully edulcorated by frequent Elutriations, and Deflagrations of Spirit of Wine. But if a ſufficient Quantity of *Aurum Fulminans*, or, which is better, of that rediſh Powder precipitated by Water from a Solution of Gold and Tin, is, by long Trituration, and the Aſperſion of Water, duly mixed with white precipitated Mercury previouſly well waſh'd, a Medicine is obtain'd of equal Efficacy with that laſt deſcribed, and generally leſs expenſive. But tho' theſe Medicines are pretty efficacious, if duly exhibited, yet ſince, in theſe Preparations, the Gold is not intimately mix'd with the Mercury, but only adheres to the Surfaces of its Globules, as is evident from this, that by a moderate Fire the Mercury may be again ſeparated from it, and ſince Medicines of this kind cannot be perfectly diveſted of the Acidity of the corroſive Menſtruum, hence it happens, that, not agreeing well with delicate and tender Conſtitutions, they often excite a Salivation, tho' of a far milder and more gentle Kind, than thoſe raiſed by the Compoſitions of crude Mercury. For this Reaſon the Chymiſts have earneſtly deſired ſuch a Correction of Mercury, as, without the Addition of corroſive Menſtruums, might be commodiouſly carry'd on by the moderate Action of Fire, and conſiſt in its intimate Mixture with Gold; which End may ſo commodiouſly be obtained by the Method preſently to be laid down, in ſuch a manner, that the Mercury, its former Texture being chang'd, is converted into an highly-fix'd Powder of a rediſh purple Colour, and not eaſily to be reduced to its conſtituent Parts. 'Tis to no Purpoſe to object, that this Powder, in conſequence of its fix'd Nature, can produce no conſiderable Effects on the human Body; for tho' it is Proof againſt the Action of the Fire, and tho' the Texture of the Gold uſed in preparing it is ſo firm, as to reſiſt the Influence of corroſive Menſtruums, yet, by the Mercury, previouſly exalted in a proper manner, and render'd more ſpirituous, the firmeſt Coheſion of Gold may be thoroughly diſſolved, and, by a ſubſequent Digeſtion, its minuteſt Parts ſo united with the Globules of the Mercury, that from this mutual Coalition there may be produced a concreted Subſtance, not only capable of being quickly exagitated by the gentleſt Heat of the Body, but, alſo, productive of very ſingular Effects, by no means to be obtained by the other Corrections of Mercury, as is ingeniouſly demonſtrated by *Stahl in Notis ad Poterium*, in the following Words: "Tho' very few Remedies of ſingular Efficacy are prepar'd with Gold, yet this Metal is of great Uſe and Service in the Preparation of an highly efficacious Medicine, if it is reduc'd to a due Temperament by a ſtrict and intimate Union with Mercury, which abounds with an highly active mineral Spirit; for the fixed Subſtance of the Gold receives the highly minute Particles of the Mercury into its Pores; ſo that an equable Harmony and Proportion betwixt them is produc'd: Hence, in my Opinion, nothing is a more proper Corrector for Mercury than Gold, whilſt, at the ſame time nothing exalts, actuates, and increaſes the medicinal Virtues of Gold, ſo effectually as Mercury.

In order, therefore, to produce a ſtable and permanent Mixture of Gold with Mercury, the firſt thing neceſſary is, to ſeparate from the latter, that Mineral Earth, with which it abounds, and is, as it were, loaded, that by this means the ethereal Fluid may afterwards act more forcibly on the more pure and ſubtile Globules of the Mercury, and, by forcing them effectually into the Pores of the Gold, mix them intimately with the pure Earth contain'd in that Metal. The Mercury prepar'd in this manner is ſometimes call'd *Virgin Mercury*; and at other times diſtinguiſhed by the Epithets *animated*, and *philoſophical*. Tho' this Mercury, is with great Expences prepared in different Methods by the Chymiſts, yet we ſhall not pretend to form a Judgment of any of them. That Method, however, deſcrib'd, tho' in myſtical Terms, by the Author who aſſumes the Name of *Philaletha*, in his *Introitus apertus ad occluſum Regis Palatium*, and from him, as the *Literati* think, tho' ſome, what more diſtinctly, taken by the Author of *Riplæus Redivivus*, is found to anſwer upon making the Experiment; and is, therefore, highly celebrated by the more skilful Chymiſts. But, as the myſtical Style of theſe Authors is not to be comprehended without ſome Thought and Conſideration, I ſhall, in plain and intelligible Language, give the Deſcription of animated Mercury, communicated by *Stahl*, and which, from my own Experience, I have found to be accurate and juſt. This Author, then, orders common Quickſilver to be amalgamated with genuine Martial Regulus of Antimony, (for the common ſort does not attract the ſmalleſt Particle of Iron) by means of the *two Doves of Diana*, which many of the myſtical Chymiſts take to be two Parts of Silver; to which they have been perhaps induc'd, by ſome imaginary and hieroglyphical Analogy between Silver and Doves, or, perhaps, by the Authority of *Alexander Suchtenius*, who formerly attempted the Correction of this Species of Mercury, as we may ſee in his *Tractat. de Antim.* 2. But others, and eſpecially *Becher*, in *Supplement. Phyſ. Subterr.* aſſert, that by theſe two Doves are meant two Salts, alcaline Salt, for Inſtance, and Sal Ammoniac. Both theſe Opinions are agreeable to Reaſon, and confirm'd by Experience; but the Proceſs will proceed more expeditiouſly, if one Part of Regulus of Antimony, and two Parts of Silver, are melted by means of Fire; and if to theſe, when united, we add Mercury, with a due Quantity of theſe Salts; and thus make an Amalgama. Then the Amalgama is to be ſtrongly triturated in a glaſs Mortar, pouring upon it, at proper Intervals, a ſufficient Quantity of Rain-water; which by that means becomes black, and, when pour'd off, exhibits a Powder of the ſame Colour, which, when kindled, diffuſes a fetid Smell, tho' Salts were not us'd in the Amalgamation. But this Trituration, with frequent Affuſions of the Rain-water, is to be continued, till all the Regulus of Antimony is ſo effectually waſh'd off, that nothing but the pure Amalgama is left. After this, the Amalgama is to be put into a glaſs Retort, and the Mercury abſtracted by a Sand-heat. By this means the pure Silver is left in the Bottom of the Retort; and this Silver, when mixed with the Regulus of Antimony, is again to be amalgamated by the Addition of the Salts, afterwards depurated by the like Trituration, and laſt of all diſtil'd. When theſe Meaſures are repeated for at leaſt ſeven or nine times, a much more pure and ſubtile Mercury is afforded, which not only acts more powerfully upon other Metals, but, alſo, produces more conſpicuous and ſalutary Effects on the human Body. The Mercury muſt be exalted in this manner, in order to render it fit for the Preparation of this celebrated and efficacious Medicine. This Diſcovery, tho' originally made and perfected by Experiments, is nevertheleſs ſupported by Reaſons, which greatly illuſtrate it; for whilſt the Martial Regulus of Antimony is, by its Colloquition, intimately mixed with the minuteſt Globules of the Silver, the Subſtance of that Fluid, which was before ſmooth and poliſh'd, is, by the angular and irregular Parts of the Regulus, ſo chang'd, that the minuteſt Parts of the Silver not only acquire unequal Surfaces, but, alſo, have their Interſtices render'd ſmaller, into which when the Mercury is, by a due Amalgamation, and the mutual Conflict of the Salts, violently and impetuouſly forc'd, the groſs and impure Earth of the Mercury is, as it were, ſeparated, and torn from its Adheſion with the other Parts; and is afterwards, when the Globules of the Mercury enter ſmaller and more tortuous Pores, to be abſterg'd and remov'd; together with the heterogeneous Parts of the Regulus, by means of frequent Triturations and Waſhings. The Mercury produc'd by this laborious Preparation is to be afterwards added to pure Gold; to one Part of which, three or four, or (according to *Philaletha*) only two Parts of Mercury, are to be united and join'd by the common Method of Amalgamation. After this, the Amalgama is to be put into a glaſs Phial with a flat Bottom, that the Heat may act on a larger Surface. Then the Phial, when the groſſer Air is exhauſted, leſt, being expanded by the Heat, it ſhould burſt the Veſſel, is to be hermetically ſeal'd; and, in that Species of Furnace call'd *Athanor*, expoſed to a proper Digeſtion, for ſeven, or even nine ſolar Months, ſucceſſively, gradually proceeding from a fainter to a ſtronger Degree of Fire. As in this Digeſtion the Whole of the Affair conſiſts, ſo, if it is duly made, the Amalgama will be gradually converted into a rediſh Powder; which, during the firſt Months of the Digeſtion, is not ſo corrected, but that it will excite Fluxes or Salivations, eſpecially in tender Conſtitutions. But by a protracted Digeſtion it is ſo perfected, and diveſted of all its draſtic Qualities, that the fixed Powder produc'd by it may be ſafely exhibited to the Quantity of two, three, or four Grains for a Doſe, and thus perſiſted in for ſome Days; ſo that thoſe of the moſt delicate Conſtitutions have no Reaſon to be afraid of having a Salivation, or any of the Commotions produc'd by the Preparations of crude Mercury, excited by it.

This Exaltation and Correction of Mercury is, therefore, the moſt proper and agreeable to the Principles of rational Chymiſtry: And, as this Method is claſs'd among the more abſtruſe and ſacred Myſteries, 'tis, alſo, ſo highly eſteem'd by the curious and induſtrious Part of the Chymiſts, that they have judg'd Mercury, thus animated, neceſſary to the Diſcovery of the Philoſophers Stone: But, ſtruck with Terror at the Fate of others, who have wrote on this Subject, I ſhall only conſider the medicinal Uſes of Mercury thus prepar'd, which are not only very conſiderable in themſelves, but, alſo, ſuperior to thoſe of other Medicines. For this Reaſon it has, by ſeveral eminent Phyſicians, been with uncommon Succeſs preſcrib'd for various obſtinate Diſeaſes, which would not yield to the Efficacy of other Medicines. Thus, as I have been inform'd by *Stahl* it was frequently ordered by *Crelles*, an eminent and ſucceſsful Practitioner. The Efficacy alſo of this ſolar

animated Mercury was at *Hall* often happily experienced by the celebrated Chymiſt *Hochgræff*; eſpecially in ſubduing thoſe Reproaches of Mercury, Quartan Fevers, and Gouts: So that ſome who labour'd long under the former, and one afflicted with it for four Years ſucceſſively, were, by a few Doſes of this Medicine, reſtor'd to perfect Health and Eaſe: But, among the gouty Patients, who were by means of this Medicine quickly cur'd, we may juſtly reckon a certain Man, who, being miſerably rack'd with fix'd arthritic Pains, and Contractions of his Limbs, was perfectly reſtor'd to his former Health, without ever having had a Relapſe. The Succeſs of *Cnoeffelius*, in curing the Gout with Mercury thus fix'd, may be ſeen in *Append. ad Miſcell. Nat. curioſ.* and confirm'd by unexceptionable Witneſſes that is, the Perſons cur'd. With reſpect to this, the Reader may conſult that Work, intituled, *Epiſtola de Curata Podagra per D. Andream Cnoeffelium, Gorlitzii*, 1644. Theſe Inſtances ſufficiently prove, that the Encomiums beſtow'd on this Medicine are not groundleſs and overdone, but ſupported by Experience; So that there is no manner of Doubt, but that, without any Dread of Danger, this Medicine is capable of producing ſuch ſalutary Effects in obſtinate Diſorders, if really curable, as can neither be obtain'd by any other Remedies of the Animal and Vegetable Kingdom hitherto known, nor by a Mercurial Salivation, which is not only harſh, and attended with violent and often dangerous Commotions, but is, alſo, frequently highly tedious. The Uſe of the ſolar animated Mercury is preferable to a Salivation, becauſe it may be gratefully exhibited to the moſt delicate Conſtitutions in a due manner, and ſmall Doſes, provided it is once or twice a Day taken, and its Uſe perſiſted in, according to the Circumſtances of the Patient; which may be done in a ſufficiently grateful manner, if the Doſe is mix'd with Conſerve of Roſes, or any other agreeable Conſerve, without the Uſe of any other Medicines. But, before the Exhibition of this Preparation, the Primæ Viæ muſt be freed from thoſe Sordes, which might prevent the Efficacy of the Medicine, by Abſtergents, whoſe Efficacy is heighten'd by a gently ſtimulating reſinous Purgative; ſince draſtic Purgatives, as they are rarely proper, ſo they are always prejudicial, in the Beginning of a Cure: The Primæ Viæ may, alſo, according to the Situation of the Patient, be freed from the Sordes contain'd in them, by a Vomit; which, however, is not to be exhibited without the previous Uſe of ſaline and inciding Medicines. When this Medicine is taken, after ſuch a previous Preparation of the Body, 'tis proper to drink after it ſome warm aqueous Liquor; ſuch as Tea, Coffee, an Infuſion of *Paul's* Betony, or a Decoction of Sarſaparilla, and China, heighten'd by Saſafras-bark. Theſe diluting Liquors make the Medicine exert its proper Efficacy, render the Body perſpirable, and receive the ſaline Sordes, diſengag'd by the Force and Energy of the Medicine, and which, being diſpers'd in them, may be without any Violence afterwards eliminated from the Body thro' proper Emunctories, eſpecially thro' the Pores of the Skin, provided they are kept ſufficiently open by due Regimen, in which, by proper Cloths, the external Cold is excluded without inducing an intolerable and troubleſome Heat, and the whole Body is preſerved in a gentle and moiſt Warmth; for profuſe Sweats are ſo far from being neceſſary, or productive of happy Effects, in the Cure of almoſt all chronical Diſeaſes, that they rather exhauſt the Strength, already too much impair'd in the Courſe of a ſlow Diſorder. But, if ſuch Sweats are forc'd, and, as it were, extorted, as they often are, the greateſt Misfortunes, eaſily productive of Infarctions of the Viſcera, are to be dreaded. With reſpect to this, the Reader may conſult various Paſſages of *Sylvius* in *Prax. Med.* but eſpecially *Append. Tract.* 3. Let all violent and ſudden Commotions, therefore, be avoided, as much as poſſible; and, as this Medicine is not productive of ſuch Effects, the viſcid and peccant Matter will not, by one or two Doſes of it, which Quacks affirm of their Medicines, be ſubdued and eliminated; but muſt be conquer'd by the continual and uninterrupted, tho' mild and gentle, Action of it. Thus, tho' *Lucas Tozzi*, Phyſician to Pope *Innocent* the Twelfth, in his *Praxis Medica*, aſſerts, that by Mercury thus fix'd, exhibited only ſeven times, he totally remov'd a Lues Venerea, and a Quartan Fever, without being ſo arrogant, as to call his Veracity into Queſtion, I muſt only ſay, that I can hardly believe, that in cold Climates, ſuch as are more Northerly, and where, in chronical Diſorders, there is ſuch a Viſcidity and Redundance of the peccant Humours, the like Effect can be ſo ſpeedily, and in ſo few Days, produc'd by this Medicine. Such an happy and ſalutary Effect will, however, without any Violence to the Patient, be much accelerated, if, after the repeated Uſe of the Medicine for ſome Days, we interpoſe balſamic and ſaline ſulphureous Medicines, the moſt conſiderable and efficacious of which are *Stahl's Elixir*, *Balſamicum*; or the *Spiritus oleoſus*, prepar'd according to the Directions of *Sylvius*, and accommodated to the Situation of the Patients: And certainly a moderate Doſe of theſe, daily taken between Meals, and duly perſiſted in, calmly accelerates the Cure of chronical Diſorders; an Effect not to be produc'd by more violent Means: For, as the languid Digeſtion is by this means promoted, the Chyle, before not ſufficiently ſubdu'd, and, by its Viſcidity, contaminating the Humours, is corrected, and, as it were, ſheath'd up, in theſe balſamic Subſtances. The vital Energy and Turgeſcence of the Humours before ſuppreſs'd, and, as it were, ſuffocated, by their preternatural Lentor, is ſo animated with freſh Vigour, that the Fomes of the obſtinate Diſorder is thereby ſeaſonably deſtroy'd, eſpecially if the Efficacy of the Midicines is back'd by a proper Regimen.

But, however eaſily the rich and proſperous Part of Mankind may be able to ſupport the Continuation of a Cure attempted by this ſolar Mercury, yet thoſe who are ſtraitened in their Circumſtances, can by no means afford the Expences neceſſary for ſuch a Courſe; for which Reaſon, I think they may, at a far cheaper Rate, have the ſame Ends anſwered by the *Mercurius Diaphoreticus Jovialis*: And in this Sentiment I am confirmed, not only by the Experiments made by skilful Phyſicians, but, alſo, by the Compoſition of the Medicine, in which every thing is calculated for promoting the ſame Ends with Mercury. As the Operation of this Medicine is ſomewhat more quick and ſpeedy than that of ſolar animated Mercury, ſo, when it is exhibited in large Doſes, in thoſe Diſorders, where there is a violent Intemperature of the Humours, ſuch as a Lues Venerea, and a Scurvy, it excites a Kind of Salivation; yet this Salivation, unleſs excited by improper Doſes of it, is ſo gentle, as hardly to be perceived by the Patients, or, at leaſt, is ſupported without any Trouble. But in other Caſes, where there is not ſuch a large Quantity of acrid Humours, but rather an Immobility and Spiſſitude of the Juices, it promotes the Cure without a Salivation, a Circumſtance peculiar to itſelf. Beſides, a Diſcharge of the Saliva, excited by this Medicine, may almoſt be univerſally prevented, if the Cauſes concurring to it are only ſeaſonably checked and removed. And ſince, only by the Acceſs of a violent Acrimony, the Medicine can be ſo heightened, as to excite any Degree of a Salivation, this can never happen in the Maſs of Humours, where the Acrimony is not ſo diſengaged and intenſe, that it can attack and mix itſelf with the Globules of Mercury, ſheathed up in the pure Sulphur of the Tin: But, if ſuch a Misfortune can happen any-where, it muſt be in the Primæ Viæ, which in moſt chronical Diſorders, beſides other Sordes, are alſo loaded with a large Quantity of acid Humours: And, ſince the Medicine is for a conſiderable time lodged in the Primæ Viæ, it may more eaſily aſſume a droſſy Quality in them, than in the Maſs of Blood. In order to prevent this theſe Sordes are, before the Uſe of the Medicine, to be, as effectually as poſſible, removed by mild and proper Cathartics of a gummous and reſinous Nature, ſuch as Galbanum, Ammonial, Bdellium, and Maſtich, rendered ſomewhat brisker by a proper Quantity of red Myrrh, and a ſmall Quantity of the Extractum Aloeticum of *Ludovicus*; for theſe Subſtances, by their gummous and mucilaginous Parts, embrace the Acid of the Primæ Viæ, and ſo ſheath up and obtund its Spicula, that it may be gently carried off without any violent Symptoms, which, in Caſes of this Nature, are excited by more draſtic reſinous Subſtances. After the previous Uſe of ſuch a Cathartic, repeated according to the Condition of the Patient, the Medicine is to be exhibited in Conjunction with temperate earthy Subſtances; which, as they more quickly abſorb the Acid, than the Mercury corrected with the Sulphur of the Tin, ſo, by keeping it free from all foreign Acrimony, they render it capable of exerting its mild and gentle Efficacy: But if, by the Addition of the abſorbent Powders, the Bulk of the Medicine, and much more its Continuation, ſhould prove uneaſy, in the Morning, and, if 'tis neceſſary, in the Evening, we may exhibit a Doſe of the Diaphoretic Mercury alone, from ſix to ten Grains, but no more; and, when the Patient goes to Bed, let him take a ſufficient Doſe of the abſorbent Powders, that is, from two Scruples to one Dram, in ſome proper aqueous Vehicle. But the mild and gentle Operation of this Medicine will be the more effectually promoted, and a Salivation entirely prevented; if, by a proper Regimen, the Body is kept duly warm, or, in proper Caſes, a mild Sweat for ſome Hours is promoted by now-and-then exhibiting Sudorifics of a neutral Kind, ſuch as the Spiritus Alexipharmacus Buſſii Correctus, the ſuccinated Liquor of Hartſhorn, and the Bezoardic Tincture, without an Acid. Theſe, when ſeaſonably interpoſed between the Doſes of the Mercury, for the moſt part, by one mild and gentle Sweat, remove the beginning Salivation, as is obvious from the Obſervations of many practical Phyſicians; much more might a Salivation, if it was to be produced by the Uſe of the Mercurius Diaphoreticus Jovialis, a Medicine ſufficiently corrected, be prevented by this means. As this Medicine, therefore, when exhibited in the Manner now directed, is entirely diveſted of all draſtic Qualities, ſo it may confidently be preſcribed even in a ſcorbutic Intemperature, though of a pretty violent Kind, ſince it is much more ſafe than Preparations of crude Mercury, which, as alſo a Salivation, are not only innocent, but, alſo, ſalutary, in a Scurvy, if we may believe *Willis* and *Lentilius*, in the Paſſages already quoted; though, at the ſame time, I ſee no neceſſity for raſhly imitating their Example:

But if, in Caſes of this Nature, any one is afraid to uſe the diaphoretic Mercury, now mentioned, he may have recourſe to another, though not ſo efficacious, yet no contemptible Mercurial Preparation, which we call Æthiops Mineral: And, indeed, this Medicine is ſo fortified againſt the Acceſs of an Acid, that, like other Preparations of crude Mercury, it does not acquire an adventitious and auſtere Taſte, with diſtilled Vinegar, or Spirit of Verdegriſe, though their Acidity ſhould be heightened by ſome Quantity of the Spirit of Vitriol: Beſides, it is ſo mild, and ſo effectually diveſted of every draſtic Quality, that Children afflicted with Worms are, without any Diſadvantage, capable of bearing repeated, and ſometimes large Doſes of it. From ten to fifteen Grains of this Medicine may therefore ſafely be exhibited to a Perſon in the Flower of his Age; and, if in obſtinate Diſeaſes it ſhould operate in too languid a Manner, the Efficacy of each Doſe may be previouſly augmented, by adding to it a Grain or two of the Sulphur Antimonii Conerdingiani, or ſome other more diaphoretic Sulphur of Antimony, which is generally made without the Aſſiſtance of a precipitating Liquor. The Reguline Parts of this Preparation, intimately mixed and contemperated with the Subſtance of the Sulphur, by a proper Stimulus, ſo augment the Efficacy of this Medicine, that a ſmall Doſe of it is capable of producing Effects, otherwiſe in vain expected from larger Quantities of it. Among the great Number of Mercurial Medicines, I reckon the three laſt-mentioned, not only the moſt properly corrected, but alſo the moſt efficacious, only with this Difference, that I give the Preference to the ſolar animated Mercury; but, when it cannot be had, I ſubſtitute, in its room, the Mercurius Diaphoreticus Jovialis: And to tender and delicate Patients I appropriate Æthiops Mineral, a Medicine, which, though eaſily prepared, is yet preferable to many far more laborious Compoſitions.

As the Brevity of our Deſign will not allow us to give a long Catalogue of the chronical Diſeaſes, in which theſe Medicines are proper; or to ſpecify when, to whom, in what Manner, and at what Time, they are to be exhibited, we ſhall only obſerve, that 'tis agreed upon by almoſt all Phyſicians, whether antient or modern, that the Fomes of moſt, if not of all chronical Diſorders, conſiſts in a Lentor, Mucidity, Spiſſitude, tenacious Viſcidity, or whatever other Names different Authors have been pleaſed to give to the Immobility of the Humours: For as by the due Tranſpreſſion, and equable Circulation of the Humours, through the ſolid Parts, the due Fluidity of the former is preſerved, the Secretion of the recrementitious Parts, through proper Emunctories, promoted, and in a Word, the Vigour of the whole Body maintained; ſo, when this Circulation, the moſt ſimple, though the principal Inſtrument in preſerving Life and Health, becomes languid, the Humours become concreted and inſpiſſated, the ſaline, acid, and ſulphureous Sordes, or whatever elſe of a recrementitious Nature is derived from our Aliments, cannot be ſufficiently diſengaged, much leſs thrown off by proper Emunctories, ſince the Impulſe of the Humours to that is ſlow and languid; for which Reaſon they are frequently infarcted and obſtructed. As, therefore, the defective and languid Motion of the Blood is the principal Cauſe of chronical Diſorders, ſo the Faults of the Humours are beſt, and moſt naturally, corrected, by reſtoring the Circulation to its due and natural State. But ſince by a brisk and ſudden Commotion no happy Effects are produced, and ſince a more conſtant and mild Motion is neceſſary, ſuch as I have demonſtrated may be produced by the Mercurial Remedies abovementioned, 'tis ſufficiently obvious, how efficacious theſe muſt be, even in the Beginnings of chronical Diſorders, ſuch as a Cachexy, for Inſtance, or a Scurvy proceeding from a cold Cauſe, and their Conſequences, which are Accumulations of the Lymph, and painful Infarctions of various Parts, which tend to a Corruption. Theſe Medicines are, alſo, highly efficacious in obſtinate chronical Fevers, and arthritic Diſorders, eſpecially thoſe of the cold Kind, or ſuch as are accompanied with ſerous Tumors of the Part affected; in long-protracted Head-achs, and that Diſorder called Clavus, from its being fixed in a particular Part of the Head; in various cutaneous Diſorders, ſuch as a Lues Venerea, violent Itches, Impetigos, the Elephantiaſis, and the black Jaundice, when not ariſing from ſtony Concretions in the Gall-bladder, or biliary Ducts; in the various Species of Dropſies, and œdematous Tumors, eſpecially when produced by long Obſtructions of the Menſes, or Suppreſſions of other uſual Evacuations, and not accompanied with any conſiderable Diſorder, or ſcirrhous Obſtructions, of the Viſcera; for as theſe can never be removed, a Cure can never be performed. But theſe Medicines are more efficacious, and produce their ſalutary Effects more quickly, in Diſorders of the Brain, ariſing from the Accumulation and Stagnation of a peccant Lymph or Serum. Theſe Mercurial Preparations are alſo ſingularly efficacious in lethargic Diſorders of long ſtanding, Epilepſies, and Palſies. They are, beſides, proper for deſtroying Worms in Infants and Children, and removing thoſe Obſtructions, which are produced by the Milk and Pulſes they uſe; but eſpecially for opening the Obſtructions of the Meſeraic Glands; and conſequently removing the Atrophies ariſing thence, which as they but little yield to other mild Medicines, and are often increaſed by vitriolated Tinctures of Mars, and other Medicines improperly called aperient, ſo they require Medicines, which by a conſtant, but gentle Impulſe, act upon the infarcted Parts, without creating violent Commotions, which the tender Bodies of Infants are unable to bear. In ſuch Caſes, therefore, the Efficacy of theſe Mercurial Preparations is ſufficiently obvious, from what has been ſaid. But, notwithſtanding the juſtly celebrated Efficacy of theſe Preparations, 'tis ſtill neceſſary, they ſhould be exhibited and preſcribed by a skilful Phyſician, who has carefully inveſtigated the Nature of the Diſorder, knows the moſt proper Seaſons of uſing them, and the Caſes in which they will prove beneficial. It muſt, alſo, be conſidered, whether any Evacuation, together with an univerſal Correction of the peccant Matter, is neceſſary; and, if it ſhould, we muſt attentively diſcover what particular Parts are moſt proper to have this Evacuation made by, that thus by a proper Regimen, and the due Interpoſition of Sudorifics, Diuretics, or Purgatives, this peccant Matter may be commodiouſly conveyed to theſe Parts. Theſe, and ſome others, are the general Cautions to be obſerved in the Cure of chronical Diſorders, and conſtitute the moſt important Part of Medicine. *F. Hoffman.*

Dr. Cheyne's Opinion of Mercury.

Mercury, judiciouſly manag'd, ſeems to me to be the only true Panacea, and univerſal Antidote, ſought by the wiſe, and boaſted of by pyrotechnical Enthuſiaſts. Mercury ſeems pointed out and impreſſed by the Signature of the God of Nature, for the Cure, at leaſt for the Relief, of intelligent Creatures, made miſerable by hereditary Diſeaſes, by natural Appetites irregularly indulged, by Ignorance, bad Example, and Frailty, in the human Kind, eſpecially made ſo by high Food, and ſpirituous Liquors moſtly. I will not run into the ſubtle and too refined Qualities of this only ſecondary and true ſenſible Fluid in all Nature, (which, though entertaining to Philoſophers, would be of little Uſe in the Practice of Phyſic; our Senſes and Senſations being ſo obtuſe, as to be little hurt by Indiviſibles or Minuteneſſes) but take thoſe that are manifeſt and inconteſtable, which are, firſt, Its Gravity, which is, at leaſt, fourteen times more than that of the other ſenſible Fluid in Nature, that is, Water: From whence flows its Momentum and Force, in opening a Way to itſelf in all animal Tubes, where the Reſiſtance is leſs than its Force, or where the Aperture is naturally to be effected. Secondly, The Rotundity of its component Particles, which, in all Probability, holds to its very laſt and leaſt Particles; for to the leaſt inviſible Particle (when compreſs'd on a ſmooth poliſhed Glaſs) it continues ſtill globular; and the leſs the Particle is, the more perfect the Spheres, ſo that its very leaſt Particles muſt, on that Account, be perfect Spherules, as is evident by fine Microſcopes. Thirdly, The Smoothneſs and conſequent Softneſs of theſe Particles on ſenſible animal Subſtances, they having no Points to tear animal Fibres and Tubes, and by their Globoſity touching them in a Point only; and this is evident from its great reflective Virtue, every the leaſt Globule being a perfect Speculum. Fourthly, Its readily anſwering, by this extreme Smalneſs of its Parts, the leaſt Impulſe; for, on the leaſt Compreſſure between ſmooth poliſh'd Glaſſes, it readily flies into perfect Spherules, innumerable, and inviſible even to the fineſt Glaſſes; ſo that the leaſt Heat or Action puts it into Motion, as is evident from its Aſcent in glaſs Tubes, or in an Alembic, not ſo readily, indeed, as Water or Air, (for that were ſuppoſing it to act contrary to the univerſal Law of Gravity) but by reaſon of this Smalneſs of its Particles, and its greater Degree of Attraction, more readily in proportion to its Denſity and Gravity, than any other Fluid. Fifthy, Its greater Degree of attractive Force, and Adheſion to ſome Bodies or Particles of Matter more than to others, as to Gold, and Salts of all Kinds; which probably may ariſe from the Smalneſs of their Pores, which can only receive and retain ſo ſmall Particles as thoſe of Mercury probably are. Theſe are ſenſibly known and acknowledged Properties peculiar to Mercury, from whence all its great and ſalutary Effects on animal Bodies may be readily explain'd, and render'd intelligible, without running into Fineſſes and Subtilties; and theſe ſalutary Effects are, indeed, great and many.

The great Art required to make Mercury the moſt uſeful, ſalutary, and beneficial poſſibly, in the ſeveral Caſes, is, firſt, to divide it into the ſmalleſt Particles poſſible, and then to unite it with ſome other Medium, which may keep theſe Particles ſeparated, and at a Diſtance, from one another, ſo as not to be readily united again into larger Globules or Cluſters; by which means it may be more eaſily introduced into the ſmalleſt Fibres, and capillary Tubes, by the Force and Courſe of the Circulation, to render them pervious, diſſolve their obſtructing Slime, and carry it out of the Habit by the common Sewer, (the Guts) or the Emunctory, urinary or perſpirative Drains, which Qualities make the proper and peculiar Excellency of Mercury above all other Medicines. When it is given crude, and in Subſtance, or in its groſſer Preparations, that is, without chymical Fire, beyond all Doubt (as we daily ſee by its ſenſible Effects, and

ſome-

ſometimes by its viſible Appearance in Subſtance on the Surface of the Skin) ſome of its ſmalleſt Parts, by their Mobility, attractive Force to one another, and ready Aſcent, paſs through the whole Body, not only in the Courſe of Circulation, but even through the Sides of the Tubes themſelves, through the Membranes and Parenchymatous Subſtance; but then this Effect is not ſo ſoon, ſo readily, and effectually, produced in the crude Subſtance, as in ſome of its Preparations, where it is minutely divided, and its Particles kept ſeparated, and at a Diſtance, from one another, to enter ſingly the ſmall Tubes. Secondly, To endeavour to make the Medium of the Diviſion, this Cover and Shell of the Particles, and the Matter they are united with, as ſalutary and conducive to the Intention of the Cure as poſſible; or to mix the Particles of the Mercury with ſome vegetable or mineral Subſtance, that has been found, by Experience, ſpecific in the Diſtemper given. This will be more plain, in running through ſome of the moſt common Preparations of Mercury.

There is ſcarce a Body, or Kind of Matter, with which Quickſilver, with Labour and Art, may not be incorporated, or intimately mix'd. It may be united either with Salts by chymical Fires, as in Sublimate, Precipitate, Calomel, and the like; but as the Salts, when thus divided, have a ſtrong Stimulus, are extremely active, and ſo neceſſarily produce very violent Pains and Evacuations of all Kinds *qua data Porta*, I think, they are extremely dangerous in delicate Conſtitutions, and tender Bowels; eſpecially if they muſt be long continued, to alter the whole Maſs, and perform the Cure of a great and ſtubborn Diſtemper: All of this kind I call Mercurials *cum Stimulo*. Secondly, Or with Sulphur, Antimony, Sugar-candy, Turpentine, Crabs-eyes, and the like; eſpecially ſuch Bodies as are harmleſs, and not violently active Medicines, and are not ſo ready to run the Patient into great Evacuations, and conſequently more proper for tender Bowels, and weak Conſtitutions, when deſign'd as Alteratives. Sulphur in Æthiops, indeed, will gripe and purge there; but this is readily prevented, by joining equal Quantities of Crabs-eyes, *Crocus Martis*, Aſtringents, or proper teſtaceous Powders, which by their abſorbent Quality will make this an admirable, eaſy, and ſafe Medicine, I think, above all others, if long continued, as I have often found with great Pleaſure. Native and factitious Cinnabar, alſo, is as ſafe and eaſy as Sugar, but muſt be long continued to produce any ſenſible Benefit, being weak, though, of all the Preparations, it is the moſt proper, and will, at laſt, have the ſafeſt and beſt Effect on very ſlender Habits, becauſe tender Conſtitutions are more eaſily alter'd. The *Alcaliſatus*, by the ſtrong Friction required to unite the Mercury with the Crabs-eyes, divides it the moſt minutely; and, by the natural Poroſity of the Crab's-eyes, there are prepar'd Cellules to ſeparate and retain them aſunder, whereby it would be the moſt ſafe, active Preparation hitherto, I think, found out, but that, like Calomel, from its infinite Diviſion, and the Smalneſs of the Particles, it is apt to ſalivate, if given in any Quantity, without interſpers'd Cathartics: But every Preparation of Mercury hitherto in Uſe will do the ſame, except Cinnabar, and, therefore, muſt be watch'd. But, I think, the moſt effectual way of adminiſtring Mercury to a given Diſtemper, is to unite and combine it, (by pounding, rubbing, or with Fire) with that ſpecific Medicine, that has been found moſt effectual in that Diſeaſe: Thus, for Example, in the Scurvy, Gout, Eryſipelas, and cutaneous Defedations, plain Quickſilver, Æthiops, or Alcaliſatus, well rubbed into Gum Guaiacum, and joined to an Aloetic, will be found the moſt effectual Remedy: In Hyſterics, theſe, joined to Gum-pills, with an Aleotic or Extract of the Bark, or of wild Valerian with Millepedes, theſe, I ſay, in ſuch a Caſe, will do great Matters. In Obſtructions of the Menſes, Æthiops with Steel does excellently: In Intermittents Mercury, with Bark and Steel, either in Subſtance, in an Electuary; or in Pills, as with the Extract of the Bark and Salt of Steel: In an Inflammation of the Eyes, Æthiops with Millepedes, and the Lenitive Electuary, or the *Electuarium Diacaſſiæ cum Manna*, joined with Milk of Sulphur; and the ſame in the Piles, or hæmorrhoidal Inflammations and Tumors: In the Eryſipelas, and every other Inflammation, and in Diſorders of the Stomach and Bowels, Æthiops, or Alcaliſatus, with Rhubarb, in Pills, or in an Electuary: In a Rheumatiſm, Æthiops, or Alcaliſatus, with Gum Guaiacum, in large Doſes: In the Sciatica, Æthiops, or Alcaliſatus, with boil'd Turpentine: In the Jaundice, Æthiops, or Alcaliſatus, with *Venice* Soap, or the *Sapo Philoſophorum*, and with Lime, or calcin'd Egg-ſhells: In an Anaſarca, or even beginning Aſcites, Æthiops, or Alcaliſatus, with Reſina Jalapii; and ſo in other chronical Diſtempers. All I intend here, is, that, ſuppoſing the Preparations of Mercury attenuate the Juices, and open Obſtructions, the moſt readily and effectually of any thing known, that then another Medicine or Medicines may be joined to it, that is known or acknowledged to be moſt effectual in the Diſeaſes given. I neither ſet down Forms, nor determine Concomitants: That muſt always be under the Direction of the Phyſician in ordinary, without whom no one in their Senſes ought to venture on Mercury, either ſimple, or any-how prepared; for it is either a divine Antidote, or may become dangerous by a wrong manner of uſing it, without due Regard to the Caſe, and the Patient, as well as the Form. But, judiciouſly and properly manag'd, ponderous Medicines, and Mercurial Preparations, are not only the ſole univerſal Attenuants and Deobſtruents, but, alſo, the moſt ſimple, natural, and efficacious Deſtroyers of Viſcidity and Acidity, or whatever ſaline Cachexy. *Cheyne's Diſeaſes of Body and Mind.*

It is found in the Ocean. *Trallian* recommends it in an hepatic Dyſentery from a cold Intemperature, and Epilepſy. *Pliny* relates, that it is good in Diſorders of the Liver, and Fevers. *Dale*.

MESARÆON, μεσάϱαιον. The Meſentery. Hence the Arteries and Veins, diſperſed therein, are called the Meſaraic Veſſels.

MESEL, or MOSEL. Tin. *Rulandus*.

MESEMAR. The ſame as MISMAR.

MESENTERIUM. The Meſentery. From μέσος, Middle, and ἔντεϱον, an Inteſtine. See COELIA, and HECTICA. For an Account of the meſenteric Glands, ſee CHYLUS.

The Diſorders incident to the Meſentery deſerve our moſt attentive Conſideration, ſince the ſuperfluous Humours of the Veins are eaſily conveyed to it, and lay a Foundation for very terrible Diſorders, ſuch as a Cholera, Melancholy, Fluxes, Gripes, Cachexies, Atrophies, Languors, ſlow and erratic Fevers, together with other Diſeaſes, whoſe Natures are not to be diſcover'd without great Difficulty. When the Meſentery is affected with a Tumor without Inflammation, the Tumor is generally, at firſt, lax and ſoft, but, ſome time after, becomes entirely dry and indurated. This Tumor, and the Part in which it reſides, are inſenſible of Pain; for which Reaſon the internal Swelling, which lies pretty deep, is only to be diſcovered by a rough Touch.

In this Caſe, the Part affected is diſtended, leſſens the Diameters of the Inteſtines, and, by that means, occaſions Coſtiveneſs; which Effect is by no means produced by a Tumor of the abdominal Muſcles, or prominent Fat; for neither of theſe affect the Inteſtines. The Fat, alſo, when laid hold of by the Hand, may be diſtinguiſhed from the abdominal Muſcles. But, when the Tumor is lodged in the abdominal Muſcles, it is always diſcoverable by the firſt Touch, and is ever painful when preſſed, and ſometimes painful without any Compreſſion. Beſides, a Tumor of the abdominal Muſcles is prominent when not preſſed, perceptible upon the mildeſt Touch, and of an oblong Figure, like that of the Muſculus Rectus. *Lommii Medic. Obſervat.*

Obſtructions of the Meſentery proceed from the ſame Cauſes with thoſe of the Liver and Spleen, but happen more frequently and eaſily, by reaſon of the Narrowneſs of the meſaraic, and, eſpecially, of the lacteal Veſſels, which convey the Chyle to the Organs alloted for the ſecond Digeſtion. And when the Chyle, which is ſo often mixed with crude and groſs Humours, as to ſtagnate, and produce Obſtructions, in the lacteal Veins, the meſaraic Veins are, alſo, obſtructed by groſs Humours convey'd from the Liver, Spleen, and other Parts, and lodged there for a conſiderable time. During the Stay of theſe Humours, they become gradually thicker, ſo, as at laſt, ſometimes, to produce a ſcirrhous Tumor. With theſe Humours are, alſo, ſometimes, mixed groſs Flatulencies, which generally prove the Cauſes of violent Symptoms. To the Obſtruction, alſo, or rather the Contraction, of theſe Veſſels, we refer the Compreſſion of the Glands diſperſed through the whole Subſtance of the Meſentery; for theſe, increaſing beyond meaſure, as happens in ſtrumous Perſons, compreſs the meſaraic Veins, and hinder not only the due Diſtribution of the Chyle, but, alſo, the Circulation of the Blood.

The diagnoſtic Signs of Obſtructions of the Meſentery are divided into three Claſſes, which either indicate the Species of the Diſeaſe, the Part affected, or the productive Cauſe.

The Signs which indicate the Species of the Diſorder, that is, Obſtructions of the Hypochondria, and their Cauſes, are the ſame with thoſe producing Obſtructions of the Liver and Spleen. But the Signs which in a peculiar manner indicate, that the Meſentery is affected, are Tenſion and Reſiſtance in the Middle of the Abdomen, under the Stomach, and in the Umbilical Region, where there is, alſo, a Senſe of Weight, ſometimes an obtuſe Pain, and ſometimes one of an highly acute kind, when Flatulencies are contained in theſe Parts: A Pain is, alſo, ſometimes, perceived in the Back, to which the Meſentery is affixed; Rumblings and Noiſes happen in the Belly; Eructations are excited, and Vapours are raiſed to the Head, by which means various Symptoms are produced: In a Word, all the Symptoms which generally attend Melancholy, indicate Obſtructions of the Meſentery, becauſe that Diſorder is produced and cheriſhed by Obſtructions of the ſame kind.

As for the Prognoſtics: This Diſorder is not of itſelf very dangerous, becauſe the Meſentery is capable of bearing great Diſturbances, without any immediate Danger to Life. Beſides, generous Remedies may be uſed for the Cure of this Diſorder, which, when duly exhibited, generally produce the deſired Effect, unleſs the Diſorder cauſes hypochondriac Melancholy, which, on account of the obſtinate Nature of the melancholic Humour, is generally called the Reproach of Phyſicians. But as the Meſentery is not furniſhed with an exquiſite Senſation, and as the Obſtructions of it are generally not very troubleſome to the Patient, they are often neglected, and lay a Foundation for other highly dangerous Diſorders.

The Cure of this Diſorder is to be performed in the ſame manner with that uſed for removing Obſtructions in the Liver. See HEPAR. *Riverius, Prax. Med. Lib.* 13.

The Meſentery is, alſo, ſometimes inflamed, in which Caſe there is an internal Senſe of Weight, without any manifeſt Pain. A ſlight Fever is, alſo, produced, which is attended with ſo mild a Train of Symptoms, that the Patient is capable of performing the ordinary Duties of Life. In the Beginning of the Diſorder, a certain rediſh Sanies is diſcharged by Stool. But, when an Abſceſs is formed, a white Pus is evacuated, and moſt generally mixed with the Excrements. It is, alſo, ſometimes diſcharged in great Quantities, pure and unmixed, eſpecially when the Abſceſs is ſituated near the inferior Inteſtines. Now it is certain, that this Pus muſt be conveyed from the Meſentery, becauſe it could not deſcend from other Parts, without either Pain, or a Mixture of other Matter, or a violent Fever. *Lommii Obſervat. Medic.*

As the Meſentery is, as it were, a kind of Drain, in which the more noble Parts depoſite their Superfluities, which are afterwards diſcharged by Vomit or Stool, thus, in ſome Patients, we obſerve, at certain Intervals, a large Quantity of vitious Humours evacuated either by Vomit, or Stool. Now, if theſe Evacuations, in conſequence of an Obſtruction of the Paſſages, through which they were before diſcharged, or any other Cauſe, are hindered, theſe Humours, being retained and remaining long in the Part, conceive a preternatural Heat, which lays a Foundation for Putrefactions, Inflammations, Fevers of various kinds, and Abſceſſes. But an Inflammation is, in a particular manner, excited, when the Blood, accumulated in the meſaraic Veins, is diſcharged into the Subſtance of the Meſentery, by the Aperture of any of the venous Ramifications. But, ſince the Blood is greatly accumulated in theſe Veins by means of Obſtructions, for this Reaſon the Cauſes of an Inflammation in the Meſentery may be referred to the common Cauſes of other Inflammations.

The Acrimony and corroſive Quality of the Humours, alſo, contribute a great deal to the Production of an Inflammation in the Meſentery; as, alſo, a Fall, or Blow, on the hypogaſtric Region; a Weakneſs of the attractive, concoctive, or retentive Faculty of the Liver; an exceſſive Heat of the Body; or an unſeaſonable Uſe of Refrigerants; a critical Effort of Nature in malignant Fevers; or the Small-pox, conveying the peccant Humours to the Meſentery; and a Diarrhœa, or Dyſentery, unſeaſonably ſuppreſſed.

The diagnoſtic Signs of an Inflammation in the Meſentery are a languid, latent, and ſlow Fever, without any Thirſt or violent Symptoms, a Loſs of Appetite, a Senſe of Tenſion and Weight below the Stomach, without any conſiderable Degree of Hardneſs, and capable of being only known by preſſing upon it. This Tenſion is, alſo, without any conſiderable Degree of Pain, becauſe the Meſentery is only furniſh'd with a kind of dull and obtuſe Senſation. The Stools, alſo, are chylous, and generally ſucceeded by the Diſcharge of a thin Ichor, without any Senſe of Pain, ſometimes pure and unmixed, and ſometimes mixed with the Fæces.

The Symptoms now enumerated are mild and gentle, if the Meſentery is only inflamed; but if the Liver, Spleen, or Inteſtines are, alſo, affected with an Inflammation, the Symptoms are more violent, and ſome particular Signs indicate the reſpective Diſorders of theſe Parts: For ſince Inflammations and Abſceſſes of the Meſentery, when unattended with other Diſorders, are highly latent on account of the dull Senſation of the Part, and as the Myſentery performs no Function in the Body, the Injury done to which can be diſcovered, but is only ſubſervient to the Diſtribution of the Chyle and Blood, its Diſorders are, for this Reaſon, rather to be gueſſed at, than certainly and infallibly diſcovered; when, for Inſtance, during the Preſence of a Fever, and other Symptoms, no Signs of an affected Liver, Spleen, or Inteſtines, appear. When the Inteſtines are inflam'd together with the Meſentery, the Diſorder is diſcovered by a ſemitertian Fever, which *Spigelius* obſerved to be generally produced by an Inflammation of theſe Parts. This Diſorder is, alſo, different from an Inflammation of the abdominal Muſcles, becauſe in theſe the Tumor and Pain run according to their Direction, Figure, and Situation. For the moſt part, alſo, the Tumors of the abdominal Muſcles are oblong, or diffuſed over the whole Abdomen, and poſſeſs principally the exterior Parts, ſo that they are perceptible by the gentleſt Touch, and generally accompanied with intenſe Pain and a violent Fever.

This Diſorder is, alſo, to be carefully diſtinguiſhed from Tumors of the Diaphragm, which have hitherto been adverted to by very few Phyſicians; for theſe are always accompanied with a conſiderable Difficulty of Breathing, a Revulſion of the Hypochondria, an hard and ſmall Pulſe, without any Senſation or Appearance of Tumor in the Hypochondria. Beſides, if the Tumor proceeds from an hot Cauſe, an acute Fever, intenſe Pain, Deliriums, and Convulſions, enſue; which Symptoms never happen in Inflammations of the Meſentery, when not complicated with other Diſorders.

As for the Prognoſtic of this Diſorder, Inflammations of the Meſentery are highly dangerous, ſince, for the moſt part, they degenerate into Abſceſſes, or bring on a Putrefaction and Corruption of the Meſentery. The morbific Matter is, alſo, by the Efforts of Nature, frequently tranſlated to other Parts, without being removed from the Habit: Hence the Diſorder recurs, and often continues for many Years, or during the Patient's Life; in which Caſe, ſometimes the Fever returns, and is ſometimes changed into a Colic; the Inflammation alſo, or, at leaſt, a preternatural Heat, returns. Inflammations of the Meſentery are to be cured in the ſame Manner with thoſe of the Liver and Spleen. See the Articles HEPAR and LIEN.

Inflammations of the Meſentery frequently terminate in Abſceſſes, though, at the ſame time, every Abſceſs of this Part does not proceed from Inflammations, but, for the moſt part, from peccant and putrid Humours, accumulated in the Meſentery; ſo that Abſceſſes of this Kind are gradually produced without any previous Fever, or other violent Symptoms, juſt as in other Parts we obſerve Atheromata, Steatomata, Melicerides, and other Species of Abſceſſes, generated without any previous Inflammation; and when Abſceſſes of this Kind break, the Pus being evacuated, the Ulcers remain, and are not to be cured without great Difficulty. But if theſe Humours are highly pituitous, melancholic, or of ſuch a Quality, as to reſiſt Putrefaction and Corruption, they frequently become ſo concreted and indurated, as to degenerate into a Scirrhus. Sometimes they alſo acquire the Hardneſs of a Stone; for 'tis certain from the Obſervations of many practical Authors, that Stones have been found in the Meſentery.

The Diagnoſtic of Abſceſſes of the Meſentery is ſometimes eaſy, and at other times highly difficult; for if an Abſceſs proceeds from an Inflammation of the Part, and if this Inflammation is previouſly diſcovered by the Signs before-mentioned, and continues for a conſiderable time, 'tis a Sign, that the Inflammation could not be diſcuſſed, but is ſuppurated and transformed into an Abſceſs. But when an Abſceſs proceeds from peccant Humours, remaining long, and at laſt becoming putrid, in the Meſentery, the Diagnoſtic is ſo highly difficult, that many Authors, who have wrote the Hiſtories of ſuch Abſceſſes, inform us, they did not diſcover them, till they laid open the Patients Bodies after Death; for though they may be generally diſcovered

by the Touch, yet they ſometimes lie ſo deep as to fruſtrate this Method of Diſcovery; and the Senſation of the Part is ſo dull and languid, that the Abſceſs ſometimes diſcovers itſelf by no internal Pain; but, becauſe theſe Misfortunes happen in various Ways, they are to be diſtinguiſhed in the following Manner.

If an Abſceſs of the Meſentery is accompanied with a conſpicuous Tumor, it is to be diſtinguiſhed, both from an Inflammation and a Scirrhus: It is diſtinguiſhed from an Inflammation, if it does not draw its Origin from one, there is no Fever, or at leaſt a very ſlight one preſent, no Fever preceded, nor any other Signs which could indicate an Inflammation: But, if an Abſceſs ſhould ſucceed an Inflammation, it is only to be diſtinguiſhed by its Duration and Continuance: For if the Symptoms of an Inflammation have continued for thirty or forty Days, or perhaps longer, 'tis a Sign, that the Inflammation has degenerated into an Abſceſs. An Abſceſs of the Meſentery is diſtinguiſhed from a Scirrhus by this, that the latter is exceſſively hard, whereas, in the former, a certain Softneſs is perceived. Beſides, a Scirrhus is entirely deſtitute of Pain, of which there are always ſome Degrees perceived, in an Abſceſs at leaſt, when it is ſtrongly compreſſed. Beſides, Abſceſſes of the Meſentery are to be diſtinguiſhed from Tumors of other Parts, by their Situation, as we have already obſerved concerning Inflammations of the Meſentery.

But, if an Abſceſs is formed in the Meſentery without any conſpicuous Tumor, it cannot be certainly and infallibly diſcovered: We may, however, conjecture at ſuch a Misfortune, if a Loathing of Food, a Nauſea, and Vomiting, are preſent, without any manifeſt Diſorder or Fault of the Stomach; if there is a kind of Satiety after taking even the ſmalleſt Quantity of Aliments, Laſſitudes and Languors of the whole Body, without any manifeſt Cauſe, preternatural Coſtiveneſs, or an uncommon Solubility of Body; during which the Excrements diſcharged are highly fetid, and ſometimes bloody, without any Suſpicion of a Dyſentery. To theſe Signs we may add, continual Watchings; and, if the Patient ſhould at any time fall aſleep, he is uneaſy for the time, and falls into Deliquiums, accompanied with cold Sweats: And though ſometimes neither Fever nor Pain are perceived, yet, for the moſt part, a kind of ſlow Fever is conſpicuous, of which if no manifeſt Cauſe appears, we may conjecture that it depends upon this Misfortune, if ſome of the now-mentioned Signs accompany it. Beſides, if the Abdomen is violently compreſſed, a certain internal Pain is perceived by the Patient. 'Tis true, in Parts entirely ſound, Pains may be excited by violent Compreſſion; but if a greater Pain is perceived in one Part of the Abdomen more than another, ſo that when all its Parts are ſeparately handled, if, upon the Approach of the Hand, there is gradually a greater Pain felt upon the handling of ſome particular Part, we have juſt Ground to ſuſpect, that an Abſceſs is lodged there.

But, if a purulent Matter is diſcharged, then the latent Abſceſs becomes manifeſt: For the moſt part, however, a Pus is evacuated, poſſeſſed of various Qualities and Conditions, according to the different Diſpoſitions of the Part affected, or thoſe contiguous to it. Hence a large Quantity of unmixed and whitiſh Pus is ſometimes, without any Senſe of Pain, diſcharged into the Inteſtines. Sometimes the Pus, when the Abſceſs is lodged near the Extremities of the large Inteſtines, is diſcharged, in Conjunction with the Fæces. 'Tis, alſo, ſometimes conveyed to the Kidneys, and evacuated along with the Urine; ſometimes, being copiouſly diſcharged, it either flows into the Cavity of the Abdomen, or appears externally under the Form of an Abſces, ſo that a large Quantity of Pus is ſometimes diſcharged through the Navel; and ſometimes Worms, generated by the Corruption of the Meſentery, are evacuated along with the Pus: And the Pus evacuated by Stool, which happens moſt frequently, is ſometimes pure, as we have already obſerved; and at other times mixed with Blood or Sanies. Sometimes, alſo, a black and fetid Blood, or a blackiſh Matter of a different Nature, or a Subſtance of various Colours, is evacuated. But whether the purulent Matter is conveyed from the Meſentery, the Liver, or any other Part is only to be known by the Signs expreſſive of a Diſorder in that particular Part.

When the Abſceſs is broken, and the Afflux of Pus continues, 'tis certain that an Ulcer is lodged in the Meſentery, which is ſometimes ſoon cured, ſometimes continues long, and at other times renders the whole Part putrefied and ſphacelated.

As for the Prognoſtic of this Diſorder, an Abſceſs of the Meſentery is highly dangerous; for if it continues long in the Part, which frequently happens, it acquires a malignant Prutrefaction, and either induces a Gangrene of the Part, or throws the Patient into a Conſumption, or a Dropſy. If, alſo, the Abſceſs breaks, and the Ulcer is not quickly cured, but acquires a bad State and Condition, a Gangrene, an Atrophy, or a Conſumption, is induced. Sometimes, alſo, when the Abſceſs breaks, and an highly corrupted Pus is diſcharged into the Cavity of the Abdomen, the Patient dies ſuddenly. But a Scirrhus of the Meſentery is leaſt dangerous, and, if recent, admits of a Cure; but, if it is very inveterate, brings on a Dropſy.

The Meaſures to be taken in the Cure of theſe Diſorders ought to be varied according to their different Natures and Conditions. And, firſt, an Abſceſs already formed, indicates the Propriety of its Apertion and Evacuation; for which Purpoſe it is to be ſoftened by means of aperient and purgative Medicines, of the ſame Kind with thoſe proper for removing Obſtructions of the Liver and Spleen; not omitting, at the ſame time, the external Uſe of emollient and relaxing Subſtances, Fomentations, Cataplaſms, and Liniments, which attenuate the Matter of the Abſceſs, and relax the Paſſages, that thus the Pus may be the more commodiouſly evacuated.

When the Abſceſs is opened, the Ulcer is to be deterged and conſolidated, by means of the ſame Remedies uſed in Ulcers of the Stomach, Liver, Kidneys, and Uterus, which may be varied at the Pleaſure of the Phyſician, according to the different Habits of the Body, or the various Conditions of the Diſtemper.

A Scirrhus of the Meſentery is to be cured by the ſame Remedies to be uſed for the Cure of a Scirrhus of the Liver and Spleen. *River. Prax. Med. Lib.* 13. See HEPAR and LIEN.

MESERA. Alexandrian Tutty. *Rulandus.*

MESEREON. A Name for the *Thymelæa*; *Lauri folio, deciduo*; *ſive Laureola fœmina.*

MESIANUM. The Name of a Plaiſter, the ſame as ANICETON; which ſee.

MESIRE. A Diſorder of the Liver, mention'd by *Avicenna*, accompanied with a Senſe of Heavineſs, Tumor, Inflammation, pungent Pain, and Blackneſs of the Tongue.

MESOCOLON, μεσόκωλον, from μέσος, middle, and κῶλον, the Colon. See COELIA.

MESOGLOSSI. The Muſcles of the Tongue, called *Genioglossi.*

MESOMERIA, μεσομήεια. All that Part of the Body which lies betwixt the Thighs. *Ruffus Epheſius.*

MESOMPHALION. The Navel.

MESOPHRYON, μεσόφρυον. That Part of the Face which lies betwixt the Eye-brows. *Ruffus Epheſius.*

MESOPLEURIOS, μεσοπλεύριος. An Epithet of the Intercoſtal Muſcles.

MESOPOTAMENON. An Epithet for an Ointment deſcribed by *Paulus Æginetæ, Lib.* 7. *Cap.* 21.

MESPILUS.

The Characters are;

The End of the Pedicle becomes an Ovary, whoſe Apex forms a quinquefid, ſtellated Calyx, with long, acute, expanded Segments; the Flower is roſaceous and pentapetalous, grows upon the Ovary, and has numerous Stamina ariſing from the Margin of the Calyx; the Ovary, which is furniſhed with five Tubes with gaping, bifid Apices, becomes a crown'd, carnous, ſoft, unicapſular Fruit, generally containing five Seeds.

Boerhaave mentions thirteen Species of this Plant; which are,

1. Meſpilus; Germanica; folio Laurino, non ſerrato; ſive Meſpilus ſylveſtris. *C. B. P.* 453. *Tourn. Inſt.* 641. *Boerh. Ind. alt.* 2. 256. *Meſpilus.* Offic. Ger. 1265. Raii Synop. 3. 453. *Meſpilus ſativa.* Ger. Emac. 1453. *Meſpilus vulgaris.* J. B. 1. 64. Raii Hiſt. 2. 1460. Park. Theat. 1422. THE MEDLAR-TREE.

The Medlar-tree grows to be about as big as an Apple-tree, having ſeveral Thorns upon the younger Branches; the Leaves are long, and ſharp-pointed. The Flowers are five leaved, white, about as big as Apple-bloſſoms, and are ſucceeded by round Fruit ſomewhat flat at Top, with a large open Umbilicus, including five hard Stones; it grows only in Gardens, and flowers in *May*. The Fruit is not ripe till towards *November*, being hard, and of a rough, auſtere Taſte, and is the only Part uſed.

Medlars are cooling, drying, and binding, eſpecially before they are ripe, and are uſeful in all kinds of Fluxes. The ripe Fruit, eaten too freely, is ſubject to tie up the Stomach, and cauſe the Colic. The Lapilli, or hard Seed, are accounted good for the Gravel and Stone: They are an Ingredient in the Syrupus Myrtinus. *Miller's Bot. Off.*

Dale ſays, the Fruit is cooling, drying, and of an auſtere Taſte; that it is very aſtringent, and binding, and injurious to the Stomach; eſpecially whilſt hard. When ſoften'd, they are leſs aſtringent, not ſo injurious, and quickly rot, and then only they are eatable: They are uſed both externally, and internally, in Diarrhœas and Dyſenteries.

2. Meſpilus; folio Laurino; major. *C. B. P.* 453.

3. Meſpilus; folio Laurino; fructu dulci.

4. Meſpilus; Apii folio laciniato. See ARONIA.

5. Meſpilus; Apii folio laciniato; flore pleno.

6. Meſpilus; Apii folio; ſylveſtris; ſpinoſa; ſive Oxycantha. *C. B. P.* 456. *Raii Synop.* 3. 453. *Tourn. Inſt.* 642. *Boerh. Ind. alt.* 2. 256. *Spina alba, Oxycantha.* Offic. *Spina appendix vulgaris.* Park. Theat. 1025. *Oxyacanthus.* Ger. 1146. Emac. 1327. *Oxycanthus Galeni.* Raii Hiſt. 2. 1458. *Oxyacantha vulgaris ſive Spinus albus.* J. B. 1. 249. THE WHITE-THORN, or HAW-THORN.

This is well known to be an Hedge-tree, or Buſh, having many tough Branches, ſet alternately with ſharp Thorns; the young Twigs are rediſh, cloathed with ſmall Leaves, divided into three, and ſometimes five Segments, coming forth over-againſt the Thorns. The Flowers grow in Cluſters, conſiſting of five white Leaves, with rediſh Apices in the middle; of a pleaſant Smell, and are ſucceeded by ſmall round, umbilical Berries, of a fine red Colour, containing a pretty big Stone, divided into two, and covered with but a little Pulp. Theſe Trees grow every-where in the Hedges, flowering in great Plenty in *May*, whence they are called *May* Buſhes by the Vulgar. The Berries, or Haws, are ripe in *September*. The Flowers and Fruit are uſed.

They are accounted diuretic, and good for the Stone and Gravel, as, alſo, for the Pleuriſy. Of the Flowers is made the Aqua Nephritica. *Miller's Bot. Off.*

By the chymical Analyſis it yields, beſide ſeveral acid Liquors, an urinous Spirit, no concreted volatile Salt, but a good deal of Oil and Earth: Thus it probably contains a Salt, like that of Coral, wrapped in a good deal of Sulphur, and mixed with a little Sal Ammoniac. *Tragus* affirms, that the diſtilled Water of the Flowers, or the Spirit drawn in diſtilling them with Wine, in which they have been macerated for three Days, gives great Relief in the Pleuriſy and Colic. *Martyn's Tournefort.*

In general, it agrees with the Medlar in Virtues.

7. Meſpilus; ſpinoſa; five Oxyacantha; flore pleno. *T.* 642. *Oxyacantha, ſive Spina alba, flore pleno.* Munt. H. 186.

8. Meſpilus; ſpinoſa; Pyri folio. *Boerh. Ind. alt.* 2. 257. *Pyracantha.* Offic. Park. Parad. 604. Raii Hiſt. 2. 1459. *Pyracantha quibuſdam.* J. B. 1. 51. *Oxycantha Theophraſti.* Ger. Emac. 1604. *Oxyacantha ſive Spina acuta Pyri folio.* C. B. P. 454. *Meſpilus aculeata Pyrifolia.* Tourn. Inſt. 642. EVERGREEN THORN.

It is cultivated in Gardens. The Part in Uſe is the Berry, which agrees in Virtues with that of White Thorn. *Dale.*

9. Meſpilus; ſpinoſa; ſive Oxyacantha Virginiana; nigra.

10. Meſpilus; ſpinoſa; ſive Oxyacantha Virginiana; maxima. *Oxyacantha; Americana, Calcar Galli dicta.* Raii.

11. Meſpilus; ſylveſtris; ſpinoſa; hirſuta; Apii folio palmato; fructu majore. *H. Cath.*

12. Meſpilus; folio rotundiore; fructu nigro, ſubdulci. *Tourn. Inſt.* 642. *Boerh. Ind. alt.* 2. 257. *Dioſpyros.* Offic. J. B. 1. 75. Raii Hiſt. 2. 1461. *Meſpilus Alni effigie, lanato folio, minor.* C. B. P. 452. *Vaccinia alba.* Ger. 1230. Emac. 1416. *Vitis Idæa tertia Cluſii.* Park. Theat. 1458. WHITE WHORTLES.

It grows upon the *Alps*, and mountainous Places; and flowers in *May*. The Fruit is ſaid to eaſe Coughs, and promote Expectoration.

13. Meſpilus; folio ſubrotundo; fructu rubro. *T.* 642. *Cotoneaſter, folio rotundo, non ſerrato.* C. B. P. 452. *Cotoneaſter.* J. B. 1. 73. *Chamæmeſpilus. Geſneri.* Boerh. Ind. alt. Plant. *Vol.* 2. 257.

MESPILUS is, alſo, a Name for ſeveral ſorts of CRATÆGUS; which ſee.

MESQUITE. The Name of an *American* Tree, like an Oak, but bearing a Pod like the Kidney-bean. It is not uſed in Medicine; but the Seeds, called *Huitzaſe*, are employed in making Ink, like Galls, and fattening Cattle; and ſometimes Bread is made of them, in a Dearth of Corn. *Lemery des Drogues.*

MESSALINÆ DENTIFRICIUM. A Dentrifice deſcrib'd by *Scribonius Largus.*

MEST. Sour Milk. *Rulandus.*

MESUE. The Name of an *Arabian* Phyſician. See the PREFACE.

METABASIS, μετάβασις, from μεταβαίνω, to paſs, or migrate, from one Place to another. A Tranſition, for Example, from one Medicine to another; or a Change of one Remedy, or Method, for another.

METABOLE, μεταβολὴ, from μεταβάλλω, to change. A Change of any Kind.

METACARPIUS.

This is a ſmall very fleſhy Muſcle, ſituated obliquely between the large internal Annular, or tranſverſe Ligament of the Carpus, and the whole Inſide of the fourth Metacarpal Bone.

It is fixed by a ſmall ſhort Tendon to the Os Orbiculare, and to the neighbouring Part of the large Ligament of the Carpus. From thence its Fibres run more or leſs obliquely, toward the Inſide of the fourth Metacarpal Bone, in the outer Edge of which they are inſerted. The Fibres of this Muſcle are of unequal Lengths, and extend all the Way to the Articulation of the firſt Phalanx of the little Finger with the fourth Metacarpal Bone; but they have no manner of relation to that Finger.

The Metacarpius ſerves to turn the fourth Bone of the Metacarpus towards the Thumb, and, at the ſame time, to increaſe the Convexity of the Back of the Hand, which is called making *Diogenes's Cup.* The fourth Bone, thus moved, carries the third along with it, by reaſon of their Connection, which ſtill augments the Hollow on one Side, and the Convexity on the other. *Winſlow.*

METACARPUS, or METACARPION. The Part of the Hand betwixt the Carpus and the Fingers. See BRACHIUM.

METACERASMA, μεταχέρασμα. The ſame as CERASMA, according to *Galen.*

METACHORESIS, μεταχώρησις, from μεταχωρέω, to recede, or remove from one Place to another. A Seceſſion of a morbid Humour from one Part to another, and, conſequently, of the Diſtemper excited thereby.

METACINEMA, μετάκινημα, in *Hippocrates, Prædict. Lib.* 2. imports a Removal of the Pupil of the Eye from its proper Situation.

METACONDYLI, μεταχόνδυλοι. The laſt Joints of the Fingers next the Nails.

METALLAGE, μεταλλαγὴ, from μετὰ, importing Tranſition, and ἀλλάσσω, to change. The ſame as METABOLE.

METALLUM. A Metal. There are, properly, but ſix Metals, Gold, Silver, Copper, Tin, Iron, and Lead. But Philoſophers have added a ſeventh, which is Mercury, though it agrees with Metals in nothing but Weight, and being found in the Bowels of the Earth.

Geoffroy defines a Metal to be an hard, ſhining, mineral Body, fuſible by Fire, concreſcible by Cold, ductile, and capable of amalgamating, or being intimately united to Quickſilver. Metals are divided into baſe or imperfect, and noble or perfect: Imperfect Metals are thoſe which loſe much by being expoſed to Fire, ſuch as Lead, Tin, Iron, Copper, and they are baſe or ignoble, as being not much eſteemed. Perfect Metals are thoſe which undergo all Trials by Fire, without any ſenſible Loſs, ſuch as Gold and Silver; and theſe are called noble, as being highly eſteemed.

The Chymiſts have ſhewn, that Metals are nothing but bituminous Subſtances, which have undergone a long Digeſtion; for, by depriving them of their Sulphur, they are reduced to Aſhes, and then to Glaſs. This is eaſily ſeen in the imperfect Metals: For if any of them be expoſed to a long Heat, and eſpecially to the Rays of the Sun, collected by a large Burning-glaſs, the ſulphureous Principle flies off, and only a Calx, or Aſhes, will be left behind, which, in a more vehement Degree of Fire, are preſently vitrified; and, by reſtoring the Sulphur, this Glaſs may again be reduced to Metal.

TINCTURA METALLORUM.

Tincture of Metals.

This is a celebrated Remedy in *Holland, Germany*, and many Parts of the North; and is, by ſome, kept as a great Secret, tho' it was made public in 1687. in a Book printed at *Leyden*, intitled *Chymia Rationalis.*

This Tincture is made with Tin and Copper, to which ſome add Gold, and double its Quantity of martial Regulus of Antimony, melted together. There reſults from thence a metallic Maſs, to which ſome Chymiſts have given the Name of *Electrum minerale.* They pulverize this Maſs, and then, with Nitre, and Powder of Charcoal, reduce it by long Detonation to a kind of Scoriæ, whoſe Colour inclines to a pale Green: They pulverize it once more hot, and ſet it to digeſt in a certain Quantity of Spirit of Wine, or Spirit of Juniper, to which it gives a very beautiful Red. *Memoires de l'Acad. Royale des Scienc. An.* 1700.

It is intended for a Deobſtruent.

METALLURGIA. Metallurgy, is that Part of Chymiſtry, which is concern'd in the Separation, Depuration, and Preparation of Metals. And ſometimes it implies the digging them out the Mines.

METALLUS. *Helmont* uſes this Word in the ſame Senſe as METALLUM.

METAPEDIUM, μεταπέδιον. The ſame as METATARSUS.

METAPHRENON, μετάφρενον. The Back; properly the Part betwixt the Shoulders.

METAPOROPOEIA, or METAPOROPOIESIS, μεταπορεποιία, or μεταποιησις, from μετὰ, importing a Change, πόρος, a Paſſage, and ποιέω, to make. An Induction of a Change in the Pores of the Body. See METASYNCRISIS.

METAPTOSIS, μετάπτωσις, from μεταπίπτω, to change either for the better, or the worſe. A Change of one Diſtemper into another; either by *Diadoche*, or *Diadexis*, as it is call'd, when the Change is for the better, and the morbid Matter removes from a noble to a more ignoble Part; or by a *Metaſtaſis*, when the Change is for the worſe, and the morbid Matter removes from an ignoble to a more noble Part. *Caſtellus.*

METASTASIS, μετάστασις, from μετατίθημι, to transfer, ſignifies a Tranſpoſition and Settlement of ſome Humour, or Diſeaſe, on ſome other Part. Sometimes *Metaſtaſis* means ſuch an Alteration of a Diſeaſe, as is ſucceeded by a Solution, as in *Aph.* 7. *lib.* 5. where, it is ſaid, τὰ ἐπιληπτικὰ ὀλόσοισι πρὸ τῆς ἥβης γίνηται μετάστασιν ἔχει, &c. "Epileptic Diſorders, whenever "they happen before the Age of Puberty, ſuffer a *Metaſtaſis*; "but,

" but, if they ſeize the Patient after the Age of Twenty-five, " they generally accompany him to his Grave." *Galen*, commenting on this Place, ſays, κυρίως, &c. " Properly ſpeaking, there " is a *Metaſtaſis* of a Diſeaſe, when it is tranſlated from one " Part to another; but improperly, and by an Abuſe of the " Word, a Solution is ſo called: And in this latter Senſe I " think it plain that *Hippocrates* uſes the Term *Metaſtaſis*; for " the epilepſie Fit is not only ſolved by a Tranſlation of " the Humours which excited it, to ſome other Part, but the " Diſeaſe itſelf is perfectly cured."

METASYNCRISIS, μεταςύγκρισις, from μετὰ, a Prepoſition importing Change, and συγκρίνω, to collect, or mix together, in the Senſe which *Theſſalus* meant by it, is a Change which he pretended to effect in the whole Body, or only in ſome Part of it. *Galen* expreſſes the Word *Metaſyncriſis* by *Metaporopoieſis*, a Change in the Pores. For the clearer underſtanding the Force, and true Signification, of theſe two Words, we are to conſider the Opinion of *Aſclepiades*, with relation to the Bodies of Animals, which, he fanſy'd, were formed, as well as every thing elſe in the Univerſe, by the Concourſe of Atoms; for which Reaſon he called all Bodies συγκρίματα, *Syncrimata* or συγκρίσεις, *Syncriſeis*, Mixtures, becauſe they were, according to him, an Effect of a Collection and Mixture of Atoms. The ſame Author, the better to explain what happen'd to Bodies, made uſe, alſo, of the Verbs συγκρίνεσθαι (*ſyncrineſthai*) and διακρίνεσθαι (*diacrineſthai*) *to mix*, and *to ſeparate*; the firſt of which Words imported the Union of thoſe Atoms for the Formation of a Body, and the other their Diſſolution; there wanted a third Term to expreſs the Alteration, which is made, when theſe ſame Bodies, after being diſunited, returned to their firſt State; and that Word was μεταςυγκρίνεσθαι, (*metaſyncrineſthai*). *Cœlius Aurelianus*, who was himſelf a Methodic, renders this Word by *recorporare*, and μεταςύγκρισις, which was formed of it, by *recorporatio*. I know not indeed whether *Aſclepiades*, who uſed the Words συγκρίνεσθαι and διακρίνεσθαι, made uſe alſo of μεταςυγκρίνεσθαι, but *Caſſius*, who was one of his Diſciples, uſed that Word: Whence it appears, at leaſt, that *Theſſalus*, who lived a long time after *Caſſius*, was not the Inventor of it: But however that be, *Galen de S. F. Lib.* 5. *Cap.* 25. obſerves, with good Reaſon, that *Theſſalus* did not keep himſelf within the Bounds of the *Method*, when he made uſe of this Word, ſince it was impoſſible to underſtand what was meant by this Term, without firſt ſuppoſing, as a thing known, the Exiſtence of theſe ſmall Bodies, and their meeting together. Now this extended farther than what the Methodics profeſſed to know; for they would allow of no Penetration into Cauſes, which were leſs remote and occult, than thoſe Principles of *Aſclepiades*.

The celebrated *Cyclus Metaſyncriticus* of the Methodics, then, is a long-protracted Courſe of Remedies, perſiſted in with a View of recorporating, or reſtoring the Particles which compoſe the Body to ſuch a State as is neceſſary to Health.

METATARSIUS.

This is a fleſhy Maſs, lying under the Sole of the Foot. It is fix'd by one End, in the fore Part of the great Tuberoſity of the Os Calcis; and, running forward from thence, it terminates in a kind of ſhort Tendon, which is fixed in the Tuberoſity, and poſterior Part of the lower Side of the fifth Bone of the Metatarſus.

The *Metatarſius* moves the laſt Bone of the *Metatarſus*, much in the ſame manner as the *Metacarpius* does that of the *Metacarpus*. By this Action it draws, alſo, the fourth Bone along with it, and contracts the Sole of the Foot, increaſing the Convexity of the upper Side; provided that the Foot is not become inflexible by long wearing ſtrait Shoes, by old Age, or by any other Conſtraint or Indiſpoſition. *Winſlow.*

METATARSUS, from μετὰ, and after ταρσὸς, the *Tarſus*. The Aſſemblage of ſmall Bones, articulated to the *Tarſus* at one End, and to the Toes at the other.

METATHESIS. A Tranſpoſition, or Change of Place, us'd with reſpect to morbific Cauſes, which, when they cannot be evacuated, are remov'd to Places where they are leſs injurious. Thus a *Metatheſis* of a Cataract is a Depreſſion thereof, ſo that it may no longer intercept the Rays of Light.

METAXA, μίταξα. Silk.

METEL. A ſort of *Nux Vomica*, but ſomewhat larger. *Raii Hiſt. Plant.*

METEOROS, μετέωρος, from μετὰ, and ἄειρω, to elevate; elevated, ſuſpended, ſublime, erect, tumid. Thus μετέωρα ἀλγήματα are expounded by *Galen*, *Com. ad Aph.* 7. *lib.* 6 ſublime Pains, thoſe which are above the Peritonæum, or affect the ſuperficial and external Parts of the Body; theſe Pains are oppoſed to ſuch as are deeply ſeated, and called τὰ μὴ μετέωρα, not ſublime, but deep, and ſeated within the Peritonæum. And τὰ ὑποχόνδρια μετέωρα, *Aph.* 67. *Lib.* 5. are expounded in *Galen* by τὰ ἐκπεφυσημένα, φυσώδη καὶ τετυμένα (Hypochondria) tumefy'd and diſtended with Flatulences. Sometimes they are expreſſed by τὰ ἐπηρμένα, elevated, tumid, and inflamed, 1 *Epid. Ægr.* 8. Hence μετεωρισμὸς ſignifies an highly elevated Tumor, and μετεωρίζεσθαι, 5 *Epid.* and *Coac.* is uſed in the ſame Senſe. But μετεωρισμοὶ, in *Progn.* and *Coac.* 494. ſignifies the Patient's raiſing himſelf in order to ſit up, which if he does in a light and eaſy manner, it is there ſaid to be a good Sign. Again, μετέωρα πνεύματα καὶ φυσήματα, *Lib. de R. V. I. A.* are the Spirits and Humours in a State of Elevation and Suſpenſe, no way determin'd in their Courſe, but diſpoſed to a Flux or Evacuation. In another Senſe μετέωρον πνεῦμα is a ſublime and erect Reſpiration, which is performed with raiſing the whole Body, and elevating the Thorax. Again, *Lib. de ſalub. Diæta*, we are directed in the Summer τὰ μετεωριζόμενα κάτω ὑπάγειν, to evacuate the Humours which are then in a State of Elevation, or Æſtuation, and Fermentation, by Purging; this Elevation of the Humours ſeems to be what the Chymiſts call *Exaltation*. And to the ſame Purpoſe, *Lib. de priſca Medicina*, we read, ὅσον δ' ἂν χρόνον ταῦτα μετέωρα ᾖ, καὶ ἄπεπτα, καὶ ἀκρῆτα, " So long as theſe " [the Humours] are elevated, and unconcocted, and untem- " pered, neither the Pain, nor the Fever, can by any Art be " ſubdu'd"; nor can this be effected, as he ſays a little after, πρὶν ἀποκαθαρθῆ τε, καὶ καταςαθῇ, καὶ μιχθῇ τοῖσιν ἄλλοισι, " be- " fore they are evacuated, depreſſed, and mixed with others."

METHEMERINOS, μεθημερινός. An Epithet of a Quotidian Fever.

METHODICA SECTA. The Methodic Sect. See the PREFACE.

METHONICA. The Superb Lily, *vulgo*.

The Characters are;

The Root is carnous, and of the Figure of a rectangluar Rule, or Carpenter's Square, and very poiſonous. The Stalks are ſcandent; the Leaves are alternate, Lily-ſhaped, and running out at the Apex into a Tendril. The Flower is naked and hexapetalous, the Petals being elegantly ſinuated, and reflected quite backwards; it is furniſhed with ſix Stamina, and bears in its Centre the Ovary, which becomes an oval Fruit, tricapſular, and containing little roundiſh Seeds.

Boerhaave mentions but one Sort of this Plant; which is,

Methonica, Malabarorum. *H. L.* 688. *Methonica.* Ac. R. Sc. 1706. T. 7. F. 5. *Nienghala Zeylonenſium.* Muſæi Zeyl. *Lilium Zeylanicum ſuperbum.* Vulgo & H. A. 1. 69. Plukn. 116. 3. *Mendoni.* Raiz. d'Empoſe Luſitan. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 134.

It is planted in Pots, and cultivated for its Beauty; but I find no medicinal Virtues aſcribed to it.

METL. A Name of ſeveral Species of *American* Aloes. *Raii Hiſt. Plant.*

METOPION, μετώπιον. The Name of an Ointment deſcrib'd by *Dioſcorides*, *L.* 1. *C.* 71. Thus nam'd becauſe the Plant which produces *Galbanum*, a principal Ingredient in this Unguent, was call'd, in *Egypt*, *Metopion*.

METOPON, μέτωπον. The Forehead.

METRA, μήτρα. The *Uterus*, or Womb.

METRENCHYTA, μητρέγχυτα, from μήτρα, the *Uterus*, and ἐγχύω, to infuſe, or pour into. Injections for the *Uterus*.

METRENCHYTES, μητρεγχύτης, of the ſame Derivation as the preceding Word. A Womb Springe.

METRETES, μετρητής. An *Attic* Meaſure, containing ſomewhat more than nine Gallons. See MENSURA.

METROCELIDES, from μήτρη, a Mother, and κηλὶς, a Spot, or Mole. A Mole, or Mark, impreſs'd upon the Child, by the Mother's Imagination. *Caſtellus* from *Theophilus Bierlingius*.

METROPROPTOSIS, μητροπρόπτωσις, from μήτρα, the *Uterus*, and πρόπίπτω, to fall down. A Deſcent of the *Uterus*, or *Prolapſus Uteri*. In the old College Diſpenſatory, there is a Plaiſter directed by the Title of *Emplaſtrum* μητροπροπτωτικόν.

MEVIUM. A Name for the Venereal Diſeaſe. *Fallopius.*

MEUM.

The Characters are;

The Root is perennial; the Leaves are capillaceous, and much ſlenderer than thoſe of Fennel. The Seeds are long, and bigger and broader than Fennel-Seeds.

Boerhaave mentions but one Sort of this Plant; which is,

Meum. *Ger.* 895. *Emac.* 1052. *Raii Hiſt.* 1. 432. *Synop.* 3. 207. *Boerh. Ind. A.* 49. *Meum & Meum Athamanticum.* Offic. *Meum vulgatius.* Park. Theat. 888. *Meum foliis Anethi.* C. B. P. 148. Tourn. Inſt. 312. *Meum vulgare ſeu Radix Urſina.* J. B. 3. 2. SPIGNEL.

The Root of Spignel is about a Finger thick at the Head, which is covered with ſtiff Hairs or Briſtles; it runs deep into the Earth, and is divided into ſeveral Branches, of a very ſtrong aromatic Smell. The Leaves are not very large, but divided into ſeveral very fine Segments; the ſmalleſt and ſlendereſt of any Plant we have, of a dull, dark, green Colour. The Stalk grows to be a Foot or more high, not much branched, with a few ſmaller Leaves growing thereon, bearing on the Top Umbels of ſmall, white, five-leav'd Flowers. The Seed is longer and larger than Fennel, two growing together, which are ſtriated on the Back; it grows in ſome Parts of the North of *England*, and flowers in *June*. The Root is the only Part uſed.

It is hot and dry, carminative, and expelling Wind; and helps the Colic and Gripes. It is, alſo, alexipharmic, and good againſt peſtilential Diſtempers, being an Ingredient in the Theriaca and Mithridate. It is of Uſe likewiſe againſt the Stone, and Stoppage of Urine, and good in all uterine Diſorders. *Miller's Bot. Off.*

It diſcuſſes Flatulencies, and is principally uſed for Inflations, and Eructations of the Stomach, for provoking Urine and the Menſes, for Catarrhs, and for expectorating the Tartar of the Lungs: Hence it is an Ingredient in many Compoſitions.

The Root, as well as that of Mint, is furniſhed with an excrementitious ſort of Humidity, which flies to the Head, and there excites the Head-ach; for which Reaſon it ought not to be too frequently uſed, eſpecially by thoſe who have made a Vow of Chaſtity, or abſtain from Venery on ſome other Account; for, by the ſame Influence it affects the Head, it excites Venereal Deſires. *C. Hoffman.* This perhaps is the Reaſon, why in *Weſtmorland*, where it grows very plentifully in the Meadows and Paſtures, it is called *Bawd-money*.

It has the Name *Meum* from the *Greek* μεῖον, *meion*, leſs, becauſe of the extreme Slenderneſs of its Leaves.

The Seed, Leaves, and Root, are uſed. The Seed has the ſame Virtue, as that of Fennel; but is more balſamic, and recommended in an Aſthma, where there is an Adheſion of ſlimy and viſcid Matter, provided there be no Inflammation. They ſay, that no Plant is a greater Provocative to Luſt than *Meum*. Chewed in the Mouth faſting in the Morning, it corrects a fetid Breath, ſtrengthens the Gums, and rectifies the Diſorders of the Stomach. *Hiſt. Plant. aſcript. Boerhaav.*

Beſides the foregoing Species of *Meum*, *Dale* mentions the following:

MUTELLINA. Offic. *Mutellina, Meum umbellâ purpuraſcente.* Mont. Ind. 48. *Mutellina.* J. B. 3. 66. Raii Hiſt. 1. 453. *Meum Alpinum Germanicum, illis Mutellina dictum.* Park. Theat. 889. *Phellandrium Alpinum, umbellâ purpuraſcente.* Tourn. Inſt. 307. GERMAN or MOUNTAIN SPIGNEL.

It grows on hilly Places, and the Herb is in Uſe, to which *Monti* attributes the ſame Virtues as to the common *Meum*.

MEUM SPURIUM. A Name for the *Seſeli; perenne; folio glauco breviori.*

MEZEREON. A Name for the *Thymelæa; Lauri folio; deciduo; flore purpureo; ſive Laureola fœmina.*

MIASMA, μίασμα. Contagion.

MIGAMBE. The Name of a Plant, which grows at *Angola* in *Africa*, and at *Braſil*; to which I find no medicinal Virtues aſcrib'd.

MICHA, or MICHACH. Copper. *Rulandus.*

MICHAELIS ANGELI ANTIDOTUS. The Antidote of *Michael* the Archangel. The Name of an Antidote deſcrib'd by *N. Myrepſus, Cap.* 294, 295.

MICLETA ANTIDOTUS. An Antidote preſcribed by *N. Myrepſus, Sect.* 1. *Cap.* 200.

MICROCOSMETOR. An imaginary Being, repreſented by *Dolæus*, as reſiding in the Brain, and governing the Animal Faculties.

MICROCOSMOS, μικρόκοσμος, from μικρὸς, little, and κόσμος, the World. The Microcoſm, or Little World; that is, Man, who is ſo called by way of Eminence, as being an Epitome of all that is wonderful in the Great World, or Macrocoſm.

MICROLEUCONYMPHÆA.

The Characters are;

The Calyx is bifoliated; the Flower tripetalous, and adorn'd with nine Stamina; the Ovary is tricapſular, furniſhed with three Tubes; the Capſules are ſometimes divided into two; the other Parts are leſs than thoſe of the Nymphæa.

Boerhaave mentions but one Sort of this Plant; which is,

Microleuconymphæa; quæ Nymphæa; alba minima. *C. B. P.* 193. *Raii Hiſt.* 2. 1320. *Boerh. Ind. A.* 282. *Morſus Ranæ.* Offic. Ger. Emac. 818. *Nymphæa alba minima, ſive Morſus Ranæ.* Park. Theat. 1253. *Nymphæa minor, ſive Morſus Ranæ.* J. B. 3. 773. *Stratiotes foliis Aſari, ſemine rotundo.* Raii Synop. 3. 290. FROG-BIT.

It grows in muddy and ſlow Waters, and flowers in *July*. The Herb is uſed, and agrees in Virtues with the *Leuconymphæa*.

MICRONYMPHÆA.

The Characters are;

It is leſs than the Nymphæa in all its Parts; the Calyx and Flower are pentapetalous.

Boerhaave mentions one Species of this Plant; which is,

Micronymphæa; quæ Nymphæa; lutea; minor; parvo flore. *C. B. P.* 194. *Nymphæa, minor, lutea.* J. B. 3. 772. *Nymphæa, lutea, minor, ſeptentrionalium.* Lob. Ic. 595. *Boerh. Ind alt. Plant. Vol.* 1. *p.* 282.

It grows in Ditches, and agrees in Virtues with the Nymphæa. *Boerhaave.*

MICROSPHYCTOS, μικρόσφυκτος. A Perſon whoſe Pulſe is very ſmall.

MICTIO, or MICTUS. An Excretion of Urine.

MIDYON. A Species of Oak, mentioned by *Theophraſtus*. In *N. Myrepſus, Sect.* 1. *Cap.* 156. Midyon is mentioned as an Ingredient in an Antidote there deſcribed; but *Fuchſius*, his Interpreter, thinks it a Miſtake for Miſy.

MIENCAPHETITES. The Name of an Antidote, deſcribed by *N. Myrepſus, Sect.* 1. *Cap.* 393.

MIFRES. Aſphaltum. *Rulandus.*

MIGRANA. The ſame as HEMICRANIA.

MILAX. The ſame as SMILAX.

MILESIUS. An Epithet for the fineſt Wool.

MILIARIS FEBRIS. The Miliary Fever.

The Miliary Fever is ſo called from the Puſtules, or Veſicles, which principally appear on the ſuperior Parts of the Body, and in ſome meaſure reſemble Millet-ſeeds. But, in my Opinion, this Diſorder ought rather to be called the *Veſicular Fever*, becauſe the Puſtules are Veſicles, at firſt, full of a limpid, and, afterwards, of a whitiſh and almoſt Pearl-coloured Serum.

Though ſome are of Opinion, that only peſtilential and petechial Fevers ought to be claſſed among thoſe of the malignant Kind; yet, I think, ſome others, of a quite different Species, juſtly deſerve to be ſo.

Among this Number we reckon all ſuch Fevers as are communicated either by Contact, Exhalations, or any other Method of Contagion; as, alſo, thoſe Fevers which are, from the Beginning, accompanied with a violent and fixed Pain in any particular Part of the Body, ſuch as the Head, the Inteſtines, the Region of the Kidneys, or the Joints. To this Claſs, alſo, belong thoſe Fevers, in which the Patient is afflicted either with a Colic, a Gravel, a Gout, a Rheumatiſm, or Child-birth Pains, as original Diſeaſes, when, at the ſame time, the Symptoms of ſuch a Miliary Fever do not yield to thoſe Remedies, which generally prove efficacious in removing thoſe Diſorders, when of the primary Kind.

Among the malignant Fevers, we may, alſo, reckon thoſe in which the animal Spirits ſuddenly fail, and are oppreſſed; as, alſo, thoſe in which the above-mentioned Symptoms ſeem to depend upon no evident Cauſe, but upon a kind of latent Poiſon, by the Antients called an *Occult Quality*, and by the Moderns, Vapours.

To this Claſs, alſo, belong thoſe Fevers, in which, from a Cauſe ſimilar to that laſt-mentioned, the Hopes of Recovery are ſucceeded by a ſudden Death. Now, as all theſe Symptoms diſcover a proportionable Degree of Malignity, ſo I have obſerved them happen in a Miliary Fever, which, in the *Indies*, rages with a Degree of Malignity equal to that of the petechial Kind.

A Miliary Fever is of two Kinds, ſimple and compound. The ſimple is when none but miliary Puſtules appear; the compound Kind is when, with the miliary Puſtules, there are, interſperſed, red papillary Puſtules, which, when appearing alone, are called a *Raſh*.

It is, alſo to be obſerved, that the miliary Puſtules are ſometimes mixed with thoſe of the Small-pox; and that the former are gradually dried up, in proportion as the latter become tumid; whereas the miliary Puſtules remain after thoſe of the papillary Kind are dried up.

That I may, with the greater Diſtinctneſs and Perſpicuity, give the Hiſtory of the Miliary Fever, I ſhall enumerate its antecedent, concomitant, and ſubſequent Signs.

This Diſorder, then, is preceded by a weakly Conſtitution of Body, whether natural, or brought on by exceſſive Evacuations, or the Uſe of too ſmall a Quantity of Aliments; a ſerous State of the Blood; a weak and tumid Mind, eaſily ruffled and diſcompoſed by external Impreſſions, as in Women, and effeminate Men; cloſe and intenſe Thinking, or a gloomy Sadneſs; an Obſtruction, or Ulcer, accompanied with Pain in ſome particular Part of the Body: For this Reaſon thoſe who have been long afflicted with the Colic, Gout, Stone, or Ulcer of the Kidneys, are more ſubject to the Miliary Fever than others. In Women this Diſorder is preceded by an internal Heat, either with or without a Thirſt, eſpecially about the time of their Labour. In conſequence of this Circumſtance, their Pains are leſs violent than uſual; their Spirits, alſo, are ſunk, without any evident Cauſe; and their Breaſts ſo oppreſſed, as to lay a Foundation for the deepeſt Sighs; and, as in other Fevers, they are almoſt always cold externally.

A Miliary Fever is frequently accompanied with a Pain reſembling that of a Woman in Labour, a Colic, a Gravel, a Pleuriſy, or a Rheumatiſm. The Breaſt is alſo oppreſſed, and the Spirits ſunk. But, after two or three Days, the above-mentioned Pain being removed, an Horror, and then an alternate Cold and Heat of the whole Body, are produced; but this Heat is gentler and more natural, than that which accompanies an ordinary continual Fever; the Palm of the Hand is intenſely hot, but the Heat of its convex Part is ſomewhat more mild; the Pulſe is frequent, but weak; the Spirits are often greatly ſunk; and the Breaſt, as it were, oppreſſed by an huge Weight, fetches deep Sighs; and, which is, of all others, the moſt inſeparable Concomitant of this Diſorder, Sleep, upon its firſt Ap-

proach, is ſuddenly interrupted; for the Patient often remains for ſome Days and Nights, and generally longer than in any other Fever, without Sleep; whilſt, at the ſame time, he is neither ſeized with a Delirium, nor a Pain of the Head: A remarkable Inſtance of which, ſays the celebrated Sir *David Hamilton*, I myſelf ſaw, in a certain Woman of Diſtinction, under the Care of Dr. *Francis Bernard*, and who, during the Courſe of this Fever, was afflicted with Watchings, for a whole Month, without any Delirium, or Pain of the Head. The Tongue is ſometimes covered with a white Cruſt, and at other times reſembles that of a ſound and healthy Perſon. The Urine is ſometimes pale, like common Water; and at other times retains its natural Colour: And young Phyſicians, being frequently miſled by this Symptom, imagine the Diſorder to be what they call *Vapours*. Thoſe who labour under a miliary Fever, are ſometimes afflicted with a Pain of the Stomach, eſpecially after Sleep. Sometimes, alſo, they are ſeized with a Diarrhœa, either through their own Negligence, or in conſequence of the preposterous Practice of the Phyſician; whilſt, for Inſtance, heating Medicines, uſual in hyſteric Paroxyſms, are preſcribed without Diaphoretics. Hence, inſtead of the regular and benign Workings of Nature, which would expel the morbific Matter by a Diaphoreſis, a violent and rapid Fermentation throws it upon the Inteſtines. The Patient is ſometimes coſtive, whilſt at other times he is afflicted with a preternatural Solubility of Body, accompanied with a Pain of the Stomach and Inteſtines. Sometimes the Tongue, and Hands, when held out for the Phyſician's Information, tremble; and the Patient ſpeaks, as it were, with a tremulous Voice. Thoſe who are afflicted with a Miliary Fever, are, alſo, frequently ſeized with Convulſions, Deliriums, and a Difficulty of Breathing. The Exacerbations of theſe Symptoms recur like the Paroxyſms of an intermitting Fever. An Oppreſſion of the Breaſt productive of Sighs, an uncommon Sinking of the Spirits without any evident Cauſe, Watchings, and that tumultuous Agitation of the Spirits commonly called a *Hurry of the Head*, when the Patient compoſes himſelf for Reſt, as, alſo, a frequent and weak Pulſe, accompanied with whatever other Symptoms, are always Signs, that the miliary Puſtules are about to make their Eruption; and all theſe Symptoms continue, till the Puſtules become prominent, after which the Patient is freed from moſt of them.

Theſe Puſtules are, for the moſt part, only conſpicuous on the Breaſt, Neck, and Interſtices of the Fingers; though they are, alſo, ſometimes found over all the Body, and, being daily and gradually increaſed, they at laſt diſappear, the Cuticula, in the mean time, remaining rough in thoſe Parts where they were. Sometimes theſe Puſtules itch, eſpecially in the compound Miliary Fever, where the Puſtules are intermixed with thoſe of the red papillary Kind. It is, alſo, to be obſerved, that the ſimpler this Species of Fever is, the more mild its Symptoms always are; a Circumſtance which not only renders the Patient, but, alſo, the more incautious Sort of Phyſicians, careleſs and inadvertent. By this means the Fever is either rendered more dangerous, or another Diſorder produced, ſince, for the Want of that Care and Caution, which are neceſſary at firſt, this Fever ſometimes begins with a Train of violent Symptoms, ſuch as Pain of the Stomach, Loſs of Appetite, internal Heat, Oppreſſion of the Breaſt, a Sinking of the Spirits attended with Sighs, an irregular Return of Heat and Cold, Watchings, and other Diſorders of a like Nature.

In the Decline of this Diſorder, the ſuperior Parts of the Hands are often moiſt, with a cold Sweat.

Whether the miliary Puſtules appear on a certain fixed and ſtated Day, is a Circumſtance not eaſily determined, ſince the firſt Appearance of this Diſorder is highly uncertain, and the Accounts given of it, by the Patient, not to be depended upon. But ſo far as I have been able to diſcover, they generally begin to make their Eruption on the tenth or eleventh Day from the Beginning of the Diſorder, when its Progreſs is regular: But they begin to be dried up about the eighteenth Day, or, where the Quantity of the morbific Matter is large, about the twenty-firſt or twenty-ſecond Day.

I firſt endeavoured to diſcover the Time of their Eruption in thoſe Women, whom, three Days after their Labour, I heard complaining of an Horror, or Cold, ſucceeded by a preternatural and uncommon Heat; for, when I ſaw the Puſtules on their Breaſts and Necks, I concluded that they had, for a conſiderable Number of Days, laboured under a Miliary Fever; and, ſtrictly examining into what happened from the Beginning of the Diſeaſe, I found that, before their Delivery, they had been afflicted, either with a preternatural Heat, or a Pain of ſome particular Part, accompanied with a violent Oppreſſion of the Breaſt, Sighs, and a Sinking of the Spirits; and, as they imagined theſe Symptoms depended upon their approaching Labour, they thought they would be removed when it was over: And though their Pains are milder than uſual, yet they are ſucceeded by an Oppreſſion of the Breaſt, accompanied with Sighs, a Sinking of the Spirits, by Midwives called Fear and Vapours, together with a frequent and weak Pulſe; all which generally prognoſticate the Eruption of the miliary Puſtules, which, in Child-bed Women, is promoted by Sweating in Bed. From the firſt internal Heat, therefore, or Pain before Labour, till the Eruption of the Puſtules after Labour, there are generally eleven Days: But the Patient's Ignorance of her own State, and the indiſtinct Account of it ſhe gives to the Phyſician, generally ſo diſconcert him in forming his Prognoſtic, that the moſt curious and accurate Profeſſor of the Art can hardly venture to aſcertain the preciſe Day of the Eruption.

The Conſequences of a Miliary Fever, ſo far as I have been able to obſerve, are a Swelling of the Thighs, Legs, and Feet, not always unaccompanied with Pain; a Tumor and Abſceſs of the Breaſts; a Depravation of the Memory; an immoderate Diſcharge of the Lochia and Urine; a kind of Indiſpoſition reſembling the hypochondriac or hyſteric Diſorder; and an internal Heat, accompanied with Weakneſs, Languor, and a Loſs of Appetite. Sometimes one, ſometimes another, of theſe Misfortunes happen, when the Fever, either in conſequence of its own malignant Nature, or the bad Management of the Phyſician, terminates in an unlucky manner.

As for the internal Cauſes of a Miliary Fever, this Diſorder ſeems to depend partly on an exceſſive Seroſity, and a kind of acid Acrimony in the Blood, and partly on a preternatural Commotion of the nervous Fluid. This Conjecture ſeems probable, not only from the preceding Hiſtory of the Diſeaſe, and the Remedies calculated for its Removal, but, alſo, from the Diſſection of the Bodies of thoſe who have fallen Sacrifices to it.

The Acrimony and Acidity of the Blood may be diſcovered by the Secretions made in this Species of Fever; for the Urine is paler, liker that of an healthy Perſon, and diſcharged in larger Quantities, than in a burning Fever, in which the Blood, and nervous Fluid, are impregnated with ſaline-ſulphureous Particles. We find, in like manner, that, in the Beginning of a Dropſy, a copious Diſcharge of pale Urine is excited by the Uſe of Oxymel of Squills. In a Miliary Fever there is, alſo, a more copious Diſcharge of the Saliva, than in one of the burning Kind: In the former the Thirſt is generally leſs, and the Tongue cover'd with a leſs viſcid Humour, than in the latter. Beſides, the Matter of the miliary Puſtules, which are Veſicles full of Serum, ſeems to be ſecreted by the above-mentioned Acid, juſt as the Serum of Milk is by the Affuſion of any Acid.

The Truth of this Theory is, alſo, evinced by the Qualities of the Medicines calculated for the Removal of this Diſorder; which are thoſe of the teſtaceous kind, ſuch as Crabs-eyes, and other Subſtances capable of abſorbing Acids.

The ſame Thing is, alſo, confirmed by the Subſtances which prove injurious in this Diſorder; for Lemon-juice, and all other Subſtances of an acid Taſte, are hurtful in a Miliary Fever.

The ſerous State of the Blood is proved by the Heat, which, in this Diſorder, is milder than in a burning Fever; and the more ſimple the Miliary Fever is, the ſmaller is the Degree of Heat, with which it is accompanied; for when thoſe red Puſtules, which we commonly call a Raſh, are interſperſed with theſe of the Miliary Kind, all the Symptoms render the Diſorder more like a burning than a Miliary Fever; and tho' thoſe who labour under an Anaſarca, in which the Blood abounds with Serum, are ſometimes ſeized with a Miliary Fever, yet they are never afflicted with one of the burning Kind.

The ſerous State of the Blood is, alſo, proved by the Time in which the miliary Puſtules make their Eruption; for theſe, in conſequence of the Seroſity of the Blood, and the gentler Heat and Motion, are not ſo ſoon expelled as thoſe of the papillary and variolous Kind, in which the Blood abounds with a larger Quantity of Sulphur; in the ſame manner as common Water, is, by equal Degrees of Heat, longer before it boils, than Wine or Brandy. For this Reaſon, alſo, the animal Spirits are, in this Diſorder, firſt of all put into a Commotion.

The ſerous State of the Blood is, alſo, proved by the Remedies uſed for the Cure of this Diſorder, which are a continued Diaphoreſis, and the ſucceſſive Application of Veſicatories, which at once diminiſh the Seroſity, and correct the Acidity, of the Blood, and nervous Fluid. Beſides, the Cure of this Fever is perfected by Nature, by eliminating, in ſome meaſure, the Serum of the Blood, in the Generation and Production of the Puſtules. Nor are diluting and aqueous Liquors ſo beneficial in this as in burning Fevers; but Broths, prepared of Fowls, are rather to be copiouſly drank. Beſides, whatever hinders the Diminution of the Serum by a Diaphoreſis, proves injurious in this Diſorder; ſuch as external Cold, and heating Medicines, not poſſeſſed of a diaphoretic Quality.

The Acidity, as well as Seroſity, of the Blood are ſufficiently demonſtrated, by the Diſſections of thoſe who die of a Miliary Fever; for in ſome Parts the Blood is coagulated, and of a blackiſh Colour, like that produced in Oil by an Affuſion of the Spirit of Vitriol; but the ſame Blood, when taken out of the Veſſels, tinges a Linen Cloth with a pale Colour. In other Parts the Blood is ſo ſerous, that the Veſſels which contain it are of a pale Colour on that account: An Inſtance of which we have in one of the following Hiſtories; and I lately ſaw one not unlike it, in a certain illuſtrious Youth, of about twenty-one Years of Age, who died of this Fever for want of a ſeaſonable

Uſe of proper Meaſures. Upon laying open his Abdomen, Thorax, and Cranium, the Veſſels were in ſome Parts diſtended with a blackiſh and coagulated Blood: But this Blood, when out of the Veſſels, tinged a Linen Cloth with a pale Colour. We, alſo, frequently find, from Experience, that Blood, which, in conſequence of drinking a large Quantity of generous Wine, is of a rediſh Colour, when flowing from the Veins, nevertheleſs diſcovers its Seroſity by the pale Colour with which it tinges a Linen Cloth. In other Parts of this Carcaſe the Blood appeared ſerous, and turgid, with a pale Colour. The Heart, alſo, together with the Plexus Choroides, which, by reaſon of the numerous Blood-veſſels of which it is compoſed, is almoſt always red, was of a highly pale Colour; a Circumſtance which proves, that the Blood was both ſerous and acid: Nor is it to be doubted but the nervous Fluid, proceeding from the Blood, had acquired the ſame Qualities.

That the febrile Intemperies is firſt excited in the nervous Fluid, is ſufficiently proved by the nervous Symptoms which appear firſt, ſuch as the Pain, the Sinking of the Spirits, the Watchings, and other Symptoms above enumerated: But at the ſame time there are no Symptoms, which, in the leaſt, indicate a febrile Fervor of the Blood; ſuch as a violent Heat, a ſtrong Pulſe, a Pain of the Head, Thirſt, Drineſs of the Tongue, and red Urine, diſcharged in a ſmall Quantity. That the febrile Intemperies firſt begins in the nervous Fluid, is, alſo, obvious from the Things which prove beneficial in this Diſorder; ſuch as, a Mind, for Inſtance, free from all exorbitant and tumultuous Paſſions. This febrile Commotion ſeems, therefore, to derive its Origin from a Tranſlation of the Serum of the Blood to the nervous Fluid, from whence it affects the Maſs of Blood.

Moſt Phyſicians are of Opinion, that an acute continual Fever, which is not of the malignant Kind, draws its Origin, principally, from an Obſtruction of the cutaneous Glands, and a Plethora of the Blood-veſſels, produced by that means: And it is highly probable, that the like happens to the nervous Fluid, in a ſimple Miliary Fever; for as, by the Obſtruction, the Nerves are render'd tenſe, ſo, from this Tenſion, ariſes the Pain, which generally appears the firſt of all the other Symptoms; for which Reaſon it is rather to be ſoothed and allayed by diaphoretic Medicines, which diminiſh the Plethora, and leſſen the Obſtruction of the capillary Veſſels, than by Laudanum; in the ſame manner as the Patients are, by the Eruption of petechial and variolous Puſtules, more effectually freed from Pain, the primary Symptom of thoſe Diſorders, than by the Uſe of Laudanum.

The nervous Fluid, having its Quantity enlarged, and its Motion retarded, by the Obſtruction of the capillary Nerves, impreſſes an irregular Motion on the animal Spirits, and affects the Patient with an Horror.

But the Cold is ſucceeded by an Heat, becauſe the nervous Fluid, when the Obſtruction is removed, is more copiouſly conveyed into the Maſs of Blood, and by that means accelerates its Circulation. Nor even in this Caſe, in which the Blood abounds with ſerous and acid Particles, which check its Motion, is the Pulſe ſo great as in other Fevers, which are firſt excited in the Blood, when impregnated with ſaline and ſulphureous Particles.

The Heat and Cold mutually ſucceed each other, but in an irregular manner: This is occaſion'd by the Seroſity of the Blood, and the nervous Fluid ſecreted from it, which are, for this Reaſon, ſooner affected by Medicines, Exerciſe, much Speaking, or the Paſſions of the Mind. For this Reaſon nothing more effectually contributes to hinder the irregular Returns of the Heat and Cold, than lying in Bed, and Reſt.

The Sighs and Oppreſſion of the Breaſt ariſe from a Stagnation of the nervous Fluid in the capillary Nerves of the Breaſt; for, after an Eruption of the miliary Puſtules, the Patients are freed from this Oppreſſion: This Symptom by no means draws its Origin from Serum lodged in the moſt minute Veſſels of the Aſpera Arteria, ſince by that means an Aſthma would be produced, and the Oppreſſion mitigated by pectoral Medicines, which, however, together with all ſuch Subſtances as prevent the Eruption of the Puſtules, are, in this Caſe, prejudicial.

This Oppreſſion is accompanied with a Defect of Spirits, becauſe the Blood being ſerous, there is, for that Reaſon, a ſcanty Secretion of Spirits into the nervous Fluid. This Defect is, alſo, owing to the Seroſity of the nervous Fluid, by means of which the animal Spirits are clogged, and oppreſſed; for, when the Seroſity is diminiſhed by a Diaphoreſis, the animal Spirits are ſet at Liberty, and the Patient ſeems to recover freſh Strength, juſt as a Porter, upon laying down his Burden, begins, gradually, to reſume his Breath: But this does not happen in a Defect of Spirits, ariſing from an Hypercatharſis. And it is obſervable, that the Pulſe of Patients labouring under a Miliary Fever, whilſt they are afflicted with a Defect of Spirits, and when they are freed from it, exactly reſembles that of Perſons fatigued by Burdens, and gradually recovering their natural State. But in Caſes where too copious Evacuations are made, the Weakneſs of the Pulſe is proportioned to the Depreſſion of the Spirits.

By too brisk a Motion of the animal Spirits, Patients labouring under the miliary Fever are rendered incapable of ſleeping, and often delirious; and, when they compoſe themſelves for Reſt, they complain of a certain Confuſion of the internal Senſes.

Their Freedom from a Pain of the Head, during their Courſe of Watching, depends upon the languid Impetus of the Blood to the Brain; for tho' it circulates ſomewhat more briskly, than in ſound Perſons, yet its Motion is ſtill more faint and languid, than in other Fevers, whether of the intermittent, or continual Kind. For this Reaſon, alſo, the Thirſt is, in a miliary Fever, far more moderate than in one of the burning Kind. The Urine, alſo, is paler, more reſembling that of ſound Perſons, and diſcharged in larger Quantities, becauſe the Acidity of the Blood produces a Separation of the Serum. For which Reaſon, alſo, Patients labouring under miliary Fevers are ſubjected to frequent Vomitings.

In conſequence of the Seroſity of the animal Spirits, the antagoniſt Muſcles are not always kept equally contracted; by which means convulſive Motions are produced. But if, in conſequence of ſuch a Seroſity, the Contraction of the Muſcles is but ſmall, a Tremor of the Tongue and Hands is only produced.

If, in the Beginning of this Fever, the Patient, miſtaking his Diſorder for Vapours, riſes out of Bed, and uſes hot Medicines, the Motion of the Blood and Spirits is, by that means, increas'd; and Nature, inſtead of producing the miliary Puſtules, is ſtimulated to a prepoſterous and unſeaſonable Secretion of the morbific Matter. Hence various Symptoms are produced in various Parts, and the Miliary Fever appears under the Form of ſome other Diſorder. If it affects the Stomach, a Nauſea and Vomiting are produced; if the Inteſtines, Pain, and a Diarrhœa. In which Caſe, the Pain and Diarrhœa are ſooner removed by a gentle and protracted Diaphoreſis, than by the Uſe of Laudanum, or Aſtringents; and if the Patient ſhould have only two or three Stools, without Gripes, or a Defect of Spirits, I am of Opinion, that neither Opiates, nor Aſtringents, ought to be us'd; for there is often a ſufficient Quantity of Matter to be carry'd off both by Stool, and the miliary Puſtules; for which Reaſon the Prevention of their Eruption by Stools is not to be dreaded. The Truth of this we ſufficiently experience in Caſes, where there is a large Quantity of Matter to be ſecreted; in the Small-pox, for Inſtance, where neither Clyſters, nor Veneſection, prevent the Eruption of the Puſtules. Nor, during the whole Courſe of the Small-pox, is any Misfortune produced by a gentle Diſcharge of the Menſes.

The Weakneſs of the Pulſe is produced by the Seroſity of the Blood, and nervous Fluid; for hence ariſe a Defect of the animal Spirits, and a languid ſyſtaltic Motion of the Heart.

In a Miliary Fever, the Prognoſtics are theſe following: If, in the Beginning, the Patient has uſed an improper Regimen, and the Phyſician has exhibited ſuch heating Medicines as do not excite a Diaphoreſis, tho' the Symptoms ſhould at firſt be pretty mild, yet the Diſorder is often dangerous, becauſe it either terminates in the Death of the Patient, or proves chronical, and long-protracted.

If, from the Beginning of this Fever, any particular Part is affected with Pain; if the Patient is hot, without any Senſe of Pain; or if he labours under a Sickneſs of the Stomach; and if theſe Symptoms are ſucceeded by alternate Heats and Colds recurring at unequal Intervals, a Defect of the Spirits, an Oppreſſion of the Breaſt, accompany'd with Sighs, and an eaſy Reſpiration; and, at laſt, if the Puſtules make their Eruption with a gentle and continual Diaphoreſis; the Patient is, for the moſt part, in a hopeful Condition.

If the Delirium, the Convulſions, or the Apoplexy, ſhould, from the pathognomonic Signs of this Fever, ſuch as the violent Oppreſſion of the Breaſt, the Sighs, and the Defect of Spirits, appear concomitant Symptoms, and happen in the Beginning of the Diſorder, they eaſily yield to the diligent Efforts of the Phyſician, and the Influence of proper Medicines. But, in the Progreſs and Decline of the Diſeaſe, when the Patient is weak, and the miliary Puſtules are, by Cold, or, perhaps, a prepoſterous Practice, repel'd, a Tranſlation of the morbific Matter is made to the Brain and Nerves; a Cataſtrophe ſoon ſucceeded by Death.

In a Miliary Fever, a ſudden Suppreſſion of a Diarrhœa, whether ſpontaneouſly, or by the Abuſe of Opiates and Aſtringents, lays a Foundation for an Apoplexy, eſpecially if the Patient was before diſpos'd to that Diſeaſe, in conſequence of a Plethora, and an unfavourable Structure of the Parts.

When the Urine, being diſcharg'd yellow, ſuddenly becomes pale, the Phyſician is to be upon his Guard, in order to prevent a Tranſlation of the morbific Matter.

In Child-bed Women, afflicted with this Fever, a Diarrhœa is a dangerous Symptom; becauſe it not only hinders the Eruption of the Puſtules, but, alſo, the Diſcharge of the Lochia.

A difficult Reſpiration, a Privation of Voice, a Trembling of the Tongue, and more eſpecially a nervous Dyſpnœa, are to be claſs'd among the dangerous Symptoms attending this Diſorder.

The more the Patients are diſpos'd to Sleep, they, for the moſt part, recover the more happily.

Perſons of a mild and ſweet Diſpoſition are more eaſily cur'd of a Miliary Fever, than ſuch as are the unhappy Victims of turbulent and unruly Paſſions.

If

If Nature and the Phyſician take the ſame Meaſures, and, as it were, act in Concert, the Patients recover their Strength immediately after the Deſiccation of the Puſtules, unleſs, in conſequence of a Redundance of the morbific Matter, there ſhould be ſome of its Remains depoſited on ſome particular Part.

If in a Scarlet Fever, after the red Colour is gone, miliary Puſtules appear, they prognoſticate the Safety of the Patients.

The Cure of a ſimple Miliary Fever.

From the Nature of a ſimple Miliary Fever, as already deſcribed, we muſt perceive, that the following Intentions of Cure muſt be purſued. The Acidity of the Blood, and nervous Fluid, muſt be corrected, their Seroſity removed, and the animal Spirits ſet at Liberty, and reſtored; ſince, by theſe means, the moſt dangerous Symptoms are prevented, and a due Equilibrium between the Motion of the Blood, and that of the animal Spirits, reſtor'd. After theſe Meaſures are taken, we muſt wait a proper Time for the Eruption of the Puſtules, produc'd by a Matter duly diſpos'd.

In order to correct that Acidity of the Blood, and nervous Fluid, which gives Birth to Coagulations of the Blood and Secretions of the Serum, alcaline Medicines, and eſpecially thoſe of the teſtaceous Kind, are to be choſen; ſuch as Crabs-eyes, prepared Pearls, and others of a like Nature. In order to diminiſh the Seroſity of the Blood, and nervous Fluid, thoſe Subſtances are moſt efficacious, which promote a gentle and continual Diaphoreſis, the moſt conſiderable of which are the compound Powder of Crabs-claws, Goa-ſtone, and Oriental Bezoar; for, by the repeated Uſe of theſe for ſome Days, the bad Qualities of the Blood, and nervous Fluid, are corrected; and the Pulſe, being reſtored to a ſtronger and briſker Motion, accelerates a more laudable and equable Eruption of the miliary Puſtules. Indeed, if no Regard was to be had to a Diaphoreſis, and if no other Intention was to be purſued, than the Exaltation of the Blood, and animal Spirits, the hotter Cardiacs, ſuch as Virginian Snake-root, Wine, and others of a like Nature, might be copiouſly exhibited. But in this Fever, theſe, and other Things of a like Nature, are rarely proper, in order to promote the Eruption of the Puſtules; for the Secretion of the morbific Matter cannot be well carry'd on, when the Blood is in a violent Ferment. Beſides, Deliriums, convulſive Motions, and other Misfortunes of a like Nature, are often produced by the Uſe of hot Medicines: All the Secretions, therefore, whether promoted by Nature, or Art, are moſt properly made by ſlow Degrees; and this End is moſt efficaciouſly obtained by teſtaceous Subſtances, which not only cheriſh a moderate Heat, but, alſo, correct the peccant Qualities of the Fluids, and promote a Diaphoreſis.

Veſicatories are, alſo, highly efficacious, not only in diminiſhing the Serum, but, alſo, in preventing Coagulations, by means of the volatile Salt they contain; for which Reaſon no Remedy is generally more powerful in ſoothing Commotions of the animal Spirits, procuring Sleep, or elevating the depreſs'd and languid Spirits; for ſo far are Veſicatories from hindering the Eruption, that, by their means, the morbific Matter being in ſome meaſure diminiſh'd, Nature is rendered capable of more eaſily throwing off the Remainder thro' the uſual Emunctories; nor are we to apply more Veſicatories at a time than one, but only one after another, unleſs ſome violent Symptom ſhould indicate the Propriety of ſuch a Practice. We muſt, alſo, obſerve to apply a freſh Veſicatory, as ſoon as the Ulcer, produced by the former, is dry'd up; ſince I have often obſerv'd, that, immediately upon the Deſiccation of the Ulcers, all the Symptoms were exaſperated, and again mitigated by the Application of other Veſicatories.

In the Year 1697. ſome Patients, ſeiz'd with a Miliary Fever, were not only afflicted with a Pain, but, alſo, with a Swelling of the Head; but theſe Symptoms were gradually abated by the ſucceſſive Application of Veſicatories. The Diſorder of the Forehead was removed by Veſicatories apply'd behind the Ears; that of the Temples and Eyes, by their Application between the Scapulæ; and that of the Cheeks, Lips, and Fauces, by the Application of Veſicatories to the Arms, Thighs, and Legs: And, 'tis obſervable, that, from the Deſiccation of one Ulcer, the Pain and Tumor were ſuddenly augmented, till another was excited by the Application of a freſh Veſicatory.

In the Year 1704. ſome Patients, labouring under this Diſorder, were ſeiz'd with a Pain of the Fauces, reſembling that with which a Quinſey is attended. And though, upon the Appearance of this Symptom, many dy'd ſuddenly, yet all, ſays Sir *David Hamilton*, who were under my Care, eſcap'd ſafely, by means of a gentle and continual Perſpiration.

In a Miliary Fever, Cathartics are never to be uſed, unleſs their Propriety is indicated by ſome violent Symptom. An emollient Clyſter is, however, often proper for cleanſing the Primæ Viæ.

Veneſection is, alſo, rarely proper, unleſs indicated by ſome violent Symptom, ſuch as an Aſthma, a Pleuriſy, or ſome other Diſorder of a like Nature.

In a Miliary Fever, the Paſſions of the Mind are, as much as poſſible, to be guarded againſt; and whatever Circumſtances, whether of a grateful or diſagreeable Kind, throw the animal Spirits into Commotions, are prejudicial. Reſt in Bed is, alſo, to be preſcrib'd. If a contrary Regimen is uſed in the Beginning of this Fever, the Matter of the miliary Puſtules about to move to the Surface of the Body, being repel'd to other Parts, produces dangerous Symptoms. If, in order to remove theſe Symptoms, ſuch Medicines are uſed, as are improper for ſubduing the primary Diſorder, either Death, or a chronical Diſeaſe, without any future Eruption of the Puſtules, enſue. Hence we underſtand why Child-bed Women generally recover ſo eaſily from this Diſorder, that is, becauſe, by lying at Eaſe in Bed, they procure a gentle and perpetual Diaphoreſis, and are treated with diluting Aliments, inſtead of heating Medicines; for it has been frequently obſerved, that, among Women in this Condition, ſuch as ſeem'd to enjoy a tolerable State of Eaſe, whilſt in Bed, were, upon their getting out of Bed, ſeiz'd with ſuch a Sinking of Spirits, that they ſeem'd ready to die; and ſome of them have really died ſuddenly. Such of them, alſo, as quit their Beds too ſoon, imagining themſelves to be only hyſteric, are rendered worſe by that raſh and incautious Step.

A memorable Inſtance of this we have in one Mrs. *Shepherd* in *Bartholomew-lane*, who, being ſeized with an Oppreſſion of the Breaſt attended with Sighs, a Confuſion of the internal Senſes, and a Palpitation of the Heart, not only imagined herſelf vapouriſh, but was, alſo, by thoſe who ſaw her, thought to be in that Condition; for which Reaſon it was judged expedient ſhe ſhould get out of Bed. But as ſoon as ſhe had put on her Clothes, Tremors, and convulſive Motions, were added to the former Symptoms. I, ſays Sir *David Hamilton*, being called, from the Oppreſſion of the Breaſt, the Sighs, and the Sinking of the Spirits, concluded that ſhe laboured under a Miliary Fever, was in a dangerous Condition, and could not be preſerved without a gentle and continual Diaphoreſis: I, therefore, preſcribed Reſt in Bed, without admitting any Viſitants; a Veſicatory to be applied between her Scapulæ; and directed the following Bolus to be taken every ſixth Hour, with ſome proper Julap:

> Take of the compound Powder of Crabs Claws, and Sperma Ceti, each one Scruple; of Saffron, ſix Grains; and of the Syrup of Cowſlips, a ſufficient Quantity: Make up into a Bolus.

By theſe Meaſures her Cure ſucceeded ſo happily, that in two Days time the convulſive Motions were almoſt entirely remov'd; and the miliary Puſtules, at laſt appearing, became gradually larger; and the Serum diſcharged from them, till the very time they were dried up, was thicker and whiter than uſual.

It has, alſo, been ſometimes obſerved, that when Child-bed Women, labouring under a Miliary Fever, have quitted their Beds too ſoon, they have, by that means, been cut off by a ſudden Death. This Misfortune is, no doubt, produced by the Cold repelling the Matter of the Miliary Puſtules upon the Nerves. For which Reaſon, ſays Sir *David Hamilton*, when I am called to Women in Labour, and obſerve the pathognomonic Signs of a Miliary Fever, I order them to keep in Bed, and compoſe themſelves for the Delivery of the Fœtus.

It is, alſo, obſervable, that Child-bed Women, who in Bed have appeared pretty well, have, upon their riſing, been ſeiz'd with ſuch a Sinking of Spirits, that they appeared as if they were dying: For which Reaſon theſe, as well as Women in Labour, getting the Fœtus extracted as ſoon as poſſible, are, when they perceive a Languor, and Oppreſſion of the Breaſt, without any evident Cauſe, to deſpiſe the fooliſh Advice of their Nurſes, and confine themſelves to Bed, in order to have a gentle and continual Diaphoreſis excited.

The Cure of the Symptoms attending a Miliary Fever.

All the Symptoms of a Miliary Fever, taken collectively, are, in my Opinion, to be removed by the ſame Medicines, which would be proper to be uſed, if theſe Symptoms appeared ſeparately, and by themſelves; unleſs ſome important Circumſtance, to be judged of by a ſkilful Phyſician, ſhould contraindicate ſuch a Practice.

A Pain of the Head, or any other Part, is far more infallibly removed by a gentle and continual Diaphoreſis, than by Opiates; juſt as in petechial Fevers, and the Small-pox, we find the Pain is by no means to be removed, till the Matter to be expelled appears on the Skin. When, therefore, ſays Sir *David Hamilton*, I am called either to a Woman in Labour, or a Patient labouring under any other Pain, and obſerve a Defect of Spirits, and a frequent, but weak Pulſe, omitting the Uſe of Narcotics, I act in Concert with Nature, and forthwith direct my Intentions to excite a Diaphoreſis. But, if the Intenſeneſs of the Pain indicates the Uſe of Opiates, I order Diaphoretics to be mixed with them; otherwiſe they either do not ſooth the Pain, or bring on ſome other Misfortune in its ſtead; and, if the Pain is of the pleuritic Kind, or ſuch as diſcovers an Inflammation in any other Part, Veneſection is rarely to be omitted.

But when the Heat and Cold recur alternately, but in an irregular manner, as they generally do, a gentle Diaphoreſis, excited

cited by means of the compound Powder of Crabs-eyes, without any heating Subſtances, is highly beneficial. This Medicine, though deſpiſed by ſome, ſays Sir *David Hamilton*, I have often found ſurpriſingly efficacious: Of this we have a remarkable Proof in one Mrs. *Bolton*, who, on the ſecond Day after her Labour, was ſeized with a Pain of the Abdomen, near the Top of the Thigh. But, the Pain of this Part being ſomewhat mitigated, ſhe was afflicted with alternate Heats and Colds, Watchings, and an Oppreſſion of the Breaſt, attended with Sighs and Languor; at laſt, after ſome Days, the miliary Puſtules appeared. But by every ſix Hours exhibiting a proper Doſe of the compound Powder of Crabs-eyes, in order to continue the Diaphoreſis, by checking all the Symptoms, by treating the Patient with diluting Aliments, and a little *Canary* Wine, and ordering her to keep her Bed for fourteen Days after the Eruption of the Puſtules, ſhe was perfectly reſtored to Health; though before her Labour an hectic Heat, a Cough, and a difficult Reſpiration, ſeem'd to expoſe her to the Danger of a Conſumption. It is, therefore, obvious, that many, ſeiz'd with a Miliary Fever, are with great Difficulty reſtored to Health, either for the want of due Care in the Beginning, as if the Patients were only hyſteric; or by the Abuſe of hot Medicines, which expel the morbific Matter, not in a critical, but in a ſymptomatic manner. And it is worth Obſervation, that as, during the Courſe of this Fever, I, for the ſake of Experiment, neglected its Uſe, by which the Diaphoreſis was ſtopt, and all the Symptoms augmented; ſo, by repeating the Uſe of it, all the laudable and favourable Symptoms of the Diſorder were again brought back.

The Watchings of Perſons labouring under Miliary Fevers are removed by Veſicatories, Reſt in Bed, Freedom from all Noiſe, and preſerving the Mind unruffled by the Sallies of exorbitant Paſſions.

In order to remove the Delirium, diaphoretic Antimony, exhibited by itſelf, is highly efficacious; and though this Medicine is, by ſome Phyſicians, eſteemed a Calx, deſtitute of all Virtue, yet I have often in Conjunction with other Medicines, and always by itſelf, preſcribed it with Succeſs, not only in Watchings, but, alſo, in a Delirium.

Watchings are, alſo, often removed by a gentle and continued Diaphoreſis; which, if it cannot be obtained by the compound Powder of Crabs Claws, is, rather than by means of any other Medicines, to be procured by Spirit of Hartſhorn, to be drank in a Poſſet prepared with Sage, rather than in an Infuſion of that Herb, becauſe the former affords more Nouriſhment, which, in this Fever, is neceſſary.

If Opiates are ever to be uſed in this Fever, it is after the Veſicatories. And when the Patient is afflicted with a Diarrhœa, or the Eruption of the Puſtules retarded, the moſt proper and efficacious Medicines are the Diaſcordium, or *Venice* Treacle.

In removing the convulſive Motions, with which Miliary Feveas are attended, I have found nothing more effectual, than anointing all the Joints with Eſſence of Amber, and frequently exhibiting about twenty Drops of it in ſome proper Liquor.

In an Oppreſſion of the Breaſt, attended with Sighs, and eſpecially with a convulſive Aſthma, a gentle and continued Diaphoreſis, the Uſe of the Spirit of Hartſhorn, and the Application of Veſicatories, are highly beneficial.

In a Defect of the Spirits, eſpecially when accompanied with a Palpitation of the Heart, I have found nothing more effectual than Treacle-water, either by itſelf, or in ſome proper Vehicle, with a few Drops of Sal volatile oleoſum, and a proper Quantity of the Powder of Saffron.

In the Tremors attending Miliary Fevers, the animal Spirits are to be recruited by proper Medicines, the moſt efficacious of which is Saffron; as, alſo, by nouriſhing Liquors; ſuch as Broth of Fowls, and others of a like Nature.

In univerſal Convulſions, eſpecially when ariſing from a Tranſlation of the morbific Matter to the internal Parts, I have ſucceſsfully uſed Cupping with Scarification. Then I order heating and volatile Spirits to be put into the Patient's Mouth, and Clyſters to be injected, which are highly beneficial in Convulſions, and more eſpecially thoſe of Children.

Sickneſs, attended with a Nauſea, and a preternatural Heat of the Breaſt, are Signs of approaching Aphthæ. But theſe Symptoms are mitigated by a Diaphoreſis, continued till the Tongue is covered with Aphthæ; at which time it is obſervable, that the Aphthæ are increas'd in proportion as the miliary Phitules are dried up; and that the miliary Puſtules are again elevated, in proportion as the Aphthæ on the Tongue diſappear. It, alſo, ſometimes happens, that the Remains of the Fever are, after the Deſiccation of the Puſtules, derived to the Aphthæ, which are nouriſhed and ſupported by them.

The Vomiting is prevented by exhibiting ten Grains of the Salt of Wormwood, mixed with one Scruple of the compound Powder of Crabs-eyes, eſpecially if the febrile Heat recurs at equal Intervals, unleſs this Practice is contraindicated by ſome Symptom, ſuch as an Inflammation of the Tonſils, which is increaſed by the Uſe of lixivial Salts.

A Diarrhœa happening in a Miliary Fever, I have often found to be augmented by Aſtringents; or, if ſuppreſſed, ſucceeded by ſome other more terrible Symptom. For which Reaſon, ſays Sir *David Hamilton*, I, in this Caſe, ſucceſsfully order a Veſicatory, that, by the joint Means of that, and the Diaphoreſis, there may be a Revulſion made of the ſerous Matter from the Glands of the Inteſtines. I, alſo, order a Scruple of prepared Pearls to be exhibited either by themſelves, or with ſome proper Diaphoretic; and the Uſe of this Medicine is to be repeated for ſome time.

I have often found the Efficacy of a Veſicatory in curing a long-protracted Diarrhœa, during the Courſe of a Miliary Fever; for I had a Patient of Diſtinction, who, after Child-birth, among other Symptoms of a Miliary Fever, labour'd under a Diarrhœa ſo violent as to produce a Suppreſſion of the Lochia; and by the following Method I removed her Diſorder, which had laſted for a conſiderable Number of Days:

> Take of Sperma Ceti, and compound Powder of Crabs Claws, each one Scruple; of Saffron, five Grains; and of the Syrup of Cowſlips, a ſufficient Quantity for making into a Bolus, to be taken every ſixth Hour in a Spoonful of common Julap.

I, alſo, ordered a Veſicatory to be applied between her Scapulæ; by which means the miliary Puſtules appear'd, and the Diarrhœa was gradually diminiſh'd.

If the Theriaca, or other Opiates, are to be uſed in Miliary Fevers, 'tis certainly after the Uſe of Veſicatories, which prevent their bad Effects; which Advantage is, alſo, obtained by mixing Sudorifics with them. But I am convinced, that Laudanum, exhibited by itſelf, generally ſuppreſſes all the Evacuations; or, if it ſhould happen otherwiſe, the Phenomenon is not to be aſcrib'd to the Laudanum, but to ſome other Cauſe; juſt as if, after taking *Peruvian* Bark, or Claret Wine, a Diarrhœa ſhould be produced by a large Quantity of morbific Matter, a Weakneſs of the Inteſtines, or a certain Antipathy not to be accounted for. Nor is it any Objection to this Doctrine, that, after taking Laudanum, a Sweat is ſometimes produced, and the variolous Puſtules enlarged, ſince neither of theſe Circumſtances depend immediately upon the Nature of the Laudanum, but on the State and Condition of the Diſtemper. For as in Fevers, during the Fermentation, the Blood is in too rapid a Motion, and Nature, if we may ſo ſpeak, not at Leiſure for a Fermentation, for which Reaſon the Patient diſcharges a thin Urine, but, after the Fermentation is over, a thick and turbid Urine, with an Hypoſtaſis; ſo in like manner, when, after taking Laudanum, the violent Motion of the Blood is check'd, the Nerves relax'd, and the Pores open'd, Sweats in Fevers, and the Pus in the Small-pox, are, by theſe means, more eaſily eliminated. The Nature, therefore, of a Medicine is not to be aſcertained from any remote and precarious, but from its proximate and immediate Effect; ſince, in ſome Patients, Laudanum renders the Body ſoluble. Inſtances of a like Nature frequently occur, and, if duly conſider'd, would, in a great meaſure, prevent a great many of the ungenteel Diſputes and Altercations of Phyſicians.

The compound Miliary Fever.

The compound Miliary Fever is, when the miliary Puſtules are interſpers'd with red Papillæ, commonly called a Raſh, or with petechial Eruptions, the Small-pox, or Meaſles.

The Symptoms of this Diſorder are almoſt the ſame with thoſe attending that Species of Fever called *Synochus*, only the Patients are, in the former, more afflicted with a Sinking of the Spirits, and Sighing, than in the latter; they are, alſo, more ſubject to Watchings, and their Urine bears a nearer Reſemblance to that of ſound Perſons.

In this Diſorder the miliary Puſtules are ſometimes not only intermixed with others of a reddiſh Colour, but, alſo, remain after theſe laſt-mention'd Puſtules are totally dried up: But, in the Meaſles and Small-pox, the miliary Puſtules generally precede theſe Diſorders, and accompany them in their Beginnings.

In a compound Miliary Fever, the Symptoms ſeem rather to proceed from ſome Diſorders of the Blood, than of the nervous Syſtem, ſince the Pulſe is frequent and ſtrong, the Heat intenſe, the Tongue dry, and the Thirſt immoderate; whereas 'tis quite otherwiſe in a ſimple Miliary Fever. But a Defect of Spirits, and Sighs produced by the Oppreſſion about the Breaſt, are Symptoms common to them both.

As for the Cure, in Caſes where miliary Puſtules accompany the Meaſles and Small-pox, diaphoretic Medicines, pretty hot in their Natures, are ſafer than in the Small-pox appearing by themſelves.

External Cold, or a cold Regimen in any reſpect, are dangerous, and frequently prove the Cauſes of a ſudden Death, even when moſt of the Symptoms lay a Foundation for expecting an happy Termination of the Diſorder.

For this Reaſon hot Opiates, ſuch as Diaſcordium, and others of a like Nature, produce more happy Effects, than Diacodium,

or Laudanum, when the Miliary Puſtules appear in Conjunction with the Small-pox.

Of some Diseases which succeed Miliary Fevers.

Beſides the Conſequences of a Miliary Fever already mention'd, there are two, which, ſomewhat more frequently than the reſt, occur; that is, a Tumor of the inferior Parts of the Body, and an hectic Heat.

Sometimes the Feet, Legs, Thighs, and Groin, are remarkably ſwell'd, ſometimes without, but, often with more an immoderate previous Pain: This Swelling is produced by a Congeſtion of the Remains of the morbific Matter, in conſequence of prepoſterous Methods uſed for the Cure of theſe Fevers.

This Species of Diſorder is to be cured by exhibiting every Night cathartic Pills, together with Opium itſelf, or ſome Opiate. The Opiate, ſays Sir *David Hamilton*, I preſcribe, is one Scruple of the Pilulæ de Cynogloſſo; and I am directed in my Choice of a Cathartic, by the Nature of the Symptoms. Thus, for Inſtance, when the Appetite and Digeſtion are diminiſh'd, I give half a Dram of the Pilulæ Stomachicæ; in a Suppreſſion of the Lochia or Menſes, a proper Doſe of the Pilulæ Aloephanginæ, or the Pilulæ fœtidæ; ſometimes, alſo, I order four or five Grains of the Reſin of Jalap, to be added; and on other Occaſions, I order a Draught of the bitter Decoction without Sena, twice a Day. If ſtronger Cathartics are to be uſed, I exhibit them every other Night, and order ſome ſtomachic Decoction to be taken on the intermediate Days. By following this Method I have rarely fail'd to produce a happy Cure, after a great many other Medicines have been uſed to no Purpoſe.

When the Tumor is without Pain, I uſe Cathartics without Opiates; but, if the Swelling is a concomitant Symptom of the Miliary Fever, it is diſſipated by a Diaphoreſis duly protracted without any other means.

Both the ſimple and cathartic Spirits of Scurvy-graſs are of ſingular Efficacy for removing this Swelling ſubſequent to the Miliary Fever. The Efficacy of the ſimple Spirit I experienc'd in Mr. *Bellaſis*, who, about the eightieth Year of his Age, being ſeized with a violent Miliary Fever, was, by the King, committed to my Care. In this Patient the Fever, when remov'd, was ſucceeded by a Tumor from the Groin to the Toes, which after the Application of Veſicatories to no Purpoſe, at laſt yielded to the Uſe of ſimple Spirit of Scurvy-graſs.

The Efficacy of the joint Uſe of the ſimple Spirit of Scurvy-graſs, and that of the cathartic Kind, prepared with Jalap, I experienced in one Mrs. *Lane*, who ſome Years before had been afflicted with a Miliary Fever in Child-bed. She being ſeized with a violent Pain, and a Swelling from the Groin to the Toes, was committed to the Care of two very eminent Phyſicians, but to no Purpoſe. This Patient I perfectly cured, by giving twenty or thirty Drops of the ſimple Spirit of Scurvy-graſs, thrice a Day, for two Days ſucceſſively, in ſome proper Vehicle, and every third Day about an hundred Drops of the cathartic Spirit of Scurvy-graſs, and a proper Doſe of the *Pilulæ Matthæi* at Bed-time.

An hectic Heat, a Diminution of Appetite, and a Defect of the vital Spirits, are, alſo, ſometimes the Conſequences of a Miliary Fever, eſpecially when the Patients quit their Beds too ſoon.

The Method of treating theſe Caſes with Succeſs is this; Every Morning, for ſome Days, let the Patient take ten or eleven Grains of the Salt of Wormwood, in a ſmall Draught of Spaw-water; and, if the Spirits are highly defective, let him drink after it, by little and little, two Pints of the ſame Water. Or if Spaw-waters cannot be had, he may take his Salt of Wormwood in a proper Quantity of Bath-water, drinking after it two Pints of the ſame, in like manner, that by this means the Remains of the Acid, which in this Fever is always productive of Miſchief, may be diſcharged along with the Water and Salt of Wormwood.

If a Pain of the Head ſhould be induced by the Uſe of the Salt of Wormwood, I order ſome lenitive Medicine to be exhibited every third or fourth Day at Bed-time. Saline and acid Subſtances are not to be uſed; and too much Exerciſe, either of Body or Mind, is carefully to be avoided; for I have often ſeen a Relapſe produced by either of theſe Errors; nor is the Relapſe of an intermittent Fever more effectually produced by the prepoſterous Uſe of the *Peruvian* Bark. In this Caſe Aſſes-milk, with the teſtaceous Powders, and eſpecially Pearls, generally proves highly beneficial. *Hamilton de Febre Miliari.*

MILIARIUM. A tall narrow Veſſel, uſed in the antient Baths for heating Water.

MILIOLUM. A ſmall Tumor in the Eye-lid, of the Size of a Millet-ſeed. *M. A. Severinus.*

MILITARIS HERBA. The ſame as Stratiotes; which ſee.

MILIUM.

The Characters are;

It hath a looſe divided Panicle; and each ſingle Flower hath a Calyx, conſiſting of two Leaves, which are inſtead of Petals, to protect the Stamina and Piſtillum of the Flower, which afterwards becomes an oval ſhining Seed.

Boerhaave mentions ſeventeen Species of this Plant; which are,

1. Milium; ſemine luteo. *C. B. P.* 26. *Theat.* 502. *Tourn. Inſt.* 514. *Boerh. Ind. A.* 2. 162. *Milium.* Offic. Ger. 73. Emac. 80. J. B. 2. 446. Raii Hiſt. 2. 1251. *Milium vulgare album.* Park. Theat. 1136. MILLET.

Millet has large, broad, Graſs like, ſomewhat hairy Leaves, encompaſſing the Stalk, which grows to be three or four Feet high, bearing on the Top a large Panicle, hanging down the Head, compoſed of a great Number of ſlender Stalks, having many ſmall Glumes growing on them, including ſmall, white, hard, ſhining Grain: It is ſown more in foreign Parts, than here in *England*; and is there uſed for Food. It is ſown in *April*, and ripe in *Auguſt* and *September*.

Millet is cooling, drying, and binding, ſomewhat windy, and not eaſily digeſted; a ſtrong Decoction of it with Figs and Raiſins, mixed with Wine, and drank warm a-bed, is a very good Sudorific, though it is ſeldom uſed. *Miller's Bot. Off.*

Milium, κέγχρος, according to *Varro*, is of *Greek* Derivation; for firſt it was called μίλιν (*Milin*), afterwards μίδιν (*Midin*), and μελίνη (*Meline*), a common Name to it with Panic. But *Voſſius* proves, that μελίνη, in *Dioſcorides*, *Galen*, and others of the Antients, ſignifies only Panic; and therefore ſome are inclined to the Opinion of *Feſtus*, that it is called *Milium*, from *Mille*, a thouſand, becauſe of its numerous Seeds.

Millet, by Conſent of Authors both antient and modern, is refrigerating and drying; it is of bad Juice, difficult of Digeſtion, binds the Belly, and generates Flatulencies; it is, however, well known to be a very grateful Food to many Nations at preſent. In former times it ſerv'd to make Bread, under a Dearth of better Corn, as we are aſſured by *Dioſcorides*, *Pliny*, *Galen*, and others of the Antients. Among the *Italians*, ſays *C. Bauhine*, Loaves made of Millet, which are yellow, and eaten hot by many, not out of Neceſſity, but for their Sweetneſs; but, when this Bread is grown hard, it is quite black. Of the Flour of Millet and Milk the *Italians* make fine Cakes, which muſt be eaten as ſoon as dreſſed, or elſe they become glutinous, and ungrateful to the Taſte. In former times they made a ſort of white Puddings of Millet, as *Pliny* tells us. And among the *Coſſacks* and *Tartars*, their principal Food is Millet, the crude Meal of which they mix with the Milk of Mares, or with Blood drawn from the crural Vein of their Horſes. A Pudding, prepared of Millet, boiled in Milk, with an Addition of Butter, and Sugar ſprinkled over it, is much in Requeſt among the *Germans* at preſent; and theſe Puddings have been long ago introduced into *England*, and are ſtill in Faſhion.

The Flour of Millet was formerly us'd in Fomentations for the Gripes, and for Pains of the Head and Nerves; it was applied externally in Bags, becauſe the Uſe of it in Cataplaſms was difficult, on account of its Friability. If the Membrane of the Brain happens to wounded, it is excellently conglutinated, ſays *Archigenes*, by infuſing thereon the Juice of Calaminth, and ſprinkling it with the dry Flour of Millet. A Decoction of Millet, with Figs and Raiſins, is called, by *Heurnius*, a noble Sudorific and Diuretic. Or, take of a Decoction of Millet, boiled till it burſts, four Ounces; White-wine, two Ounces. Let the Patient take it hot. *Cheſneau. Raii Hiſt. Plant.*

Millet is diuretic and aſtringent; the Seeds are of extraordinary Service in Diſeaſes of the Lungs, and Exulcerations of the Kidneys; made into a Cataplaſm, they are anodyne and reſolvent. *Hiſt. Plant. adſcript. Boerhaav.*

2. Milium; ſemine nigro. *C. B. P.* 26. *Th.* 505. *J. B.* 2. 18. 446. *M. H.* 3. 196.

3. Milium; Arundinaceum; ſubrotundo ſemine; Sorgo nominatum. *C. B. P.* 26. *Boerh. Ind. A.* 2. 162. *Tourn. Inſt.* 514. *Sorghum.* Offic. Ger. 77. Emac. 83. Raii Hiſt. 2. 1252. *Sorghi.* J. B. 2. 447. *Melica, ſive Sorghum.* Park. Theat. 1136. *Milium Arundinaceum, ſive Indicum, ſemine ſubrotundo.* C. B. Theat. 511. INDIAN MILLET.

It delights in a fat and humid Soil; for which Reaſon ſome ſow it in their Fields to correct their Luxuriance. It was brought from *India* into *Spain*, *Italy*, and other warm Countries: They ſow it in Summer, and reap it in Autumn.

The Seed is like Panic both in Taſte and Temperament. The pooreſt ſort of People in *Italy*, and the Peaſants in the *Paduan*, grind the Seed, and make it into Loaves, which are friable, and afford but little Nutriment, being black, difficult of Digeſtion, and binding. It is more uſual to make Puddings, or White-pots, of the Flour, and Milk. In *Tuſcany* they ſow it more for the ſake of feeding their Poultry, than to ſerve as Aliment for Men. They, alſo, give it to their Cows, Horſes, and Swine. Of the Pith of the Stalks is prepared an excellent Remedy for the Strumæ; the Preparation of which ſee in the *Bauhines*, and *Matthiolus*; which laſt Author commends, alſo, the Flowers, for uterine Fluxes, and the Dyſentery. *Raii Hiſt. Plant.*

4. Gramen; ſylvaticum; panicula miliacea ſparſa. *C. B. P.* 8. *Th.* 141.

5. Gramen; ſegetum; altiſſimum; panicula ſparſa. *C. B. P.* 3. *Th.* 141.

6. Gramen;

6. Gramen; arvenſe; panicula criſpa. *C. B. P.* 3. *Theat.* 32.

7. Gramen; nodoſum; avenacea panicula. *C. B. P.* 2. *Theat.* 18.

8. Gramen; agrorum; ſpica venti. *M. H.* 3. 200.

9. Gramen; pratenſe; majus; latiore folio; Πόα Theophraſti. *C. B. P.* 2.

10. Gramen; pratenſe; majus, anguſtiore folio. *C. B. P.* 2. *Prodr.* 11. *Th.* 29. *M. H.* 3. 201.

11. Gramen; pratenſe; paniculatum; medium. *C. B. P.* 2. *Th.* 30. *M. H.* 3. 201.

12. Gramen: pratenſe; minimum; album & rubrum. *Ger. Park. M. H.* 3. 201.

13. Gramen; paniculatum; aquaticum latifolium. *C. B. P.* 3. *Th.* 40. *M. H.* 3. 201.

14. Gramen; pratenſe; ſerotinum; panicula longa purpuraſcente. *Raii Synop.* 260.

15. Gramen; aquaticum; fluitans; multiplici ſpica. *C. B. P.* 3. *Th.* 41.

16. Gramen; exile; hirſutum. *Ger.*

17. Milium; Indicum; arundinaceo caule; granis nigris. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 162.

MILIUM ARUNDINACEUM. See LACHRYMA JOBI.

MILIUM SOLIS. A Name for the *Lithoſpermum*; *majus*; *erectum*.

Beſides the foregoing, *Ray* mentions another Species of *Milium*, under the following Head;

Milium Arundinaceum, ſemine plano, & albo. C. B. *Sorghi album, Milium Indicum, Dora.* J. B. It grows in *Arabia*, and, alſo, in *Cilicia* and *Epirus*.

This Plant is ſuppoſed to be the *Dora* of the *Arabians*. It is dry, nouriſhes little, and binds the Belly. The Seeds are very white, and yield a Flour, of which they make a ſavoury Sort of Bread in the Form of Cakes, which they bake under the Aſhes. The Inhabitants chew the Stalks, and by that means extract a ſweet Juice out of them, in the ſame manner as they do out of Sugar-canes. In the Iſle of *Corcyra* (*Corfu*) they feed their Pigeons with this Grain; and in *Cilicia* they ſow it, to ſupply their Want of Wood for Fuel. *Raii Hiſt. Plant.*

MILLEFOLIUM.

The Characters are;

The Leaves are very finely cut; the Calyx is ſquamous, and almoſt cylindrical; and the Flowers are very cloſely collected into Umbellas.

Boerhaave mentions fifteen Species of this Plant; which are,

1. Millefolium; purpureum; majus. *C. B. P.* 140. *Prodr.* 72.

2. Millefolium; purpureum; minus. *C. B. P.* 140.

3. Millefolium; vulgare; album. *C. B. P.* 140. *Tourn. Inſt.* 496. *Boerh. Ind. A.* 112. *Millefolium.* Offic. *Millefolium vulgare.* Park. 893. Raii Hiſt. 1. 345. Synop. 91. *Millefolium terreſtre vulgare.* Ger. 914. Emac. 1072. *Millefolium Stratiotes pennatum terreſtre.* J. B. 3. 136. *Achillea vulgaris, flore albo.* Act. Reg. Par. An. 1720. 320. YARROW.

Yarrow has a white creeping Root, which ſpreads much on the Surface of the Ground. The Leaves are long and narrow, having on each Side ſeveral very finely divided Pennæ. The Stalk is firm and erect, a Foot or two high, ſomewhat hairy, and beſet alternately with ſmaller, and rather finer Leaves. The Flowers grow on the Top of the Branches in flat Umbels, each Flower being made of five little, white, roundiſh Leaves, ſet about a Thrum of the ſame Colour, growing in a ſcaly Calyx, in which is contained flatiſh white Seed. It grows every-where in the Fields, and flowers in *June* and *July*. The Leaves are uſed.

Yarrow is cooling, drying, and binding; very ſerviceable in all Kinds of Hæmorrhages, whether Spitting or Vomiting Blood, Bleeding at the Noſe, Dyſentery, or the too great Flux of the Menſes, or violent Flooding, cooling and tempering its immoderate Heat and Sharpneſs. It, alſo, helps a Gonorrhœa, Strangury, Heat of Urine; and, applied outwardly, is of Service againſt Ruptures, and to ſtanch the Bleeding in freſh Wounds. *Miller's Bot. Off.*

This Plant is a little acrid, bitter, aromatic, and gives a conſiderable Tincture of red to blue Paper. It ſeems to me, that the acid Part of the natural Salt of the Earth, diſengaging itſelf of the other Principles thro' the Texture of this Plant, forms, with the terreſtrial Parts, an aluminous Salt, united with a little eſſential aromatic Oil.

By the chymical Analyſis are extracted from the Yarrow ſeveral acid Liquors, a great deal of Earth, no volatile concrete Salt, and a little urinous Spirit.

Thus this Plant is vulnerary, reſolvent, and aſtringent. It is uſed in Ptiſans, and Infuſions, after the manner of Tea. Some boil its Leaves in Broths, to ſtop all Sorts of Hæmorrhages, and eſpecially the irregular Flux of the Piles, and Fluor albus. Its Juice is preſcribed from eight Ounces to ſix; the Powder, from a Dram to half an Ounce: It is mixed, alſo, with Paſte, to make aſtringent Biſcuits. *Tabernæmontanus* ſays, the Water of Yarrow is good for the Epilepſy; and that the Wine of Mead, made with this Plant, ſtops all Sorts of irregular Fluxes. *Martyn's Tournefort.*

It is called *Millefolium* from the Multitude of its Leaves; *Achillea*, from *Achilles*, who firſt diſcovered its Efficacy in the Cure of Wounds, as *Pliny* tells us, and with the ſame cured *Telephus*. It is, alſo, called *Stratiotes*, from στρατὸς, an Army, on account of its Uſefulneſs in the Camp, as an excellent Vulnerary.

Later Obſervation, ſays *C. Hoffman*, has taught us, that our Millefolium is ſo far from ſtopping an Hæmorrhage, that it rather excites one. But *J. Bauhine* ſuppoſes, that the Reaſon why Blood happens to be provoked from the Noſtrils with Millefoil, is becauſe they are rubbed. It is, alſo, ſo violent a Diuretic, that the Uſe of it for a conſiderable time, procures bloody Urine. *Hoffman*, therefore, makes a Diſtinction, and ſuppoſes the *Millefolium acerbum*, or harſh-taſted Millefoil, to have a conglutinating Virtue; and the bitter Sort to be deobſtruent, diſſolvent, diuretic, helminthic, or a Deſtroyer and Expeller of Worms, and the like: Now there is a manifeſt Acrimony and Bitterneſs in the *Millefolium minus Cordi*, and the *Millefolium nobile Tragi*.

But, whatever are the Qualities by which it produces ſuch an Effect, *Riverius*, in his *Obſervations*, produces many Examples of Hæmorrhoids cured by Decoctions of Millefoil; and many other Writers have experienced the ſame.

I know ſome Women, ſays *S. Paullus*, who have preſerved themſelves from Abortion, by only making a proper Uſe of the common Millefoil.

For Spitting of Blood, take two Drams of the Powder of Millefoil, in the Juice of Plantain. Millefoil is very proper to provoke Blood from the Noſe, by its Roughneſs, and prickly Hardneſs, opening the capillary Veins; for which Purpoſe they put it into the Noſtrils, and then, by rubbing and preſſing them, cauſe them to bleed after an eaſy manner, and in a ſufficient Quantity: Hence we call it *Noſe-bleed*.

The tuberous Excreſcence, which is ſometimes found on the Root, proceeds from the poiſonous or fermentative Liquor infuſed into the Wound or Puncture inflicted by ſome Inſect, together with its Egg: This Liquor, mixed with the Juice of the Root, excites a Tumor, which becomes the Receptacle, and, as it were, the Matrix of the Egg, and Worm, which is to be hatched, or excluded; and affords it Aliment and Security. *J. Cornutus*, therefore, was miſtaken, in making the tuberous Millefoil a diſtinct Species.

For an exceſſive Flux of the Menſes, *Sennertus* gives the following Preſcription: Take Juice of Millefoil, three Drams; Sugar, one Ounce. *Raii Hiſt. Plant.*

4. Millefolium; maximum; umbella alba. *C. B. P.* 140. *Prodr.* 72.

5. Millefolium; nobile; Tragi. *Boerh. Ind. A.* 112. *Achillea.* Offic. *Achillea, ſive Millefolium nobile.* Ger. 915. Emac. 1703. Raii Hiſt. 1. 346. *Achillea ſideritis, ſive nobilis odorata.* J. B. 3. 140. *Millefolium nobile.* Tourn Inſt. 496. *Tanacetum minus album odore Camphoræ, ſive Achillea Dioſcoridis.* C. B. 132. ACHILLES's IRONWORT.

It grows in *Germany*, by the *Rhine*; in *Languedoc*, about *Montpelier*; and in every Part of *Italy*; and flowers in *July*.

It repreſſes all Sorts of Hæmorrhages; and, outwardly uſed, is an excellent Vulnerary.

6. Millefolium; Orientale; altiſſimum; luteum; Abrotani folio. *T. Cor.* 37.

7. Millefolium; Orientale; erectum; luteum. *T. Cor.* 37.

8. Millefolium; Orientale; erectum; flore flaveſcente. *T. Cor.* 37.

9. Millefolium; tomentoſum; luteum. *C. B. P.* 140. *J. B.* 3. 138. *Stratiotes, Millefolia, flavo flore.* Cluſ. H. 330.

10. Millefolium; luteum; magis tomentoſum; & altius.

11. Millefolium; luteum; majus; folio lato.

12. Millefolium; Orientale; foliis Tanaceti incanis; radiis pallide luteis. *Ptarmica, Orientalis, foliis Tanaceti incanis, ſemifloſculis florum pallide luteis.* T. Cor. 37.

13. Millefolium; odoratum; Monſpelienſe. *Pillet.* 271.

14. Millefolium; Tanaceti foliis; flore albo. *M. H.* 3. 38. *Tanacetum montanum, album, tenuifolium, flore candido.* Bocc. Muſ. Plant. T. 26.

15. Millefolium; vulgare; majus; album; foliis elegantèr variegatis. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 112.

Beſides other Names before-mentioned, it is, alſo, called *Herba Carpentaria*, Waggoners Herb, becauſe it is much in Uſe among Carriers and Waggoners, to ſtop Bleeding. The firſt and ſecond Species were in Requeſt among the Antients; they are repreſſive of Hæmorrhages, and at the ſame time ſtrengthening and aſtringent, and are proper for a Gonorrhœa, when proceeding from a Laxneſs of the Parts, and a Solution of the Humours. Externally it is of Service in the Tooth-ach, Hæmorrhoids, Hernia, Tumors of the Penis, Head-ach, Pterygia of the Eyes, and poiſonous Stings or Bites. *Hiſt Plant. adſcript. Boerh. p.* 169.

MILLEFOLIUM MONTANUM. A Name for the *Ptarmica*; *Alpina*; *Tanaceti foliis.*

MILLEFOLIUM AQUATICUM. A Name for the HOTTONIA; it is, alſo, a Name for the *Potamogeiton*; *floſculis ad foliorum nodos*; and for the *Potamogeiton*; *foliis pennatis*.

MILLEGRANA MAJOR. A Name for the *Herniaria*; *glabra*.

MILLEGRANA MAXIMA. A Name for the *Knawel*; *folio Alſines*; *glabro*; *floſculis plurimis*.

MILLEPEDES.

Aſelli, Millepedes & Oniſci. Offic. *Aſelli*. Schrod. 5. 338. Jonſ. de Inſect. 126. *Aſelli, Millepedes*. Ind. Med. 15. *Aſellus*. Mouff. 202. Charlt. Exer. 57. Mer. Pin. 203. *Aſellus lividus major*. Raii Hiſt. Inſect. 42. *Oniſcus ſive Aſellus*. Aldrov. de Inſect. 632. WOOD-LICE, SOWS, or CHURCH-BUGGS. *Dale, p.* 354.

Millepedes, ὄνοι, which are found under Veſſels that hold Water, are little Animals, with numerous Feet, which, at a Touch with the Hand, roll themſelves up into a ſpherical Figure.

Drank in Wine, they cure a Difficulty of Urine, and the Yellow Jaundice. Made into a Litus with Honey, they help the Quinſey. Bruiſed, and heated with Oil of Roſes, in a Pomegranate-ſhell, they are effectual, being inſtilled, for the Tooth-ach. *Dioſcorides, Lib.* 2. *Cap.* 37.

They are ſmall Inſects, ſcarce a Finger's-breadth in Length, and near half a Digit in Breadth, and of a livid blackiſh Colour.

They are of fine Parts; digeſt, attenuate, abſterge, and open: Hence they are of ſingular Efficacy in reſolving a tartareous Mucilage, and reducing the Stone to a Mucilage, in opening Obſtructions of the Viſcera, and, conſequently, for the Jaundice, nephritic Pains, Dyſury, Colic, Aſthma, and the like. Outwardly, the Powder of them is good for the Eyes, and Pains of the Ears; and, made into a Litus, for the Quinſey; apply'd alive, they cure a Phagedæna.

Theſe are ſo much in the Acquaintance of the common People, that they ſeem to be Maſters of their Medicinal Virtues, and uſe them in many Caſes, without any other Direction. They are, by all Experience, found to be very diuretic and abſterſive; which makes them not only frequent in the Preſcriptions for Diſorders of the Kidneys, but, alſo, in Obſtructions of the Viſcera, and in the Jaundice particularly. They abound with a nitrous Salt, which they ſeem to derive from what they live on. It is ſomewhat volatiliz'd by its Digeſtion and Circulation in the Inſect, as ſuch Salt always is, more or leſs, in proportion to the digeſtive Powers of Animals, into whoſe Food it enters; yet not ſo much, but that it is brackiſh and pungent to the Palate. This makes their deterſive Quality extend further than the Finger Glands, and enables them to ſcour even the minuteſt Paſſages, and keep the Nerves clean from Viſcoſities, and ſuch Things as would clog their Springs, whereby they are good in Palſies, Epilepſies, and all nervous Diſtempers. And, alſo, becauſe they open, and, as it were, by their Minuteneſs and Aſperities, cut their Way through any Obſtructions, they are good in Strumas, ſcrophulous Tumors, and inveterate Ulcers. Very remarkable Cures have been performed in theſe Caſes by a long Uſe of them. They are much the beſt taken in Subſtance, or bruis'd in White-wine, the Liquor being drank without ſettling fine, elſe a great deal of a ſaline Matter will fall to the Bottom. Theſe are greatly in Uſe amongſt all Practical Authors, and frequently to be met with in the preſent occaſional Preſcriptions. *Sennertus*, in the third Book of his *Practice*, commends them againſt the Stone in the Bladder. *Riverius* gives Inſtances of Wonders perform'd by them in inveterate Strumas and Ulcers, as does, alſo, that Honour to our Country, Mr. *Boyle*, who takes notice of them for the ſame Intention, in his Diſcourſe of the Uſefulneſs of Experimental Philoſophy.

MILLERIA.

The Characters are;

It hath a compound Flower, conſiſting of ſeveral Florets, and one Half-floret, contained in one common Flower-cup; but theſe Florets are barren, and the Half-floret, which is fruitful, is ſucceeded by one Seed, which is ſurrounded by the Flower-cup.

Miller mentions four Species of this Plant, none of which have any Medicinal Virtues aſcrib'd to them, that I know of.

MILPHOSIS, μίλφωσις, or μίλφωσι. A Baldneſs of the Eye-lids. It is thus call'd according to *Aetius, Tetrab.* 2. *Serm.* 3. *Cap.* 2. becauſe, when the Eye-laſhes are fallen off, the Edges of the Eye-lids appear red, as if colour'd with μίλτῳ, *Minium*.

MILTOS, μίλτος. A Species of *Rubrica*, red Earth, or *Minium*. See RUBRICA.

Hippocrates, in his Treatiſe of Ulcers, recommends this as a proper Application to Burns.

MILVUS. Offic. Bellon. des Oyſe. 130. Schrod. 5. 321. Raii Synop. A. 17. Mer. Pin. 170. Aldrov. Ornith. 1. 391. Geſn. de Avib. 549. Jonſ. de Avib. 13. Charlt. Exer. 72. *Milvus, vulgaris cauda forcipata*. Will. Ornith. 41. *Milvus cauda forcipata*. Raii Ornith. 74. THE KITE, or GLEAD. *Dale, p.* 393.

Of Uſe in Medicine, are the whole Bird burnt, the Head, Liver, Gall, Dung, and Fat. The Aſhes of the Bird, burnt, are ſaid to be effectual in the Gout and Epilepſy, being taken inwardly; the ſame is ſaid of the Head and Liver, being burnt; and the latter is, alſo, an Ingredient in ophthalmic Medicines. The Blood, mix'd with Nettles, and apply'd, is ſaid to give Relief under the Gout; the Gall enters the Compoſition of Collyria, for the Eyes; and the Fat is uſed to anoint the Parts pained with the Gout. *Dale* from *Schroder*.

MILVUS. Offic. Bellon. de Aquat. 195. Salv. de Aquat. 188. Aldrov. de Piſc. 140. Raii Ichth. 293. Ejuſd. Synop. Piſc. 89. Charlt. de Piſc. 29. Jonſ. de Piſc. 66. *Hirundo*. Rondel. de Piſc. 1. 284. Geſn. de Aquat. 434. *Pirabebe prima*. Piſon. Ἰγνξ. Oppian. THE KITE-FISH. *Dale, p.* 376.

It is taken in great Plenty both in the *Ocean* and *Mediterranean*, and the Gall thereof is uſed to abſterge an Albugo, or whatever elſe in the Eye may occaſion a Dimneſs of Sight.

MILZADELLA. A Name for the *Galeopſis*; *lutea*; *amplioribus foliis*; *maculatis*.

MIMOSA.

The Characters are;

The Flowers are monopetalous, Funnel-ſhaped, uſually furniſhed with a Multitude of Stamina, and collected into Heads. The Pod is either ſimple, bivalve, and full of oblong Seeds; or compounded of ſeveral Parts, united by tranſverſe Joints, each of which Parts is pregnant with a roundiſh Seed; the Leaves are endued with a Syſtole and Diaſtole.

Boerhaave mentions ſeven Species of this Plant; which are,

1. Mimoſa; folio lato Sennæ; ſpinoſa.

2. Mimoſa; major; fruteſcens; ſpinoſa; ramulis communi pediculo in orbem coactis. *Plukn. Alm.*

3. Mimoſa; non ſpinoſa; major Zeylanica; Domino Hermanſ. Excellentiſſimi Domini Syen. *Breyn. Cent.*

4. Mimoſa; Zeylanica; ſiliculis articulatis tenerrimis; glabris; ſemine minimo.

5. Mimoſa; Surinamenſis; ſpinoſa; repens tenuifolia; flore cœruleo.

6. Mimoſa; Surinamenſis; tenui Acaciæ folio; ſiliqua nigra; glabra; articulata; ſemine nigro; longo.

7. Mimoſa; ſpuria; de Pernambucq; dicta Mimoſa Italica. *Zanon.* 151. *Herba Mimoſa, non ſpinoſa*, λεπτομαχροκίφαλος, *ſive Spuria de Pernambuca*. M. H. 2. 200. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 56.

MINA, μνᾶ. The Attic *Mina* was either nummary, or ponderal: In the firſt Acceptation, it was the ſixtieth Part of a Talent, and contained a hundred Drachmæ or Denarii, amounting, in our Coin, to three Pounds four Shillings and ſeven Pence. *Mina*, conſidered as a Weight, was alſo divided into an hundred Drachmæ. See DRACHMA and DENARIUS.

Mina was, alſo, a medicinal Weight, conſiſting of ſixteen *Roman* Ounces, as appears by *Dioſcorides* and *Galen*, and *Cleopatra in Coſmeticis*, who tells us, that *Mina*, as a Weight, contained ſixteen Ounces, one hundred twenty-eight Drams, three hundred eighty-four *Scrupula*, or Scruples, ſeven hundred ſixty-eight *Oboli*, one thouſand fifty-two *Lupini*, two thouſand three hundred and four *Siliquæ*, and ſix thouſand one hundred forty-four *Æreoli*. It is evident, that there was an antient *Attic Mina* of ſixteen *Roman* Ounces. All Authors, and particularly the Fragment printed with *Galen*, of the Compoſition of Medicines, agree in this. It is affirmed, in the ſecond Chapter of that Fragment, that the *Attic* and *Egyptian Mina* contain ſixteen Ounces. *Cleopatra, Cap.* 7. ſays a *Mina* weighs ſixteen Ounces, though in another Place of the ſame Author, it is ſaid, that an *Attic Mina* had twelve Ounces and an half; when they ſpeak of Ounces, they mean the *Roman*, which is our *Averdupois* Ounce. *Arbuthnot, of Weights and Meaſures*.

MINARI, *ſeu Pongam*. H. M. A ſiliquous, or Pod-bearing Tree, in the Provinces of *Paracaro* and *Mangatti* in the *Eaſt-Indies*: It has a papilionaceous Flower, and the Pods are long and broad, and lie one upon another, on the flat Side. It is eaſily propagated; for the Branches require only to be laid on the Ground, in order to take Root; it bears Flowers and Fruit from *April* to *January*, and is always green.

The Wood ſerves to burn; a Bath, prepared of the Flowers, diſcuſſes Flatulencies, and mitigates the Pains of the Gout; a Suffumigation of the Flowers removes a Fever; and their Juice, ſeaſonably applied, cures the venomous Bites of Serpents. *Raii H. P.*

MINEA. A very bad Species of Myrrh, mentioned by *Oribaſius, Collect. Med. L.* 12.

MINERA. Properly a metallic Ore; but, by a very bold Figure, it is uſed by ſome Authors, to expreſs the morbific Matter which excites and ſupports a Diſeaſe.

MINERALIA. Mineral Subſtances. Philoſophers divide all compound natural Bodies into Animal, Vegetable, and Mineral. According to this Diviſion, all Subſtances, which are neither Animal, or Vegetable, muſt be Mineral.

MINISTER. An Aſſiſtant to a Surgeon; or a Perſon who takes care of the Sick.

MINIUM. *Pliny* tranſlates the *Greek* κινάβαρι, by *Minium*. See CINNABARIS, where all the Significations of this Word, among the Antients, are explained. By *Minium*, at preſent, Red-lead is principally underſtood. See SATURNUS. The *Trochiſci de Minio* are deſcribed under the Article CORRODENTIA.

MINORATIO. A ſlight and moderate Evacuation, which only leſſens the Humours.

MINUTA.

MINUTA. An Epithet for a very violent Fever, accompanied with a Syncope, which is ſaid to reduce the Patient ſo much, that he cannot ſupport it longer than four Days. *Caſtellus.*

MINYANTHES, according to *Blancard*, is the ſame as MILLEFOLIUM.

MIPPI. A Name for the *Cereus*; *ſcandens*; *minor*; *polygonus*; *articulatus.*

MIRABILIS. Wonderful. An hyperbolic Epithet for many Medicines.

MIRABILIS PERUVIANA. See JALAPA.

MIRACAIBA. The Name of a Sort of Palm, which grows in *Braſil. Raii Hiſt. Plant.*

MIRACH. An *Arabic* Word, importing the ABDOMEN.

MIRITI. A *Braſilian* Species of Palm. *Raii Hiſt. Plant.*

MIRMIDONES, in *Paracelſus*, imports Chimeras, Fancies, or idle Dreams. *Caſtellus.*

MISADIR, or MIXADIR. Sal Ammoniac. *Rulandus.*

MISANTHROPIA, μισανθρωπία, from μῖσος, Hatred, and ἄνθρωπος, a Man. An Averſion to the Converſation of Men. It is a Symptom of Melancholy.

MISCE. Mix. This is generally expreſſed at the End of Preſcriptions, by *M.*

MISERERE MEI. A Name for the Iliac Paſſion.

MISMAR. A Corn on the Toes.

MISOPTOCHOS, from μῖσος, Hatred, and πτωχὸς, a Beggar. An Epithet for the Gout, which ſeldom inhabits with a Beggar; but frequently accompanies the Rich, Idle, and Luxurious.

MISSA. A Name for the Philoſophers Stone.

MISSADAN. Quickſilver. *Rulandus.*

MISCERASSI. Gypſum. *Rulandus.*

MISSIO *Sanguinis*. Letting of Blood.

MISY. See CHALCITIS.

MITELLA, in Surgery, is a Scarf for ſuſpending the Arm; in Botany, the Name of a Plant.

MITELLA.

The Characters are;

The Root is perennial; the Leaves reſemble thoſe of the *Cortuſa*, and the End of the Pedicle expands into a monophyllous, quinquefid, open Calyx. The Flower is roſaceous, pentapetalous, ſpiked, the Petals growing out of the Interſtices of the Segments of the Calyx. The Fruit is roundiſh, acuminated, opens into the Form of a Biſhop's Mitre, and contains a Multitude of Seeds.

Boerhaave mentions four Species of this Plant; which are,

1. Mitella; Americana; florum petalis integris. *T.* 242. *Cortuſa Indica, vel. Hedera terreſtris.* Stap. in Theoph. 366. *Sanicula, montana, Americana, repens.* H. R. Par.

2. Mitella, Americana, florum petalis fimbriatis. *T.* 242. *Sanicula ſeu Cortuſa Americana, altera, flore minuto fimbriato.* H. R. Par.

3. Mitella; Americana; flore ſquallidè purpureo, villoſo. *Cortuſa, Americana, flore ſquallide purpureo, villoſo.* Flor. 287.

4. Mitella; Americana; maxima; tinctoria. See ACHIOTL. *Boerh.-Ind. alt. Plant. Vol.* 1. *p.* 207.

It has its Name *Mitella*, from the Reſemblance of its ſeminal Veſſel to an epiſcopal Mitre; but I find nothing ſaid of its medicinal Uſe.

MITHRIDATIUM. It is reported, that the famous *Mithridates*, King of *Pontus*, guarded himſelf againſt the Effects of Poiſon, by taking every Morning a certain Antidote. *Serenus Samonicus* informs us, that, when *Pompey* took the Baggage of this Prince, he was much ſurpriſed to find, that his Antidote conſiſted only of twenty Leaves of Rue, a little Salt, two Walnuts, and as many Figs.

The Medicine now called *Mithridate* is much more compounded, and is thus directed.

Take of *Arabian* Myrrh, Saffron, Agaric, Ginger, Cinnamon, Spikenard, Frankincenſe, and Seeds of Treacle, Muſtard, of each ten Drams; of the Seeds of Hartwort, Opobalſamum, or, in its ſtead, expreſſed Oil of Nutmegs, ſweet Ruſh, *Arabian* Stœchas, the true Coſtus, Galbanum, *Cyprus* Turpentine, Long Pepper, Caſtor, Juice of Hypocyſtis, Styrax, Opopanax, and *Indian* Leaf, or, in its ſtead, Mace, of each one Ounce; of Caſſia-bark, Poley-mountain, white Pepper, Scordium, Seeds of wild Carrot, Carpobalſam, or Cubebs, Troches of Cypheos, and Bdellium, of each ſeven Drams; of Spikenard cleanſed, Gum Arabic, *Macedonian* Parſley-ſeed, Opium, the leſſer Cardamoms, Fennel-ſeeds, Gentian-root, red Roſe-flowers, and Dittany of *Crete*, of each five Drams; of Aniſeeds, Aſarum, Acorus, or Calamus Aromaticus, Orrice, the greater Valerian, and Sagapenum, of each three Drams; of Meum-root, Acacia, Scinks, and the Tops of St. John's-wort, of each two Drams and an half; of the beſt Canary, enough to diſſolve the Gums and Juices, which will uſe about twenty-ſix Ounces; of clarified Honey, as much as the Weight of all the Ingredients, except the Wine; and make into an Electuary. *S. A.* It may alſo be prepared with Diacodium inſtead of Honey.

This is reckoned one of the officinal Capitals. *Zwelfer*, in his Notes upon the *Auguſtan* Diſpenſatory, blames ſome of the Ingredients, with his uſual Freedom on ſuch Occaſions, either as uſeleſs, or out of the principal Intention of the Whole; but he ſeems to have taken much more Pains than was needful, in diſtributing the ſeveral Ingredients into Claſſes for powdering, becauſe all, except the Gums, are as well ſo ordered together; and every ordinary Operator knows how to diſſolve the Gums and Juices, that will not powder, in the Wine. This is greatly uſed as a Cordial, an Opiate, and a Sudorific; all which Intentions it is fitted for, from the ſeveral Simples in its Compoſition, of thoſe Virtues. Its Doſe is from one Scruple to two Drams; and in moſt Caſes, both as a Cordial, and an Alexipharmic, is a much better Medicine than the *Venice* Treacle. But this, as all other antient Officinals, has many Ingredients, which might have been as well, or better, left out, becauſe they bear no Affinity to the main Deſign of the Whole. Thus the Agaric is not only uſeleſs, but hurtful, by making the Medicine more nauſeous: The Succus Hypocyſtidis anſwers no End at all; the Caſſia-bark ſhould be rejected, becauſe it renders the Medicine ſlimy; the Poley-mountain, Daucus-ſeeds, Gum Arabic, red Roſes, Dittany of *Crete*, Gentian-root, and Acacia, have neither of them Virtues of any Reſemblance, to what is aimed at by this Compoſition; and, conſequently, are more a Clog than a Help to the Whole. It would, therefore, make a much better Medicine, if the other Ingredients of the right Intention were proportionably increaſed in their Quantities, ſo as to make the Opium, to which particular Regard is to be had, ſtill bear the ſame Proportion in the Whole.

MITRALES VALVULÆ. The Mitral Valves of the Heart. See COR.

MIVA. Marmalade.

MIXAITHRION, or MIXAITHRIA, μιξαίθριον, or μιξαιθρία. *Galen* explains this, Serenity of Weather, with Showers ſometimes interpoſed. It occurs in *Hippocrates*, *Epidem. L.* 1.

MIXOPYOS, μιξόπυος. Mixed with Pus; an Epithet for Urine in *Hippocrates*, *Epidem. L.* 1.

MIXTURA SIMPLEX.

Take of the *Spiritus Theriacalis Camphoratus*, (deſcribed by *Bates*) ten Ounces; Spirit of Vitriol, two Ounces; rectified Spirit of Tartar, ſix Ounces. Digeſt in a Glaſs Veſſel, hermetically ſealed, for three Weeks, that they may be exactly united.

It excites Sweat, reſiſts Putrefaction, and is good in malignant Fevers. The Doſe is a Dram, more or leſs. *Pharmacop. Batean.*

MIXTURA TUBULARIS. A Mixture to ſmoke.

Take the outward Hulls of Piſtachio-nuts, two Ounces; Colts-foot, Betony, Roſemary, all dried, of each three Ounces: Cut them ſmall, and add to them the ſmall Raſpings of Guaiacum, three Ounces; white Amber, and Olibanum, groſsly bruiſed, of each one Ounce and an half; Maſtich, one Ounce; diſtil'd Oil of Nutmegs, one Dram. Mix all together.

Or,

Take of Betony, and Colts-foot, each two Ounces; Roſemary-flowers, and Piſtachio-hulls, of each one Ounce; Cardamoms the leſſer, one Ounce and an half. Cut them ſmall, and add Oil of Aniſeed, ſixteen Drops; Oil of Cinnamon, eight Drops: And mix.

Or,

Take Piſtachio-hulls, one Ounce; Colts-foot, two Ounces; Tobacco, half an Ounce; Oil of Aniſeed, eight Drops. Cut ſmall, and mix together, for ſmoking.

Either of theſe may be ſmoked by Perſons ſubject to Catarrhs, and Defluxions of Rheum; which, for want of drawing off by ſuch warm and drying Things, would foul, relax, and ſpoil the Glands, and, at laſt, deſtroy the due Texture of the Lungs themſelves. But theſe are adviſeable to thoſe only, who have contracted ſuch an Habit of Smoking, that they cannot leave it off.

MIXQUITL. A Name of ACACIA. *Raii Hiſt. Plant.*

MNA, μνᾶ. The ſame as MINA.

MNASÆI *Pharmacon.* The Name of an emollient Plaiſter, deſcribed by *Galen*, *L.* 1. *C.* 4. *de Comp. M. P. G.* and of another directed by *Paulus Ægineta*, *L.* 7. *C.* 17.

MNEME. *Caſtellus* informs us, that this is a Name for a Cephalic Balſam, deſcribed by *Junken*; I believe it is the ſame as the *Balſamum Vitæ*, deſcribed by *Schroder*, *L.* 2. *C.* 41.

MNEMECEPHALICUM *Balſamum.* This Balſam is ſaid to have been purchaſed from a certain *Engliſh* Phyſician, by *Charles* Duke of *Burgundy*, at no leſs a Price than ten thouſand Florins;

Florins; and ſome Authors aſſert it to be of ſo uncommon Efficacy, as to preſerve in the Mind the perpetual Remembrance of Things paſt. Whether this be true or falſe, is beſt known to thoſe who have experienced its Virtues. 'Tis, however, prepared in the following Manner.

Take of the Juices of the Leaves of Baum and Baſilicon, and of the Juices of the Flowers of Tamariſk, Lilies, Primroſes, Roſemary, Lavender, Borage, and Broom, each two Ounces; of Lilies, Roſes, and Violets, each one Ounce; of Cubebs, Cardamoms, Grains of Paradiſe, Yellow Sanders, Carpobalſamum, Orris, oriental Saffron, Savory, Piony, and Thyme, each half an Ounce; of liquid Storax, and Storax Calamita, of Opopanax, Bdellium, Galbanum, Gum Hedera, and Ladanum, each ſix Drams; of the Roots of long Birthwort and Piony, and of the Oils of Turpentine, Nard, Coſtus, Juniper, Bays, Maſtich, Been, and Spike, each five Drams.

Reduce to a Powder the Ingredients which ſhould be ſo treated; mix all together, and diſtil from an Alembic, with due Degrees of Fire, till the Water and Oil are ſeparated. The Method of uſing this Balſam is ſaid to be this: The firſt two Months, the Paſſages of the Noſtrils and Ears are duly to be anointed with the Bulk of a Pea of it; the two following Months, every third Day; and for two other Months, twice a Week; then once a Week; then once each Fortnight, till a whole Year is expired; and afterwards, in the ſucceeding Years, once each two Months. *Sennert. Pract. Lib.* 1. *Cap.* 5.

MNIUM. A Sort of Maſs. See the Explication of Botanic Terms under the Article BOTANY.

MOCHLIA, μοχλία. This is defin'd, A Reduction of the Bones from an unnatural to a natural Situation.

MOCHLICA. Draſtic, or violent Purges.

MOCHUS. A Name for the *Ervum verum*.

MADAGAM. The Name of a Shrub, which grows in *Malabar*, call'd *Pomifera Indica, flore Rhododendri; fructu pyriformi*.

A Decoction of the Root and Bark is ſaid to remove inveterate Pains of the Head. A Potion is prepar'd of the Leaves, of Efficacy in reſtoring the ſuppreſs'd *Catamenia*.

MODERNI. The Moderns. As the antient and modern Medicinal Writers are frequently mention'd in this Work, I judg'd it neceſſary, in order to explain what I mean by the one and the other, to fix ſome particular Time as a Limit betwixt them. The Revival of Learning in *Europe* was caus'd by the Deſtruction of the *Greek* Empire, at the ſacking of *Conſtantinople* by *Mahomet the Great*; for on that Occaſion many learned *Greeks* retir'd from that City, and brought with them the Sciences into *Italy*. The Day, therefore, on which *Conſtantinople* was taken, may be eſteem'd the Birth-day of Learning, with reſpect to the Weſtern Parts of *Europe*. This was *May* the twenty-ſeventh 1453. All the Medicinal Authors, therefore, who wrote before this *Æra*, I call Antients, and thoſe who ſucceeded them Moderns.

MODIOLUS. The Crown, or Saw of the Trepan. See CAPUT.

MODIUS. A Meaſure of Capacity for things dry, containing ſixteen Sextaries, or Pints.

MODUS ſometimes ſignifies a Meaſure, or Proportion. *Rhodius in Scribon. Larg.*

MOGILALIA, from μόγις, importing Difficulty, and λαλέω, to ſpeak. A Difficulty of Speech.

MOGORI FLORES. The Name of certain very fragrant Flowers, deſcrib'd by *Breynius*, from which the *Indians* diſtil a very fragrant Water, of the ſame Uſe as Orange-flower-water.

MOLA. This has various Significations; for the *Patella* is ſometimes thus call'd; and the *Dentes molares*, and the Jaws, are by ſome nam'd *Molæ*.

But *Mola* generally ſignifies a fleſhy Maſs, which grows preternaturally in the Womb.

La Motte ſays, that a Mole, and a falſe Conception, ſeem to be the ſame thing, except that, if it is excluded before the ſecond or third Month, it is called a falſe Conception; if after that time, a Mole. And thus it is diſtinguiſhed by *Mauriceau*.

The Signs of a Mole, or falſe Conception, are the ſame as thoſe of a true one; except that in a true Conception the Belly often grows flat, and leſs, till the End of the ſecond Month; on the contrary, a Woman who has a Mole, or falſe Conception, grows big from the very firſt, and her Belly continues to increaſe till the End of the ſecond or third Month, at which time it generally comes away. If it happens to ſtay longer, it frequently proves fatal to the Woman, cauſing violent Floodings, which are not to be remedied without Delivery, before which a Woman is often reduc'd to the utmoſt Extremity; eſpecially if a skilful Midwife is not call'd in time.

A Mole is not, like a Child, invelop'd in Membranes; nor has it any Waters, or Secundines, itſelf performing the Office of the Secundines, and being in the ſame manner attach'd to the Uterus, from whence it derives its Nouriſhment by means of its Veſſels: Hence it appears, that, as ſoon as a Mole is excluded, the Flooding ceaſes.

When a falſe Conception, or a Mole, comes away before the End of the third Month, the Woman is frequently deliver'd of it without any Aſſiſtance, but never without Floodings; but it often happens, that a skilful Hand is neceſſary to bring it away.

A Mole is to be extracted in this manner. A Finger is to be introduc'd thro' the Vagina into the Os Uteri; and, if the Mole cannot be brought away with one Finger, a ſecond is to be introduc'd; and with theſe the Mole is to be taken hold of, and extracted.

It is to be obſerv'd, that in caſe, when a Mole is brought away, the Flooding continues, it is to be ſuſpected, that either a Part of it, or another entire Mole, is left behind, which is, therefore, to be ſound, and brought away as the firſt. *La Motte*.

A Mole, ſays *Weipfer*, is a fleſhy Subſtance, of an irregular Form, produced in the *Uterus*, either from a Concretion of the menſtruous Blood, from a Retention of Part of the Secundines, or from an imperfect Conception. Virgins and Widows are ſeldom affected with this Diſorder, but married Women frequently. The Forms and Sizes of Moles are extremely different. Sometimes they have no Connection with the *Uterus*; ſometimes they are attached to it by a Blood-veſſel, or fleſhy Fibre; and ſometimes they are ſtrongly and intimately conjoined. They are generally diſcharg'd alone, but ſometimes excluded with the Fœtus. If they are generated alone, they are uſually brought forth about the ſecond or third Month, and are preceded by the ſame Pains, which attend a real Delivery; ſometimes theſe Pains are more violent, the Symptoms more ſevere, and the Hæmorrhage is often ſo exceſſive, as to endanger the Life of the Mother. Sometimes Moles continue many Months in the *Uterus*, and acquire the Size of a mature Fœtus.

Theſe falſe Conceptions are generally accompanied, for the firſt four Months, with the ſame Symptoms which attend a natural Pregnancy; but afterwards they afford Signs, by which they may eaſily be diſtinguiſhed. For, 1. a Mole excites no Motions in the Womb, like a live Child, after the fourth or fifth Month of Pregnancy. 2. A Mole diſtends the Belly equally, but a Child makes it moſt prominent toward the Navel, or one Side. 3. A Mole changes its Situation in the Belly, according to the Poſture of the Mother; a Circumſtance never obſerved in a living Fœtus. 4. In a falſe Conception, little or no Milk is collected in the Breaſts; but the Breaſts, in a natural Pregnancy, are more and more diſtended with Milk. 5. More ſevere Symptoms attend a falſe Conception; the Complexion is diſagreeably altered, the Appetite is vitiated, the whole Habit is impaired, and the Region of the Loins and Pubes is affected with excruciating Pains. Sometimes a Dropſy, when it reaches the Abdomen, alſo, occaſions theſe Symptoms.

When a Mole, and not a Child, certainly appears to be contained in the *Uterus*, its Expulſion ſhould be attempted by proper Medicines; and, if theſe prove ineffectual, an expert Operator, ſhould endeavour to extract it, by judiciouſly introducing the Hand into the Womb. If the Mouth of the Womb be too ſtrongly contracted to admit the Hand of the Operator, it will be neceſſary to excite the Mother's Throes by briſk Cathartics, and ſtrong Clyſters, while the Mouth of the Womb, and Parts adjacent, are, in the mean time, gradually relaxed and opened by the Application of emollient Fomentations. One or two Fingers may now be gently inſinuated, and by degrees the whole Hand, to lay hold of the Mole. If the Mole, as is often the Cauſe, adheres firmly to the *Uterus*, it ſhould then be gently ſeparated by the Fingers, before its Extraction, as we are told by *Hildanus*, who performed this Operation. But, if the Fingers are unable to make this Separation, it will be neceſſary to uſe a Pair of long and obtuſe-pointed cutting *Forceps*, like that repreſented in *Tab.* LV. *Fig.* 1. Laſtly, if the Mole be too large to be extracted entire, it may be carefully ſeparated, and brought out in Pieces, either with the Fingers, a falciform Knife, or a Hook, repreſented in *Tab.* LIV. *Fig.* 17, 18. Thoſe who are deſirous of further Information, particularly with regard to the Extraction of the Mole, may conſult the Obſervations of *Hildanus*, *Roonhuſch*, and *Mauriceau*. To conclude, when a Mole occaſions no bad Symptoms or Uneaſineſs in the Mother, and its Extraction appears difficult, no Violence ought to be uſed, ſince we have many Inſtances of their being retained with little Detriment, to the Patient, during Life.

MOLARIS LAPIS. The *Mill-ſtone*. It is thus diſtinguiſh'd.

Lapis molaris. Offic. Aldrov. Muſ. Metall. 721. Cup. Hort. Cath. Supp. 2. 53. *Lapides Molares*, Charlt. Foſſ. 17. Boet. 524. *Molæ*. Worm. 41. *Molares*. Mer. Pin. 212. THE MILL-STONE.

It is digged out of the Quarries in *Derbyſhire*.

I find

I find this, says *Dale*, inſerted in the Catalogue of officinal Simples, at the End of *Shipton's* Diſpenſatory; but, for what Reaſon, I cannot gueſs, ſince the only Uſe we know of it in *England* is to grind Corn. But the Grit of the Mill-ſtone, may probably have the ſame Virtues as that of the Whetſtone. See Cos.

MOLDAVICA. *Turkey* Balm, or Baum.

The Characters are;

The Leaves are long, narrow, and crenated; the Galea, or Creſt, is arched, bifid, and reflexed upwards; the Beard is divided into two Parts, which are united by marginated Fauces; the Calyx is tubulous, cut into two unequal Parts, and cloſes when mature; the Seeds are of an oblong Figure.

Boerhaave mentions ſix Species of this Plant; which are,

1. Moldavica; Betonicæ folio; flore cœruleo. *T.* 184. *Meliſſa, peregrina, folio oblongo.* C. B. P. 129. M. H. 3. 408. *Meliſſa, Turcica multis dicta.* I. B. 3. 2. 234. Tab. Ic. 351.

2. Moldavica; Betonicæ folio; flore albo. *T.* 184. *Meliſſa Moldavica, flore albo. Citrago Turcica, flore albo.* H. Eyſt. Æſt. 6. 7. F. 2. Fig. 2.

3. Moldavica; Americana; trifolia; odore gravi. *T.* 184. *Cedronella, Canarienſis, viſcoſa, foliis plerumque ex eodem pediculo ternis.* H. A. 2. 81. *Dracocephalo affinis, Americana, trifolia, odore Terebinthinæ.* Volk.

4. Moldavica; Orientalis; Betonicæ folio; flore magno, violacea. *T. Cor.* 11.

5. Moldavia; Orientalis; Betonicæ folio; flore magno, albido. *T. Cor.* 11.

6. Moldavica; Orientalis; ſalicis folio; flore parvo, cœruleo. *T. Cor.* 11. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 168.

It is called *Moldavica* from *Moldavia*, the Name of the Country whence it was brought, and where it grows without Culture.

This Plant, ſays *Boerhaave*, was brought to me from *Moldavia* in *Turkey*, by a Botaniſt, who gave it the Name of *Moldavian Turkey Baum*; but, for avoiding a Synonymy of Names, I think we had better call it *Moldavica*. There is nothing ſaid of its Virtues; the firſt and ſecond Species have exactly the Smell of Baum, and may be uſed inſtead of it; they have a very ſtrong balſamic Smell. The third is like *Peruvian* Balſam, and is perhaps endu'd with the ſame Virtues. *Hiſt. Plant. adſcript. Boerhaav.*

MOLENDESIS, in the *Theatrum Chymicum, Vol.* 5. is a Defect of Heat.

MOLGA. The Salamander. *Rulandus.*

MOLIBATO. *Rulandus* explains this by *Calchum, Æs Flumbi.*

MOLLE. The *Indian* Molle, or Maſtich-tree.

The Characters are;

The Leaves are pinnated, and terminate in an odd Lobe; the Flower is roſaceous, and the Fruit like a Grain of Pepper.

Boerhaave mentions but one Sort of this Plant; which is,

Molle. *Cluſ. in Manard.* 312. *Lentiſcus, Peruana.* C. B. P. 399. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 258.

The Tree, being wounded, yields a very fragrant Reſin, like that of the *Lentiſcus*. *J. Bauhine* deſcribes this Reſin, or Gum; and ſays, that it much reſembles what is ſold in the Shops by the Name of *Gum Elemi*, only it appears a little whiter. This Tree grows plentifully in the Valleys and Countries of *Peru*.

The Decoction of the Bark makes a Fomentation of extraordinary Efficacy in Pains of the Legs, and Inflations. Of the ſmall Branches are made very ſerviceable Toothpicks. Of the Fruit boiled in Water, according to the Meaſure of Decoction, they prepare either a Wine, or a very good ſort of Drink, or Vinegar, or Honey; the Decoction of the Leaves gives Relief under Pains proceeding from a cold Cauſe. The Gum diſſolved in Milk is ſaid to abſterge Things in the Eye cauſing Dimneſs of Sight. *C. Romanus* aſſured *J. Bauhine*, from his own Experience, that a Dram and an half of it was an excellent Purge. *Monardes* writes, that the Powder of the Bark cleanſes and heals Wounds, being ſprinkled thereon; the ſame faſtens looſe Teeth, and reſtores the Gums, when fallen away, or abſceding from them. The Leaves, bruiſed, emit a moſt excellent and remarkable Smell; Cloths dipped in their Decoction, and apply'd to Wounds hot, or the Powder of the Bark ſprinkled thereon, haſtens the Cure by preventing the Flux of the Humours to the Part. The ripe Grains have on their Superficies a very ſmall Quantity of a pleaſant and very palatable Pulp; the reſt is extremely bitter. They make a Drink of them, by gently rubbing them between their Hands in warm Water, till all the Sweetneſs is rubbed out, carefully avoiding the Bitter, which would ſpoil the Drink. They ſtrain this Water, and keep it ſome Days, till the Fæces ſubſide. This Drink is clear and limpid, very grateful, and no leſs wholſome, eſpecially for thoſe who labour under Diſorders of the Kidneys or Bladder; and the more, if it be mixed with the Drink prepared of Mayz. The ſame Water, being more fully boiled, becomes a very good Honey; and, being expoſed to the Sun, with an Addition of I know not what Ingredients, is converted into very good Vinegar. It is uſual with *Empirics* to exhibit in this Water the Buds of the Tree, after they have been expoſed to the Night-dew, under the Paroxyſm of a Fever, and with good Succeſs. *Raii H. P.*

MOLLIFICATIO. A barbarous Term for a Palſy of the Muſcles of any particular Part, as the Anus.

MOLLUCCA. A Crab which has juſt caſt its old Shell, and acquired a new one, which is ſoft.

MOLLUGO.

The Characters are;

The Leaves are ſoft, diſpos'd five or more at a Place, neither rough, nor hairy. The Fruit conſiſts of a Pair of dry Seeds, which are lunated, or of the Figure of a Creſcent, or Half-moon.

Boerhaave mentions three Species of this Plant; which are,

1. Mollugo; montana; latifolia; ramoſa. *C. B. P.* 334. *Boerh. Ind. A.* 148. *Mollugo montana.* Offic. *Rubia ſylvatica lævis.* J. B. 3. 716. Raii Hiſt. 1. 481. *Gallium, ſive Molluga montana.* Ger. 967. Emac. 1127. *Gallium flore albo majus, ſive Mollugo montana.* Park. Theat. 564. *Gallium montanum latifolium ramoſum.* Tourn. Inſt. 115. MOUNTAIN WILD MADDER.

It grows in mountainous Places, and flowers in *July*. The Herb is uſed, which agrees in Virtues with the two other Species which follow. *Buxbaume* obſerves, that this Plant is ſold in our Shops under the Name of the *Matriſylva*, or *Aſperula*. *Dale.*

2. Mollugo; hexaphyllos; latifolia; caule firmo rigido, rubello, tenui; flore albo. *Rubra Pyrenaica, folio Molluginis.* Tourn. Flor. 2. 58.

3. Mollugo; Americana; folio Parietariæ. *Vaill. Anonymos Americana, foliis Parietariæ ſcabris, floribus albis, ad foliorum ortum vix conſpicuis.* Plukn. Phyt. 136. 4. *Boerh. Ind. alt. Vol.* 1. *p.* 148.

It has its Name from *mollis*, ſoft, becauſe of the Softneſs of its Leaves. The whole Plant has the outward Appearance of the *Rubia*, or Madder, but is ſoft on the Inſide: It is ſaid to have an aperitive Virtue. *Boerhaave.*

MOLLUGO is, alſo, a Name for the *Cruciata; glabra; folio nervoſo, rigido; Bacca gemella, ſicca, biſpida; flore lacteo.*

Beſides the foregoing Species of Mollugo, *Dale* mentions the following, which he takes to be the *Alyſſum Plinii.* See ALYSSUM. It is thus diſtinguiſhed:

Mollugo. Offic. *Mollugo vulgatior.* Park. Theat. 565. Raii Hiſt. 1. 481. Synop. 3. 223. *Mollugo montana anguſtifolia, vel Gallium album latifolium.* C. B. P. 334. *Rubia anguſtifolia aſpera.* J. B. 3. 715. *Gallium album vulgare.* Tourn. Inſt. 115. *Alyſſum Plinii, Lib.* 24. *Cap.* 11. BASTARD MADDER.

It grows in Hedges and Buſhes, and flowers in *June*. The Root is uſed, and has the ſame Virtues as that of the common Madder, but is milder. *Dale.*

MOLOCH, in Chymiſtry, is a Leaden Pot, through which Mercury is made to paſs in the Fire. *Caſtellus* from *Libavius.*

MOLOCHINE, μολοχίνη. An Epithet for a green Plaiſter, deſcribed by *Galen, Lib.* 2. *Cap.* 2.

MOLON. A Name for the FILIPENDULA.

MOLOPS, μώλωψ. A Sugillation, or a red or purple Spot, which appears in ſome malignant Fevers, on the Surface of the Skin.

MOLUCCA. *Molucca* Balm, or Baum.

The Characters are;

The Calyx is expanded, large, Bell-ſhaped, as it were, membranaceous, and open. The Galea is hollow, the Beard tripartite, the middle Segment commonly bifid. The Flower is very ſmall, and concealed in the Centre of the Calyx. The Seeds are angulous, and hardly covered.

Boerhaave mentions two Species of this Plant; which are,

1. Molucca. *J. B.* 3. 2. 234. *Meliſſa, Moluccana, odorata.* C. B. P. 229.

2. Molucca; ſpinoſa. *Dod. p.* 92. *Meliſſa, Moluccana, fœtida.* C. B. P. 229. *Molucca aſperior, Syriaca, & Maſeluc Turcarum.* Lob. M. H. 3. 380. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 173.

This Plant takes its Name from the *Molucca* Iſlands, where it was diſcovered. It is a Vulnerary, and very good in a Phthiſis, being uſed as Tea. If the Diſeaſe be attended with Spitting of Blood, the expreſſed Juice is of Service, on account of its aſtringent Quality, which is adapted to an Hæmoptoe. No Plant is a better Lithontriptic, the Leaves being infuſed in Wine, or Spirit of Wine. It has the Virtues of Baum, but ſmells ſomewhat ſtronger. Here it may be proper to obſerve, that the perfectly cerulean Colour of all Plants proceeds from the Fatneſs of the Soil in which they grow; this is univerſally true of them all, and particularly in the Inſtance before us. *Hiſt. Plant. adſcript. Boerhaav.*

MOLUCCANA. See MOLUCCA.

MOLY.

The Characters are;

It reſembles Garlick in every reſpect, except that it has a ſweet Smell, or, at leaſt, one not very diſagreeable.

Boerhaave mentions ſeven Species of this Plant; which are,

1. Moly; latifolium; Liliflorum. *C. B. P.* 75. *Moly Theophraſti.* Cluſ. H. 191. See ALLIUM.

2. Moly; Indicum. *Cluſ. Hiſt.* 192. *Caucaſon, Moly Indicum vocatum.* Lob. Ic. 162.

3. Moly; anguſtifolium; umbellatum. *C. B. P.* 75. *Moly Dioſcoridis.* Cluſ. H. 192.

4. Moly; moſchatum; capillaceo folio. *C. B. P.* 76. *Prodr.* 48.

5. Moly; Virginianum; moſchatum.

6. Moly, quod Gethioides; ſylveſtre. *Col.* 2. 7.

7. Moly; parvum; caule triangulo. *C. B. P.* 75. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 146.

All the antient Interpreters of *Homer* expound his *Moly*, by πήγανον ἄγριον, wild Rue; becauſe the *Cappadocians* and *Galatians* gave that Herb, which is a Native of their Country, the Name of *Moly*. This Plant, however, is quite different from *Homer's Moly*, which, *Theophraſtus* tells us, was ſtill to be found in his Time in *Arcadia*, with the Leaf of the Sea-onion, and the Root of the Bulbus. With reſpect to this the following Paſſage in *Pliny*, *Lib.* 25. *Cap.* 24. ought to be conſidered: "There is an Herb, much celebrated by *Homer*, which the Gods "as he ſuppoſes, call *Moly*. The Diſcovery of it he aſcribes to *Mer*- "*cury*, who propos'd it as a Preſervative againſt the moſt power- "ful Inchantments. The true *Moly* of *Homer* grows, they ſay, "at preſent, about *Pheneum*, and in *Cyllene*, in *Arcadia*. It "has a round and black Root, of the Bigneſs of an Onion, "and the Leaf of the Sea-onion; but it is difficult to be dig'd "up." Here the Author confounds together different Relations; the former Part he takes from *Theophraſtus*, who ſays, that *Homer's Moly* grew in *Arcadia*, in the ſame Form as he there deſcribes; but then he adds, ὃ μὴν ὀρύξαι γε εὐ χαλεπὸν, ὡς Ὅμηρός φησι· "it was not difficult to be dug up, as *Homer* ſays:" The contrary of this is taken by *Pliny* out of *Homer*, and ſubjoined to the Deſcription of *Theophraſtus*, with a View, probably, that it might appear to be the ſame *Moly*, which, he tells us, ſome Phyſicians, well vers'd in Herbs, had perſuaded themſelves they had found growing in *Italy*; in Confirmation of which, "he had "ſent him, out of *Campania*, a Root thirty Feet in Length, "which, with much Difficulty, and the Labour of ſome Days, "was dug up from among the Stones and Rocks; and yet, after "all, was not entire, but broken off." We may judge, by this ſingle Inſtance, what a skilful Botaniſt our Author was, who could imagine, that the *Moly* deſcribed by *Theophraſtus*, with the Leaf of the Sea-onion, and a round black Root, like that of the Onion, was the ſame with the Root ſent him from *Campania*, thirty Feet long, and yet not entire, the End of it being broken off, and left among the Stones, becauſe it could not be taken up. How did he know, that ſo long a Root, whoſe whole Length he never yet ſaw, was a Species of Bulbus? Nay, its Length rather proved it to be otherwiſe than bulbous. This Root of *Pliny*, then, agrees with the *Moly* of *Homer*, in nothing but the Difficulty of its being dug up. But this is denied by *Theophraſtus* of the *Moly* of *Arcadia*, which, in other reſpects, agrees with that in *Homer*. *Pliny*, then, in order to make his *Campanian* Root agree with the *Moly* of *Theophraſtus*, confirmed the Difficulty of its Digging, contrary to the Senſe of his own Author, by the Credit of another Author. To this he adds, with relation to the ſame *Moly*, "The *Greek* Au- "thors have deſcribed it with a yellow Flower, though *Homer* "ſays it was white." I know not what *Greek* Authors he means; there is nothing like it in any of them now extant; nor do I ſuppoſe there was any ſuch Difference in their Accounts, for ſome have even called wild Rue, μῶλυ, *Moly*, becauſe it, in ſome meaſure, reſembles the true *Moly*, in its black Root, and Milk-white Flower: So very improbable is it, that any Writer ſhould ſay, that it had a yellow Flower. *Pliny* ſeems to have imagined thus from an imperfect Tranſcription of the Paſſage of his Author, into his *Adverſaria*, where ſomething was omitted; he had inſerted what follows, μῶλυ τὰ μὲν φύλλα ἔχει ἀγρώστεως ὅμοια, ἄνθη λευκοΐοις ὅμοια· "*Moly* has Leaves like thoſe of the Agro- "ſtis, and Flowers like thoſe of the Leucoia:" But omitted what follows, that is, γαλακτόχροα, "Milk-white." Now, becauſe the *Greeks* often call the *Viola lutea* abſolutely λευκόϊον, *Leucoium*, he underſtood ἄνθη λευκοΐοις ὅμοια, to be *yellow Flowers*. An Author in the *Priapeia* ſeems to have followed *Pliny*, when he ſays of the *Moly*,

—— *de qua Flos aureus exit.*

"Whence proceeds a Gold-coloured Flower." Obſerve how juſtly he has expreſſed that in *Homer*, of the *Moly*;

—— γάλακτι δ' εἶκελον ἄνθος.

"A Flower like Milk" (in Whiteneſs). I have often diverted myſelf with the Debates of two very learned Botaniſts, who have hotly diſputed, to no Purpoſe, whether the μώλυζα, *Molyza*, of *Hippocrates* were the μῶλυ, *Moly*. The μώλυζα, or, as ſome wrote it, μάλυζα, in *Hippocrates*, is an Head of Garlick, and has no relation to the *Moly*. Thus we read, *Lib.* 1. *de Muliebr.* μώλυσαν κεφαλὴν ἀπόξαντες· "having peeled an Head of Garlick." *Galen* obſerved both Readings in the following Paſſage in his *Exegeſis*, which is to be read thus, μώλυζα κρόμυόν ἐστιν ἁπλῆν τὴν κεφαλὴν ἔχον, ἣ μὴ διαλελυμμένην εἰς ἄγλιθας, τινὲς δὲ μάλυζαν· "Garlick, which has a ſingle Head, not divided into two Cloves; "ſome call it μάλυζα (*Malyza*)." The common Editions read corruptly, τινὲς δὲ μῶλυ. *Heſychius* ſays, μώλυζα μονοκέφαλον κρόμυον, τινὲς δὲ μάλυζαν· "*Molyza* (μώλυζα) is ſingle-headed "Garlick, by ſome called *Malyza*" (μάλυζα). And *Pſellus*, of antient medicinal Terms, ſays, μάλυζαι αἱ τῶν κρομύων κεφαλαί· "Malyzæ are Heads of Garlick." In *Erotian*, μώλυξ (*Molyx*), is written for μάλυζα (*Malyza*).

From the Premiſes it appears, that there are two Kinds of *Moly*, and thoſe very different; the *Cappadocian* or *Galatian*, and the *Homerican* or *Arcadian*; and here lies the Homonymy. The *Cappadocian* was the wild Rue, which was called *Moly* by the *Cappadocians* themſelves; for *Dioſcorides* tells us, *L.* 3. *C.* 53. that the Plant, which ſome call *wild Rue*, is the ſame, which in *Cappadocia* and *Galatia* they call *Moly*. The ſame Plant, he ſays, was called by the *Syrians*, *Beſaſa*, by others *Harmala*, from whence comes the *Arabic Harmel*, though applied by an *Arabian* Botaniſt to another *Moly*. But the *Cappadocian Moly* is expreſſed in *Arabic* by *Satab-bari*, that is, wild Rue. However, wild Rue, properly ſo called, is different from this *Moly*; tho' ſome have, indeed, beſtowed on this latter the Appellation of *wild Rue*. *Avicenna*, therefore, *Lib.* 4. *Fen.* 6. *Tract.* 3. *C.* 33. rightly diſtinguiſhes between *Harmel*, and wild Rue; for *Harmel* is not wild Rue, but only a Species of it. The Tranſlators, therefore, would have done better in rendering the *Arabic* Word *Harmel* into *Latin* by *Cappadocicum Moly*, the *Cappadocian Moly*, than by *Ruta ſylveſtris*, *wild Rue*. *Salmaſius*, *de Homonym. Hyl. Iatr.*

We learn from *Photius*, that the *Moly* was fabled to have ſprung up from the Blood of a Giant, who was killed by *Circe*.

MOLYBDÆNA, in Pharmacy, is a metallic Recrement thus diſtinguiſhed;

Molybdæna, & Plumbago factitia. Offic. Schrod. 460. *Molybdæna, ſive Plumbago.* Matth. 1349. *Plumbago.* Worm. 136. Charlt. Foſſ. 56. PLUMBAGE.

The beſt Molybdæna is like Litharge, yellow, ſomewhat ſhining, and of a pale-red under Levigation; but, boiled in Oil, takes an Aſh-colour; what is Sky-colour'd, or of a Leaden-colour, is not good. It is generated in the Furnaces adapted for the refining of Gold and Silver. There is, alſo, a foſſile Sort, which is found about *Sebaſtia* and *Corycum*. Generally ſpeaking, the moſt valuable is what has no Reſemblance of Scoriæ, nor is ſtony, but yellow and ſhining.

It has the Virtues of Litharge, and the Scoriæ of Lead; and is burnt and waſhed after the ſame manner. But the *Molybdæna* is a more proper Ingredient in lenient and ſticking Plaiſters, called *Lipara*, and with very good Effect; for it incarns and cicatrizes; but it is by no means adapted to enter the Compoſition of agglutinant and deterſive Medicines. *Dioſcorides*, *Lib.* 5. *Cap.* 100.

Plumbage is that Recrement, which, in the Purification of Gold and Silver with Lead, being concreted and calcin'd, adheres to the Furnace. Its ſuperior Part reſembles Litharge, its inferior Aſhes, and its Middle is a Subſtance compounded of both. It is of the ſame Virtues with Litharge, and ſomewhat cold, though, at the ſame time, not poſſeſs'd of an abſtergent Quality. *Dale.*

MOLYBDÆNA, alſo, ſometimes ſignifies black Lead, according to *Lemery*.

MOLYBDÆNA, in Botany, is a Name for the *Plumbago*; *quorundam*.

MOLYBDOEIDES, μολυβδοειδής. This is deſcribed as a Stone of the Colour of Lead, to which the Virtues of the *Scoriæ* of Lead are aſcrib'd. *Caſtellus* conjectures, that it may be the ſame as Lead-ore.

MOLYBDOS, μολυβδός. Lead. See SATURNUS.

MOLYZA, μώλυζα. An Head of Garlick, or Garlick having an Head not diviſible into Cloves. *Galen. Exegeſis.*

MOMISCUS, μώμισκος. The Part of any of the *Dentes Molares* next the Gum. The *Dentes Molares* themſelves are, alſo, called *Momiſci*.

MOMORDICA.

The Characters are;

The Flower conſiſts of one Leaf, is of the expanded, Bell-ſhap'd kind, but ſo deeply cut, as to appear compoſed of five diſtinct Leaves: Theſe Flowers are ſome male, (or barren) others female, growing upon the Tops of the Embryo, which is afterwards changed into a Fruit; which is fleſhy, and ſometimes more or leſs tapering and hollow; and, when ripe, uſually burſts, and caſts forth the Seeds with an Elaſticity; which Seeds are wrapped up in a membranous Covering, and are, for the moſt part, indented on their Edges.

Boerhaave mentions five Species of this Plant; which are,

1. Momordica; vulgaris. See BALSAMINA.

2. Momordica;

2. Momordica; fructu luteo; rubescente. *H. Eyst. Aut.* o. 1. *f.* 4. *Fig.* 3.

3. Momordica; Zeylanica; pampineâ fronde; fructu breviori. *T.* 103. *Pavel.* H. Mal. 8. 18.

4. Momordica; Zeylanica; pampineâ fronde; fructu longiori. *T.* 103. *Pandi Pavel.* H. Mal. 8. 17.

5. Momordica; Americana; fructu reticulato; sicco. *Commel. Rar. Exot.* 22. *Boerh. Ind. alt. Plant.*

MONÆ, in *Paracelsus*, signifies the *Nates*.

MONAS, *μονάς*. Unity. In Chymistry, it seems to import the Union of the Virtues of Simples, and is much the same as *Clyssus*, or *Elixir*.

MONBIN. *The Hog Plum-tree.*

The Characters are;

It hath a Rose-shaped Flower, consisting of several Leaves, which are ranged in a circular Order; from whose Cup arises the Pointal, which afterward becomes an oval, fleshy, soft Fruit, inclosing an hard Stone, in which are contained four Kernels, or Seeds.

Miller mentions but one Sort of this Tree; which is,

Monbin, Arbor, foliis Fraxini, fructu luteo racemoso. *Plum. Nov. Gen.*

This Tree is a Native of the warmest Parts of *America*, where it grows in the *Savannas*, and low marshy Places, in great Plenty. It rises to be forty or fifty Feet high, and divides into a great many crooked Branches, which are beset with winged Leaves, somewhat like those of the Ash-tree. The Flowers, which appear in the Spring, are produced in large pyramidal Bunches, at the Extremity of the Branches, which are of a white Colour, and are very sweet. These are succeeded by several yellow, oval-shaped Plums, growing in Clusters. The Wood of this Tree, being soft, is used, instead of Cork, to stop Bottles in *America*. *Miller's Dict.*

MONEDULA. Offic. Jonst. de Avib. 26. Bellon. des Oyse. 286. Charlt. Exer. 75. Schw. A. 305. Raii Ornith. 125. Gesn. de Avib. 468. *Monedula sive Lupus.* Aldrov. Ornith. 1. 770. Will. Ornith. 25. Raii Synop. A. 40. *Graculus vel Monedula.* Mer. Pin. 172. THE JACKDAW.

The Flesh of this Bird is used, and, when applied externally, dissolves Tumors, and proves beneficial in scrophulous Swellings. *Dale.*

MONEMBASIATICUM. This Word occurs in *N. Myrepsus, Sect.* 1. *C.* 467. It is a sort of Wine, which *Fuchsius* conjectures to be the same as *Malvaticum*, Malmsey.

MONEMERON. The Name of a Collyrium in *Marcellus Empiricus, C.* 8. and of others in *Galen, L.* 4. *C.* 2. *de Comp. M. S. L.* and *Aetius, Tetrab.* 2. *S.* 3. *C.* 101. so called, because it is said to perform a Cure in one Day.

MONERES, *μονήρης*, is properly an Epithet for a Boat with a single Oar. But it is figuratively applied to a melancholy Person, who has a strong Love for Solitude.

MONOCEROS. See UNICORNU.

MONOCOLON, in *Paracelsus*, is the *Intestinum Rectum.*

MONOEMEROS. The same as MONEMEROS.

MONOMACHON. The Intestine, called otherwise CÆCUM.

MONOMELUM. The Name of a *Collyrium*, described by *Aetius, Tetrab.* 2. *Serm.* 3. *C.* 101.

MONONYCHA. The same as MENYCHA; which see.

MONOPAGIA, or MONOPEGIA. A Pain in the Head, affecting only one Point. *Castellus*, from *Velescus de Taranta*, explains it an *Hemicrania.*

MONOPHYLLON. A Name for the *Smilax*; *unifolia*; *humillima.*

MONORCHIS, *μόνορχις*. A Person who has only one Testicle, is thus called.

MONOSITIA, *μονοσιτία*, from *μόνος*, single, and *σῖτος*, Meat. The eating of one Meal a Day only.

MONOSPERMALTHÆA. The Name of a Genus of Plants, established by Mr. *Danty d'Isnard*, in the Memoires of the Academy of Sciences for 1721. Of this he mentions two Species; which are,

1. Monospermalthæa arborescens; villosa, folio majore. *Betonica arborescens, foliis amplioribus, ex Insula Barbadensi, flore luteo minimo. Raii Hist.* 3. 297.

2. Monospermalthæa arborescens, villosa; folio minore. *Betonica arborescens, Madraspatana, villosis foliis, profunde venosis. Pluk. Phytog. Tab.* 150. *Fig.* 5. *& Alm.* 67. Adde *floribus luteis, summo caule in breviorem spicam glomeratis. Pluk. Mant.* 31. *Raii Hist.* 3. 297. *Num.* 6.

MONS VENERIS. The superior external Part of the Female *Pudendum*, cover'd with Hair.

MONTIA.

The Characters are;

It hath a Funnel-shaped Flower, consisting of one Leaf, whose under Part is tubulous, but the upper Part is expanded, and cut into five Parts; the Fruit, which succeeds the Flower, is a bicapsular, flat Seed-vessel, which is surrounded on the Borders with a Plume, which expands like Rays.

Miller mentions but one Sort of this Plant; which is,

Montia arborescens, abutili folio serrato, fructu racemoso. *Houst.*

This Plant was discovered by the late Dr. *William Houstoun*, near old *La Vera Cruz*, in *New Spain*, who gave this Name to it, in Honour to Dr. *Monti*, Professor of Botany at *Bononia.*

It grows about sixteen or eighteen Feet high, and hath a woody Stem, which divides into several Branches; these are beset with Leaves, somewhat like those of the yellow Mallow, which are five Inches long, and four broad, ending in a Point; these are sawed round the Edges, and have a Down on their under Sides. The Flowers are of a greenish-yellow Colour, and are produced in Bunches. The Season of its flowering is in *January*, in the native Place of its Growth, and the Seeds are ripe in *March. Miller's Dictionary.*

MONTIFRINGILLA. A Bird, called the Mountain Chaffinch.

MONYCHA *Animalia*, from *μόνος*, single, and *ὄνυξ*, an Hoof. Animals, whose Feet are solid, and undivided.

MORA, in *Paracelsus*, is mentioned as a Symptom of the Venereal Disease. It seems to be a Callosity or Hardness of the Skin.

MORBILLI. The Measles. See VARIOLÆ. This Disease, says *Sydenham*, arises in *January*, and increases daily till the Approach of the vernal Equinox; after which Time it abates in the same gradual manner, and disappears in *July*. It principally attacks Children, especially those under the same Roof with one affected with it. It is preceded with a Chilness and Shivering, and an Inequality of Heat and Cold, which succeed alternately, during the first Day; the second Day, these terminate in a perfect Fever, attended with vehement Sickness; Thirst; Loss of Appetite; the Tongue white, but not dry; a slight Cough; Heaviness of the Head and Eyes, with continual Drowsiness; an Humour, also, generally distils from the Nose and Eyes, and this Effusion of Tears is a certain Sign of the Approach of the Measles. To which must be added, as no less certain, That though this Disease principally shews itself in the Face by a kind of Eruptions, yet, instead of these, large red Spots, not rising above the Surface of the Skin, rather appear in the Breast; the Patient sneezes, as if he had taken Cold; the Eye-lids swell a little before the Eruption; he vomits; but is more frequently affected with a Looseness, attended with greenish Stools; but this happens generally in Children, during Dentition, who are, also, more fretful in this Distemper than ordinary. The Symptoms usually grow more violent till the fourth Day, at which time, generally, little red Spots, like Flea-bites, begin to appear in the Forehead, and other Parts of the Face, which, being increased in Number and Bigness, run together, and form large red Spots in the Face, of different Figures; but sometimes the Eruption is deferred till the fifth Day. These red Spots are composed of small, red Pimples, seated near each other, and rising a little higher than the Surface of the Skin, so that they may be felt upon pressing them lightly with the Finger, though they can scarcely be seen. From the Face, where only they first appear, these Spots extend, by degrees, to the Breast, Belly, Thighs, and Legs; but they affect the Trunk and Limbs with Redness only, without perceptibly rising above the Skin.

The Symptoms do not abate here, upon the Eruption, as the Small-pox; yet I never found the Vomiting continue afterwards, but the Cough and Fever grow more violent; the Difficulty of Breathing, the Weakness of, and Defluxion upon, the Eyes, constant Drowsiness, and Loss of Appetite, persisting in their former State. On the sixth Day, or thereabouts, the Eruptions begin to dry, and the Cuticle separates, whence the Forehead and Face grow rough: But, in the other Parts of the Body, the Spots appear very large and red. About the eighth Day, those on the Face vanish, and very few appear in the rest of the Body; but on the ninth Day they disappear entirely; and the Face, Limbs, and sometimes the whole Body, seem as if they were sprinkled over with Bran, the Particles of the divided Skin being raised a little, and scarce cohering, so that, as the Disease is going off, they fall from all Parts in Scales.

The Measles, therefore, generally disappear on the eighth Day, when the Vulgar, deceived by the Term of the Duration of the Small-pox, affirm, that the Eruptions are struck in; though, in reality, they have run through the Course assigned them by Nature; and they suspect, that the Symptoms, which succeed upon their going off, are occasioned by their striking in too soon. For it is observable, that the Fever, and Difficulty of Breathing, increase at this time, and the Cough becomes more troublesome, so that the Patient can get no Rest in the Day, and very little in the Night. Children are subject to these Evils, which come on at the Declension of the Disease, especially if an heating Regimen, or hot Medicines, have been used to promote the Eruption; whence arises a Peripneumony, which destroys greater Numbers than the Small-pox, or any of its concomitant Symptoms; yet, notwithstanding, if this Disease be skilfully treated, it is not at all dangerous. These bad Symptoms are, likewise, often followed by a Looseness, which either immediately succeeds

ceeds the Diſeaſe, or continues ſeveral Weeks after the Diſeaſe, and all its Symptoms, are gone off, with great Danger to the Patient, on account of the continual Waſte of Spirits hence ariſing. Sometimes, alſo, after uſing an exceeding hot Regimen, the Eruptions turn livid, and then black; but this happens only in Adults, who are irrecoverably loſt, upon the firſt Appearance of the Blackneſs, unleſs they be immediately relieved by Bleeding, or a cooling Regimen.

As the Meaſles, in their Nature, nearly reſemble the Small-pox, ſo do they, likewiſe, agree pretty much therewith in the Method of Cure which they require; hot Medicines, and an hot Regimen, are very dangerous; though they are frequently uſed by unskilful Nurſes, to drive the Diſeaſe from the Heart. The following Method ſucceeded beſt with me:

I confined the Patient to his Bed for only two or three Days after the Eruption, that the Blood might gently breathe out the inflamed and noxious Particles, that are eaſily ſeparable through the Pores, in a manner ſuitable to the Nature of the Diſeaſe; and allowed no more Cloaths, nor a larger Fire, than he accuſtomed himſelf to, when in Health. I forbad all Fleſh-meats, and permitted Water-gruel, Barley-broth, and the like, and ſometimes a roaſted Apple, for Diet; and, for Drink, either Small-beer, or Milk boiled with thrice its Quantity of Water. To relieve the Cough, which almoſt always attends this Diſeaſe, I ordered a Draught of ſome pectoral Decoction to be taken between whiles, with a proper Linctus. But I principally obſerv'd to give Diacodium every Night, throughout the Diſtemper. Thus,

Take of the pectoral Decoction, a Pint and an half; Syrup of Violets, and Maidenhair, each an Ounce and an half: Mix them together for an Apozem, to be taken in the Quantity of three or four Ounces, three or four times a Day.

Take of Oil of ſweet Almonds, two Ounces; Syrup of Violets, and Maidenhair, each an Ounce; fine Sugar, enough to make them into a Linctus: To be taken often in a ſmall Quantity, eſpecially when the Cough is troubleſome.

Take of black Cherry-water, three Ounces; Syrup of white Poppies, an Ounce: Mix them together for a Draught, to be taken every Night.

In Children, the Doſe of the Pectorals and Opiate muſt be diminiſhed in proportion to their Age.

This Method ſeldom fails of curing, beſides being preventive of every other Symptom, which is not the neceſſary and unavoidable Attendant of the Diſeaſe; the Cough is the moſt troubleſome one, which, however, is nothing dangerous, till the Diſeaſe be gone off; after which, if it ſhould continue a Week or two, it may be eaſily cured by the Uſe of the open Air, along with proper Pectorals; and indeed it generally abates by degrees ſpontaneouſly, and at length ceaſes.

But if, by uſing Cardiacs, and too hot a Regimen, after the Ceſſation of the Diſeaſe, the Patient's Life be endangered (which is a very common Caſe) by the violent Fever, Difficulty of Breathing, and other Symptoms that uſually afflict ſuch as have a Peripneumony, I have, with great Succeſs, ordered even the tendereſt Infants to be blooded in the Arm, in ſuch Quantity as their Age and Strength indicated. Sometimes, alſo, when the Diſeaſe has been urgent, I have not been afraid to repeat the Operation; and thus have I preſerved many Children in imminent Death: Theſe Symptoms ariſe in Children upon the Ceſſation of the Meaſles, and prove ſo fatal, that they may juſtly be eſteem'd the principal Miniſters of Death, deſtroying greater Numbers than the Small pox; nor have I hitherto diſcovered any other certain Method of conquering them. Bleeding, alſo, cures the Looſeneſs, which, as we ſaid, ſucceeds the Meaſles; for, as it ariſes from the Effluvia of the inflamed Blood flowing into the Inteſtines, (as is likewiſe uſual in the Pleuriſy, Peripneumony, and other Diſeaſes cauſed by Inflammation) and irritating them to diſcharge their Contents, this Remedy alone will relieve, as it makes a Revulſion of the ſharp Humours; and, likewiſe, reduces the Blood to a due Temper.

Nor need any one be ſurpriſed at my bleeding young Children, ſince, as far as I have hitherto been able to obſerve, it may be as ſafely performed in them, as in Adults. It is indeed ſo neceſſary in the Fever above-mentioned, and in ſome other Diſorders, which Children are ſubject to, that there is no curing them without it. For Inſtance, How are Children to be reliev'd without Bleeding, during Dentition, in the Convulſions happening to them in the ninth or tenth Month, accompanied with a Swelling and Pain in the Gums, whence the Nerves are compreſſed and irritated, and the Fits, alſo, proceed? In this Caſe, Bleeding alone is to be preferred to all the celebrated Specifics yet known; ſome of which prove detrimental by their adventitious Heat, and, while they are ſuppoſed to cure the Diſorder, increaſe it by their manifeſt Heat, and deſtroy the Patient: Not to mention, at preſent, the great Relief which Bleeding affords in the Chin-cough in Children, in which it far exceeds all Kinds of Pectorals whatever.

What has been ſaid of the Cure of thoſe Symptoms ſucceeding the Meaſles, after its Diſappearance, may ſometimes, alſo, hold good, when the Diſeaſe is at the Height, provided the Symptoms be occaſioned by an artificial Heat, if the Expreſſion may be allowed me.

In *January* 1674. ſays the ſame Author, there aroſe a different Species of the Meaſles from that which began in the ſame Month in 1670. and yet it proved as epidemic, but not equally regular, nor ſo conſtantly kept its Train of Symptoms; for ſometimes the Eruptions came out earlier, and ſometimes later, whereas in the other Kind they always appeared on the fourth Day, incluſive, from the Beginning of the Illneſs. Beſides, the Eruptions here appeared firſt on the Shoulders, and other Parts of the Trunk; but, in the other Species, they firſt ſhewed themſelves in the Face, and, by degrees, ſpread over the reſt of the Body. In this Species, likewiſe, I rarely found, that the Skin peeled off, like branny Scales, upon the Diſappearance of the Eruptions, which happened as certainly, after the other Kind, as after a ſcarlet Fever. Moreover, this Sort proved more deſtructive, when unskilfully treated, than the former; for the Fever, and Difficulty of Breathing, which uſed to come at the Cloſe of the Diſtemper, were more violent here, and reſembled a Peripneumony more. But though this Species of the Meaſles was anomalous and irregular, with reſpect to the Symptoms juſt mentioned; it nevertheleſs anſwered, in general, to the Deſcription already given, and, conſequently, the Method of Cure differed little.

MORBUS. A Diſeaſe.

MORBUS ATTONITUS. The Epilepſy.

MORBUS CADUCUS, or COMITIALIS, is the Epilepſy, or falling Sickneſs; called by the latter Name, becauſe People were ſeized with it ſuddenly, in the *Comitia*, or public Aſſemblies of the *Romans*. See EPILEPSIA.

MORBUS GALLICUS, HISPANICUS, INDICUS, or NEAPOLITANUS. The Venereal Diſeaſe.

MORBUS HERCULEUS. The Epilepſy.

MORBUS NIGER, or the Black Diſeaſe of *Hippocrates*. See MELAS.

As in an Hæmoptyſis, a frothy, thin, and florid Blood, is now-and-then expectorated in Coughing, ſo, in the Black Diſeaſe of *Hippocrates*, a concreted Blood, of a blackiſh-red Colour, and mixed with a large Quantity of inſipid, acid, or viſcid Phlegm, is thrown up by Vomit.

This Diſorder is generally preceded by a pungent and tenſive Pain of both Hypochondria; and the Eruption, or immediate Appearance, of the Diſeaſe is almoſt always accompanied with an Anxiety, and compreſſive Pain, of the Præcordia, and a Conſtriction of ſome one of the Sides: Beſides, no Diſcharge of Blood is ſo readily, or ſo often, accompanied with Faintings, as the Black Diſeaſe of *Hippocrates*, eſpecially when the Blood evacuated is fetid and corrupted.

The Seat of this Diſeaſe, and the Source from which the Blood is diſcharged, is in the Stomach, though, in conſequence of the Conſent of the Parts, the Spleen is affected; and muſt, therefore, be conſider'd as another Seat of the Cauſe of the Diſorder, as is obvious from diſſecting the Bodies of thoſe who die of this Diſeaſe: Thus, in ſuch Patients, the Spleen is almoſt always found tumid, infarcted, and ſometimes indurated. And as for, the Heart, which is every-where furniſhed with a large Number of Veſſels, it is obſervable, that, when the arterial and venous Vaſa brevia, eſpecially thoſe diſtributed through the ſuperior, Left, and more ſlender Part of the Stomach, and there covered with an highly tender Membrane, are open'd or broken, they diſcharge that Blood, which, during Life, was thrown up by Vomits; for which Reaſon they are found varicoſe, and diſtended with black Blood, the Subſtance of the Stomach being, at the ſame time, corrupted in that Part. Thus *Riolanus*, in *Anthropolog. Lib.* 2. *Cap.* 17. informs us, that, in a Diſcharge of Blood by Vomit and Stool, he found one of theſe Vaſa brevia as broad as a Perſon's little Finger. Other Inſtances of the ſame Kind are found in *Columbus*, *Rerum Anatomic. Lib.* 15. *Wedelius*, in *Phyſiolog. reformat. Platerus*, *Obſerv. Lib.* 2. and *Bonetus*, *Medicin. Septentrional. Lib.* 3. *Sect.* 5. *Cap.* 4.

'Tis not, however, improbable, tho' it rarely happens, that ſuch a Vomiting of Blood may proceed from other Veſſels of the Stomach, if they are corroded by acid and corroſive Juices, or by Poiſons. That this has happen'd, we may conclude, if an acute Pain of the Stomach has preceded, and if the Blood, thrown up by Vomit, is black, acid, ſtupefies the Teeth, ſcorches the Fauces and Mouth, and, when thrown upon the Floor, riſes in an Ebullition, according to the Deſcription given by *Hippocrates*, in *Lib.* 2. *de Morbis*, *Sect.* 17.

As Perſons of ſlender and tender Conſtitutions are, of all others, moſt ſubject to internal Hæmorrhages, ſo 'tis certain from Experience, that, in this Diſorder, there happens an Hæmorrhage of the Stomach, eſpecially if the Patients are of ſo delicate a Turn of Mind, as to be eaſily ſuſceptible of Commotions; for

Bodies

Bodies of this Kind are generally furniſhed with ſmall Veſſels, whoſe Subſtance is tender, and, conſequently, eaſily capable both of Diſtention and Rupture. Hence proceeds the Effuſion of Blood.

Young Women are obſerved to be principally ſubject to this Diſorder, eſpecially ſuch of them as are coſtive about the time of Puberty, when the Menſes firſt begin to appear, and when they are afterwards ſuppreſs'd, or too ſcantily diſcharg'd; for, when they are thrown into Commotions by Anger or Frights, whilſt, in the mean time, the inferior Parts are refrigerated, or when the Phyſician, by Vomits, prepoſterouſly endeavours to remove the Symptoms ariſing from the Regurgitation of the Blood from the Uterus to the Stomach, a Vomiting of Blood is eaſily brought on.

In like manner, after an intermittent Fever, unskilfully treated, and too ſoon ſtopt, I have known a Suppreſſion of the Menſes happen in Women of a tender and delicate Texture; and if the Phyſician, by ſtrong and hot Emmenagogues, endeavours to reſtore this Evacuation, he will produce terrible Conſequences; and I myſelf have twice had an Opportunity of obſerving a mortal Vomiting of Blood brought on by this means.

I have, alſo, obſerved, that ſome old Women, who, when their Menſes have ſtopt, and they themſelves been waſted with violent and long-protracted Grief, have, for a conſiderable time, complain'd of preſſory Pains in the Left Hypochondrium, accompany'd with Want of Appetite and Weakneſs; after which, a ſudden and impetuous Vomiting of Blood prov'd mortal.

'Tis, alſo, certain from Experience, that pregnant Women, when they are plethoric, and neglect Veneſection, are ſeiz'd with a Vomiting of Blood, eſpecially, when, about the Middle of their Geſtation, their Stomachs have been frequently thrown into violent Commotions. But becauſe in this Caſe the Blood they vomit is diſcharged thin, and in a ſmall Quantity, it ſeems more probable, that it comes from the Corrugations of the ſmall Arteries in the Oeſophagus and Fauces, than from the Veſſels of the Stomach itſelf; for which Reaſon it is leſs dangerous.

On the contrary, in difficult Labours ariſing from an unnatural Situation of the Fœtus, I have ſometimes obſerv'd a copious and mortal Vomiting of Blood. I have, alſo, obſerv'd Women in Labour ſeiz'd with a Vomiting of Blood, which did not prove mortal; but theſe Patients vomited but a ſmall Quantity of Blood, were plethoric, and had neglected Veneſection in the latter Part of their Geſtation.

There are, alſo, ſome Men of valetudinary Conſtitutions, and ſubject to hæmorrhoidal Diſcharges, who, when this Evacuation is diminiſh'd, or totally ſuppreſs'd, complain of Anxieties of the Præcordia, Cardialgias, cold Sweats, alternate Heats and Colds. If ſuch Patients evacuate by Stool, and vomit a feculent Blood of a cadaverous Smell, and if the Paroxyſm recurs frequently, they generally, ſoon after, die of a Deliquium.

Of a leſs dangerous Nature was that Epidemical Vomiting of Blood, which lately happen'd at *Martisburg*; for, tho' ſome Quarts of a dark-colour'd blackiſh Blood were vomited up by the Patients, who were principally Adults among the common People, yet the Strength was only impair'd, but not the Life deſtroy'd. At the ſame time there happen'd, eſpecially in plethoric Perſons, Spittings of Blood, which were, alſo, removed without any great Difficulty; for, about the Equinoxes, in conſequence of the various and ſudden Changes of the Atmoſphere from Hot to Cold, and from Cold to Hot, the free and equable Circulation of the Blood is diſturb'd; ſo that, eſpecially when it is redundant, it ruſhes impetuouſly to ſome particular Part, and makes an Eruption, which ceaſes, when a large Quantity is diſcharged.

With reſpect to the Progreſs of the Diſeaſe, we muſt obſerve, that the ſpaſmodic and oppreſſive Pain of the Stomach, which is generally accompany'd with an Heat, and Vomiting of Blood, is not to be taken for an Inflammation of the Stomach; for an Inflammation of this Part is always accompany'd with a Coldneſs of the Extremities, a violent Heat about the Præcordia, Thirſt, a Fever, a contracted, weak, and quick Pulſe, which Symptoms do not attend a Vomiting of Blood; nor, in an Inflammation of the Stomach, can the Patient bear warm Liquors, and the external Application of hot Tiles and Cloths; which, however, afford ſingular Relief in a Vomiting of Blood.

But, as all Hæmorrhages eaſily return ſometimes a Week, ſometimes ſome Months, and ſometimes ſome Years after, ſo the ſame happens in Hæmorrhages of the Stomach; for ſince, in conſequence of the Effuſion, a Weakneſs of the Parts is induc'd, they are afterwards leſs capable of reſiſting the Blood, copiouſly and briskly convey'd to them. Hence this Blood retains its former Courſe, ſtops in theſe Parts, and, at laſt, breaking the Veſſels, diſcharges itſelf. Beſides, 'tis ſometimes obſervable, that Nature, in Hæmorrhages, generally reſumes the ſame Parts ſhe had formerly evacuated herſelf by; and that, eſpecially in Hæmorrhages of the Noſe, there is almoſt always a Dropping of Blood from that Noſtril whence the Hæmorrhage was firſt made.

The Danger of the Morbus Niger is not equally great in all Patients, though, at the ſame time, there is hardly any Species of Hæmorrhages of a more dangerous Nature. There is not, however, ſo great Danger to be dreaded, if a Fever is abſent, and if the Diſorder ariſes from a Plethora, produced by a Suppreſſion of the natural Evacuations. On the contrary, if a Fever is preſent; if the Blood vomited is corrupted, fetid, and black; if the Diſeaſe ariſes from a preternaturally large and corrupted Spleen, or an indurated Liver; and, laſtly, if the Diſeaſe is accompany'd with Deliquiums, the Danger is great, and the Symptoms prognoſticate a ſpeedy Death, as is obſerved by *Hippocrates*, in *Aphor.* 37. *Sect.* 6. and in his Prognoſtics.

The Danger is far greater, and more certain, if, as it ſometimes happens, the Vomiting of Blood is accompany'd with Diſcharges of black, Pitch-like, and fetid Matter by Stool; for this Circumſtance generally denotes ſpeedy Death, according to *Hippocrates*, who gave the Name of the *Black Diſeaſe* to this Diſorder.

This Diſcharge of bloody Matter, both by Vomit and Stool, does not proceed immediately from the Veſſels of the Stomach, nor from the Blood extravaſated in the Cavity of the Stomach, but rather from ſome of the other Viſcera, or ſmall Inteſtines, eſpecially the Ileum, and a Rupture of the meſaraic Veſſels, which are only cover'd with a weak and ſlender Coat; for, in Patients, who dy'd of this Diſorder, I have often found theſe Veſſels diſtended with black Blood, and the Stomach filled with a ſimilar bloody Matter.

The Patients ſubject to theſe terrible Diſcharges of black Matter by Stool, whether with or without a Vomiting of Blood, are either hypochondriac, or diſpoſed to hæmorrhoidal Diſcharges; for, in ſuch Patients, the Blood is not duly, but in a faint and languid manner, convey'd thro' the meſaraic Veins. Hence ariſe painful Diſtentions and Spaſms of the Veſſels diſtributed under the Membranes, and, at laſt, hurtful Congeſtions and Effuſions of the Blood. By theſe Marks the Morbus Niger may be excellently diſtinguiſhed from the hæmorrhoidal Diſcharge; which, tho' its Matter is ſometimes blackiſh, is by no means accompany'd with ſuch intenſe ſpaſmodic Pains of the Inteſtines; and is ſo far from threatening Death, that it rather affords great Relief.

This blackiſh Matter, diſcharg'd by Stool, is generally highly fetid, becauſe the diſcharg'd Blood, being, as it were, fermented with the Fæces in the Cavity of the Inteſtines, in conſequence of the Exaltation of its ſulphureous alcaline Principle, degenerates into an highly fetid Putrefaction. And, as this fetid Putrefaction is highly injurious to the nervous Fluid, hence it ſoon impairs the Strength, and deſtroys the vital Motions, of the Body; ſo that preternatural Loſs of Strength, with which this Diſeaſe is always accompany'd, is not to be accounted for from the Nature and exceſſive Effuſion of the Blood, but rather from its putrid Corruption.

The Cure.

In the Cure of this terrible Diſorder, the Phyſician ought to have a due Regard to the Diverſity of Conſtitutions, Cauſes, and Times; for one Method of Procedure is requiſite under the Paroxyſm, and another, when it is remov'd. One Set of Meaſures are expedient, when the Diſorder ariſes only from a Redundance and Orgaſm of the Blood, and the Excretion is, as it were, critical; and another, when it ariſes from Pains and Spaſms forcing the Blood to the internal Parts; and ſtill another, when it ariſes from a Corruption or Obſtruction of any of the Viſcera, from an external Cauſe, from Poiſon, or any other corroſive Matter.

Under the Paroxyſm itſelf, if the Body is plethoric, and the Motion of the Blood preternaturally determined from the external to the internal Parts, Veneſection in the Arm is highly beneficial. But the Quantity of the Blood to be taken away, and the proper Times for repeating the Veneſection, are to be determined by a cautious and skilful Phyſician, according to the Repletion of the Veſſels, the Conſtitution, Strength, and Age of the Patient.

When the Blood is in too violent a Commotion and Orgaſm, and the Pulſe impetuous and ſtrong, Spring-water, or Plantain-water, in a Pint of which a Dram of pure Nitre, and half an Ounce of the Syrup of wild Poppies, have been diſſolv'd, gradually and ſlowly drank, are highly beneficial; for this refrigerating and cooling Potion, at once, corrects the Acrimony of the Humours, checks the elaſtic Effervescence of the ſulphureous Parts in the Veſſels, and ſo ſtrengthens and corroborates the relaxed Orifices of the open'd Veſſels, that they afterwards come more eaſily into Contact, and are conſolidated.

Beſides, in this Diſorder, Emulſions are always beneficial, eſpecially when the Region of the Præcordia, principally about the Left Side, is afflicted with pungent and vellicating Pains, and ſpaſmodic Strictures, and when the Patient is rack'd with an intolerable Thirſt and Heat. Theſe Emulſions may be prepared of the Four cold Seeds, and Poppy-ſeeds, with the antiſpaſmodic Waters, prepared of the Flowers of the Lime-tree, Lilies of the Valley, Primroſes, *Egyptian* Thorn, wild Poppy, Piony, and black Cherries, with the Addition of a ſmall Quantity of Nitre, and a ſufficient Quantity of the Syrup of white Poppies.

Beſides, in order to relax the ſpaſmodic Stricture of the Inteſtines, and divert the impetuous Afflux of the Humours to the

Part

Part affected, Clyſters of the emollient and demulcent Kind are highly beneficial, but they muſt be impregnated with ſome gently ſtimulating Ingredient, corrected with Nitre, and frequently injected.

Among the external Remedies appropriated to this Diſorder, we muſt, alſo, reckon thoſe which exert their Influence by checking the Spaſms, corroborating the Stomach, and diſcuſſing the peccant Matter. For anſwering this Intention, I have found nothing more efficacious than Oil of Camphire, prepared thus:

Diſſolve one Dram of Camphire in one Ounce of the Oil of ſweet Almonds; and then drop into it twenty Drops of the Oil of Roſe-wood.

The whole Region of the Præcordia, and Left Hypochondrium, are to be anointed with this Oil; and afterwards a Bag, filled with the Flowers of *Roman* Chamomile and Elder, the Herbs Mint and Wormwood, and boiled in Vinegar of Roſes, or red Wine, is to be applied warm.

But if a large Quantity of Blood is already evacuated, and the Strength conſiderably impaired, Ligatures are to be made on the Joints, in order to check the violent Effuſion of the Blood; and theſe Ligatures are afterwards to be cautiouſly removed. I know it has, alſo, been preſcribed with Succeſs, to immerſe the Hands and Feet, to the Wriſts and Ancles, in cold Water, that the Cold may the longer detain the Blood in the minute Veſſels, and its Return to the Heart, by this means, be ſomewhat retarded.

Out of the Paroxyſm, in order to prevent the Return of the Diſorder, it is proper to exhibit half a Dram of the Powder of Rhubarb, either by itſelf, or with Crabs-eyes; or twelve Grains of the Troches of Amber, and half a Grain of Camphire, taken twice every Week, before going to Bed, in a Draught of Spring-water: For Rhubarb is a kind of Specific for gradually removing Obſtructions. In this Diſorder great Service is, alſo, done by Infuſions of Paul's Betony, Knot-graſs, the Tops of Yarrow, Liquorice-root, and Fennel-ſeeds; ſome Cups of which muſt be drank daily. For ordinary Drink, the Patient may uſe pure and light Spring-water, in which Iron has been extinguiſh'd; or he may, alſo, uſe acidulated Whey.

This Diſorder is to be treated in a particular manner, if it ariſes from a Suppreſſion or Obſtruction of the Menſes; for in this Caſe a Vein is to be opened in the Foot, and the Body rendet'd frequently ſoluble by Clyſters prepared of emmenagogue Ingredients, ſuch as Mugwort, Peny-royal, Wall-flowers, Bay and Juniper-berries; or temperate Emmenagogues, of the ſame Nature, may, alſo, be, at the ſame time, exhibited in Decoctions or Infuſions.

Another Method of Cure is, alſo, requiſite, when the Veſſels of the Stomach, corroded by acid or acrid Liquors, diſcharge their Contents, and produce this Vomiting of Blood. In this Caſe the earthy and alcaline Powders are of ſingular Efficacy in correcting the Acrimony, and obtunding the corroſive Quality, of the Humours; and, for conſolidating the ruptured Veſſels, Milk, boiled with Starch, is a Medicine of all others the moſt efficacious.

In all Hæmorrhages of the Stomach, produced by whatever Cauſes, we are not, without the greateſt Caution, to uſe Opiates and Narcotics, becauſe they augment the Loſs of Strength with which this Diſeaſe is always attended. We are, alſo, carefully to abſtain from ſtrong, ſtyptic, aſtringent, and vitriolic Medicines; for, by means of theſe, the Eruption of the Blood is, indeed, ſtopt; but the Blood, ſtagnating in the Veins, becomes putrefied, and a violent Inflammation, with a Sphacelus, is to be dreaded. Or, at beſt, if the Body is cachectic, the Diſorder is eaſily converted to a Dropſy. When the Vomiting of Blood is remov'd, the Patient is afterwards carefully to abſtain from Emetics, and Preparations of Aloes, by which an Orgaſm, an immoderate Motion, and a Congeſtion of the Blood to the Stomach, is brought on, and the Diſorder eaſily excited afreſh. *Hippocrates* juſtly adviſes, that oleous and pinguious Subſtances are to be avoided; to which we may add, alſo, ſweet Subſtances; for though theſe are excellent for ſeaſoning Aliments, yet they favour the Generation and Return of this Diſorder, becauſe, by too much relaxing the dilacerated Veſſels, they rather invite than prevent an Afflux of the Blood.

Hippocrates, in *Lib.* 2. *de Morbis*, *Sect.* 5. has given the following Directions with reſpect to the Cure of the Black Diſeaſe: "In this Diſorder, ſays he, purgative Medicines are to be frequently exhibited; as, alſo, Whey, and Milk, if they can be had. The Patient is to abſtain from ſweet, oleous, and pinguious Subſtances; but is rather to uſe ſuch as are cold and purgative, unleſs he is too weak. Blood is to be taken from his Arm. If he is coſtive, let his Body be rendered ſoluble, by an emollient Clyſter. Let him abſtain from Venery and Surfeits; neither let him walk, nor exerciſe himſelf too much. Let him not drink hot Liquors, nor eat acrid and ſaline Subſtances: And, if he obſerves theſe Meaſures, he will, in Proceſs of Time, get free from the Diſorder."

Observation I.

A certain young Man, having for a long time laboured under a Quartan Fever, and being, at laſt, prepoſterouſly cured by an Empiric, contracted a bad Habit of Body, a livid Complexion, a certain Tumor about his Eye-lids, and a continual Languor of Strength; beſides, he frequently complained, eſpecially after the Uſe of flatulent Subſtances, or after any Commotion of Mind, of a Pain of his Left Side, a Coſtiveneſs, and Tenſion of the Inteſtines. At laſt, when, walking on Foot for ſome Miles, he had ſpent himſelf pretty much, and had ſome Quarrels with his Companions, he was ſuddenly ſeized with a copious Vomiting of black Blood, which frequently returned. His Excrements were, at the ſame time, black as Pitch, and highly fetid. In this Condition the Patient frequently fell into Deliquiums, when he raiſed up his Body, and, in the Space of twenty-four Hours, died. Upon diſſecting his Body, next Day, the By-ſtanders were not able to endure the highly fetid Smell. The Vaſa brevia were black, and ruptured; and both in the Cavity of the Stomach, and in the Ilium, there was a black fetid Sordes, and its Veſſels were, alſo, black. The Liver was ſomewhat harder than in a natural State; but the Spleen was ſo hard, as almoſt to reſemble a Cartilage; and its exterior Subſtance, which was of a whitiſh Colour, could hardly be divided with a ſharp Knife; but the little of the internal Part, which remained ſoft, was full of black Blood.

Observation II.

Being called to a Gentlewoman of a delicate and tender Conſtitution, ſeized with a violent Vomiting of Blood, her Huſband ſhew'd me two Baſons full of Sordes, conſiſting of concreted Blood and Phlegm, which ſhe had vomited up. Her Pulſe was weak, and her Strength ſo much impaired, that, when ſhe raiſed her Body, ſhe fell into a Deliquium. For this Reaſon I affirmed her Caſe was dangerous. I exhibited Analeptics and Corroboratives; but next Day, after vomiting ſome Matter like Waſhings of Fleſh, intermixed with ſmall Grumes of dark-colour'd Blood, ſhe died calmly. Upon inquiring into the Cauſe of her Diſorder, I found, that after Child-birth ſhe was ſeized with an anomalous Tertian Fever, then raging; that this Fever, after five Paroxyſms, was removed by a neighbouring Phyſician; but that, for three Months after, her Menſes were ſtopt, which Circumſtance brought on a violent Pain of her Left Hypochondrium; that her Mother, being alarm'd at this, implored the Aſſiſtance of another Phyſician, who gave her a Medicine, which, to me, ſeemed to be Elixir Proprietatis without any Acid, and with the Eſſence of Zedoary, and Amber: Of this ſhe was daily to take fifty Drops, in old and generous *Rheniſh* Wine, uſing for common Drink well-hopt Malt Liquor. But hardly were three Weeks expired, till ſhe fell into the Morbus Niger, which put an End to her Life.

Observation III.

A Woman, of about thirty Years of Age, during the Diſcharge of her Menſes, was terribly frighted; and, whilſt ſhe was yet trembling, took a large Draught of cold Water; by which means ſhe was ſeized with a Trembling of the Joints, and a Want of Appetite; at the next Return of her menſtrual Period, they, indeed, flowed, but in too ſmall a Quantity; and ſhe was afflicted with a violent Anxiety of the Præcordia, a Nauſea, a Vomiting, a Coldneſs of the Extremities, and a Redneſs of the Face. On the third Month all the former Symptoms returned, accompanied, for three Days, with copious Vomiting of Blood, which greatly impaired her Strength. *Frederic Hoffman.*

MORBUS REGIUS, is the Jaundice: But ſome Authors call the King's Evil by this Name.

MORBUS SACER. The Epilepſy.

MORDEHI. The Inhabitants of the *Eaſt-Indies* are frequently ſubject to a Diſeaſe, by them called *Mordehi*, which is no more than a diſordered Stomach. The perpetual Heat, the copious Sweats excited by it, and the ſupervening Cold, very much weaken the Stomach. Now, if the Inhabitants ſhould either eat or drink too liberally, eſpecially at Night, the Concoction of their Aliments muſt, of courſe, be unduly carried on; for which Reaſon Diarrhœas are not only very frequent, but, alſo, with great Difficulty cured among them. *F. Hoffman, de Morbis Endemiis.*

MORDEXYN. At *Goa*, the principal Colony of the *Portugueſe*, in the *Indies*, the Inhabitants are much ſubject to a Diſorder called *Mordexyn*, which ſeizes the Patient ſuddenly and unexpectedly; is attended with a Nauſea, and continual Vomiting; and often proves fatal. *Frederic Hoffman, de Morbis Endemiis.*

MORDILAPIDES. Small Fiſhes, which are frequently found under Stones; I take them to be Loaches.

MORETARIUM. The ſame as MORTARINUS.

MORETUS. A ſort of cordial Julap, thus called from the Syrup of Mulberries, which ſhould be an Ingredient in it.

MORHNA, or MORLUA. The Cod-fiſh. See ASELLUS.

MORIA, *μωρία*. The ſame as MOROSIS.

MORINA.

The Characters are;

It hath a tubulous anomalous perſonated Flower, conſiſting of one Leaf, which is divided into two Lips: The upper Lip is, again, divided into two Parts; but the under Lip is divided into three. From the Flower-cup, which is, for the moſt part, bifid, ariſes the Pointal, fixed like a Nail in the hinder Part of the Flower; but is barren, for the Flower-cup reſts on the Embryo, and is ſurrounded by another, as a Sheath, in which are many roundiſh and angular Seeds.

Miller mentions one Sort of this Plant; which is,

Morina Orientalis, Carlinæ folio. *Tourn. Cor.*

This Plant was diſcovered by *Tournefort*, in his Travels in the *Levant*, who gave it this Name in Honour to Dr. *Morin*, a Phyſician at *Paris*. *Miller's Dictionary*, *Vol.* 2.

It is cordial, cephalic, and ſtomachic; good for reſiſting the Influence of bad Air, and to excite the Tranſpiration of peccant Humours, being taken in Infuſion or Conſerve. *Lemery des Drogues.*

MORINGA *Lentiſci Folio, Fructu magno anguloſo, in quo Semina Ervi.* J. B. *Arbor, exotica Lentiſci Folio.* C. B. *Moringa.* Ferrar. Flor. Park. Acoſt. *Modringou.* H. M.

It is a Tree growing in *Malabar*, and other Countries of the *Eaſt-Indies*, about ten Yards in Height, and in Bigneſs, as much as a Man can fathom; it is cultivated in Gardens and Orchards, only for the ſake of its Fruit, which, as *Acoſta* ſays, is a Foot in Length, of the Thickneſs of a Radiſh, and remarkable for its eight Corners, and much valued for its delicious Taſte.

Of the Leaves, Roots, Bark, and Fruit of this Tree, they prepare antiſpaſmodic Pills. The Root of the Tree, as *Acoſta* tells us, ſupplies the Place of the Unicorn's Horn, and the Bezoar-ſtone; and is the true Theriaca, which the *Malabarians* uſe as an Alexipharmic againſt all Sorts of Poiſon, particularly the Bites of thoſe moſt venomous Serpents, commonly called *Cobras de Capellas*, and other poiſonous Inſects and Animals, taking it inwardly, and externally applying it; the mere Juice of the Bark, mixed with Water and Garlick, drives theſe Serpents from their Houſes. *Acoſta* found the Root to be of ſingular Efficacy in the Cholera Morbus. The Juice of the Leaves, mixed with Pepper, is inſtilled into the Eyes for the Vertigo; and, with an Addition of Ginger, it removes a Fever. The Root is much in Requeſt with thoſe who labour under an Elephantiaſis; many of whom, they ſay, have been cured by the continued Uſe of it. *Acoſta.* Uſed as a Peſſary, it procures Abortion. *H. M.*

The Bark, bruiſed in Water of Rice, is proper for an Oedema, and, with an Addition of Cumin, for the Tooth-ach, and the poiſonous Bites of Dormice; the Juice, taken up the Noſtrils, is good for a Mania; and the ſame, drank, cures racking Pains of the Joints, proceeding from a Cold; the Juice of the Leaves diſcuſſes Venereal Tumors, and expels Worms in the Feet, and ſuch as are generated in Ulcers. *H. M. Raii Hiſt. Plant.*

MORMYROS, μορμύρος. A Sort of Sea Fiſh, mentioned by *Aldrovandus.*

MORO. An Abſceſs of the Fleſh, reſembling a Mulberry. *Rulandus.*

MOROCHTHUS, μόροχθος.

Lapis Morochthus. Offic. Boet. 411. De Laet. 140. Matth. 1385. Calc. Muſ. 275. *Morochthus aliis Leucogæa, Leucophragis, Galaxius, Graphida, Galactites.* Worm. 71. Charlt. Foſſ. 30. *Morochthus.* Aldrov. Muſ. Metall. 668. Agricol. 606.

WHITE MARKING-STONE.

The Stone *Morochthus*, which ſome call *Galaxius*, or *Leucographis*, is produced in *Egypt*, and is uſed by the Fullers in whitening their Linen, as being of a ſoft Subſtance, and eaſily diluted. It is ſuppoſed to be of an emplaſtic Quality, and good for Spitting of Blood, the Cœliac Paſſion, and Pains of the Bladder, being taken in Water, as alſo for uterine Fluxes, being taken in like manner, or applied in a Peſſary. It is likewiſe an Ingredient in Collyria, or ophthalmic Medicines of a ſoft Conſiſtence; for it fills up a Cœloma, and repreſſes Defluxions: Made into a Cerate, it cicatrizes ſuch Ulcers as happen in the tender and ſoft Parts of the Body. *Dioſcorides, Lib.* 5. *Cap.* 152.

MOROSIS.

The *Greek* Word μώρωσις correſponds to what we commonly call *Stupidity*, a Diſorder, which, though commonly thought incurable, is nevertheleſs, according to the Opinions of the moſt celebrated Phyſicians, to be either totally removed, or at leaſt greatly alleviated, by proper Meaſures.

This Diſorder, according to the celebrated *Willis*, proceeds either from a Fault of the Brain, or from a bad Condition of the animal Spirits, or from both theſe in Conjunction.

Thus, for Inſtance, it is produced, when the animal Spirits are deprived of their active Particles, and become vapid, languid, and incapable of exerting themſelves in a due Manner, in Conſequence of their being clogged with aqueous and terreſtrial Particles.

But though this Diſorder frequently ariſes only from a Fault of the animal Spirits, yet it is oftener produced by ſome Imperfection of the Brain: Thus, for Inſtance,

1. It is a common Obſervation, that the Genius, in ſome meaſure, depends upon the Bulk and Figure of the Head, and conſequently, of the Brain: Hence it is become proverbial, that either too ſmall, or too large, a Quantity of Brains are Marks of Folly and Stupidity. And though this does not always happen, yet it is frequently found to hold true. The Reaſon of both is ſufficiently obvious, becauſe, in a ſmall Brain, too few Spirits are generated and ſecreted; whereas a preternaturally large Brain is generally of a Texture too coarſe and ignoble to produce a Quickneſs and Vivacity of the mental Powers.

2. Since, in order to a due Diſtribution of the Spirits from the Center to the Circumference of the Brain, and their equable Return from the latter to the former, 'tis requiſite the Brain ſhould be of a duly globular Figure, hence we obſerve, that Perſons, whoſe Craniums are preternaturally depreſſed or acuminated, labour under an Imperfection of the mental Powers, or are what we call *ſtupid.*

3. As a due Texture, and laudable Temperament, of the Brain, with reſpect to Cold, Heat, Drineſs, and Humidity, are requiſite to Brightneſs of Genius; ſo 'tis obvious, that its Reverſe, which is Stupidity, muſt be produced by a want of theſe. Some Climates are, by the unlucky Influence of their Atmoſphere, ſaid to incline their reſpective Inhabitants to *Stupidity*. Thus, for Inſtance, *to be born in Bœotia*, is, in the emphatic Language of Antiquity, a proverbial Expreſſion, importing that the Perſon, to whom it is applied, is a *Fool.*

4. *Stupidity* may not only ariſe from theſe Faults of the Brain, which are already enumerated, and are, for the moſt part, original and connate; but, alſo, from its bad Conformation, with reſpect to its Pores and Veſſels, brought on by adventitious Cauſes; and, in conſequence of which, the animal Functions are unduly performed. Thus, if theſe Pores and Veſſels are too much conſtricted, they do not admit a Quantity of Matter ſufficient for a due Generation of Spirits. If, on the contrary, they are too much relaxed, they admit, along with the Matter deſtined for the Generation of the Spirits, heterogeneous Particles, highly unfriendly to the animal Oeconomy. There may be, alſo, an Inequality in the Conformation of theſe Pores and Veſſels; when, for Inſtance, they are more wide and pervious in one Part of the Brain, than in another. This, perhaps, is the Reaſon why ſome Perſons receive juſt enough Impreſſions of Things, but, at the ſame time, form wrong Judgments concerning them. Perhaps, alſo, 'tis for this Reaſon, that thoſe who are bleſſed with an Imagination ſufficiently ſtrong and lively, are curſed with a treacherous and fallacious Memory.

It ſometimes happens, that both a bad Condition of the animal Spirits, and a Fault or Imperfection of the Brain, concur to the Production of Stupidity. And whichever of theſe is firſt affected, will, of courſe, ſoon convey a proportionable Diſorder to the other; for, if languid and inactive animal Spirits are not freely conveyed through theſe Pores or Veſſels, they will either not be ſufficiently extended, or again coaleſce. If, on the contrary, the Spirits, in conſequence of a bad Structure and Conformation of the Brain, cannot expand themſelves duly, they will, at laſt, become ſlow and torpid, and acquire a peccant Diſpoſition, capable of producing Stupidity.

Stupidity, as we have already obſerved, is ſometimes original and connate; and this Species of the Diſorder is either *hereditary*, or *accidental*; *hereditary*, when Fools beget Fools; that is, when the languid and effete Particles of the Parent conſtitute the animal Organs of the Child; and *accidental*, when wiſe and ingenious Parents procreate dull and ſtupid Children. Thus, in Parents addicted to Study, Reading, and Meditation, the moſt rich and generous Particles of the Blood are conveyed to the Brain, in order to ſupply a ſufficient Quantity of Spirits; in conſequence of which, too few of theſe generous Particles deſcend to the ſpermatic Veſſels.

Though, in the Brute Creation, the Temper and Genius of the Parent is conveyed through a long Series of the Offſpring, when duly managed, yet it often happens otherwiſe in the human Race; ſince Parents, by Intemperance, Luxury, and an irregular Courſe of Life, have their Conſtitutions ſo broken, and their Strength ſo impaired, as to procreate languid and valetudinary Children. Hence, the Offſpring of Parents loaded with Age, or propagating their Species when too young, or of ſuch as are addicted to Drunkenneſs, Softneſs, and Effeminacy, are generally curſed with a dull, an heavy, and a ſtupid Genius. The ſame Misfortune is alſo incident to thoſe who ſpring from Parents afflicted with Diſorders of the Brain, ſuch as Palſies, Epilepſies, a Carus, and Spaſms: So that 'tis an unſpeakable Advantage, to ſpring from Parents bleſſed with a ſound Mind in a ſound Body.

Various evident Cauſes concur to the Production of Stupidity in Perſons originally ſound. Thus ſome Perſons, at firſt ingenious and acute, in the Decline of Life, without any conſiderable Error in Regimen, become gradually dull, and at laſt ſtupid, becauſe the Blood, and nervous Fluid, by degrees, loſe their native Vigour, and become languid and inactive; for 'tis obſerva-

ble, that the Genius of ſome Perſons is variouſly brighten'd, or beclouded, according to the various Periods of their Age. Thus ſome, who in their Childhood are the Admiration of all around them, for their Sagacity, Docility, and Quickneſs of Apprehenſion, afterwards become the Scorn of their Acquaintance, on account of their Dulneſs and Stupidity; whereas, on the contrary, it often happens, that Perſons in their Infancy dull, and inſuſceptible of the Impreſſions of Literature, afterwards become remarkable for the Penetration of their Judgment, and the Sprightlineſs of their Genius. In this Caſe, the animal Spirits, being at firſt clogg'd and incumber'd, at laſt emerge, and exert themſelves with due Vigour; whereas, in the former, being at firſt too free and uncouſin'd, they are ſoon diſpatch'd, and leave the Patient dull and ſtupid. Hence Children in their Infancy dull may afterwards become ſufficiently ingenious, when the Temperament of the Brain is chang'd, and its ſuperfluous Humidity evaporated.

Stupidity and Dulneſs are, alſo, frequently produced by violent Blows and Concuſſions of the Head, by frequent Drunkenneſs, Surfeiting, and the exceſſive Uſe of Opiates; by violent and ſudden Paſſions, ſuch as Frights, and exceſſive Sorrow; and by Diſeaſes of the Brain, ſuch as Epilepſies, Palſies, Apoplexies, and a Carus.

There are various different Species of this Diſeaſe: Thus, for Inſtance, it is diſtinguiſh'd into Folly and Stupidity. In the former, the Patients dexterouſly and quickly enough apprehend ſimple Things, and retain them ſufficiently in their Memories; but, for want of Judgment, compound and divide their Notions ill, and are ſtill more unlucky in drawing Inferences; whereas, in the latter, that is, Stupidity, the Imagination, the Memory, and the Judgment, are ſo defective, that the Patient neither apprehends quickly, nor reaſons well.

There are various Gradations and Degrees of Stupidity; ſince ſome, who are incapable of acquiring Literature, and the liberal Sciences, are yet well enough qualified for the mechanic Arts; whilſt others, abſolutely incapable of either of theſe, are nevertheleſs adapted to the Fatigues of Agriculture, and the toilſome Labours of a Country Life. Others, incapable of every Employment, can only be taught what is neceſſary to the Preſervation of Life, and the common Method of behaving in the World; whilſt others are ſo ſuperlatively ſtupid, that they hardly underſtand any thing at all; but act and ſpeak in an abſurd, ridiculous, and inconſiſtent manner.

As for the Prognoſtics of this Diſeaſe; Stupidity, whether hereditary, or produc'd by unknown Cauſes, if it remains to the Years of Puberty, is ſcarcely ever cur'd, tho' it frequently happens, that Children at firſt dull and ſtupid, upon a laudable Change of the Brain, and animal Spirits, become ingenious and docile.

Stupidity ſucceeding an inveterate Epilepſy, or produc'd by an evident Cauſe, ſuch as an Injury done to the Head, or the Sally of ſome violent Paſſion, if it continues long, becomes incurable.

The Species of Stupidity, which principally conſiſts in a Loſs of Memory, and ſucceeds Lethargies, and lethargic Diſorders, ſometimes ſpontaneouſly ceaſes, when theſe Diſeaſes are cur'd. In the Cure, therefore, of this Species of Stupidity, the principal Intentions are, to free the animal Spirits from their languid and torpid State, and to render them capable of circulating freely, and expanding themſelves duly in the Pores and Veſſels of the Brain.

It has been ſometimes obſerv'd, that fooliſh and ſtupid Perſons have been cur'd, and their Genius render'd more acute and bright, by a Fever. Thus *Huartus* informs us, that, at *Corduba*, a Fool, being ſeiz'd with a violent malignant Fever, in the middle of the Diſeaſe acquir'd an uncommon Judgment and Penetration, which remain'd with him during the future Part of his Life. Inſtances of this kind may be accounted for from this, that the febrile Heat ſometimes rarefies and diſpels the Matter which injures the Brain, and by that means produces the Stupidity.

As for the Cure of this Diſorder, *Stupidity*, whether connate, or adventitious, if it is not a Folly incapable of Change or Inſtruction, may be greatly alleviated, tho' not totally remov'd. For this Purpoſe, both the Phyſician and the Preceptor are to join their Care, in order to poliſh the Patient's Mind, and drag him, as it were, from the brute to the human Species.

As ſtupid Perſons, therefore, become as ſlowly acquainted with the common Notions and Ideas of Things, as Children do with Words; ſo 'tis expedient they ſhould conſtantly be inſtructed by a careful and laborious Preceptor, who ſhould never become weary of inculcating the ſame things over and over again: For by this means, the Spirits, tho' naturally torpid and inactive, will, by the perpetual Exerciſe, be ſomewhat rous'd and brighten'd; and, being continually excited, will make, in the Brain, tho' coarſe and groſs, Tracts or Paſſages, tho' imperfect, for their own more free and eaſy Expanſion. But, that this Intention may be the more effectually obtain'd, ſuch Medicines as clear the Brain, purify and refine the Blood, the nervous Fluid, and animal Spirits, are to be exhibited.

In order to purify the Blood, gentle Purges, and Veneſection, if the Strength permits, frequently, tho' moderately repeated, are to be us'd. Beſides, in order to derive the feculent Matter more effectually from the Brain, Fontanels are to be made in the Arms, or in the Legs, or in both. In ſuch Patients as are fat, and have a moiſt Brain, it is ſometimes expedient to make two Fontanels near the Scapulæ. For this Purpoſe Trepanning is by ſome, alſo, highly commended, ſince by its means the Brain perſpires more freely. The Patient ought to uſe Food of a light and attenuating Nature, to live in a free and dry Air, and to take but moderate Sleep.

If, after the due Uſe of theſe Meaſures for a conſiderable time, no ſalutary Effect is produc'd, 'tis in vain to attempt any thing farther by Medicines: But if, by their means, any hopeful Signs of Recovery begin to appear, it is expedient every Day, at medicinal Hours, to exhibit alterative Medicines for a long time. The Medicines, in a peculiar manner calcuted for the Removal of Stupidity, are theſe following.

Take of the ſuccinated Spirit of Sal Ammoniac, ſix Drams: Of this, exhibit between fifteen and twenty Drops, every Evening and Morning, in three Spoonfuls of the following diſtil'd Water, drinking ſeven Spoonfuls of the ſame after it. The diſtil'd Water is thus prepar'd.

Take of the Leaves of Miſleto, and recent Apples each ſix Handfuls; of the leſſer Sage, Roſemary, Savory, Mother of Thyme, Calamint, Peny-royal, Marjoram, and the greater Rocket, each four Handfuls; of the Roots of Angelica, and Maſterwort, each ſix Drams; of Zedoary, the leſſer Galangals, Calamus Aromaticus, and Winter's-bark, each two Ounces; of Cloves, Nutmeg, Mace, Cinnamon, Ginger, each one Ounce; of Cubebs, Cardamums, and Grains of Paradiſe, each ſix Grains: Upon all theſe, when cut ſmall, and bruis'd, pour twelve Pints of the beſt Canary Wine: Digeſt cold in a cloſe Veſſel for three Days; then diſtil all together, and let the Liquor obtain'd be adulcorated with Sugar when us'd. Its Doſe is two or three Ounces.

After the Uſe of the Spirit of Sal Ammoniac, for fifteen or twenty Days, other Medicines are to be us'd for about as long, ſuch as the Spirits of Soot, Harts-horn, and of the human Cranum. The Tinctures of Coral, Antimony, Caſtor and Amber, *Quercetan*'s Elixir of Life, Elixir Proprietatis, and Spirit of Lavender.

Or,

Take of the Conſerve of the Flowers of Lilies of the Valley, ſix Ounces; of the preſerved Roots of Sweet Flag, of Ginger preſerved in the *Indies*, and of preſerv'd Nutmeg, each half an Ounce; of the Species Diambræ, two Drams; of Aloes-wood, Yellow-ſanders, the beſt Zedoary-root, Cubebs, and *Jamaica* Pepper, each a Dram and an half; of prepared Coral, two Drams; and of the Syrup of preſerved Ginger, a ſufficient Quantity for making an Electuary; of which two Drams are to be taken Morning and Evening, drinking afterwards three Ounces of the diſtil'd Water before preſcrib'd.

Thoſe whoſe Brains are too moiſt, ſhould every Morning drink Coffee, with Sage-leaves previouſly boil'd in it. Thoſe whoſe annual Spirits are faint and languid, ſhould, on the contrary, drink Chocolate for common Drink. Ale, or Small-beer, ſhould be uſed in three or four Gallons of which, after the Fermentation is over, the following Bag ſhould be put.

Take of the Leaves of Sage dried, four Handfuls; of Cubebs, one Ounce; of Cloves and Nutmegs, cut and bruis'd, a ſufficient Quantity: Mix all together, and put in the Bags.

External Applications, ſuch as Cucuphas, or medicated Caps, Plaiſters, and Liniments, are alſo uſed in this Diſorder. Thus a Cucupha, to be uſed in it, may be thus prepared.

Take of the Flowers of Lily of the Valley, Roſemary, and Stœchas, each one Handful; of *Celtic* Spikenard, two Drams; of the Roots of the Cyperus, the leſſer Galangals, and Florentine Orris, each three Drams; of Laudanum, Benjamin, Balſam of Tolu, and Amber, each two Drams; of Nutmegs, Cloves, Mace, and Cinnamon, each one Dram and an half: Reduce all to a fine Powder, to be ſew'd up in Cotton in a Cap.

A Plaiſter, to be uſed by Patients labouring under Stupidity, may be prepared in the following manner.

Take

Take of the Emplaſt. Flor. Unguent. two Ounces; of Tacamahac, Caranna, and Balſam of *Tolu*, each three Drams; of the Powders of Amber and Myrrh, each two Drams; of Cloves, Nutmeg, and Mace, each one Dram. Melt all together into a Maſs, of which make a Plaiſter, to be ſpread on Leather, and applied to the Head when ſhav'd.

A Liniment may be prepared thus:

Take of the Oil of Palm, half an Ounce; of the Balſam of Capivi, three Drams; of *Peruvian* Balſam, one Ounce; of the Oil of Nutmegs, by Expreſſion, two Drams; and of the Oil of Amber, half a Dram: Make into a Liniment for the Head. *Willis.*

See ANACARDIUM.

MOROXOS. The ſame as MOROCHTHOS.

MORPHÆA. Morphew. This is defined to be a Species of Leproſy, differing from it in this, that the Seat of the Leproſy is in the Fleſh, but that of the Morphew in the Skin.

MORPHNOS. A Species of Eagle mentioned by *Aldrovandus.*

MORPIONES. Crab-lice. Theſe, being flattiſh, ſtick ſo faſt with their Claws to the Skin, as to create much Difficulty to diſlodge them. Being viewed by a Glaſs, they nearly reſemble the ſmall Crab-fiſh, and thence are called, by ſome, Crab-lice, by others Plactulæ, Morpiones, Petolæ, and Peſſolatæ. They uſually infeſt the Arm-pits, Eye-lids, Eye-brows, and Pudenda.

Turner, in his Diſeaſes of the Skin, gives the following Caſe, as an Example of the Method of treating this ſort of Vermin. A young Man, long labouring under an intolerable Itching of the Pubes and Scrotum, had almoſt flayed the Parts by ſcratching. Upon narrowly obſerving the Roots of the Hairs, I perceived, in their Interſpaces, ſome of the Crab-like Vermin, ſo riveted, as it were, in the Skin, that I could only raiſe two or three of them, to convince him of the Cauſe of his Complaint.

The Tenderneſs of the Parts rendering him unable to bear any of the uſual Applications, I mixed up one Dram of Quickſilver with two Ounces of Diapompholyx. I ordered him to ſpread this thin upon a Cloth, and apply to the Parts, and to ſecure his Dreſſing wi h a ſmall Bag-truſs. In a few Days he was eaſed, the Lice coming daily away, dead, upon the Dreſſings.

In others, who have not thus excoriated themſelves, I have ſeen Hundreds fall from the Arm-pits, and Pubes, dead, upon the firſt Application of a Rag wet with the Milk of Sublimate. This ſort of Vermin is reckoned to prognoſticate ſpeedy Mortality to thoſe they abandon, when not removed by Medicine.

MORSELLUS, or MORSULUS. A Lozenge, or Troche.

MORSUS. A Bite. Figuratively it is uſed to expreſs a ſort of Pain reſembling that which is excited by a Bite, or by Gnawing.

Orpheus, in his Hymn to *Mercury*, ſays, that Coral in Powder, and mix'd with Wine, is good againſt the Bites of Serpents.

The *Pſylli*, a People of *Libya*, were famous amongſt the Antients, for curing the Bites of Serpents, by ſucking the Wound. One of theſe *Pſylli* was made to ſuck the Wounds *Cleopatra* had receiv'd from the Aſps. It was ſaid no Serpent could hurt theſe *Pſylli*.

MORSUS DIABOLI, in Anatomy, is the fimbriated, or jagged Extremity of the Fallopian Tubes of the *Uterus*. But, in Botany, *Morſus Diaboli* is a Name for the *Scabioſa, integrifolia, glabra, radice præmorſa.*

MORSUS GALLINÆ is the *Alſine*. Offic.

MORSUS RANÆ is the *Microleuconymphæa.*

MORTARIOLUM, in Chymiſtry, ſeems to be a ſort of Mold, for faſhioning Cuppels. In Anatomy, the Sockets of the Teeth are thus called.

MORTARIUM. A Mortar. Mortars are uſually made of Wood, Marble, Iron, Braſs, Lead, or Glaſs; but Care muſt be taken not to uſe them indifferently; for acid and corroſive Subſtances will corrode Metals, and, if pounded or rub'd in metal Mortars, will be impregnated with the Qualities of Metal, or be utterly ſpoiled. Thus, alſo, very hard Subſtances will, by rubbing, wear away a Part of Wooden, or even Marble Mortars; and a Medicine will be ſpoiled by having the Raſpings of the Wood, or the Powder of the Stone, mixed with it.

MORTIFICATIO. A Mortification, or Sphacelus. See GANGRÆNA.

MORUM. An Excreſcence on the Surface of the Skin in many Parts of the Body, reſembling a Mulberry. When this happens upon the Eye-lids, the *Arabians* call it *Alchute.*

MORUS.

The Characters are;

The Leaves are rough, and of a roundiſh Form. The Flower is amentaceous, conſiſting of three Stamina, which ariſe from a Calyx, compoſed of four Leaves; in the Centre of the Flower is an aqueous Receptacle, or Cell. The Fruit, which grows at a Diſtance from the Flower, is compoſed of a long Axis, to which grow, on every Side, Eggs, cauſing it to appear as if it conſiſted of a Multitude of little Conglomerations, each of which conſiſts of a ſmall ſucculent Berry, furniſhed with a wreathed Tube, which is ſurrounded with four ſmall Leaves; the Union of a Multitude of theſe conſtitutes the Fruit; the Seeds are of a roundiſh Form.

Boerhaave mentions three Species of this Plant; which are,

1. Morus; fructu nigro. *C. B. P.* 459. *Tourn. Inſt.* 589. *Boerh. Ind. A.* 2. 209. *Morus.* Offic. Ger. 1325. Emac. 1507. *Morus nigra.* J. B. 1. 118. Raii Hiſt. 2. 1429. Park. Parad. 596. *Morus nigra vulgaris.* Park. Theat. 1491. THE MULBERRY-TREE.

The Mulberry-tree grows to be a large tall Tree, with a brown rugged Bark, ſhooting out its Leaves very late in the Spring, when the Winter's Froſts are paſt, which are large, and ſomewhat rough or ſcabrous, broad at the Baſe, and growing narrower towards the End, ſerrated about the Edges, and ſet on ſhort Foot-ſtalks. The Flowers ſtick cloſe to the Branches, each compoſed of four ſmall Leaves, growing in Cluſters. The Fruit is oblong, conſiſting of a great Number of Acini, ſet together in a round Form, of a deep-purple Juice; it grows in Gardens, and the Fruit is ripe in *Auguſt* and *September*. The Bark of the Root, and the Fruit, are uſed.

The Bark of the Root is ſomewhat warm and dry, opens Obſtructions of the Liver and Spleen, and helps the Jaundice. The unripe Fruit is drying and binding, uſeful in all Kinds of Fluxes, and very good for Inflammations in the Mouth and Throat. The ripe Fruit is cooling, and ſomewhat looſening; good to allay the Heat of burning Fevers; it is grateful to the Stomach, and creates an Appetite.

Officinal Preparations are the *Syrupus* and *Mel Mororum. Miller's Bot. Off.*

The Fruit of the black Mulberry-tree, called, in the Shops, *Mora Celſi*, while immature, is cooling, dry, and very aſtringent; and is, therefore, proper in Diarrhœas, Dyſenteries, the Cœliac Paſſion, an immoderate Flux of the Menſes, and Spitting of Blood; outwardly they are ſerviceable in Inflammations and Ulcers of the Mouth and Fauces.

The ripe Fruit of the Mulberry-tree, taken in the Beginning of a Repaſt, and before other Food, according to *Dioſcorides*, looſens the Belly; but, eaten laſt, after other Food, is eaſily corrupted, and hurtful to the Stomach. *Pliny* tells us, and what he ſays, is confirmed by Experience, that it is cooling, quenches Thirſt, and excites an Appetite; if it be eaten laſt, it ſwells upon the Stomach, which is, alſo, the Opinion of *Galen*. *Horace*, on the contrary, ſays,

——Ille ſalubres
Æſtates peraget, nigris qui Prandia Moris
Finiet, ante gravem quæ legerat Arbore Solem.

"The Way to paſs the Summer in Health is, to finiſh your "Meals with black Mulberries, gathered before the Heat of the "Day." Others, alſo, will have Mulberries to be grateful and friendly to the Stomach. *Galen* conjectures, that Mulberries participate, in a very ſmall meaſure, of that Property which Cathartics poſſeſs in an high Degree; and that they are hereby qualified not only for an eaſy Secretion, but are, alſo, diſpoſed to corrupt, if retained long in the Belly; and he ſuppoſes the whole Tree, in all its Parts, to be endued with a kind of Virtue compounded of a reſtringent and cathartic Quality. In the Bark of the Root, however, it is certain, that a purgative Quality, with a ſort of Bitterneſs, prevails ſo far as to qualify it for deſtroying the broad Worm.

The Juice of ripe Mulberries is very ſerviceable in ſtomatic Medicines, that is, ſuch as are adapted to the Mouth and Fauces. *Plin. Lib.* 23. *Cap.* 7. gives the following Preſcription of a Medicine of this Kind, which he calls *Panchreſtos Stomatice*, and, alſo *Arteriace*:

Take of Juice of Mulberries, three Pints; evaporate it gently, to the Conſiſtence of Honey; after which take of dry Omphacium, two Drams; of Myrrh and Saffron, each one Dram: Bruiſe them, and mix them together for Decoction.

There is not prepared a more agreeable Remedy for the Mouth, Aſpera Arteria, Uvula, or Stomach; other Ways of preparing a *Stomatice* are preſcribed in the ſame Chapter. A Decoction of the Leaves, either by themſelves, or with the Bark, uſed as a Gargariſm, eaſes the Tooth-ach. *Schroder.* The ſame bruiſed in Oil, or Vinegar, according to *Schwenchf.* and applied, cure Ambuſtions. *Dioſcorides.*

The Syrup of Mulberries, by its grateful Acidity, is very uſeful in Fevers, to extinguiſh Thirſt, and allay the burning Heat; it is of no leſs Service in Inflammations, Puſtules, or Ulcerations of the Mouth, Palate, Uvula, Tonſils, Throat, and Fauces. The Wood is ſerviceable in Works which require Bending, and is of a ſolid Subſtance, and no leſs durable in Water than Oak: It is thought to be eternal, as we are told by *Theophraſtus*, and to grow black with Age, like to *Lotus*. *Raii H. P.*

The

The Fruit, according to *Bartholine*, is very good for the Scurvy, and reckoned among Cardiacs. The *Diamorum* is very proper to be taken in Caſes where a Putrefaction, and Alcali, predominate. *Hiſt. Plant. adſcript. Boerhaav.*

2. Morus, Fructu albo. *C. B. P.* 459. *Morus alba.* J. B. 1. 119. *Morus candida.* Dod.

3. Morus, Fructu albo; humilior; profundius laciniata. *C. B. P.* 459.

For the manner of preparing the *Diamoron*, ſee MEL.

MORXI. The Name of a peſtilential Diſtemper, very common in *Malabar*, and other Parts of the *Eaſt Indies*.

MOSA. A ſort of Aliment very common in *Germany*, among the Country People, made of the Meal of Wheat, or Spelt, and Milk; and like what we call thicken'd Milk. It is eſteem'd a great Error to feed Children too much with this.

MOSCH. According to *Caſtellus*, a ſort of roriferous Veſſels, ſaid to be diſcovered by *Bilſius*, in the Kidneys.

MOSCHATA NUX. See NUX MOSCHATA.

MOSCHATELLINA.

The Characters are;

The End of the Pedicle unfolds itſelf into a three-lob'd Calyx, expanded like a Star, and not caducous. The Ovary grows out of the Placenta, ſeated in the Centre of the Pedicle, within the Calyx, and has on its Sides five Tubes; the fifth Ovary on the Apex has, ſometimes, four Tubes, and appears quadricapſular, containing four Seeds. The Flowers grow to the Sides of the Calyx, are quinquefid, and furniſhed with ten Stamina; the fifth Flower, elevated above the reſt, is quadrifid, and furniſhed with eight Stamina. The Flowers and Ovaries, which are always five in Number, are compacted together into the Figure of a Cube, deficient only on its loweſt Side.

Boerhaave mentions one Sort of this Plant; which is,

Moſchatellina foliis Fumariæ bulboſæ; de quâ Cordus. *J. B.* 3. 206. *Ranunculus nemoroſus, Moſchatellina dictus.* C. B. P. 178. M. H. 2. 438. *Ranunculus; minimus Septemtrionalium, herbido, muſcoſo flore, & Muſcatella* Cordi. Lob. Ic. 674. *Ariſtolochiæ rotundæ concavæ ſimilis herbula, Tragi Radix cava minima.* Tab. *Denticulata.* Lugd. 1296. *Boerh. Ind. alt. Plant.*

It is called *Moſchatellina*, as a Diminutive from *Moſchus*, Musk; that is to ſay, a ſmall Plant ſmelling like Musk. The Root of the Plant is reſolvent, vulnerary, and detergent. *Hiſt. Plant. adſcript. Boerhaav.*

MOSCHELÆUM. A ſort of aromatic compound Oil, in which Musk is an Ingredient.

MOSCHOSITERON, μοσχοσίτερον. This Word occurs in *N. Myrepſus, Sect.* 3. *Cap.* 92. *Fuchſius* interprets it Fenugreek.

MOSCHUS. The Animal which produces Musk, is thus diſtinguiſhed.

ANIMAL MOSCHIFERUM. Offic. Raii Synop. A. 127. *Moſchius ſive Moſchi Capreolus.* Schrod. 5. 301. *Capra Moſchus.* Aldrov. de Quad. Biſul. 743. Jonſ. de Quad. 55. *Capreolus Moſchi.* Ejuſd. Tab. 29. Geſn. de Quad. 695. *Capra Moſch, aliis Cervus odoratus.* Charlt. Exer. 10. THE MUSK ANIMAL.

This Animal ſeems neither to be of the Goat nor of the Hart-kind. The only Part of it in Uſe is Musk, which is a grumous, pinguious, and unctuous Subſtance, not unlike grumous Blood, of a blackiſh ruſty Colour, of a ſomewhat acrid and bitter Taſte, of a fragrant grateful Smell, and found in Follicules, ſituated near the Navel of the Animal: It is of an heating, drying, attenuating, diſcutient, cordial, alexipharmic, and, conſequently, cephalic Quality: It is principally uſed in Palpitations, and all other Diſorders of the Heart, becauſe it cheriſhes, rouſes, and refreſhes the vital Spirits. For the ſame Reaſon it is, alſo, uſed in Diſorders of the Head and Nerves, produced either by cold or groſs Humours, as, alſo, in Colics. Externally it deterges Specks of the Eyes, dries up moiſt Defluxions, proves a Stimulus to Venery, and reſtores the diminiſhed Hearing.

The Generation of Musk has laid a Foundation for no ſmall Diſputes among Authors; ſome affirming one, and ſome another thing; for ſome maintain it to be a purulent and excrementitious Humour, concocted and collected in the Follicule, near the Navel of the Animal: But, according to them, the Animal itſelf, of a ſalacious and laſcivious Diſpoſition, by rubbing its Belly againſt Stones and Trees, tears this Follicule, and, by that means, diſcharges the Humour contained in it, which, being coagulated by the Air and Sun, is concreted into that Subſtance we call Musk. Others maintain, that the Musk is not evacuated by any Dilaceration of the Follicule, but flows ſpontaneouſly through an excretory Duct, allotted for that Purpoſe. Others affirm, that Musk is only the Follicule of the Animal, cut out after it is killed: And this Opinion is confirmed by our Merchants, who, for the moſt part, buy the Musk contained in its natural Follicule. Others are of Opinion, that Musk is Blood extravaſated, and collected into Apoſtems, by beating the Animal till Tumors and Abſceſſes are raiſed, which being, as it were, by a Ligature conſtricted into Follicules, are afterwards cut out, and afford the Musk. Others are of Opinion, that all the Parts of the Animal afford Musk. In my Opinion, Musk ſeems to be an excrementitious Blood, which has undergone various Concoctions and Alterations in its proper Follicule, and is either naturally ſecreted, and collected by human Induſtry, or contained in the Follicule of the Animal, when killed at a proper Seaſon: But the crafty and fraudulent Merchants add the Blood, Skins, and other Parts of the Animal to the Musk; and with this Mixture they ſtuff Bags, made of the Skin, and ſell them for true and genuine Musk-follicules: But this Piece of Fraud is eaſily diſcover'd by the Skilful, and the Cautious; for that Musk, which, when burned, evaporates, is thought to be genuine; but if, when burned, there remains ſomething like a Coal, it is adulterated. The Curious may, for their farther Satisfaction, conſult *Schrockii Hiſtoria Moſchi. Dale.*

MOSCOLEA. The ſame as MOSCHELÆUM.

MOSQUITÆ.

Bontius, in his Treatiſe *de Medicina Indorum*, informs us, that the Eruptions which *Celſus* calls *Papulæ*, and *Pliny*, *Sudamina*, are, in the *Indies*, as common as the Bites of that Species of Inſect which the *Portugueſe* call *Moſqueta:* Theſe Papulæ are of a rediſh Colour, ſomewhat rough, thrown out upon the Skin by Sweat, for the moſt part poſſeſſing the whole Body, and, at their firſt Appearance, accompanied with an intolerable Itching, and a perpetual Deſire of ſcratching. Strangers, on their firſt Arrival, are more expoſed to theſe Eruptions, as, alſo, to the Bites of the Muſquetas, than thoſe who have reſided in the Country for ſome time; ſo that, by way of Ridicule, a Perſon labouring under any of theſe Misfortunes is called *Organ Baron*, which, in their Language, ſignifies a Man lately arrived: They, alſo, by way of Reproach, tell him, That the Muſquetas and Papulæ demand a kind of Tribute, or Tax, for that Milk and Butter which he has conſumed; for thoſe who have reſided in that Country for a long time, give themſelves the pompous Name of *Orang Lamme*, that is, Veterans. The Papulæ, when expelled by Nature, are only to be ranked among the cutaneous Diſorders. But when either theſe, or the Bites of the Muſquetas, are raſhly treated, or the Skin torn off by the Nails, they often produce malignant Ulcers, not to be cured without the greateſt Difficulty.

Sic neglecta ſolent incendia ſumere vires.

In order, therefore, to remove this troubleſome Itching, I cauſe Water to be mixed with Vinegar, adding a proper Quantity of Nitre, or Sal Prunellæ; and the Body is to be fomented with a Linen Cloth, dipt in this Liquor; or, if a more acrid Preparation is wanted, recent expreſſed Juice of Lemons is to be added: Though, by this means, an intenſe Pain is at firſt produced, yet it ſoon decreaſes ſo far, as to be more tolerable than the troubleſome Itching. I, alſo, adviſe Phyſicians and Surgeons by no means to preſcribe Purgatives, however mild, in the Papillæ, leſt the bilious and acrid Matter, being, by their means, convey'd to the Inteſtines, ſhould bring on a Dyſentery; but, rather, either to leave the Cure to Nature, or aſſiſt the Excretion of the peccant Matter by Sudorifics; for, through the Careleſneſs or Ignorance of ſome, I have often ſeen ſuch Misfortunes happen.

MOSYLETICUS BLASTUS. A Name for the Species of Caſia, the third in Goodneſs. *Oribaſius, Med. Collect. Lib.* 12.

MOSYLLON, μόσυλλον. An Epithet for the choiceſt Cinnamon in *Galen. Lib. de Theriac. ad Piſon. Cap.* 12.

MOTACILLA. Offic. Schrod. 5. 321. Mer. Pin. 178. *Motacilla alba.* Aldrov. Ornith. 2. 726. Geſn. de Avib. 557. Jonſ. de Avib. 86. Charlt. Exer. 96. Schw. A. 386. Raii Ornith. 237. Ejuſd. Synop. A. 75. Will. Ornith. 171. *Cnipologus.* Bellon. des Oyſe. 356. THE WATER-WAGTAIL.

This Bird is celebrated for its Virtue in waſting the Stone. *Dale.*

MOTELLA. Aldrovandi. *Lota Gallorum.* Jonſt. A Fiſh much like a Lamprey, but ſomewhat larger, and more round, furniſhed with ſmall rediſh Scales, and marked with black Spots. *Lemery* informs us, that the Spawn injures the Stomach, and excites Gripes; and that the Fat is emollient, and good to remove Specks of the Skin.

MOTOS, μοτός. Lint.

MOUL-ELAVOU, *ſive Arbor lanigera ſpinoſa*, H. M. *Goſſipium arboreum Caule ſpinoſo*, C. B. is a fine, tall, lanigerous, or Cotton-bearing Tree, ſometimes no leſs than fifty Feet in Height, and eighteen in Compaſs, in the Stem or Trunk.

The Down, or Cotton, ſerves to ſtuff Beds and Pillows. The Bark of the Tree pulverized, and with the Juice of Lemons reduced into the Form of a Liniment, mitigates all Kinds of Inflammations, and conſolidates Fractures of the Bones: Mixed with burnt Wine of the *Indian* Nut, or Cocoa, it makes a Liniment for the Herpes. Of the Bark of the Root is prepared an excellent Emetic. The ſweet Liquor collected in the Boſom of the Flower, exhibited with the Leaves of the Tamarind, potently evacuates watery Humours by Stool and Urine. *Raii Hiſt. Plant.*

Moul-ila, ſeu Moul Elavou. H. M. The *Indian* Lemon, with umbellated Flowers, and a ſmall Fruit. The Fruit is round, cover'd with a dark-green, thick, and rugged Rind, of the Colour of Citron-peel, and of the ſame Taſte, only hotter, and more acrimonious, and incloſing an acid juicy Pulp; for which Reaſon

ſon it ſerves to boil with Food, inſtead of Lemons and Pepper, and is, alſo, thought proper to be preſerved with Sugar, or Honey, as a Strengthener of the Stomach, a Promoter of Digeſtion, and Deſtroyer of Worms; it is, alſo, pickled in Brine and Vinegar; and with an Addition of Garlick, Muſtard, and Ginger, enters the Compoſition of the *Atſjar*. *Raii Hiſt. Plant.*

MOULLAVA, H. M. is a ſiliquous *Indian* Plant, with a yellow pentapetalous Flower, and a ſmooth Pod, containing generally four Seeds: It grows to the Height of eight or nine Feet, and delights in ſandy Places; it is an Evergreen, flouriſhes moſt in a wintry Seaſon, and the Fruit is ripe in *November* and *December*. It is of no medicinal Uſe but only to the *Pollias*, (ſo they call the Poor in thoſe Countries) who receive the Smoke of the Leaves up their Noſtrils, and ſo cure themſelves of the Head-ach and Vertigo. *Raii Hiſt. Plant.*

MOUROUVE. J. de Laet. Ind. Occid. *Lib.* 16. *Cap.* 11.

All we know of this Plant is, that it is not much different from a Plum-tree, bears a yellow Flower, and a Fruit like a Cherry, with a long Pedicle, a ſmall Stone, and a ſaffron-coloured and ſweet Pulp. *Raii Hiſt. Plant.*

MOXA. See ARTEMISIA CHINENSIS.

Moxa is a kind of downy Subſtance, taken from the Leaves of a ſort of *Indian* Mugwort, which is uſed by the *Indian* Nations, as ſomething of the ſame Kind was formerly employ'd by *Hippocrates*, and other antient Phyſicians, in cauterizing Parts afflicted with Pain. Some Moderns highly extolled this Operation, as the moſt effectual Remedy for curing, and even wholly extirpating, the Gout. For this Purpoſe,

Make a Cone of Lint, Tow, Moxa, or a certain Species of Agaric, about a Thumb's-breadth in Height, (ſee *Tab.* XXXIII. *Fig.* 12. at the Letters A and B) like thoſe uſed in a Fumigation: Stick the Baſis of the Cone on the affected Part, with Gum Arabic, or Gum Tragacanth, and fire its Point with a Candle. By theſe means the Cone will be gradually conſumed; the Part will be, by degrees, cauterized; and thence Pains in the Gout will frequently have ſome Remiſſion. If Pain is not removed by the firſt, a new Cone muſt be applied; and the Operation repeated, till the Pain ceaſes.

But, though this Proceſs was for ſome time highly commended in *Europe*, it is now entirely diſuſed, and not without Reaſon; for, beſides the acute Pain produced, it has often little or no Effect. Among the *Chineſe* and *Japoneſe*, however, this Operation and Acupuncture continue in the higheſt Eſteem. Theſe Cauterizations are, alſo, ſaid to be at preſent uſed by the *Arabians*. More may be ſeen on this Head in *Rhynius de Arthritite*, *Cleyerus in Medicina Sinica*, *Purman in Obſerv. Valentini polychreſt. exotic.* in *Kempfer's Amœnit. exotic.* and in his *Hiſtor. Japon. Nat.* and in a particular Diſſertation by Sir *William Temple*.

MUCAGO. Mucilage.

MUCHARUM. A barbarous Word, importing an Infuſion of Roſes, made with warm Water, or ſuch an Infuſion ſweeten'd with Sugar, and reduced to the Conſiſtence of a Syrup.

MUCILAGO. Mucilage. A Mucilage is any viſcid and glutinous Liquor; thus called, perhaps, from the Mucus of the Noſe, which it reſembles in Conſiſtence.

PREPARATION OF MUCILAGES.

For making this we muſt have four Veſſels, either of *Delft* Ware, or of common Earth, varniſhed. In one of theſe we muſt put a Dram and an half of white Gum Tragacanth, bruiſed: In another we muſt put half an Ounce of the Seeds of Pſyllium; in another, three Drams of Quince-ſeeds; and in the fourth, ſix Drams of the Root of Marſhmallows, well cleanſed, cut into ſmall Portions, and bruiſed. Upon the Gum Tragacanth we muſt pour two Ounces and an half of Strawberry-water; and as much of Betony-water: Then we muſt cover the Veſſel, and place it over hot Aſhes, for three or four Hours, or till the Gum is entirely melted, and incorporated with the Water: Then the Matter is to be paſſed through a proper Sierce, and is called the Mucilage of Gum Tragacanth.

MUCILAGE OF FLEAWORT.

On the Seeds of the Pſyllium we muſt pour three Ounces of Strawberry-water, and as much of Betony-water: Then we muſt cover the Veſſel, and allow the Matter to ſtand in Infuſion over warm Aſhes, for eight or ten Hours: Then we muſt boil the Infuſion gently, and ſtrain it by Expreſſion; and this is the Mucilage of Pſyllium.

MUCILAGE OF QUINCES.

On the Quince-ſeeds we muſt pour two Ounces and an half of Betony-water; and as much of that of Strawberries: Then we muſt cover the Veſſel, and leave the Matter in Infuſion, for eight or ten Hours: Then we are to heat the Infuſion, till it is almoſt ready to boil: Then it is to be ſtrained by Expreſſion; and this is the Mucilage of Quinces.

MUCILAGE OF THE ROOTS OF MARSHMALLOWS.

On the Marſhmallow-root pour Betony, and Strawberry-water, of each ſix Ounces: Cover the Veſſel, and leave the Matter in Infuſion, warm, for eight or nine Hours: Then boil to a Diminution of two Thirds; ſtrain the Decoction, expreſſing it ſtrongly: And this is the Mucilage of Marſhmallows. *Lemery Pharmac. Univerſelle.*

MUCILAGO, Mucilage, alſo, imports the Mucilage of the Joints. This Liquor, which principally ſerves to moiſten the Ligaments and Cartilages of the Articulations, is ſupplied by Glands, which are commonly ſituated in the Joint after ſuch a manner as to be gently preſſed, but not deſtroyed, by its Motion. By this means, when there is the greateſt Neceſſity for this Liquor, that is, when the moſt frequent Motions are performed, the greateſt Quantity of it muſt be ſeparated. Theſe Glands are ſoft and pappy, but not friable; they are moſtly of the conglomerate Kind, or a great Number of ſmall Glandules are wrapt up in one common Membrane. Their excretory Ducts are long, and hang looſe like ſo many Fringes, within the Articulation, which, by its Motion and Preſſure, will prevent Obſtructions in the Body of the Gland itſelf, or its Excretories, and will promote the Return of this Liquor, when fit to be taken up by the abſorbent Veſſels, which muſt be in the Joints as well as in the other Cavities of the Body; and, at the ſame time, the Preſſure on the excretory Ducts hinders a ſuperfluous Secretion, while the fimbriated Diſpoſition of theſe Excretories will not allow any of the ſecreted Liquor to be puſhed back again by theſe Canals towards the Glands, as *Cowper* has juſtly remarked. Beſides theſe congloremate Glands, we meet ſometimes with ſmall ſimple Folliculi, obſerv'd by *Morgagni*, which are full of Liquor.

Upon preſſing theſe Glands with the Finger, we can ſqueeze out of their Excretories a mucilaginous Liquor, which ſomewhat reſembles the White of an Egg, or Serum of the Blood, but is manifeſtly ſalt to the Taſte. It does not coagulate by Heat, as the Serum does, but turns, firſt, thinner, and, when evaporated, leaves only a thin ſalt Film. Different Salts have much the ſame Effect on it as the other Juices of our Body; for Acids coagulate it, and Alcalies attenuate it. The Quantity of this Mucilage, conſtantly ſupplied, muſt be very conſiderable, ſince we ſee what a plentiful troubleſome Diſcharge of Synovia follows a Wound or Ulcer of any Joint, of which Liquor the Mucilage is a conſiderable Part.

The Veſſels which ſupply Liquors for making the Secretion of this Mucilage, are to be ſeen without any Preparation; but, after a tolerable Injection of the Arteries, the Glands are cover'd with them.

In a ſound State we are not conſcious of any Senſibility in thoſe Glands; but, in ſome Caſes, which I have ſeen, when they inflame and ſuppurate, the moſt racking Pain is felt in them: A melancholy, though a ſure Proof of their Nerves.

Theſe mucilaginous Glands are commonly lodged in a cellular Subſtance, which is, alſo, to be obſerv'd in other Parts of the Bag formed by the Ligaments of the Articulation, and contains a pinguious Matter, that muſt neceſſarily be attenuated, and forced through the including Membranes into the Cavity of the Joint, by the Preſſure which it ſuffers from the moving Bones.

If, then, the Oil is conveyed from this cellular Subſtance, and if the attenuated Marrow paſſes from the Cancelli of the Bones by the large Pores, near their Extremities, or in their Cavities, and ſweats through the Cartilages there into the Articulations; which it may, when aſſiſted by the conſtant Heat and Action of the Body, more eaſily do, than when it eſcaped through the compact Subſtance of the Bones in a Skeleton; if, I ſay, this Oil is ſent to a Joint, and is incorporated with the Mucilage, and with the fine Lymph, that is conſtantly ouſing out at the ſmall Arteries diſtributed to the Ligaments, one of the fitteſt Liniments imaginable muſt be produced; for the Mucus, diluted by the Lymph, contributes greatly to its Lubricity, and the Oil preſerves it from hardening. How well ſuch a Mixture ſerves the Purpoſe it is deſigned for, *Boyle* tells us he experienced, in working his Air-pump; for the Sucker could be moved with much leſs Force after being moiſtened with Water and Oil, than when he uſed either one or other of theſe Liquors. And, I believe, every one, at firſt View, will allow the diluted Mucilage to be much preferable to ſimple Water. This Synovia, as this Liquor, compoſed of Oil and Mucilage, is commonly called, will, therefore, while in a ſound State, effectually preſerve all the Parts concerned in the Articulations ſoft and flexible, and will make them ſlide equally on each other, by which their mutual Detrition and Overheating may be prevented, in the manner daily practiſed in Coach and Cart-wheels, by beſmearing them with Greaſe and Tar. After this Liquor of the Articulations becomes too thin, and unſerviceable, by being conſtantly

ſtantly pounded, and rubbed between the Bones, it is reaſſumed into the Maſs of Blood, by the proper abſorbent Veſſels, which the Articulations have in common with all the other Cavities of the Body.

When the Synovia is not rubbed betwixt the Bones, it inſpiſſates; and, ſometimes, when the Head of a Bone has been long out of its Cavity, this Liquor fills up the Place of the Bone, and hinders its Reductions; or, if a Joint continues long unmov'd, the Synovia cements the Bones, and occaſions a true Anchyloſis. *Ambroſe Paré* ſays, he has frequently ſeen ſuch Caſes; and *Hildanus* gives a particular Example of it. If the Synovia becomes too acrid, it erodes the Cartilages and Bones, as frequently happens to thoſe who labour under the Lues Venerea, Scurvy, Scrophulæ, or Spina Ventoſa. If this Liquor is ſeparated in too ſmall a Quantity, the Joint, as *Galen* remarks, becomes ſtiff; and when, with Difficulty, it is moved, a crackling Noiſe is heard, as People advanced in Years frequently experience. This Sort of Diſeaſe *Aquapendente* very accurately deſcribes, and rationallly accounts for. If the Mucilage and Lymph are depoſited in too great a Quantity, and the abſorbent Veſſels do not their Office ſufficiently, they may occaſion a Dropſy of the Joints, which *Hildanus* has at large treated of. From this ſame Cauſe, alſo, the Ligaments are often ſo much relaxed, as to make the Conjunction of the Bones very weak: Thence ariſe the Luxations from an internal Cauſe, which are eaſily reduced, but difficultly cured; and, frequently, when ſuch a ſuperfluous Quantity of this Liquor is pent up, it becomes very acrid, and occaſions a great Train of bad Symptoms, ſuch as Swelling and Pain of the Joints, long ſinuous Ulcers and Fiſtulas, rotten Bones, Immobility of the Joints, Marcor and Atrophy of the whole Body, hectic Fevers, and ſeveral others. Moſt of theſe Symptoms from the diſeaſed Mucus of the Joints, *Hippocrates* very accurately deſcribes; and *Hildanus* gives the Hiſtories of a great many People labouring under them. *Monro's Oſteology.*

MUCOCARNEUS, in *M. Aurel. Severinus*, is an Epithet for a Tumor, or Abſceſs, which is partly fleſhy, and partly filled with a ſort of Mucus.

MUCOR is the ſame as Mucus.

MUCOSÆ GLANDULÆ are the Glands diſcovered by *Cowper*, in the Penis, commonly called *Cowper's Glands.*

MUCRO, in Anatomy, is the acute Point of the Heart.

MUCRONATUM OS, or, more properly, MUCRONATA CARTILAGO, is the Enſiform Cartilage.

MUCUITABA & MOCITAIBA *Braſilienſibus.* Marcgrav. *Pyriformis Braſiliana.*

The Name of a large Tree, not unlike a wild Pear-tree, to which I find no medicinal Virtues aſcribed.

MUCUNA GUACU. *Piſon.* The largeſt and moſt beautiful Species of Phaſeolus growing in *Braſil.* It grows on a Tree of the ſame Name. The Pod has a black Shell, almoſt as hard as a Stone, and covered with ſoft yellow Hair, is an Hand's-breadth long, and three Fingers-breadth wide. When broke open, it diſcovers three or four very beautiful globular Beans, divided by Interſtices of a ſcarlet or red Colour, round, ſmooth, and with a large Eye, which, being macerated in Water, are deprived of ſome Part of their noxious Quality; and, being prepared with *Tipioca de Mandihoca*, are eaten by the Natives, ſo that their poiſonous Quality does not ſeem ſo deeply implanted in them by Nature, as not to admit of proper Correctives; for though the interior Subſtance of the Bean, by its Acrimony, and biting Property, vellicating the Viſcera, excites great Perturbations in the Body, and purges violently by Stool and Vomiting, the cooling and demulcent medicinal Aliment, prepared of the *Tipioca*, ſerves as an Antidote, and is, therefore, preferable to other Things employed to correct it. *Raii Hiſt. Plant.*

MUCUS. That viſcid Fluid, which is ſecreted in the Membrana Pituitaria, and diſcharged from the Noſe upon blowing, is thus called.

MUGIL. Offic. Raii Ichth. 274. Ejuſd. Synop. Piſc. 84. Aldrov. de Piſc. Salv. de Aquat. 75. Jonſ. de Piſc. 73. Charlt. de Piſc. 32. *Cephalus.* Rondel. de Piſc. 1. 260. *Cephalus, ſeu Mugil.* Bellon. de Aquat. 210. *Cephalus Rondeletii.* Geſn. de Aquat. 349. THE MULLET.

It is taken in the Sea; the Fleſh is uſed in the Kitchen, and the Part ſerviceable in Medicine is the BOTARGUM; which ſee.

MUGO. A Name for the Mountain-pine.

MUIVA *Braſilienſibus.* Marcgr. A pomiferous Tree of *Braſil*, bearing a round Fruit, with a ſoft Pulp, and a Multitude of very ſmall Acini, or Stones. The Natives care not to eat the Fruit, but leave it to be devoured by the Birds; and I find no medicinal Virtues aſcribed to any Part thereof. *Raii Hiſt. Plant.*

MULÆ. Puſtules contracted either by Heat or Cold.

MULLA. A Name for ſeveral Species of Jeſſamy, one of which is the *Nulla Mulla*, or *Sambac*; for which ſee JASMINUM. Another is the

Hudda Mulla. H. M. *Geſſeminum, vel Jaſminum Catalaunicum multiplex.* Park. The Leaves, bruiſed, and fried in Oil, and applied, cure the Bite of a mad Dog. The Root, boiled with Calamus aromaticus, in Water of Rice, reſiſts the Poiſon of Serpents. A third Species is

Tsjeni Mulla. H. M. *Jaſminum Indicum flore albo odoratiſſimo.* A fourth,

Tsjiregam Mulla. H. M. *Jaſminum Indicum, flore polypetalo exalbido, fructu minori.* Of the Leaves of this Species, boiled in Oil, is prepared a Balſam, which, the Head being anointed with it, removes all Affections of the Eyes, and ſtrengthens the Sight. The Powder thereof, mixed with Fat and Saffron, cures Itchings of the Skin, being anointed therewith. A fifth Species is the

Catu Pitsjegam Mulla. H. M. *Jaſminum Indicum, flore polypetalo, candido, ovis rufeſcentibus.* A ſixth is the

Katu Tsjregam Mulla. H. M. *Jaſminum Indicum, flore polypetalo, candidiſſimo, fructu majore.* The Leaves, boiled in Oil, cure Diſeaſes of the Eyes. The Root, exhibited with Calamus aromaticus, is an excellent Remedy for the Bites all Kinds of Serpents. The laſt Species is the

Katu Mulla. H. M. *Jaſminum Indicum, flore pentapetalo candidiſſimo, fructu Tsjeregam Mulla.* The Juice of the Leaves is of Service in boiling of Oil, and of no other Uſe. *Raii Hiſt. Plant.*

MULLUS. Offic. Bellon. de Aquat. 276. Schonef. Ichth. 47. Raii Ichth. 285. Ejuſd. Synop. Piſc. 90. *Mullus minor.* Salv. de Aquat. 236. *Mullus Geſneri.* Aldrov. de Piſc. 131. *Mullus Barbatus.* Rondel. de Piſc. 1. 290. Jonſ. de Piſc. 39. *Mullus Barbatus Rondeletii.* Geſn. de Aquat. 565. *Mullus Barbatus minor.* Charlt. de Piſc. 18. THE LESSER MULLET.

This Fiſh, frequently eaten, is thought to procure Dimneſs of Sight; being cut open, and apply'd raw, it cures the Bites of the Sea-dragon, the Scorpion, and the Spider. *Dioſcorides, Lib. 2. Cap. 24.*

MULSUM, generally, is us'd to expreſs Hydromel; but ſometimes imports Wine mix'd with Honey.

MULTIPEDÆ, the ſame as MILLEPEDES.

MULTISILIQUOUS Plants are ſuch as have, after each Flower, many diſtinct, long, ſlender, and, many times, crooked Caſes, or Siliquæ, in which their Seed is contain'd; and which, when they ripen, open of themſelves, and let the Seeds drop. Of this Kind is the Bear's-foot, Columbines, common Houſleek, Navelwort, Orpine, and the like.

MULUS. Offic. Schrod. 5. 302. Aldrov. de Quad. 358. Geſn. de Quad. 702. Charlt. Exer. 4. Mer. Pin. 166 Jonſ. de Quad. 15. Schw. Quad. 62. Raii Synop. A. 64. THE MULE.

This is an Animal got by an Aſs upon a Mare. The Hoof, Urine, and Dung, are us'd in Medicine. The Hoof, us'd as a Suffumigation, is ſaid to check too profuſe menſtrual Diſcharges; burnt and taken internally, it is reported to cauſe Barrenneſs, and in an Ointment, to cure an *Alopecia.* The Urine, together with its Sediment, is recommended as a Cure for Corns. The Dung ſtops Hæmorrhages of the Womb, and is good for a Dyſentery, and Pains of the Spleen. *Dale* from *Schroder.*

MUMIA. *Mummy.* See AMBRA.

There are two kinds of Mummy; the firſt of which has its Original from human Carcaſes, dry'd by the Sun and Sands in the Deſarts of *Africa*, ſuch as thoſe of *Zara, Libya*, &c. where the Winds ſometimes bury whole Caravans in the Sands. Theſe Bodies, by drying, become of the Conſiſtence of Horn, and very light. Theſe are called white Mummies, but are not us'd in Medicine. The ſecond Sort are the embalmed Bodies found in *Egypt*, which are very rare, and ſeldom to be met with among the Druggiſts; in place of which they ſell us Parts of Bodies embalmed with Myrrh, Aloes, and Incenſe, *&c.* by the *Jews.* This Mummy is reckoned a good Reſolvent of coagulated Blood after Falls or Blows, and a good Antiſeptic; acting not only by its bituminous and balſamic Parts, but alſo, by the volatile Salts of the Carcaſe, from which it is made. By diſſolving it in Spirit of Wine, we eaſily obtain a Tincture which contains its balſamic Qualities. *Geoffroy.*

But Mumia has been apply'd by *Paracelſus, Helmont*, and the Chymiſts, to other things, both real, and imaginary. Thus *Mumia Medulla* is the Marrow of the Bones; *Mumia Elementorum* is defined the Balſam of the external Elements, and *Mumia transmarina* is *Manna.* *Mumia*, alſo, imports a Water collected in a Phial from the Breath of a Man received therein, after waſhing his Mouth with Water. *Mumia* has, farther, a very ſingular Signification, being deemed, An extremely ſubtile, ſpirituous, and ætherial Subſtance, innate in every Body, and remaining therein, in ſome meaſure, after Death, and capable of correcting its own morbid Diſpoſition, and that of other Bodies; and of preſerving and confirming a ſound State.

MUNDIFICATIO. Purification, or Depuration.

MUNDIFICATIVA. Cleanſing, purifying, or deterging Medicines.

The *Mundificativum ex Apio* is deſcrib'd under the Article APIUM.

The *Mundificativum Paracelſi* is thus directed.

Take

Take of Turpentine and Honey, each half a Pound, and the Yolks of four Eggs: Boil theſe to the Conſiſtence of an Ointment, adding to every Ounce, a Dram of red Precipitate of Mercury.

MUNDUBI *Braſilienſibus*. Marggr. *Aracus ὀτόγυαδ, Americanus*. Park. A Species of *Indian Aracus*; the Seeds of which, eaten in too large Quantities, are ſaid to excite a Pain in the Head.

MUNDUY GUACU. A Name for the *Ricinoides*; *Americana*; *folio Goſſypii*.

MUNGO. A Name for the PHASEOLUS, OCTOCAULIS.

MUNTINGIA.

The Characters are;

It hath a Roſe-ſhap'd Flower, conſiſting of ſeveral Leaves, which are placed in a circular Order, from whoſe Cup ariſes the Pointal, which afterwards becomes a globular, ſoft, fleſhy, umbilicated Fruit, in which are contained many ſmall Seeds.

Miller mentions three Sorts of this Plant; which are,

1. Muntingia folio ſericeo, molli fructu majori. *Plum. Nov. Gen.*

2. Muntingia folio Ulmi aſpero, fructu minimo glomerato. *Plum. Nov. Gen.*

3. Muntingia folio Corni, fructu minore. *Plum. Nov. Gen.*

Theſe Plants, all of them, grow in *Jamaica*, and ſeveral other Parts of *America*. They were diſcovered by Father *Plumier*, who gave them the Name from Dr. *Muntingius*, who was Profeſſor of Botany, at *Groningen* in *Holland*, ſo that we have no *Engliſh* Name for them. *Miller's Dictionary, Vol.* 2.

MURÆNA. The Lamprey. See LAMPETRA.

MURALIS HERBA. Pellitory of the Wall. See PARIETARIA.

MURECI. The Name of a bacciferous Tree, which grows in *Braſil*, whoſe Fruit is like the Gooſeberry, of which the *Indians*, in *Braſil*, made cathartic Potions. *Raii Hiſt. Plant.*

MUREX. A Species of Purple Fiſh. The Fiſh is ſaid to be aperitive; and the Shell is us'd as an Abſorbent, when reduced to Powder.

MURIA, Brine, produces the ſame Effects with Salt, and is of an abſtergent Quality. It is ſucceſsfully uſed by way of Clyſter, in dyſenteric Patients, whoſe Inteſtines are corroded. It is, alſo, properly uſed in the ſame manner againſt ſciatic Pains of long Standing. In Fomentations, it may be uſed as a Succedaneum for Sea-water. *Dioſcorid. Lib* 5. *Cap.* 128.

Brine is uſed, in Surgery, as a Fomentation in Inflammations, and Gangrenes. Hence, an Acrimony in the Juices, reſembling that of Brine, is call'd a *Muriatic Acrimony*.

MURMENTUM. A Name for the MUS ALPINUS. *Rulandus*.

MURRHA. A Name for the Chalcedony.

MURUCUGIFERA ARBOR. De Laet. The Name of a very tall Tree, which grows in *Braſil*, like the wild Pear-tree.

MURUCUIA. A Name for the *Granadilla*; *pentaphyllos*; *flore cæruleo, magno*; and for the *Granadilla*; *Hiſpanis*; *flos Paſſionis Italis*.

MUS. Offic. Geſn. de Quad. Digit. 714. Charlt. Exer. 25. *Mus domeſticus*. Schrod. 5. 303. Mer. Pin. 167. Jonſ. de Quad. 115. *Mus domeſticus minor*. Aldrov. de Quad. Digit. 417. Schw. de Quad. 114. *Mus domeſticus vulgaris ſeu minor*. Raii Synop. A. 218. THE MOUSE.

The whole Animal, and its Dung, are uſed in Medicine. The Mouſe, cut up alive, and apply'd, draws out Splinters, Darts, and Arrows, and cures the Bites of Scorpions, extracting the Poiſon; the Aſhes cure the involuntary, or nocturnal Flux of Urine; the Dung purges Infants by Stool, is uſed in Clyſters, cures an Alopecia, abſterges Scurf from the Head, diminiſhes Stones in the Kidneys or Bladder, and removes a Condyloma, Verruca, Ficus, Mariſca, and the like Tumors affecting the Anus. *Dale* from *Schroder*.

MUS ALPINUS. Offic. Schrod. 5. 303. Aldrov. de Quad. Digit. 445. Geſn. de Quad. Digit. 743. Jonſ. de Quad. 117. *Mus Alpinus, Marmota*. Charlt. Exer. 19. *Mus Alpinus Plinii, Marmota Italis*. Raii Synop. A. 221. THE MOUNTAIN MOUSE.

It lives in the higheſt Parts of the *Alps*, and the Fat is uſed, being recommended in nervous Affections, and for Stiffneſs and Contractions of the Joints. *Schroder*.

MUS ARANEUS. Offic. Schrod. 5. 393. Raii Synop. A. 239. Aldrov. de Quad. Digit. 441. Charlt. Exer. 25. Geſn. de Quad. Digit. 747. Jonſ. de Quad. 116. Schw. Quad. 114. Mer. Pin. 167. THE ERD-SHREW, HARDY-SHREW, or SHREW-MOUSE.

It is an Inhabitant of the Fields, and has been found by Experience to be peculiarly ſerviceable in Affections of the Anus, being burnt, and apply'd with the Fat of a Gooſe. *Dale*.

MUS MAJOR. Offic. *Mus domeſticus major*. Schw. Quad. 115. *Mus major, ſive Sorex*. Mer. Pin. 167. Jonſ. de Quad. 115. Ald. de Quad. Digit. 417. *Mus major, Rattus*. Schrod. 5. 303. *Mus domeſticus major ſive Rattus*. Raii Synop. A. 217. *Sorex domeſticus*. Charlt. Exer. 25. THE RAT.

The Part in Uſe is the Dung; nine Pieces of Rat's-dung, ſwallowed, are accounted, by ſome of our good Women, a ſingular Remedy for a Suppreſſion of the Menſes. *Dale* from *Platerus*.

MUSA.

The Characters are;

The Root ſends forth Shoots, while the Stalk, after producing its Fruit, decays. The Stalk is like a Reed, without Branches, but running into very large Leaves, which are firſt convolved, as in the *Cannacorus*, and afterwards expanded in the Form of a Circle at the Top of the Stalk. The Flowers and Fruit are diſpos'd in Cluſters, and incloſed in Sheaths, as in the Palma, or Date-tree; the Flower is polypetalous, anomalous, and grows on the Apex of the Ovary. The Ovary is like that of a Cucumber, ſoft, tricapſular, eſculent, full of Seeds, and furniſhed with a long Tube, which has a globular Apex.

Boerhaave mentions two Species of this Tree; which are,

1. Muſa; fructu cucumerino, longiori. *Boerh. Ind. A.* 2. 171. *Muſa*. Offic. *Muſa Serapionis*. Ger. 1332. Emac. 1515. *Muſa Arbor*. J. B. 1. 148. Park. Theat. 1495. Raii Hiſt. 2. 1314. *Muza ex flore Sinenſi*. Jonſ. D. Icon. 470. *Mauz, Muſa*. Alpin. Ægypt. 78. *Palma humilis longis latiſque foliis*. C. B. P. 508. *Ficus Indica racemoſa, foliis & fructu ampliſſimis, Muſa Arabibus dicta*. Pluk. Almag. 145. *Bala*. Hort. Mal. 1. 17. Tab. 12. &c. *Banana*. Piſ. (Ed. 1648.) 75. THE PLANTAIN-TREE.

It grows in both *Indies*, and the Fruit is uſed, which is very nouriſhing, provokes Urine, and ſtimulates to Venery.

Muſa is the *Arabic* Name for this Plant, which by *Pliny*, as we ſuppoſe, is called *Pala*, from the Word *Bala*, which is the Name by which it is known to the *Malabarians* at this Day. Tho' all Botaniſts reckon it among Trees, it hardly deſerves the Name of a Shrub, much leſs of a Tree, ſince it has an annual Stalk. By *Oviedus*, and others, it is called *Platanus*; whence comes our *Engliſh* Name, the Plantain-tree; unleſs we ſhould rather think it was ſo called from its Reſemblance to Plantain, in its ribbed and fibrous Leaves.

The Fruit is eſteemed delicious Food; and, they ſay, was never known to create any Diſorder, tho' eaten never ſo freely. *Linſchooten* ſays, that it has a ſweet Taſte like Flour and Butter mixed together; and, therefore, may ſupply the Place of Bread and Milk-meats, with a ſimple kind of Diet, by which the human Body may be ſupported without any other Food.

As to its Virtues, *Alpinus* ſpeaks thus: The Fruit is of a ſoft, viſcid, fat, and ſweet Subſtance, extremely grateful to thoſe who uſe to eat it, and very nouriſhing, but burdenſome to the Stomach, difficult of Digeſtion, and generates a thick and viſcid Juice, which cauſes Obſtructions of the Viſcera, and eſpecially of the Liver; it is, however, beneficial in a Cough, and an Aſthma proceeding from Heat. The *Egyptians* uſe the Decoction with good Succeſs in a Cough, excited by a Diſtillation of hot Humours, and for Inflammations of the Pleura, Lungs and Kidneys, and for a Dyſury; it is, alſo, ſaid to ſtimulate to Venery, eaten raw or boiled.

The Authors of the *Hortus Malabaricus* tell us, that the Root bruiſed, and taken in Milk, cures the Vertigo; that the Water of it, mixed with Sugar, is drank with good Succeſs, for a burning Heat of the Kidneys, and for Pains excited by the Urine; and relieves thoſe whoſe Bodies have been infected with Quickſilver. The Pith of the Tree, or the whitiſh medullary Subſtance, which bears the Fruit, being bruiſed, and taken inwardly with Honey, is good for Affections of the Eyes, as is alſo Butter, in which Slices of the Fruit have been fry'd.

It grows in all Parts of the *Eaſt* and *Weſt Indies*, and alſo in *Africa*. The *Ficus Indica* of *Linſchooten* I take to be only a Variety, not a Species, of the *Muſa*; for it appears to be the ſame with that deſcribed by the Authors of the *Hortus Malabaricus*, both from the Synonyma, and the Place where it grows; for the *Malabarians*, he ſays, calls it *Palan*, and thoſe of *Bengal*, *Quelli*, which are Names much like the *Bala* of the *Hortus Malabaricus*, and *Keli*. Among the Species, alſo, or Varieties, I find one, both in the *Hortus Malabaricus*, and in *Linſchooten*, called *Cadalin*.

The Leaves, which are an Ell long, and three Spans broad, or, according to *Lerius*, ſix Feet long and two broad, equal in Dimenſions to thoſe of the *Lapathum Aquaticum*, ſupply the *Indians* at *Goa* with much uſeful Furniture for their Houſes, and the *Turks* make uſe of them inſtead of Paper; a Shoot is often loaded with a hundred Plantains, cluſter'd together like Grapes; and the Branches, from whence they hang, often grow to ſuch a Bigneſs, that, when lopped off with the Fruit, they can hardly be carry'd upon a Pole between two Porters. The Plant bears Fruit all the Year, and ſupplies the *Indians* with Proviſion every Day. *Raii H. P.*

The Leaves of the *Eaſt Indian* Plantain-tree are ſometimes ſo large, that a Man may cover his whole Body with one of them, and are ſaid to be thoſe with which *Adam* and *Eve* cover'd their Nakedneſs; which ſeems more probable, than that they ſhould make uſe of the Leaves of the common Fig-tree for that Purpoſe, as repreſented by the Painters. The whole Stem or Trunk of the Plant conſiſts of Leaves placed one upon another,

another, almoſt like thoſe of the Palm-tree. *Hiſt. Plant. adſcript. Boerhaav.*

2. Muſa; caudice maculato; fructu recto, rotundo, breviore odorato. *Sloan.* 192. *Boerh. Ind. alt. Plant. Vol.* 2.

MUSADI. Sal Ammoniac.

MUSARIUM *Collyrium.* The Name of a *Collyrium* deſcrib'd by *Trallian, L.* 2. *C.* 10.

MUSCA. Offic. Schrod. 5. 344. Aldrov. de Inſect. 342. *Muſca carnaria vulgaris*, Raii Inſect. 270. *Muſca carnivora, in macellis uſitata.* Mer. Pin. 199. THE FLY.

There are various Species of Flies, but the common Sort are moſt generally us'd, and theſe prevent a Falling off of the Hairs. *Schrod.*

MUSCARI. *Muſk or Grape Hyacinth.*

The Characters are;

It hath a bulbous Root; the Leaves are long and narrow, the Flower is hermaphroditical, conſiſting of one Leaf, and ſhap'd like a Pitcher, and cut at Top into ſix Segments, which are reflex'd; the Ovary becomes a triangular Fruit, divided into three Cells, which are full of round Seeds.

Boerhaave mentions twelve Species of this Plant, none of which have any medicinal Virtues aſcrib'd to them, that I know of, except the firſt, which is the *Muſcari*; *obſoletiore flore, ex purpurâ virente*; for which ſee BULBUS VOMITORIUS.

MUSCATELLA. A Name for the MOSCHATELLINA.

MUSCERDA. Mouſe-dung. See MUS

MUSCIPETA. The Name of a ſmall Bird, remarkable for little beſides deſtroying Flies. 'Tis, however, ſaid to be aperitive and reſolvent.

MUSCIPULA. See LYCHNIS.

MUSCO-FUNGO. A Name for ſeveral ſorts of LYCHNIS.

MUSCOSÆ GLANDULÆ. Some of the conglobate Glands are thus call'd, to diſtinguiſh them from the conglomerate Glands, which are call'd *Glandulæ Vaſculoſæ. Caſtellus.*

MUSCULUS. A Muſcle.

All the Motions of the human Body, whether general or particular, whether natural or preternatural, are immediately performed by Organs which Anatomiſts name Muſcles; and theſe are found in all the moveable Parts of the Body. I do not here ſpeak of Motions cauſed merely by the Elaſticity of certain Parts, by certain Impulſes, or by the Force of Gravity.

The Muſcles, in general, are Bundles of Fibres of different Figures and Sizes, and, for the moſt part, conſiſting of two different Portions; one of which is, thick, ſoft, more or leſs red, and ſometimes pale, forming what is called the Body, fleſhy Subſtance, or Belly of the Muſcle. The other is thin and ſmall, of a cloſe Contexture, and very white, forming the Extremities, and other Parts termed by Anatomiſts, Tendons or Aponeuroſes. The fleſhy Portion is the principal and eſſential Part of the Muſcle, being never wanting; but the tendinous or aponeurotic Portion is in ſome Muſcles ſo very ſmall, as to be inviſible. Both Portions are covered by a particular Membrane.

The Antients, who compared a Muſcle to a Rat, or other Animal, flayed, divided it into the Head, Belly, and Tail; but the Moderns, finding this Compariſon very lame and faulty, have left off the Uſe of all theſe Terms, except that of Belly; and, inſtead of the other two, they uſe thoſe of Beginning, or Origin, and Inſertion. Some of the lateſt Authors think it moſt proper to call one End of the Muſcle, the fixed Point, or Fulcrum, the other the moveable Point.

All theſe Terms, whether old or new, tend to miſlead us, and that of Fulcrum is without Foundation. The beſt and moſt ſimple Diviſion of a Muſcle is into the Body or fleſhy Portion, which, in ſome Muſcles, may be termed the Belly, and the Extremities, whether tendinous, aponeurotic, or fleſhy.

The Fibres of which a Muſcle is made up, go by the general Name of moving Fibres; and each of them, as well as the whole Muſcle, is partly tendinous, and partly fleſhy. They are, for the moſt part, ranked in Faſciculi, in a lateral Situation, with reſpect to each other, and diſtinguiſhed by membranous, cellular, or adipoſe Septa, as by ſo many particular Vaginæ.

Theſe Fibres are connected to each other, and to the intermediate Septa, by a great Number of very ſmall, fine Filaments, the capillary Extremities of Arteries, Veins, and Nerves running over them, and they are incloſed in a thin, membranous, cellular Covering, called the proper Membrane of the Muſcle, being a Continuation of the Septa or Vaginæ already mentioned.

All theſe Septa or Vaginæ communicate with each other by a mutual and reciprocal Continuation of their cellulous Texture, and they are bound down tranſverſely by filamentous or fibrous Pellicles, which croſs them at ſmall Diſtances from one another, and lie nearly in the ſame Direction through the whole Body of the Muſcle. The ſame ſort of Fræna are obſervable between the moving Fibres, which connect them together, and appear to be, in ſome meaſure, nervous.

The particular Structure of each moving Fibre is not as yet ſufficiently known. They may all be divided into ſeveral ſmaller Fibrillæ; and the Subſtance of their fleſhy Portion is believed by ſome to be cellulous, and by ſome to be veſicular, and by others to be ſpongy or medullary. Some of the Antients imagined this Portion to be hollow, and that it contained a ſort of Pulp called by them Tomentum, more or leſs ſaturated with Blood.

When we examine a moving Figure through the beſt Microſcopes, both the fleſhy and tendinous Parts appear contorted, but the latter not ſo much as the former Having injected any coloured penetrating Liquor, we may, by the Help of an ordinary Microſcope, diſcover a very fine and cloſe vaſcular Net-work, which inſinuates itſelf between all the Fibres, covering or being twiſted round them, and likewiſe ſpread on the Septa.

The fleſhy Portion may be contracted or ſhortened, and relaxed or elongated. The tendinous Portion yields but very little, reſiſting any Force tending to prolong it, except it be ſo violent as to diſorder its Texture.

The Diſpoſition of the moving Fibres is different in different Muſcles, and their tendinous and fleſhy Portions do not always lie in the ſame ſtreight Line, but make oppoſite Angles with each other. In ſome Muſcles, the fleſhly Portion is not all of the ſame Length, in others it is nearly equal, but the Fibres unequally and gradually diſpoſed at the Sides of each other, forming all together an oblique Plane.

Some are diſpoſed like Radii, others form Planes more or leſs incurvated; and ſome form complete Circumferences, the two Extremities meeting and uniting together.

The tendinous Portions, being only the Supplement of the whole Length of the Muſcle, may be of equal or unequal Lengths, according to the Diſpoſition of their Inſertions. They may be very ſhort at one End of the Muſcle, and very long at the other. When the fleſhy Plane is partly oblique, they vary gradually in Length; and, when that Obliquity is reciprocal at both Ends, in form of a Lozenge, the tendinous Portions are alternately long and ſhort.

In ſome Muſcles each moving Fibre is nearly of the ſame Length with the Body or Belly of the Muſcle; in others the fleſhy Fibres are very ſhort, though the Body of the Muſcle formed by them be very long. In the firſt Kind, the Fibres run more or leſs ſtreight from one End to the other, and are never very numerous. In the ſecond, they are ſituated obliquely, and are conſequently in great Numbers; ſo that the Length of each Fibre is not always to be meaſured by that of the Body of the Muſcle to which it belongs.

Theſe different Portions of Fibres are not equally to be met with in all Muſcles. Some have two or more Tendons, ſome only one, but of different Lengths; others have none at all, or at leaſt none that can be perceived.

But there is no Muſcle without a fleſhy Portion, which alone being capable of Contraction is abſolutely neceſſary; whereas the Tendons in many Places are only Productions, by which the Muſcles are fixed to Parts at a Diſtance from them.

Many Muſcles are obſerved to be covered by an aponeurotic Expanſion of different Degrees of Strength and Size, which ſeems to ariſe from one or more of the neighbouring Tendons. In proportion as it is extended it grows thinner, and then loſes itſelf in the cellular Membrane, called formerly the common Membrane of the Muſcles.

There are likewiſe ſtrong ligamentary Membranes of another Kind, by which many Muſcles are covered, as by a Girth, and which may be termed broad or ligamentary Bands or Coverings. They are made up of ſeveral Planes of ſtrong white ſhining Fibres, croſſing each other; and they are ſtrongly fixed along one or more Bones, almoſt in the ſame manner as the interoſſeous Ligaments of the Fore-arm and Leg. They furniſh Septa or common Vaginæ to the Muſcles, which they cover, and likewiſe particular Vaginæ to the Tendons, thinner than thoſe of the fleſhy Portions.

Theſe common Bands and Vaginæ ſerve to gird and confine the Muſcles, and to keep them in their Places in great Efforts. They likewiſe, in ſome meaſure, ſupply the Place of Tendons, and multiply the Inſertions. The looſe Portions of theſe Membranes are lined on the Inſide with other very fine Membranes which are continually moiſtened by a mucilaginous Liquor, to preſerve the Muſcles and Tendons contiguous to them, from Friction.

Beſides theſe Bands and Septa, there are other ligamentary Fræna peculiar to the long Tendons, called by the Name of annular Ligaments; the general Deſcription of which ſee under LIGAMENTA.

The Difference of Muſcles is very conſiderable, and depends on many Circumſtances, the principal of which are the Size, Figure, Direction, Situation, Structure, Connection, and Uſe; and it is from theſe Differences that the Names of the greateſt Part of the Muſcles are taken. From their Size they are termed Great, Middle, Small, Long, Broad, Thin; from their Figure, Triangular, Scalenous, Square, Rhomboidal, Indented, Orbicular, Deltoide; from their Direction, Streight, Oblique, Tranſverſe; from their Situation, Superior, Inferior, External, Internal, Anterior, Poſterior, Right, and Left. Theſe four Differences, and the Names derived from them, are eaſily comprehended

hended; but what relates to the other three, requires a little further Explication,

As to their Structure, Muſcles are either ſimple, or compound. Simple Muſcles are thoſe whoſe fleſhy Fibres, or rather the fleſhy Portions of their moving Fibres, are all uniformly diſpoſed, and terminate in Tendons, lying either in a ſtraight, or an oblique Line, in the manner already explained.

Compound Muſcles are thoſe whoſe fleſhy Fibres are diſpos'd obliquely, in ſeveral particular Ranks, repreſenting the ſame Number of ſimple Muſcles, with their Fibres lying in oppoſite Directions. In proportion to the Number of theſe Ranks, or Series, the Muſcle is ſaid to be more or leſs compounded.

When the compound Muſcle is made up of two ſimple Muſcles only, theſe are ſo diſpoſed as to repreſent a Feather, and the compound Muſcle is from thence termed Penniform. In ſome of theſe Muſcles one of the Tendons appears to be ſlit or divided, in order to contain the fleſhy Portion between its two Parts, while the other runs through the Body of the Muſcle, diminiſhing gradually in Size as it advances, in the ſame manner as we ſee in a Feather. In others, there is only one middle Tendon between the Series of fleſhy Fibres, which are, by their other Extremity, fixed to other Parts. In more compound Muſcles, the Tendons at one Extremity may all unite together, while thoſe at the other remain divided.

But there are ſtill other Kinds of compound Muſcles. Some are made up of two, placed Endwiſe, and joined together by a common Tendon; ſo that this Tendon, the two Muſcles and the two Tendons at their Extremities, lie all in a Line, and form the whole Length or Extent of the compound Muſcle, which is termed Digaſtricus, or Biventris; and, if three Muſcles be thus joined, the Compound is called Trigaſtricus.

Some are made up of two Muſcles, more or leſs, in a lateral Situation with reſpect to each other, and united at one Extremity; others are made up of three or four Muſcles, ſituated in the ſame manner; and, if they are united to that Extremity which the Antients call the Head of the Muſcle, they are call'd Bicipites, Tricipites, *&c.* according to the Number of theſe Heads; but, if they are joined at the other Extremity, they are called Bicornes, Tricornes, *&c.*

The Muſcles are fixed, by their Extremities, to different Parts, and in different Places, of the human Body. The greateſt Part of them are inſerted in Bones alone. Some are fixed partly to Bones, and partly to Cartilages, as thoſe of the Ear and Noſe; ſome partly to Bones, and partly to the Integuments, as ſeveral Muſcles of the Face, which may, therefore, be termed Semicutaneous, in Imitation of thoſe in Brutes, which, being inſerted in the Integuments alone, are from thence term'd Cutaneous. In ſome the Fibres make an entire Circle, without terminating any-where by their Extremities. Of this Kind are ſeveral of thoſe called Sphincters, to which may be added the Heart, Stomach, and Inteſtines. All the Muſcles have, likewiſe, a ſort of Connection with the neighbouring Parts; but this is only lateral by means of Membranes.

The Names taken from the Connections and Inſertions of Muſcles are generally of two Kinds; one Common, and referred to ſome conſiderable Part of the Body, as when we ſay, the Muſcles of the Head, of the Thorax, Abdomen, Arm, Leg, Eye, Lips, and the like; the other Proper, ſpecifying more particularly the Inſertion of each Muſcle, as the Maſtoideus, Sterno-maſtoideus, Coraco-brachialis, Anconeus, Peroneus, and the like. Some Names have no Relation to the Inſertions, as thoſe of Ulnaris and Radialis, which are given to Muſcles which lie upon the Ulna and Radius, without being inſerted in either Bone.

The Names of the firſt Kind relate more to the Uſes of Muſcles, than to their Inſertions; and are, for the moſt part, ill founded, and ready to miſlead us; the Names of the ſecond Kind are inſtructive; and thoſe of the third are tolerable.

The general Uſe of the Muſcles is to move all the Parts of the Body, whether hard, ſoft, or fluid. Moſt of the hard and ſoft Parts are moved by theſe Powers being fixed to them; and they move the reſt, without any ſuch Inſertion.

The Muſcles, fixed by both Extremities to hard Parts reciprocally moveable, may accordingly move either Part: Thus the Muſcles inſerted by one Extremity to the Os Humeri, and by the other to the Ulna, may move the Ulna upon the Os Humeri, and the Os Humeri upon the Ulna.

Muſcles, fixed by one Extremity to hard Parts, and, by the other, to ſoft Parts, cannot perform theſe reciprocal Motions; becauſe, in this Caſe, the hard Parts muſt remain immoveable, the ſoft Parts only being moved, as in the Muſcles of the Ball of the Eye, and thoſe of the Lips.

The Fluids, of whatever Nature or Conſiſtence they be, are moved, in ſome Caſes, by being immediately puſhed or projected by the Muſcles, as we ſee in the Heart; in others, by the Canals being preſſed upon, as in the oblique and tranſverſe Muſcles of the Abdomen. And there are other Muſcles, which ſtop or retard the Motion of the Fluids at one time, and facilitate or accelerate it at another, as all the Sphincters.

The Uſe of each Muſcle in particular is confined to the Motion of one or more moveable Parts. Some Parts require a certain Number of Muſcles to move them, whereof ſome act one Way, and ſome another. Several Muſcles, for Inſtance, move the Os Humeri upon the Scapula; and of theſe ſome raiſe, others depreſs it; ſome turn it forward, ſome backward, and others round upon its Axis. In like manner, the fore Arm is moved upon the Os Humeri by certain Muſcles, whereof ſome extend, and others bend it.

The general Enumeration of the Muſcles of the human Body, which is commonly made, is founded on their ſuppoſed particular Uſes. We meet with Liſts of the Muſcles of the Head, of the Thorax, Abdomen, Extremities, Eye, Noſe, Lips, and the like; and to the different Muſcles, ſaid to belong to each Part, Names are given, ſpecifying ſome determinate Uſe, ſuch as Raiſers, Depreſſors, Adductors, Abductors, Flexors, Extenſors, *&c.*

This Method of diſtributing and naming Muſcles is very well ſuited to the Memory, and may be retained for thoſe which are not entirely, or are not at all, fixed to Bones. But, with reſpect to thoſe Muſcles which are inſerted in Bones alone, this Way of talking is very capable of miſleading Beginners, of begetting falſe Ideas, of obſtructing the Progreſs of Knowledge, and even of making able Philoſophers, Phyſicians, and Surgeons, fall into conſiderable Miſtakes.

When ſeveral concur nearly in the ſame Motions, they are termed Congeneres; thoſe which act in oppoſite Directions, are relatively and alternately called Antagoniſts. Thus all the Muſcles which extend or bend the fore Arms are Congeneres; and thoſe which extend it are Antagoniſts to the Flexors, and theſe again reciprocally Antagoniſts to the Extenſors.

There muſt, at leaſt, be two Muſcles, to intitle them to the Name of Congeneres; but that of Antagoniſt may be given to one Muſcle, as well as to ſeveral. Many Muſcles contribute to the ſame Motion without being Congeneres, where by acting in an oblique Direction, they produce a third Motion, which is direct and determinate. This is termed a combined Motion, and may be ſucceſſively continued in different Directions, as that of the Arm in turning a Sling, or the Handle of any heavy Machine. Laſtly, when all the Antagoniſts on every Side, or all the Muſcles that move a Part, act equally, and keep the Part fixed in a middle Direction between all the Motions of which it is capable, they are ſaid to be in a Tonic Motion.

To move any Part, or to keep it in a determinate Situation, all the Muſcles belonging to it muſt co-operate, ſome of them drawing the Part directly to the Situation or Attitude deſigned; ſome moderating this firſt Motion, by acting in a contrary Direction; and others directing it laterally. The firſt Kind of theſe Muſcles I call Principal Movers; the ſecond, Moderators; and the third, Directors.

All theſe Kinds are to be found in the Articulations by Enarthroſis, and in many of thoſe by Arthrodia. The Director Muſcles are wanting in thoſe by Gynglymus, being there unneceſſary. The Moderators in general are the ſame with thoſe termed Antagoniſts, and the Want of their Action is, in many Places, ſupplied by the Weight of the Part to which they are fixed, or by the additional Weight, or Reſiſtance, of ſome other Body.

The Action of the Muſcles in general, or, to ſpeak more properly, the Mechaniſm of this Action, conſiſts chiefly in the Contraction or Shortening of their fleſhy Portion; by which the Extremities of the Muſcle are brought nearer to each other, and, conſequently, the Parts are moved to which theſe Extremities are fixed. It is, I ſay, the fleſhy Portion alone, which is ſhortened; the Tendons retain always the ſame Length, and only follow the Motions of the other Parts, much in the ſame manner as in drawing a great Weight by Ropes fixed to it, where the Arm alone is ſhortened, while the Ropes only follow that Motion.

The principal Phenomena of muſcular Action are theſe: The fleſhy Portion appears harder and more ſwelled in the time of Action than of Inaction, as may be readily perceived by touching it in both States. The Hardneſs of this Swelling increaſes in proportion as the Motion is continued, as is, likewiſe, evident by the Touch; and it likewiſe increaſes by merely adding to the Weight or Reſiſtance of the Part moved, though its Situation does not continue to be changed.

In many Muſcles this Action may be determined to any Degree of Velocity and Space, that is, may be proportioned to the Velocity and Space of the Motion; may be increaſed, and diminiſhed, accelerated, retarded, or ſtopt; and may be made to ceaſe in an Inſtant, and be produced again in another Inſtant.

During the Contraction of a Muſcle, its Fibres are bent thro' the whole Length, or formed into very ſmall fine Folds, in alternately oppoſite Directions, as may be plainly ſeen in Animals freſh-kill'd, when the Butchers cut their Fleſh while it remains warm, though the Blood has been let out, and the Entrails removed. By opening living Animals, and, alſo, in great Wounds, the fleſhy Fibres have been diſcovered to grow pale during their Action, and to turn red again when at Reſt.

To theſe Phenomena we muſt, likewiſe, add, that where ſeveral Muſcles are fixed to any moveable Part, they are all in a State of Contraction, in every Motion of that Part; but they are not all in the ſame Degree of Action, becauſe the principal

Movers act more than the Moderators and Directors, or collateral Muſcles, if any belong to the Part. This Co-operation of the Muſcles is eaſily perceived by touching them, when the Part they belong to is moved with a conſiderable Force. It muſt, however, be remembered, that I except the Moderators and Antagoniſts when any Weight or Aſſiſtance ſupplies their Action.

Laſtly, there are ſome Motions, to which the Muſcles, commonly believed to produce them, contribute nothing at all, but which depend ſolely on the Relaxation of the Antagoniſts to theſe Muſcles, or thoſe which lie on the oppoſite Side. This is ſeen evidently in ſupporting the Body by one Hand, reſting on a low Table, the Joint of the Elbow being in that State ſuffered to yield to the Weight of the Body, or to bend ſometimes ſlowly, and ſometimes faſt; for if, at the ſame time, we feel, with the other Hand, the Flexor and Extenſor Muſcles of the fore Arm, the firſt will be found perfectly relaxed, and the latter very much contracted. Thus it is evident, that ſome Muſcles may be relaxed to determinate Degrees of Velocity and Space, with the ſame Certainty as they can be contracted.

This laſt Phenomenon gave me room to conclude, that the Action of the Muſcles in general conſiſts as really in the Relaxation of the moving Fibres when contracted, as in the Contraction of them when relaxed, whether this Action be performed ſucceſſively, or inſtantaneouſly. For this Reaſon, when I began to ſpeak of the Action of the Muſcles, I did not ſay abſolutely, that it conſiſted in the Contraction of the fleſhy Portion, but only that it principally proceeded therefrom. I do not here ſpeak of theſe Motions which are out of our Power, and which one can determine only in Part, as thoſe of Reſpiration; or not at all, as that of the Heart.

The particular Mechaniſm, or immediate Cauſe, of muſcular Action, has very much tortured the Brains of many Philoſophers. The extreme Delicacy of the Texture of a moving Fibre, and great Number of Phenomena, ſome of them very obvious, which have not been attended to, have hitherto prevented the Diſcovery of this Myſtery. Several Hypotheſes have been form'd concerning the Structure of this Fibre, which, as already ſaid, has been ſuppoſed ſpongy, vaſcular, veſicular, contorted, elaſtic, and the like; and concerning the Concurrence of different Fluids with the ſuppoſed Structure of the Fibre: And Syſtems have even been founded wholly on the Spring or Elaſticity of the ſolid Parts, of which a Muſcle is compoſed.

But by conſidering attentively the Phenomena already mentioned, eſpecially the three firſt, concerning the Velocity, Space, and Duration of muſcular Action, all theſe Syſtems may be deſtroyed. For hitherto no Inſtance can be found either in natural Effects, or in thoſe of Art, of any Exploſion, Fermentation, Ebullition, Injection, Inflation, Imbibition, Vibration, Elaſticity, *&c.* by which we can regulate and determine, to a given Degree, the Space, Velocity, and Duration, of any artificial Motion, or by which we can begin and put an End to ſuch Motions, in an Inſtant of Time, at our Pleaſure. It is therefore altogether to no Purpoſe to amuſe ourſelves with what has been ſaid on this Subject; another Method muſt be followed, which conſiſts in collecting and examining all the Phenomena that can fall under our Obſervation.

Till ſome ſuch lucky Diſcovery is made, what can hitherto with the greateſt Certainty be gathered from the Structure, Conformation, and Action of the Muſcles, is, that their Strength depends on the Number of their fleſhy Fibres, and the Extent of their Action on the Length of theſe Fibres.

For where-ever Strength is more neceſſary than large Degrees of Motion, there we find the Fibres of Muſcles proportionably increaſed in Number, and that their Situation in a narrow Compaſs is artfully provided for by the oblique Diſpoſition of them already mentioned. In like manner, where-ever there is more Occaſion for a large Degree of Motion than for Strength, the fleſhy Fibres are of a proportionable Length. In a Word, the Strength of a Muſcle is as the Number of its fleſhy Fibres, and the Extent of its Motion as the Length of theſe Fibres.

To underſtand the Uſes and Contrivance of each Muſcle in particular, we muſt conſider attentively its Place or Situation in general, its internal Conformation, Inſertions, particular Situation, Direction, and lateral Connection, and the Relation and Compoſition of its Parts. We ought, likewiſe, to examine how the neighbouring Muſcles are diſpoſed for producing ſimple Motions, and how thoſe which are at a greater Diſtance, can produce combined or compound Motions.

It ought, moreover, to be obſerved, that in ſome Subjects the Muſcles vary, ſome being wanting, and others added in different manners; ſo that we ought to regulate ourſelves by what happens moſt frequently and univerſally, that we may not render the common Caſes obſcure for the ſake of a few which are extraordinary, and which ought to be conſidered in the ſame Light as we do the Inſtance of ſix Fingers, eleven Ribs, and other Varieties of the like kind.

Muſcles, fixed only to Bones, act as ſo many Powers applied to Levers. By a Lever we underſtand a long inflexible Body, like a Rod or Bar, by the Help of which we raiſe Weights, and overcome Reſiſtances, which it would be more difficult, or impoſſible, to do with the Hands alone.

A Lever, in order to act, is applied to three different things, at three different Places of its Length; at one Place to the Weight, or reſiſting Body, at a ſecond to the Power by which it acts, and at a third to a Fulcrum, which, with reſpect to the other two, ought to be immoveable; ſo that the whole Length of the Lever is, as it were, divided by three Points, which may be termed the fixed Point, Point of Reſiſtance, and Point of Powers.

Theſe three Points may be diſpoſed in three different manners: 1. The fixed Point may lie between the Power and the Weight; as when the Stone-cutters and Paviors raiſe or move Stones with Iron Croes. 2. The Weight may lie between the Power and the Fulcrums; as when Maſons move large Stones by applying Croes to them, ſomewhere near the Middle. 3. The Power may lie between the Weight and Fulcrum, as when Braziers ſcrape Copper in order to tin it, by laying one End of the Scraper on their Shoulder, the other on the Metal, and holding the Middle in their Hands.

From theſe three Diſpoſitions three different Kinds of Levers have been eſtabliſhed. In the firſt the Fulcrum, or fixed Point, is in the middle; in the ſecond the Weight, and in the third the Power.

In the Action of Levers, the following Maxims are to be obſerved as ſo many general Rules. The greater the Diſtance of the Line of Direction of the Power from the Fulcrum; leſs Force is neceſſary to overcome the Reſiſtance. The nearer that this Line of Direction is to the Fulcrum, more Force is neceſſary to overcome the Reſiſtance, or to raiſe the Weight. When the Line of Direction of the Power paſſes through the fixed Point, and conſequently falls in with the Direction of the Lever, the Power can produce no Effect. See SPIRITUS ANIMALES.

MUSCUS. Moſs.

Botanic Authors enumerate a great Number of Moſſes, the Virtues of ſome of which are ſpecified under the reſpective Articles of their Name.

Muſcus. Offic. *Muſcus Uſnea.* Chab. 559. *Muſcus arboreus: Uſnea Officinarum.* C. B. P. 361. Raii Hiſt. 1. 114. Synop. 3. 64. *Muſcus arboreus villoſus.* J. B. 3. 763. Synop. 22. *Muſcus arboreus vulgaris & quercinus.* Park. 1372. *Muſcus Quernus.* Ger. 1369. Emac. 1558. HAIRY TREE MOSS.

This Moſs conſiſts of a great Number of long, ſlender, hoary Strings, ſomewhat tough and hard, hanging down ſome Length from the Branches of the Trees they grow on, which are uſually old Oaks: It is ſeldom to be met with in *England*, and therefore very rarely preſcribed by Phyſicians.

It is accounted reſtringent and ſtyptic, and good to ſtop Bleeding, and all Kinds of Fluxes. *Miller's Bot. Off.*

It has an aſtringent Taſte, but in other reſpects is various, as thinner, thicker, ſhorter, longer, generally whitiſh, but ſometimes, though rarely, rediſh, and ſometimes black. It is chiefly found on Oaks, Poplars, Elms, Beeches, Apple-trees, Pear-trees, Pine-trees, Pitch-trees, Fir-trees, Cedars, Larch-trees, and many others of the moſt conſiderable Species of Trees. The Moſs which grows on the Cedar, Larch-tree, Pine and Fir, is ſweet-ſcented: The next in Value is what grows on the Poplar; the White is beſt; the Black is condemn'd; the Red is of a middle Kind; the leaſt eſteemed is what grows on Oaks. *C. B.* from *Dodonæus.*

It is found on old Oaks, and ſcarlet Oaks of the Wood of *Valena*, not far from *Montpelier*, whence it is brought to the Druggiſts; for the Powder of it is the Baſe of what they call at *Montpelier*, *Pulvis Cyprius*, or, in the vulgar Tongue, *Corps de Cypre gris.*

This Kind of Moſs is very rare in *England*, nor do I remember, ſays *Ray*, ever to have ſeen it; perhaps it is more frequent in foreign Countries, though I have very rarely had the Fortune to meet with it in my Travels: Once I obſerved great Plenty of Moſs in a Wood of old Firs in *Bavaria*, hanging down from the Boughs, which very well anſwer'd the Deſcription given by *Dodonæus* of the *Muſcus arboreus villoſus*, and, being gather'd and repoſited in Papers, dyed them of a yellow Colour, inclining to a Red, as if they had begun to be ſinged by the Fire; and, tho' ſeveral times removed, and put into freſh Papers, it ſtill communicated the ſame Colour to them, even after many Years. If therefore, it be not found in greater Plenty at *Montpelier* than elſewhere, it could by no means be ſufficient for ſo great a Quantity of *Pulvis Cyprius*, as is every Year prepared and ſold in that City. Beſides, if this Moſs, which grows on the *Quercus* and *Ilex*, be good enough to ſerve as a Baſis for that celebrated, ſweet-ſcented Powder of *Montpelier*, it cannot be eſteemed of ſo little Value, as *C. Bauhine* would have it, unleſs, perhaps, they are obliged to make uſe of it for want of better; which does not ſeem probable, becauſe this *Pulvis Cyprius Monſpelienſis* is eſteemed the moſt excellent Preparation in its Kind. But, to ſpeak the Truth, I ſuſpect that thoſe of *Montpelier* take for the Baſis of their *Pulvis Cyprius*, what we, with *J. Bauhine*, call the *Muſcus arboreus ramoſus*; and make the ſame Uſe promiſcuouſly of the *Muſcus arboreus pellatus & ſcutellatus ejuſdem*, I mean what grows on the *Quercus* and *Ilex*, partly becauſe theſe

Moſſes

Moſſes are found every-where in great Quantities, and partly becauſe *Fer. Imperatus*, who was himſelf a Druggiſt, and perfectly well acquainted with the Ingredients of theſe Sorts of ſcented Powders, writes, that both theſe Species of Moſs indifferently enter ſweet-ſcented Compoſitions. This we write by Conjecture, not denying, but that the *Muſcus arboreus* may be apply'd to the ſame Uſe, whenever it can be found.

The *Muſcus capillaceus longiſſimus* of *C. B.* ſeems not to differ from the foregoing Species; or, if there be any Diſtinction between them, it may well enough be learnt from the bare Title.

D. Sachſ. writes in the *Ephemer. Germ. An.* 2. that the *German* Surgeons make uſe externally of the *Muſcus arboreus*, pulverized, for repreſſing Hæmorrhages from Wounds. *Raii H. P.*

MUSCUS MARINUS. Offic. *Muſcus maritimus capillaceus Dioſcoridis.* Park. 1288. *Muſcus marinus capillaceus Dioſcoridis, & Donati.* R. H. 79. *Muſcus marinus verus Dioſcoridis.* Donat. p. 61. SEA-MOSS.

This Plant, which is ſlender, capillary, and without a Foot-ſtalk, is found in the *Adriatic* Sea. The Whole of it is uſed, is of an inſpiſſating Quality, checks Congeſtions of Humours, and refrigerates the Parts affected with arthritic Pains. *Dioſcorides.*

This Plant is taken for the Muſcus Marinus of *Dioſcorides* by *Conſtantine*; with whom I rather agree, than with thoſe who take the Corallina of the Shops, for the Mucus Marinus of *Dioſcorides*, which *Parkinſon* takes to be the Fucus with a capillary Leaf of *Theophraſtus*. *Dale.*

MUSICA. Muſic.

Dr. *Mead* in his Treatiſe of Poiſons, ſpeaking upon the Cure of thoſe who were bitten by a Tarantula, by Muſic, remarks, that brisk Harmony excites lively Species of Joy and Gladneſs, which are always accompanied with a more frequent and ſtronger Pulſe, or an increaſed Influx of the Liquor of the Nerves into the Muſcles, upon which ſuitable Actions muſt immediately follow. And if we conſider, that People in this Country are ſprightly, and ready to Exerciſe, and that in ſuch a State of the Fluids a ſlight Occaſion preſents a ſtrong Species, as a greater cannot another time, the Influence of Muſic on the Mind will appear to be ſo much the more powerful and certain.

As for the Body, ſince it is ſufficient for the Purpoſe of putting the Muſcles into Action, to cauſe thoſe Tremors of the Nerves, by which their Fluid is alternately dropt into the moving Fibres; it is all one whether this be done by the Determination of the Will, or the outward Impulſions of an elaſtic Fluid. Such is the Air; and that Sounds are the Vibrations of it, is beyond Diſpute.

Theſe, therefore, rightly modulated, may ſhake the Nerves, as really as the *Imperium Voluntatis* can do, and, conſequently, produce the like Effects.

That this is ſo, beſides what we ſhall add, we may be convinced by a Story, which Mr. *Boyle* relates out of *Scaliger*, of a Knight of *Gaſcony*, whom the Sound of a Bagpipe would unavoidably force to make Water; for this Secretion, we know, is regularly the Effect of an arbitrary Contraction of the Muſcle of the Bladder.

The obſtinate continuing of the *Tarantati* in this Exerciſe is doubtleſs, in a great meaſure, owing to the ſtrong Opinion they have of receiving Advantage from it, being encouraged by the By-ſtanders, and having always believed, and been told, that it was the only Cure in theſe Caſes.

The Benefit from Muſic is not only their dancing to it, and ſo evacuating, by Sweat, a great Part of the inflammatory Fluid; but, beſides this, the repeated Percuſſions of the Air hereby made, by immediate Contact, ſhaking the contractile Fibres of the Membranes of the Body, eſpecially thoſe of the Ear, which, being continuous to the Brain, communicate their Tremblings to its Membranes, and Veſſels, by theſe continued Succuſſions and Vibrations, the Coheſion of the Parts of the Blood is perfectly broken, and its Coagulation prevented; ſo that the Heat being removed by Sweating, and the Coagulation by the Contraction of the muſcular Fibrillæ, the wounded Perſon is reſtored to his former Condition.

If any one doubts of this Force of the Air, let him conſider, that it is in Mechanics demonſtrated, that the ſmalleſt Percuſſion of the ſmalleſt Body can overcome the Reſiſtance of any great Weight which is at Reſt; and that the languid Tremor of the Air, which is made by the Sound of a Drum, or Trumpet, may ſhake the vaſteſt and ſtrongeſt Edifices.

But, beſides all this, we muſt allow a great deal to the determinate Force, and particular Modulation, of theſe trembling Percuſſions; for contractile Bodies may be acted upon by one certain Degree of Motion in the ambient Fluid, though a greater Degree of it, indifferently qualified, may produce nothing at all of the like Effect: This is not only very apparent in the common Experiment of two-ſtring'd muſical Inſtruments, toned both to the ſame Height; the Strings of the one being ſtruck upon, thoſe of the other will ſound; and yet a much greater Motion of the Air may not cauſe any ſenſible Vibration at all in the ſame Chords; but, alſo, by the Trick which many have, of finding the Tone or Note peculiarly belonging to any Wine-glaſs, and, by accommodating their Voice exactly to that Tone, and yet making it loud and laſting, they will make the Veſſel, though not touched, firſt to tremble, and then burſt; which it will not do, if their Voice be but a little either too low, or too high.

This laſt Conſideration makes it no very difficult Matter to conceive the Reaſon, why different Perſons, infected with this Venom, require oftentimes a different Sort of Muſic, in order to their Cure; inaſmuch as their Nerves, and diſtractile Membranes, have differing Tenſions; and conſequently, are not in like manner to be acted upon by the ſame Vibrations.

Nor are we to wonder at the Oddneſs of this Method and Practice; for Muſic, although it be now-a-days applied to quite different Purpoſes, was antiently made great Uſe of, for the removing of many, and thoſe, too, ſome of the moſt difficult and obſtinate Diſeaſes.

For this we have a famous Teſtimony in *Galen* himſelf, who tells us, that *Æſculapius* uſed to recover thoſe, in whom violent Motions of the Mind had induced an hot Temperament of Body, by Melody and Songs. *Pindar* mentions the ſame thing; and, indeed, from hence not only the Notion, but the very Name, of Charming, ſeems to have taken its Origin. *Athenæus* relates, that *Theophraſtus*, in his Book of Enthuſiaſm, ſays, Iſchiadic Pains are cured by the *Phrygian* Harmony. This Sort of Muſic was upon a Pipe, and the moſt vehement and brisk of all the Antients knew; ſo that, indeed, it was ſaid to raiſe thoſe who heard it, to downright Fury and Madneſs; and ſuch we have obſerved to be required to the Venom of the Tarantula.

But what is, beſides, in this laſt Authority, very obſervable to our Purpoſe, is the Manner of uſing this Remedy; and that was by playing upon the Part affected: Which confirms what we have juſt now advanced, concerning the Effect of the Percuſſion of the Air upon the contractile Fibres of the Brain; for Piping upon any Member of the Body, cannot be ſuppoſed to do Service any other way, than by ſuch Succuſſions, and modulated Vibrations, as we before mentioned. And this, indeed, *Cœlius Aurelianus* agrees to, who calls this Practice, *Decantare Loco dolentia*, and ſays, that the Pain is mitigated and diſcuſſed by the Tremblings and Palpitations of the Part.

Aulus Gellius not only relates this ſame Cure of Iſchiadic Ails as a thing notorious enough; but adds, beſides, out of *Theophraſtus*, that the Muſic of a Pipe, rightly managed, healed the Bites of Vipers.

And not only does *Apollonius* mention the Cure of Diſtractions of the Mind, Epilepſies, and ſeveral other Diſtempers, this ſame Way; but *Democritus*, in his Treatiſe of *Plagues*, taught, that the Muſic of Pipes was the Medicine for moſt Diſeaſes; which *Thales* of *Crete* confirmed by his Practice, when, ſent for by the *Lacedemonians* to remove from them the Peſtilence, he did it by the Help of Muſic.

All which Inſtances evince this Remedy to have been very antient, in many Caſes; and indeed, as *Cœlius Aurelianus* takes notice, that the firſt Uſe of it was aſcribed to *Pythagoras* himſelf, ſo he having ſettled and founded his Sect in thoſe very Parts of *Italy*, which are the Country of the Tarantula, going then under the Name of *Græcia Magna*, now *Calabria*, it is not, I think, at all improbable, that he may have been the Author and Inventor of this Practice there, which has continued ever ſince; eſpecially, ſince *Iamblichus* affirms, not only that he made uſe of Muſic in Phyſic; but particularly, that he found out and contrived ſome Harmonies to eaſe the Paſſions of the Mind, and others for the Cure of Bites.

This Hiſtory of the Effects of Muſic in Medicine, however ingenious, with reſpect to the Cure of that Diſtemper, cauſed by the *Tarantula*, muſt be of leſs Weight, if, as there is ſome Reaſon to believe, this Diſorder is only imaginary; and the Notion of its prevailing in ſome Parts of *Calabria*, only founded on a vulgar Error, and a Tradition handed down from Father to Son, from Time immemorial. See TARANTULA.

MUSTELA. Offic. Schrodr. 330. Mer. Pin. 190. Bellon. de Aquat. 130. *Muſtela fluviatilis.* Aldrov. de Piſc. 577. Geſn. de Aquat. 601. Charlt. de Piſc. 40. Raii Synop. Piſc. 61. *Muſtela fluviatilis, noſtratibus* EEL-POUT *nomine a Belgis mutato, &* BURBOT *Gallico vocabulo dicta.* Ejuſd. Ichth. p. 125. *Muſtela altera.* Schonef. Ichth. 49. THE EEL-POUT, or BURBOT.

This Fiſh is found in Rivers, and its Liver, Stomach, and Spine, are uſed. The Liver, when ſuſpended in a Glaſs Veſſel, and expoſed to a due Degree of Heat, is colliquated into a yellow Liquor greatly beneficial in Specks of the Eyes, and Dimneſs of Sight. The Stomach is highly recommended againſt Diſorders of the Uterus; but, when drank in ſome proper Liquor, is principally beneficial in expelling the Secundines, and removing Colics. The Spine, when reduced to a Powder, is ſaid to cure the Epilepſy. *Schrodr. Dale.*

MUSTELA. Offic. Charlt. Exer. 20. Geſn. de Quad. Digit. 752. Mer. Pin. 167. Schw. Quad. 116. *Muſtela vulgaris.* Aldrov. de Quad. Digit. 307. Jonſ. de Quad. 105. Raii Synop. A. 195. THE WEASEL.

This

This Animal itſelf is uſed, when diſemboweled, preſerved in Salt, and dried in the Shade. Its Stomach is, alſo, uſed. Two Drams of the Animal, prepared in the manner above-mention'd, and drank in Wine, are an inſtantaneous Remedy againſt the Venom of all Kinds of Serpents; and againſt Poiſons, taken internally. The Stomach, when filled with Coriander-ſeeds, and preſerved for a due Time, if drank in ſome proper Liquor, is beneficial in Epilepſies, and Wounds inflicted by Serpents. This Animal, when burnt in an Earthen Veſſel, is ſerviceable in arthritic Pains. Strumous Swellings are leſſened by being anointed with the Blood of this Animal, or its Aſhes mixed with Vinegar. Theſe are, alſo, beneficial in Epilepſies. *Dioſcorides. Dale.*

MUSTELUS. The Hound-fiſh. See GALEUS.

MUSTUM. Muſt. The Juice of the Grape before it has undergone Fermentation.

MUSTUS. The white Calx of Urine. *Rulandus.*

MUSULA, MUSSELA, or MUSSULA. The black Weaſel, which, according to *Paracelſus*, excites the Epilepſy.

MUTELLINA. See MEUM.

MYACANTHA. Butchers-broom. See BRUSCUS.

MYAGRO AFFINIS. A Name for the *Rapiſtrum*; *arvenſe*; *folio articulato*; *acuto:* And for the *Turritis*; *folio Leucoii.*

MYAGRO SIMILIS. A Name for the *Rapiſtrum*; *arvenſe*; *folio auriculato*; *acuto.*

MYAGRUM.

The Characters are;

It has a turbinated Fruit, like an inverted Pear, unicapſular, preſſing in the Stalk, containing one Seed, with two empty Cells.

Boerhaave mentions two Species of this Plant; which are,

1. Myagrum; monoſpermum, latifolium. *C. B. P.* 109. *Prod.* 52. *T.* 211. *Raphaniſtrum, monoſpermum, latifolium, ſiliculis fungoſis, glabris, auriculatis.* M. H. 2. 267.

2. Myagrum; ex Sumatra & Syria; ſemine ſpinoſo, ſimili capiti aviculæ. *Zanon.* 142. *Roſa Hierichuntica alia.* Camer. Ic. 42. *Boerh. Ind. alt. Plant. Vol.* 2. *p.* 2.

This Plant is poſſeſſed of the ſame Virtues with the Rapiſtrum, but is not recommended for any particular Purpoſe. The Oil, however, obtained from it by Expreſſion, is excellent for rendering the Skin ſoft and ſmooth. *Hiſt. Plant. adſcript. Boerhaav.*

MYAGRUM MAJUS. A Name for the *Alyſſon*; *ſegetum*; *foliis auriculatis, acutis.*

MYAGRUM, *ſiliqua longa.* A Name for the *Turritis*; *folio Leucoii.*

MYAX, μύαξ. The ſame as MYTULUS; which ſee.

MYCE, μυκὴ, or MYSIS, μύσις, from μύω, to wink, ſhut up, or obſtruct. A Winking, Cloſing, or Obſtruction. It is applied to the Eyes, to Ulcers, and to the Viſcera, eſpecially the Spleen, where it imports Obſtruction.

MYCES, or, MYCE, μύκης, or μύκη. In Botany it imports a Fungus. In Surgery, it is a Fungus which ariſes in Wounds or Ulcers.

MYCHTHISMOS, μυχθισμὸς, from μύζω, to mutter, or groan. In *Hippocrates, Coac. Prænot.* 519 it ſignifies a ſort of Sighing, or Groaning, during Reſpiration, whilſt the Air is forced out of the Lungs.

MYCONOIDES, μυκονοειδὴς. An Epithet for an Ulcer, which is full of Mucus.

MYCTERES, μυκτῆρες. The Noſtrils. *Mycter*, μυκτὴρ, is uſed to ſignify the Noſe.

MYDESIS, μύδησις, from μυδάω, to abound with Moiſture. This imports, in general, a Corruption of any Part from a redundant Moiſture. But it is applied, particularly, to the Eye-lids, by *Galen.*

MYDON, μυδὼν. Fungous Fleſh in a fiſtulous Ulcer. *J. Pollux.*

MYDRIASIS, μυδρίασις. A Diſeaſe of the Eye, conſiſting in the preternatural Dilatation of the Pupil, and a conſequent Dimneſs.

MYDROS, μύδρος, in *Hippocrates*, is a Ball of Iron, or a Stone, which is directed to be heated in the Fire, and quenched in Urine for a Fomentation, *de Morbis Mulierum, Lib.* 2.

MYGALE, μυγάλη. A Name for the Mus Araneus.

MYLACRIS, μυλακρὶς. The Patella. *Gorræus.*

MYLE, μύλη. The Patella, or a Mole of the Uterus.

MYLOGLOSSI. Two Muſcles of the Tongue, thus called, becauſe they ariſe from the Roots of the Dentes Molares. See LINGUA.

MYLOHYOIODÆI. The two Muſcles of the Os Hyoides. See LINGUA.

MYLOPHARINGÆUS. The Name of a Muſcle of the PHARYNX; which ſee

MYLON. A Diſorder of the Eye. See OCULUS.

MYLOS. The Name of a Sea-fiſh, mentioned by *Galen.* It is a kind of Cray-fiſh.

MYOCEPHALUM. A ſmall Tumor in the Uvea Tunica of the Eye, like the Head of a Fly, from μυῖα, a Fly, and κεφαλὴ, an Head.

MYODES PLATYSMA. A muſcular Expanſion in the Neck, from μῦς, a Muſcle, and πλατὺς, broad. See CAPUT. It is called *Quadratus Genæ.*

MYOLOGIA. A Treatiſe or Deſcription of the Muſcles; from μῦς, and λόγος, a Diſcourſe.

MYOPIA, or MYOPIASIS. Short Sight, a Diſorder of the Eyes; from μύω, to ſhut, and ὤψ, the Eye; becauſe People ſo affected generally half-ſhut their Eyes, when they look intenſely on an Object.

MYOPS. A Perſon who is ſhort-ſighted, or cannot ſee at a Diſtance.

MYOSOTIS. Mouſe-ear-chickweed.

The Characters are;

It reſembles the Alſine in every reſpect; only the Flower is larger, and the Fruit, which is like the Horn of an Ox, opens at the Apex.

Boerhaave mentions ſix Species of this Plant; which are,

1. Myoſotis; Hiſpanica; ſegetum. *T.* 245. *Alſine corniculata.* Cluſ. H. 184. *Lychnis ſegetum, minor.* C. B. P. 204.

2. Myoſotis; hirſuta; altera; viſcoſa. *T.* 245. *Alſine, altera, viſcoſa hirſuta.* C. B. P. 251.

3. Myoſotis; incana; repens. *T.* 244. *Lychnis, incana, repens.* C. B. P. 206. *Ocymoides, Lychnitis, radice reptante.* J. B. 3. 353.

4. Myoſotis; tenuiſſimo folio rigido. *T.* 245.

5. Myoſotis; Alpina; latifolia. *T.* 244. *Caryophyllus holoſtius, Alpinus, latifolius.* C. B. P. 210. Prodr. 104.

6. Myoſotis; Orientalis; perfoliata; folio Lychnidis. *T. C.* 18. *Boerh. Ind. alt. Plant. Vol.* 1. *p.* 213.

This Plant derives its Name from the *Greek* Words μῦς, a Mouſe, and οὖς, an Ear; becauſe it has hairy Leaves, and grows longitudinally, like a Mouſe's Ear. *Hiſt. Plant. adſcript. Boerh.*

MYOSUROS.

The Characters are;

The Root is annual; the Leaves are gramineous, like thoſe of the Coronopus, but not laciniated; the Calyx is quinquefolious, each Leaf being furniſhed with an Appendix, tending downwards; the Floſcules are herbaceous, and furniſhed with a great Number of Stamina, which proceed from the Circumference of the Bottom of the Ovary; the Seeds are diſpoſed in a long Spike.

Boerhaave mentions but one Species of this Plant; which is,

Myoſuros. *Offic. J. B.* 2. 512. *Raii Hiſt.* 2. 1332. *Synop.* 3. 251. *Boerh. Ind. A.* 2. 202. *Cauda Muris.* Ger. 345. Emac. 426. *Holoſteum Loniceri Cauda Muris vocatum.* Park. Theat. 500. *Holoſteo affinis Cauda Muris.* C. B. P. 190. *Ranunculus gramineo folio, flore caudato, ſeminibus in capitulum ſpicatum congeſtis.* Tourn. Inſt. 293. MOUSE-TAIL.

This Herb flowers in *May*, and is found in the Fields, and by the Way-ſides. The Whole of it is uſed, and by ſome thought to be poſſeſſed of the ſame Virtues with Plantain and the Coronopus. *Dale.*

MYOTOMIA. A Diſſection of the Muſcles; from μῦς, a Muſcle, and τέμνω, to cut.

MYRACOPON, μυρόκοπον. An Epithet for a ſort of Ointment recommended againſt Laſſitude, by *Galen, de C. M. P. G. Lib.* 7. *Cap.* 12.

MYRICA. A Name for the *Tamariſcus, Narbonenſis.*

MYRINGA, or MYRINX. A barbarous Word, importing the Membrane of the Tympanum in the Ear.

MYRIOPHYLLON. Offic. *Millefolium aquaticum.* Ger. 678. Emac. 827. Raii Hiſt. 1. 459. *Millefolium aquaticum vulgatius.* Park. Theat. 1256. *Millefolium aquaticum umbellatum capillaceo brevique folio.* C. B. P. 141. *Millefolium aquaticum Fœniculo ſimile umbelliferum.* J. B. 3. 8. WATER-FENNEL.

This Plant is produced in marſhy Soils, and flowers in the Month of *April.* The Whole of it is uſed, and is thought to be poſſeſſed of a vulnerary Quality. *Dale.*

MYRIOPHYLLON *aquaticum minus.* A Name for the *Potamogeiton*; *floſculis ad foliorum nodos.*

MYRIOPHYLLON, *equiſeti folio fluviatile.* A Name for the *Hottonia.*

MYRISTICA NUX. The Nutmeg. See NUX MOSCHATA.

MYRITES. A Name for the *Caucalis*, in *Oribaſius's Medic. Collect. Lib.* 11.

MYRMECIA, μυρμήκια. A ſort of Wart about the Size of a Lupine, with a broad Baſe, deeply rooted, and very painful. It grows on the Palms of the Hands, or Bottoms of the Feet. *Celſus, Lib.* 5. *Cap.* 28. See NÆVUS.

MYRMECITES. A ſort of Stone, mentioned by *Pliny, Lib.* 37. *Cap.* 11. thus called, becauſe it has the Figure of an Ant (μύρμηξ) naturally impreſſed upon it.

MYRMECIZON, μυρμηκίζων. An Epithet for a ſort of Pulſe, the ſame as FORMICANS; which ſee.

MYRMECALEON. An Inſect, called the Lion-piſmire, more famous for its Oeconomy, and taking its Prey, than any medicinal Virtues. It is, however, ſaid to be emollient and reſolutive, applied externally.

MYROBALANI. Myrobalans.

Theſe are Fruits of the Plum Kind, which grow in the *Eaſt Indies*

Indies. They were much uſed by the *Arabian* Phyſicians, and their Succeſſors, till of late Years; but, at preſent, they are much out of Uſe, and ſeldom preſcribed. There are five Sorts, the Indica, Citrina, Chebula, Billerica, and Emblica.

The Indica is thus diſtinguiſhed;

Myrobalanus Inda, nigra. *Offic. Myrobalanus Indica.* Ger. 1316. Emac. 1500. Raii Hiſt. 2. 1531. Park. Theat. 246. *Myrobalani nigræ octangulares.* C. B. P. 445. *Myrobalani Indæ, nigræ, ſine nucleis.* J. B. 1. 204. INDIAN, or BLACK MYROBALANS.

This is a ſlenderer and narrower Fruit than any of the following, having a Shew of eight Ridges, though to be diſcerned but in a few of them; they are hard, tough, and black, both Inſide and out, of a rough auſtere Taſte. *Miller's Bot. Off.*

The Citrina is thus diſtinguiſhed;

Myrobalanus, Citrina flava. *Offic. Park. Theat.* 206. *Myrobalanus.* Ger. 1316. Emac. 1500. Raii Hiſt. 2. 1531. *Myrobalani teretes, Citrini, bilem purgantes.* C. B. P. 445. *Myrobalani Citrinæ.* J. B. 205. CITRON, or YELLOW MYROBALANS.

This is about as big as an ordinary Plum, of an oval Shape, having five remarkable Ribs, ſtanding up high. It has a pretty thick Bark, and under it a large, pentangular, hard Stone, ſharp-pointed at both Edges: It is of a ſtyptic reſtringent Taſte. *Miller's Bot. Off.*

The Chebula is thus diſtinguiſhed;

Myrobalanus Chebula. *Offic. Ger.* 1316. *Emac.* 1500. *Park. Theat.* 206. *Raii Hiſt.* 2. 1531. *Myrobalani maximi, oblongi, anguloſi, pituitam purgantes.* C. B. P. 445. *Myrobalani Chebulæ citrinis ſimiles, nigricantes.* J. B. 1. 205. CHEBULE MYROBALANS.

This is the largeſt and longeſt of all the Myrobalans, of a dark-browniſh Colour, five-cornered, containing more Subſtance, and a leſs Stone, than either the following, or the Citron Myrobalan. It is of a rough reſtringent Taſte. *Miller's Bot. Off.*

The *Bellerica* is thus diſtinguiſhed;

Myrobalanus Bellerica. *Offic. Ger.* 1316. *Emac.* 1500. *Park. Theat.* 247. *Raii Hiſt.* 2. 1532. *Myrobalani rotundæ Bellericæ.* C. B. P. 445. *Myrobalani Billericæ rotundiores.* J. B. 1. 209. BELLERIC MYROBALANS.

This is rounder and ſmoother than any of the reſt of the Myrobalans, ſomewhat reſembling a Gall, but more oblong than having the Appearance of five blunt Ridges. It has a large Stone under a Bark of but little Thickneſs. *Miller's Bot. Off.*

The Emblica is thus diſtinguiſhed;

Myrobalanus Emblica. *Offic. Ger.* 1316. *Emac.* 1. 500. *Park. Theat.* 247. *Raii Hiſt.* 2. 1531. *Milicanaram.* Hort. Mal. 1. 69. *Myrobalani Emblicæ.* C. B. P. 445. *Myrobalani Emblicæ in ſegmentis nucleum habentes anguloſæ.* J. B. 1. 206. EMBLIC MYROBALANS.

This is a roundiſh Fruit, ſomewhat flat at each End, of a black Colour, eaſily ſeparating into ſix Parts, containing an hexangular, roundiſh, white Stone, under a Bark of no great Thickneſs. *Miller's Bot. Off.*

All theſe Myrobalans come from *India*, and, according to *Garcias ab Horto*, grow on Trees reſembling Plum-trees.

The Citrins are ſaid to purge Choler, and the Indicæ Melancholy, and the other three, Phlegm at firſt, and the Choler. Whatever they do when they are freſh, they may purge but little when dry, being rather ſtyptic and binding, and are of little Uſe; and the only officinal Preſcription they are put into, in the new Diſpenſatory, is the Decoctum Epithymi. *Miller's Bot. Off.*

Geoffroy ſays, that they purge gently, and ſtrengthen the Inteſtines at the ſame time; and, therefore, are very proper in Diarrhœas and Dyſenteries, and make a good Succedaneum for Rhubarb; only the Doſe muſt be larger; and they may, likewiſe, be very conveniently mixed with Rhubarb.

All the Species of Myrobalans are of a refrigerating, drying, and aſtringent Quality, as is obvious from their acid and ſomewhat acrimonious Taſte, reſembling that of Services. According to *Caſpar Hoffman*, they are uſed in Indiſpoſitions of the Eyes, which are eaſily ſubject to cold Diſorders; they are, alſo, beneficial in Fallings off of the Hair, and in a Looſeneſs of the Teeth, which, however, they render black. They are eſteem'd good againſt the Want of a due Tone in the Stomach, Liver, and other Viſcera; in which Caſe *Meſue* affirms, that they exhilarate the Body, and preſerve it florid and youthful, render the Colour of the Skin agreeable, and communicate a grateful fragrant Odour to the Breath: Sweet Myrobalans are, alſo, claſſed among the Purgatives. The Chebule, Belleric, and Emblic Myrobalans purge Phlegm; the yellow Myrobalans, yellow Bile; and the *Indian* Myrobalans, black Bile.

Myrobalans, exhibited in Subſtance, or by themſelves, inſtead of purging briskly, prove a violent Aſtringent; and this Effect they produce ſo much the more, the finer they are powdered, according to *Meſue*; or the longer they are boiled, according to *Melichius*, in his Diſpenſatory; for which Reaſon they are never exhibited in this manner with an Intention to purge.

They, as well as Rhubarb, are, by ſome, exhibited, toaſted, in Dyſenteries; and under this Form they purge very little, and are ſtrongly aſtringent, but much more ſo when burnt. Infuſions of them are more purgative, and leſs aſtringent, than Decoctions. The *Indians*, however, as *Garcias* informs us, for purging, uſe them only in Decoctions, though in larger Doſes than thoſe uſed among us. When preſerved, they purge but little, and are of an aſtringent Quality. When there are large Quantities of them, they may be either preſerved recent, or dried, and afterwards moiſtened; the former are highly active, and the latter of a dull and languid Quality. The Chebule are, alſo, preferable, to the Emblic Myrobalans: According to *Meſue*, the former, when preſerved, corroborate the Stomach, excite an Appetite, promote Digeſtion, enliven the rational Powers, and quicken the Sight.

There are three Qualities in Myrobalans, which ſtand in need of Correction; the firſt is their aſtringent Virtue, by means of which they produce Obſtructions; for which Reaſon they are not to be exhibited to ſuch as are ſubject to thoſe Misfortunes. But this Diſadvantage is corrected by mixing them with acrid and diuretic Aperients, ſuch as all the Species of fragrant and odoriferous Seeds. Secondly, that Acrimony, by means of which they adhere to the Stomach in ſuch a manner as not to paſs into the Inteſtines, but operate ſlowly, is to be corrected. Thirdly, that Quality by which they corrugate the Subſtance of the Stomach and Inteſtines, is to be corrected. The two laſt-mentioned Diſadvantages attending Myrobalans are to be removed by mixing them, during their Trituration, with unctuous Subſtances, ſuch as Oil of ſweet or bitter Almonds; or, alſo, by mixing Raiſins, or the Caſſia Fiſtula, with them. Theſe are the Sentiments of *Meſue*, collected by *J. Bauhine.*

Caſpar Hoffman forbids the Uſe of Myrobalans, even in thoſe Fevers, in which there is no future Obſtruction dreaded. He, alſo, ſeems to think, that preſerved Myrobalans are productive of bad Effects in diary Fevers; and that the Uſe of them is unſafe in any Caſe whatever.

As Myrobalans in Subſtance never purge, Phyſicians never exhibit them, unleſs in Conjunction with other Subſtances, ſuch as the Electuarium Eleſchoph, the Hamech Tryphora Perſica, and ſome others of ſimilar Qualities; and, when they do preſcribe them, it is with an Intention to break the Force, and check the Efficacy, of other Purgatives.

Falloppius ſays, that the higheſt Doſe of the Decoction or Infuſion of Myrobalans is four Drams; but he himſelf never preſcribed above two or three. *Raii Hiſt. Plant.*

MYRON, *μύρον.* An Ointment, medicated Oil, or Unguent.

MYROPISSOCERON, *μυροπισσόκηρον.* The Name of a Topic for an Alopecia, quoted by *Galen, de Comp. M. S. L.* from *Soranus.*

MYRRHA. Offic. C. B. P. 501. Jonſ. de Dendr. 350. J. B. 1. 311. Park. Theat. 1593. Raii Hiſt. 2. 1841. *Myrrha Troglodytica.* Offic. Geoff. Trach. 361. MYRRH.

This is a Gum, which is brought from the *Eaſt Indies*, in Lumps of ſeveral Magnitudes; the beſt of a brown or reddiſh-yellow Colour, ſomewhat clear, of a fatiſh reſinous Subſtance, not hard to break, and, when powdered, of a bright-yellow Colour, of an aromatic Smell, and a warm bitteriſh Taſte.

Myrrh, is of an opening, heating, and drying Nature, reſiſts Putrefaction, and is of great Service in uterine Diſorders, opening the Obſtruction of the Womb, procuring the Menſes, expediting the Birth, and expelling the Secundines. It is good, alſo, for old Coughs and Hoarſeneſs, and the Loſs of the Voice; and is very uſeful againſt peſtilential and infectious Diſtempers, both taken inwardly, and thrown upon burning Coals, and the Fume received. Outwardly applied, it cures Wounds and Ulcers, and prevents Gangrenes and Mortifications. The Oil, per Deliquium, made with Eggs, is good to take off Freckles, and to clear the Face of Tan and Sun-burn.

Officinal Preparations are, Tinctura Myrrhæ ſimplex & compoſita, Trochiſci de Myrrha, and Olium Myrrhæ per Deliquium. *Miller's Bot. Off.*

Myrrh is brought from *Ethiopia*, and *Arabia Felix*; but we are ignorant of the Tree from which it flows. It is an excellent Stomachic, good in Indigeſtions, aperient, deobſtruent, emmenagogue, aſtringent, and vulnerary; and is uſed in Looſeneſſes, to deſtroy the Acrimony of the Humours in the Inteſtines. Outwardly applied, it is a powerful Reſolvent; and the Tincture of Myrrh and Aloes is a good Vulnerary, and prevents Mortifications. Myrrh, put into the White of an hard Egg, in the Place of the Yolk, and laid in a cool Cellar, reſolves into an Oil per Deliquium. It is an Ingredient in many Compoſitions, ſuch as the Emplaſtrum divinum, Emplaſtrum ſticticum, Theriaca, and the like. It is generally choſen ungulated, that is, marked with ſmall white Specks, in the Shape of Nails. The Antients mention a liquid Myrrh, which we are ignorant of; there is, however, ſome ground to think, that it is an oily Liquor, found in the Body of the Tree; and this was the Myrrh offered by the Magi to our Saviour, becauſe it was very precious, and an Ingredient in the richeſt Perfumes. *Geoffroy.*

Myrrh is by the *Greeks* called σμύρνα, and μύρρα; from which the *Latins* have borrowed *Myrrha*, is the *Æolian* Dialect for σμύρνα. But the Word *Myrrha* is more probably derived from μύρον, an Ointment. Nothing certain is delivered, either by the Antients or Moderns, with reſpect to the Tree, which produces the Myrrh. *Theophraſtus* affirms, that this Tree, to which he gives the Epithet *Thurifera*, is ſlender, low, ſhrubby, with an hard Trunk, crooked and contorted near the Earth, and ſomewhat thicker than the Calf of a Man's Leg; and that it has a Leaf reſembling that of the *Thus*, though aculeated, and not ſmooth like it. *Dioſcorides* affirms, that the Myrrh-producing Tree is like the *Egyptian* Thorn; and *Diodorus* makes the Tree, which produces *Thus*, like to the *Egyptian* Thorn; and compares the Myrrh-producing to the Maſtich-tree.

Fuchſius is of Opinion, that the Myrrh of the Shops is not genuine, becauſe the Characters of Myrrh, delivered by *Dioſcorides*, do not agree to it. *Braſſavolus*, and others, take the Myrrh of the Shops for *Bdellium*; and there is ſuch a near Reſemblance between theſe Subſtances, that the Incautious and Unskilful may, very readily, take the one for the other. *Langius*, and others, affirm, that *Benjamine* is poſſeſſed of all the Properties of the beſt Myrrh. Moſt Authors condemn the Myrrh of the Shops, and think it is not to be accounted genuine, and of the beſt Kind. But *John Bauhine*, *Parkinſon*, and others, converſant in examining ſimple Medicines, affirm, that genuine Myrrh is imported to us, though often adulterated with Gum; and anſwer the Arguments adduced in Oppoſition to their Opinion.

According to *Galen*, the beſt Myrrh is that which is clean, rough to the Taſte, dry, and friable, ſmooth, and conſiſting of ſmall Globules, externally of one Colour, but internally ſomewhat reddiſh, with whitiſh Veins running through it; of a fragrant Smell, but of an hot and bitter Taſte. According to *Dioſcorides*, it muſt alſo be recent.

But that Species of Myrrh is preferable to all others, which from the Place, in which it is produced, is called Troglodyty, and is of a paliſh or greeniſh Colour, ſhining: And,

As for the ſeveral Species of Myrrh, the Frauds of the Merchants, and the different Methods of Adulteration, we have nothing certain concerning them; only *Galen* orders us to beware of uſing the *Opocalpaſum* or *Opocarpaſum*, mixed with Myrrh. Now the Opocarpaſum, according to *Caſpar Hoffman*, is the *Indian* Myrrh of *Pliny*, collected from a certain Thorn; for *Pliny* falſely aſſerts, that Myrrh is adulterated with this Subſtance. But *Galen* affirms, that the Opocarpaſus may reſemble the beſt Myrrh; which, however, is not true. The Opocarpaſus was certainly a poiſonous Juice, which produced a deep Sleep, and a ſudden Suffocation. And *Galen* affirms, that, in the Courſe of his Practice, he knew ſeveral Patients killed, by inadvertently uſing Myrrh, mixed with Opocarpaſus. But of what Plant, Tree, or Herb, this Opocarpaſus was the Juice, none of the Antients have informed us; and it ſtill remains a Secret to the Moderns. But thoſe who have uſed the Opocarpaſus, are relieved by Draughts impregnated with Hemlock.

Myrrh, according to *Dioſcorides*, is of an heating and ſomniferous Quality; though, according to *Caſpar Hoffman*, it does not induce Sleep in all Patients, on which Aromatics produce that Effect, but only in ſuch Patients, whoſe Heads are naturally cold, or otherwiſe infarcted with Phlegm. But *Cordus* affirms, that the Stacte, by means of a certain Heavineſs induced on the Senſes, procures Sleep. Myrrh is alſo of a conglutinating, drying, and aſtringent Quality; but ſome deny it to be aſtringent, ſince it provokes the Menſes, and expels the Fœtus. It ſoftens and opens the Uterus, when ſhut up. It ſpeedily provokes the Menſes, and expels the Fœtus, when applied with Wormwood, Cream of Lupines, or Juice of Rue. Myrrh is, at preſent, highly commended by ſome in difficult Labours; and its ſometimes ſtopping the Menſes, is owing to that Quality, by which it dries and conſumes the Serum. A Pill of it, as large as a Bean, is uſed for inveterate Coughs, Orthopnœas, Pains of the Sides and Thorax, Fluxes, and Dyſenteries. But in theſe Caſes, according to *Caſpar Hoffman*, it is not beneficial, in conſequence of an aſtringent Quality, which it is by no means poſſeſſed of; but by means of its drying up, and digeſting, the acrid and corroſive Humours. Myrrh, alſo, prevents Rigors, preceding febrile Paroxyſms, if the Bulk of a Bean of it is drank in Water, with a ſufficient Quantity of Pepper. When it is put under the Tongue, and the Juice of it ſwallow'd, it removes a Roughneſs of the Arteria Aſpera, and an Hoarſeneſs of the Voice. By its Bitterneſs it kills Worms, and is, by ſome, chewed for a diſagreeable Breath. It is uſed by way of Ointment, in Conjunction with Liquid Alum, for Pains of the Arm-pits. When incorporated with Wine and Oil, it corroborates the Gums and Teeth. It conglutinates Wounds of the Head, when ſprinkled upon them. When mixed up with the Fleſh of Snails, it cures Contuſions of the Ears, and denudated Bones. When uſed by way of Ointment, in Conjunction with Poppy-juice, Caſtor, and Glaucium, it cures Inflammations, and Diſcharges of Pus from the Ears. When made into an Ointment, with Caſſia and Honey, it cures *Vari*; and, when mixed with Vinegar, removes an Impetigo. An Ointment prepared of Myrrh, Ladanum, Wine, and Oil of Myrtle, prevents the Falling off of the Hairs. It allays long-continued Defluxions from the Head, if applied by way of Ointment, with a Feather to the Noſtrils. It fills up Ulcers of the Eyes, and removes thoſe Specks and Aſperities, which darken the Pupil of the Eye.

Moſt of theſe Effects are produced by the drying and abſtergent Quality of Myrrh; for which Reaſon it was greatly uſed by the Antients for the Preſervation of dead Bodies. But, according to *John Bauhine*, Myrrh is not beneficial to all Patients, ſince, according to *Galen*, the Smell of it, excites an Head-ach in ſome Perſons, before perfectly ſound. And *Galen*, according to *Caſpar Hoffman*, 5. *Simpl.* 19. reckons Myrrh among thoſe Subſtances, which, when liberally uſed, in conſequence of their too great Humidity, render ſome mad, and deſtroy others.

Some Moderns affirm, that Myrrh is beneficial in Dropſies; and *Matthiolus*, for that Purpoſe, orders it to be drank with Agrimony.

Schroder informs us, that, externally applied, it is beneficial in St. *Antony's* Fire, a Gangrene, Tumors, old and recent Wounds, eſpecially of the Head, for which Reaſon it is ſo frequently uſed in adheſive Plaiſters.

The *Bœotian* Myrrh of *Dioſcorides*, which he ſays is the Root of a certain Tree growing in *Bœotia*, is of a drying emollient Nature; and, properly uſed in Fumigations, is not now known. The *Egyptians* are, at preſent, ſaid to chew Myrrh in the time of the Plague. *Raii Hiſt. Plant.*

STACTE. Offic. J. B. 1. 315. C. B. P. 501. Raii Hiſt. 2. 1842.

STACTE, according to *Dioſcorides*, is only liquid Myrrh: There were two Manners of collecting it among the Antients; for, as *Pliny* would have it, it either flowed ſpontaneouſly from the Tree, without an Inciſion; or it was expreſſed from the Myrrh, bruiſed with a moderate Quantity of Water, as we are informed by *Dioſcorides* and *Cordus*. It is never found in the Shops. *Dale*.

TINCTURE OF MYRRH.

Put into a Matraſs of fine Myrrh, in Powder, one Pound; of Spirit of Wine, four Pounds: Invert another Glaſs into the Mouth of the Matraſs, to make a double Veſſel; lute the Juncture, and ſet it in a gentle Heat of Sand to extract its Tincture.

This has the Virtues of the Gum, but is ſeldom given inwardly; externally, it is in great Eſteem among our Surgeons, for cleanſing foul Ulcers, and to exfoliate carious Bones.

ANOTHER TINCTURE OF MYRRH.

Take of Myrrh, half an Ounce; Salt of Tartar, two Drams: Mix them well together, and put them into a moiſt Place, for a Week; then add to them eight Ounces of rectified Spirits, and draw out the Tincture by a gentle Heat.

The Salt of Tartar is directed to lie with the Myrrh in a moiſt Place, becauſe the Air diſſolves it ſo into the Body of the Gum, that, when it comes into the Spirit, it much ſooner gives its Tincture, than it otherwiſe would.

COMPOUND TINCTURE OF MYRRH.

Take of the beſt Aloes, and Myrrh, each an Ounce; *French* Brandy, a Pound: Digeſt, and ſtrain for Uſe.

OIL OF MYRRH.

Half fill a Retort with coarſe Myrrh; put it to a Receiver, when in a Sand-furnace; give it Fire, by degrees, to the greateſt Height; when the Fumes ceaſe, let out the Fire, and in the Receiver there will be a fetid Oil, and an acid Spirit.

This is reckoned diaphoretic and diuretic, but is ſeldom preſcribed; externally, it brings bad Ulcers to a kind of Suppuration. Its Doſe is from eight to twenty-four Drops, in any proper Liquor.

MYRRHINE. The Myrtle. See MYRTUS.

MYRRHIS.

The Characters are;

The Petals are unequal, and is the Seed ſtriated, and reſembles the Beak of a Bird.

Boerhaave mentions fifteen Species of this Plant; which are,

1. Myrrhis; perennis; ſemine ſtriato; alba; major; odorata. *Boerh. Ind. alt.* 69. *Myrrhis.* Offic. *Myrrhis magno ſemine, longo, ſulcato.* J. B. 3. 77. Raii Hiſt. 1. 431. *Myrrhis major vel Cicutaria odorata.* C. B. P. 160. Tourn. Inſt. 315. *Myrrhis major vulgaris, ſive Cerefolium majus.* Park. Theat. 935. *Cerefolium magnum ſive Myrrhis.* Ger. Emac. 1039. SWEET CICELY.

The Leaves of ſweet Cicely are large and winged, with ſeveral long Pinnæ on each Side; ſo that they pretty much reſemble the Leaves

Leaves of Fern, of a pleaſant aromatic Smell; the Stalks are ſomewhat hairy, and chanel'd, beſet with the like Leaves, but ſmaller, bearing on their Tops Umbels of white five-leaved Flowers, which are ſucceeded by pretty large long Seed, deeply furrowed, and having five ſharp Ridges. The Root is thick, and ſpreading with many Fibres. It is ſown in Gardens, and flowers in *May* and *June*. The Leaves and Seed are uſed.

This is more a ſallad Herb than an officinal one; being much of the Nature of Chervil, of hot and thin Parts, and good for cold windy Stomachs; it opens Obſtructions of the Liver and Spleen, and provokes Urine. *Miller's Bot. Off.*

The Leaves have ſome Reſemblance to thoſe of Fern, whence it is called by many *Sweet Fern.*

Myrrhis agrees with Cerefolium, or Chervil, in Temperament and Virtues. The Root, taken in Wine, cures the Bites of Spiders: It purges Women after Childbirth, and provokes the Menſes. Boiled in Honey, and taken, it is good for a Conſumption, and expectorates viſcous Humours. The Decoction of it in Wine, taken two or three times in a Day, is a Preſervative from the Plague; the Decoction of the Herb and Root is uſed to provoke Urine; an Extract is, alſo, made of them againſt the Peſtilence, and the Epilepſy in Children.

The Root of the larger Myrrhis, or *Cicutaria odorata*, C. B. uſed in a Decoction, or any other Form, is a Cure for malignant Diſeaſes; for which Reaſon, ſays *S. Paulus*, I have recourſe to it for want of the Root of the Carline-thiſtle. *Raii H. P.*

2. Myrrhis; annua; ſemine ſtriato, lævi; tuberoſa; nodoſa; coniophyllon. *M. U.* 44. *M. H.* 3. 302. *Cicutaria, bulboſa.* C. B. P. 161. *Bulbocaſtanum, coniophyllon.* Cam. H. 31.

3. Myrrhis; perennis; alba; minor; foliis hirſutis; ſemine ſtriato, aureo. *M. H.* 3. 301. *M. U.* 44. 45. 46. 66.

4. Myrrhis; perennis; alba; minor; foliis hirſutis. *M. H.* 3. 301. *M. U.* 44. 45. 46. 66.

5. Myrrhis; perennis; alba; minor; foliis hirſutiſſimis. *M. H.* 3. 301. *M. U.* 44. 45. 46. 66.

6. Myrrhis; perennis; alba; folio glabriori, viridiori, ſplendente.

7. Myrrhis; annua; glabra; alba; minor. *Ind.* 17.

8. Myrrhis; annua; ſemine ſtriato, lævi. *M. U.* 44. *Chærophyllum ſylveſtre.* C. B. P. 152. *Apium ſylveſtre.* Germ. 1020.

9. Myrrhis; annua; ſemine ſtriato, aſpero, oblongo; nodoſa. *M. U.* 44. 67. *Chærophyllum ſylveſtre, alterum, geniculis tumentibus.* T. 314.

10. Myrrhis; annua; ſemine ſtriato, villoſo, incano. *Tourn. Inſt.* 315. *Boerh. Ind. alt.* 69. *Daucus Creticus.* Offic. *Daucus Creticus verus.* Ger. 874. Emac. 1029. *Daucus Creticus verus Dioſcoridis.* Park. Theat. 896. *Daucus foliis Fœniculi tenuiſſimis.* C. B. P. 150. *Daucus Creticus ſemine hirſuto.* J. B. 3. 56. Raii Hiſt. 1.463. CARROTS OF CREET, or CANDY CARROT.

The true Daucus has a pretty long thick Root, from which ſpring ſeveral fine winged Fennel-like Leaves, but having the Segments more thinly ſet on the Stalks, of a whitiſh-green Colour: The Stalks grow to be about two Feet high, beſet with the like Leaves, and having on the Tops Umbels of ſmall, white, five-leaved Flowers. The Seed is long, ſlender at both Ends, and ſwelling in the Middle, covered with a white downy Hoarineſs, of a pleaſant Smell, and a ſharp hot Taſte: It grows originally in *Candy*, and other Places in the *Levant*; and flowers in the Summer.

The Seed only is uſed, which is warming, aperient, and uſeful in Diſorders of the Kidneys, as Stone and Strangury, provoking Urine, as, alſo, the Catamenia: It expedites the Birth, and brings away the After-birth: It is, likewiſe, accounted alexipharmic, and good againſt the Bites and Stings of venomous Creatures; and is an Ingredient in Theriaca, and Mithridate. *Miller's Bot. Off.*

The Parts in Uſe are the Seeds, which are oblong, grey, acuminated, hairy, and of a fragrant Smell and Taſte: They are of ſingular Efficacy in uterine Affections, and diuretic. Thus it diſcuſſes Flatulences, and is principally uſed in Obſtructions of the Menſes, Strangulations, and Pains of the Matrix, in the flatulent Colic, Hiccough, Dyſury, inveterate Cough, and the like Diſorders. *Dale* from *Schroder.*

11. Myrrhis; Sicula; elatior; tenuioribus foliis. *M. H.* 3. 302. *Chærophyllum, Siculum, foliis Sophiæ, villoſo ſemine.* T. 314. *Daucus, ſecundus, Siculus, foliis Sophiæ.* Zan. 80.

12. Myrrhis; Orientalis; folio anguſtiori Peucedani; ſemine villoſo. *Ind.* 17. *Daucus Cretenſis verus.* Lob. Ic. 1. 722.

13. Myrrhis; trifolia; Canadenſis; Angelicæ facie. *T.* 315. *Angelica Canadenſis, trifolia, quorumdam.*

14. Myrrhis; folio Angelicæ rugoſo hirſuto. *Chærefolium, folio rugoſo Angelicæ, aromaticum.* Bocc. Muſc. Tab. XIX. *Podagraria hirſuta, Angelicæ folio & odore.* Vaill. Diſc. 44. 45.

15. Myrrhis; foliis Paſtinacæ læte virentibus. *T. C.* 22. *Daucus Paſtinacæ folio ſiclæ.* Zan. 78. *Boerh. Ind. alt. Plant.*

It takes its Name, eſpecially the firſt Species of it, from Myrrh, which it reſembles in Colour and Foliature, and, alſo, in Smell: The Seeds are ſtriated, but, if black, they belong to the *Chærophyllum*, or Chervil.

The firſt has the Taſte of Cloves, is uſed in Sallads, and has the aperitive, exhilarating, diuretic, and demulcent Virtues, of the Clove, and is a very good Antiſcorbutic, the expreſſed Juice being taken in Whey, to the Quantity of ſome Ounces. A Cataplaſm, prepared of the Leaves, is applied to the Perinæum and Oſſa Pubis, for Bruiſes by Falls, and for Contuſions. It is an excellent Remedy, in a Suppreſſion of Urine, from a Spaſm of the Bladder, or its Sphincter, and to provoke the Menſes, or diſcuſs Tumors. The other Species have a reſolvent, maturating, emollient, and ſuppurating Quality, and are, therefore, uſed in maturating Cataplaſms. The Seeds are aromatic, and have a very penetrating, inciding Property, and are recommended by *Helmont* for the Stone: They cure, alſo, flatulent Affections. The firſt Species is diſcutient and reſolvent, and may be exhibited in the Pleuriſy, as, alſo, in the Peripneumony, with Whey and Honey, in order to reſolve the Phlegm: It is, alſo, proper in hot Diſtempers, as well as chronic, which, though ſeeming to imply a Contradiction, is nevertheleſs true: It potently exhilarates, and is, therefore, exhibited to melancholy Patients in Whey.

The *Chærophyllum Hiſpanicum veterum* has its Name, which imports exhilarating Leaves, [from χαίρω, to rejoice, and φύλλον, a Leaf] from its Effects. The former Kind, that is, from the firſt to the fifth, incluſively, have ſomewhat poiſonous, as partaking ſomething of the Nature of the Cicuta; the latter Species, from the ſixth to the fourteenth, and eſpecially the ninth and tenth, are commended for their aromatic Quality. The eleventh is not eaſily diſtinguiſh'd from the Cicuta major, or greater Hemlock; it has Tubera, and is, therefore, called *Bulbocaſtaneum.* The ninth and tenth are ſold promiſcuouſly in the Shops, under the Title of *Daucus Creticus*; in all theſe the Taſte is the ſame. The freſh Leaves of the ninth Species, bruiſed, are made up with Salt and Wine, into the Form of a Cataplaſm, which reſolves all Kinds of ſlow and inflammatory Tumors. The Seed is hairy, and an Ingredient in all Antidotes. It is very good for the Stone in the Bladder, as *Helmont* himſelf, though a Chymiſt, allows, if an Handful thereof be put into a Barrel of Beer: This Beer, being drank, cures all ſcorbutic, arthritic, and nephritic Pains, and is, alſo, good for a Retention of Urine in Children, when it happens, as is often the Caſe, from Weakneſs; as, alſo, for a Cachexy, Phthiſis, Aſthma, and Epilepſy. *Hiſt. Plant. adſcript. Boerhaav.*

MYRRHIS is, alſo, a Name for ſeveral ſorts of CHÆROPHYLLUM.

MYRRHIS SYLVESTRIS. A Name for the *Caucalis*; *ſylveſtris*; *folio Chærophylli.*

MYRSINATON. The Name of a Plaiſter, deſcribed by *Paulus Ægineta, Lib.* 7. *Cap.* 17.

MYRSINELÆON. Oil of Myrtles, deſcribed by *Dioſcorides, Lib.* 1. *Cap.* 48.

MYRSINITES. An Epithet for Wine impregnated with Myrtle-branches. *Dioſcorides, Lib.* 5. *Cap.* 137.

MYRTIDANON, μυρτίδανον. By this *Hippocrates* means a round Fruit, or Berry of the Indicum, which the *Perſians*, as he tells us, call Pepper. But in *Dioſcorides, Lib.* 1. *Cap.* 156. it is an Excreſcence, which grows upon, and embraces the Trunk of the Myrtle; and which is more aſtringent than the Myrtle itſelf. *Myrtidanum Vinum* is Wine impregnated with the Berries of the wild Myrtle. *Pliny, Lib.* 14. *Cap.* 16.

MYRTILLUS. A Name for the *Vitis Idæa*; *foliis oblongis, crenatis*; *fructu nigricante.*

MYRTITES. A Compoſition of Honey, and the Juice of Myrtle-berries.

MYRTOCHEILIDES, μυρτοχειλίδες. A Name for the Nymphæ of the female Pudenda.

MYRTOCISTUS. *Cluſius* calls a Species of Axyrum by this Name.

MYRTON, μύρτον. The CLITORIS.

MYRTUS.

The Characters are;

The End of the Pedicle paſſes into an Ovary, on the upper Extremity of whoſe Margin grows a ſhort, quinquefid, and ſtellated Calyx. The Flower is roſaceous, pentapetalous, growing on the Ovary within the Calyx, and furniſhed with very numerous Stamina. The Ovary, in the Centre of its Apex, bears a ſmall Placenta, whence it ſhoots forth a long ſlender Tube, and at laſt becomes an umbilicated, tricapſular, oblong Fruit, containing a Multitude of Kidney-ſhaped Seeds.

Boerhaave mentions thirteen Species of this Plant; which are,

1. Myrtus; communis; Italica. *C. B. P.* 468. *Raii Hiſt.* 2. 1502. *Tourn. Inſt. Boerh. Ind. alt.* 2. 255. *Myrtus.* Offic. *Myrtus Bætica ſylveſtris.* Ger. Emac. 1412. Park. Theat. 1454. *Myrtus vulgaris nigra & alba, ſativa, & ſylveſtris.* J. B. 1. 510. COMMON MYRTLE.

This is a little Tree or Buſh, ſhooting forth many ſlender, tough Branches, ſometimes brown, and ſometimes of a reddiſh Colour, on which grow ſmall, oblong, ſharp-pointed, green Leaves, ſet alternately on the Stalks, of a very pleaſant aromatic Smell; among theſe come forth the Flowers, each ſingly on a ſhort Foot-ſtalk, conſiſting of five white, round Leaves,

full of a great many white Stamina, which being fallen, the Calyx becomes a ſmall round, black Berry, with a ſmall Crown on the Top, as big as a Juniper-berry, full of ſmall, white Seeds. It grows wild in *Italy* and *Spain*, and flowers in *Auguſt*; the Leaves are ſometimes, but the Berries moſt generally, uſed.

They are both of them drying and binding, good for a Diarrhœa or Dyſentery, Spitting of Blood, and catarrhous Defluxions upon the Breaſt, the Fluor albus, the Falling down of the Womb, or Fundament, both taken inwardly, and uſed outwardly, in Powders and Injections.

The only officinal Preparation is the Syrupus Myrtinus. *Miller's Bot. Off.*

This Plant is cultivated in ſome Gardens, and flowers in the Month of *June*; both its Leaves and Berries, which are us'd in the Shops, are of a blackiſh Colour, of an oblong round Form, of an aſtringent Taſte, and a faint and languid Smell. Both of them are refrigerating, drying, and highly aſtringent; the Powder of the Leaves, if ſprinkled on the Axillæ and Groin, prevents their fetid Smell. Theſe Leaves, if the Body is rub'd with them, ſtop immoderate and profuſe Sweats. They, alſo, prove beneficial in catarrhous Members, and Fluxes; they are an excellent Defenſive in an Herpes, heal Putrefactions of the Mouth, ſtop Hæmorrhages of the Noſe, and cure a Polypus. The Berries mitigate Inflammations of the Eyes; and are beneficial in Luxations of the Joints, and Fractures of the Bones. *Dale* from *Schroder*.

2. Myrtus; Balſamica; foliis mali Granatæ. *H. L.*

3. Myrtus; foliis odore Nucis Moſchatæ, cauliculis rubentibus; vulgo odore Citri. *Schuyl. Cat. Hort.* 49.

4. Myrtus; latifolia; Romana. *C. B. P.* 468.

5. Myrtus; latifolia; Bœtica, ſecunda; vel foliis Laurinis confertim naſcentibus. *C. B. P.* 469.

6. Myrtus; anguſtifolia, Bœtica, *C. B. P.* 469.

7. Myrtus; flore pleno. *Corn.* 203.

8. Myrtus; folio Buxi. *Schuyl. Cat. Hort.* 49.

9. Myrtus; minor; vulgaris. *C. B. P.* 469.

10. Myrtus; minor; foliis ex luteo variegatis. *H. L.*

11. Myrtus; foliis minimis & mucronatis. *C. B. P.* 469.

12. Myrtus; foliis mucronatis, ex albo & viridi variegatis; *floſculi rubro-candidi.* H. R. D.

Myrtus Zeylanica. See VITIS IDÆA. *Boerh. Ind. alt. Plant.*

Some derive its Name from *Myrrha*, Myrrh, becauſe it ſmells like Myrrh; and others will have it ſo called from an *Athenian* young Woman named *Myrtha*, who was beloved by *Pallas*, and after her Death changed by her into this Tree.

This Tree, as well as all the Myrtles, abounds with oily and balſamic Particles, is ſweet-ſcented, and contains an aſtringent Juice. In Virtues it is much of the Nature of *Caryophyllata*, or Avens; for which Reaſon the tender and freſh Leaves may be infuſed in Water, and taken after the manner of Tea in all thoſe Diſtempers, for which the *Caryophyllata* is recommended. The Leaves, with the Fruit, or Berries, are uſed internally and externally, and are all aſtringent. The Syrup prepared of it, or the Juice of the Berries, are proper in an immoderate Flux of the Menſes and Hæmorrhoids; the Syrup alone is effectual in the Dyſentery and Diarrhœa; the Leaves, boiled, and reduc'd to the Form of a Cataplaſm, are very ſucceſsfully apply'd in Luxations; and its Rob is good in all Diſorders, which require Refrigeration and Aſtringency. *Hiſt. Plant. adſcript. Boerhaav.*

MYRTUS BRABANTICA. A Name for the *Gale*; *Frutex odoratus ſeptemtrionalium.*

MYSIS, μύσις. See MYCE.

MYSTERION, μυσήριον. The Name of an Antidote mentioned by *Galen*, L. 7. *de C. M. S. L. C.* 5.

MYSTRON, μύστρον. An *Attic* Meaſure for Liquids, containing two *Cochlearia*, and an half. It is equal to one Forty-eighth of a Pint.

MYTIS, μύτις. The black Juice which is found in the Mouth of the Sepia or Cuttle-fiſh. *Galen Exeg.* who alſo informs us, that it is the Name of a Fiſh mention'd by *Hippocrates*.

MYTTOTON, μυττωτόν. A kind of *Salmagunda*, made of Garlick, and Onions; ſometimes with an Addition of Cheeſe, Eggs, Oil, and Vinegar. It was eſteemd an ordinary Country-food, and perhaps might be ſomewhat like what *Virgil* means in the ſecond *Eclogue*, when he ſays,

Theſtylus et rapido feſtis meſſoribus æſtu
Allia, ſerpyllumque, herbas contundit olentes;

MYTULUS. Offic. Schonef. Icht. 54. Bellon. de Aquat. 397. Geſn. de Aquat. 277. Rondel. de Aquat. 2. 48. *Mytuli.* Mer. Pin. 193. *Mytuli Rondeletii.* Aldr. de Exang. 512. Liſt. Hiſt. Conch. 3. n. 200. *Muſtulus ex cæruleo niger.* Ejuſd. Hiſt. Animal. Ang. 182. *Muſculus.* Bonan. 102. n. 30. THE MUSSEL.

It is taken in our Seas. The Shell is uſeful in Medicine, and is an alcaline Subſtance, of the ſame Virtues with other Shells.

MYURUS, μύουρος. An Epithet for a ſort of ſinking Pulſe, when the ſecond Stroke is leſs than the firſt, the third than the ſecond, and ſo on. Of this there are two Kinds; one when the Pulſe ſinks ſo, as never to riſe again; the other, when it returns again, and riſes in ſome degree. Both are eſteem'd of bad Preſage. The Word is derived from μῦς, a Mouſe, and οὐρά, a Tail. But it is ſometimes wrote μείουρος, and then it ſeems to have its Derivation from μεῖον, Leſs.

MYXA, μύξα. Mucus. But in Botany

MYXA, is a Plant; the Characters of which are,

The Flower is pentapetalous, roſaceous, and cluſter'd. The Ovary in the Bottom of the Calyx becomes a Plum-ſhaped Fruit, ſeated within the Calyx, and containing a ſimple Stone, or elſe three Capſules, furniſhed with a long Pedicle, and in each Capſule a Nucleus, or Kernel.

Boerhaave mentions but one Sort of this Plant; which is,

Myxa. *Boerh. Ind. A.* 2. 246. *Sebeſten.* Offic. *Sebeſtena, Myxa ſive Myxara.* Ger. 1315. Emac. 1499. *Sebeſtina domeſtica.* C. B. P. 446. *Myxas ſive Sebeſten.* Park. Theat. 252. *Myxa domeſtica.* J. B. 198. *Prunus Malabarica fructu racemoſa, calyce excepto.* Raii Hiſt. 2. 1563. THE SEBESTEN.

This is a ſweet Fruit, in Shape like one of our Plums, of a black Colour on the Outſide, having a flattiſh wrinkled Stone: It is the Fruit of a Tree like a Plum-tree, that grows in *Egypt* and *Aſſyria*, whence they uſed formerly to be brought; but, for theſe many Years, they have been quite Strangers to our Shops.

They are accounted cooling and moiſtening, and uſeful againſt ſharp, thin Defluxions upon the Lungs, helping Coughs and Catarrhs, and taking off the Heat of Urine. *Miller's Bot. Off.*

This Plant is produced in *Egypt* and *Aſia*, and flouriſhes in the Spring. Its Fruit, which is the only Part us'd, is ripe in the Autumn, reſembles a common Prune, is of a blackiſh Colour; and under a carnous, ſweet, and honeyiſh Pulp, includes a Kernel. Sebeſtens are in an intermediate Degree between Hot and Cold: They, alſo, moiſten, ſoften, and obtund the Acrimony of the Humours. They are principally us'd in acrid Catarrhs, acrid Urine, bilious Fevers, and Obſtructions of the Belly. In a Word, as in Figure, ſo in Virtues, they reſemble Damſons. *Dale* from *Schroder*.

MYXINOS, μύξινος. The Name of a ſort of Muller.

MYXORRHOOS, μυξόῤῥοος. Abounding with Mucus.

MYXOSARCOMA. A ſort of Tumor; the ſame as MUCOCARNEUS.

MYXOTER, μυξωτήρ. The ſame as MYCTER; the Noſe.
